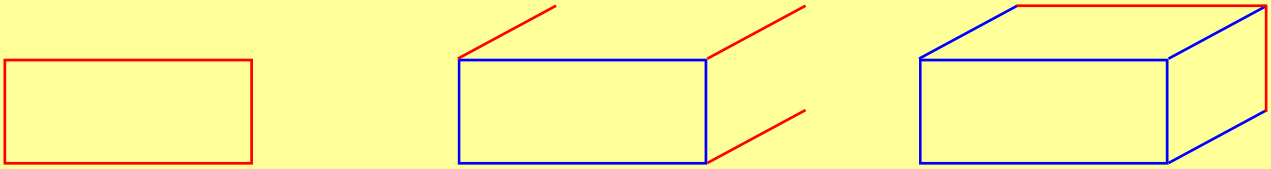
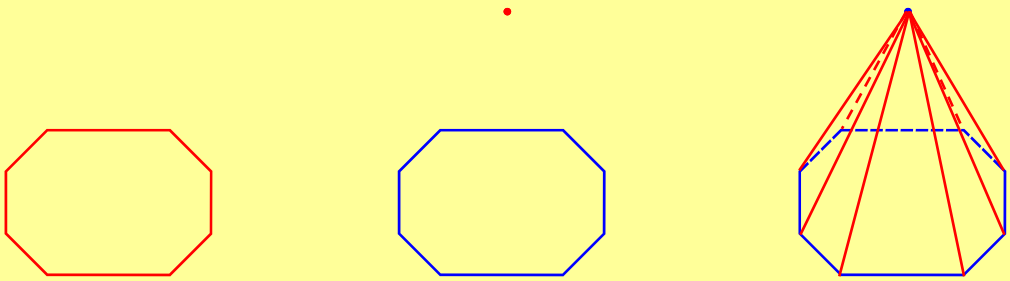
Drawing Solids

Drawing solids can be challenging as showing a 3D solid as a drawing in 2D is not always an easy task.

The way to approach drawing solids is to complete one face first, for example with a rectangular prism, draw the rectangle first. Then take each corner back, then join the ends.



With solids that have pentagonal, hexagonal or octagonal faces try to ‘squash’ the faces when you draw them, for example a octagonal pyramid. Draw the octagon, but squash it. Then pick a point above the centre of the octagon and connect to its vertices.



If you want to produce a more complicated diagram try to show hidden lines as broken lines. As shown in the example above and also at the top of the first column of the worksheet.

Drawing Solids

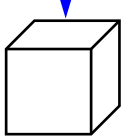
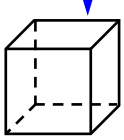
When you draw solids you can show hidden edges (as dotted lines) or not show them.

Example: Drawing a cube

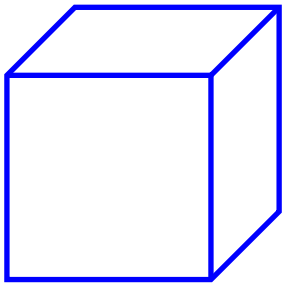
Hidden edges not shown



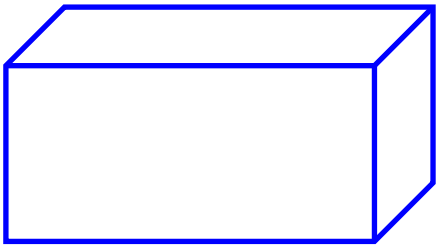
Hidden edges shown



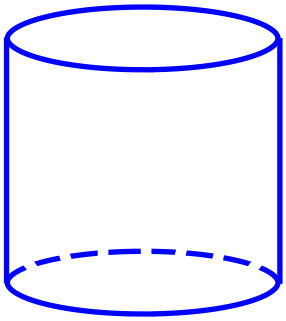
1 Draw a cube



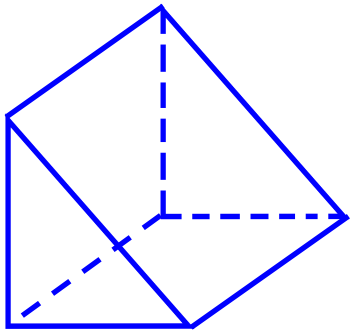
2 Draw a rectangular prism



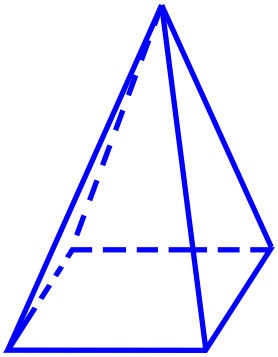
3 Draw a cylinder



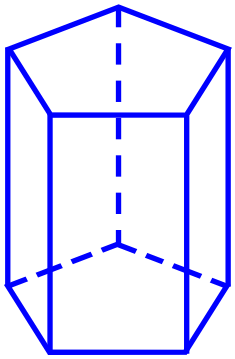
4 Draw a triangular prism



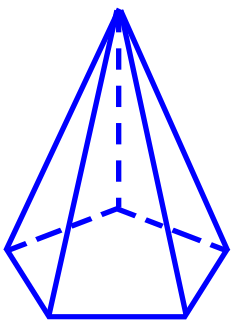
5 Draw a square pyramid



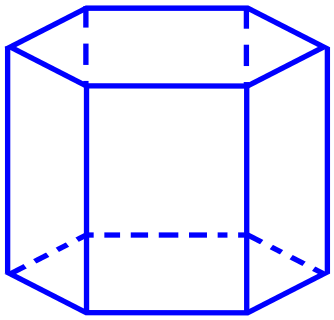
6 Draw a pentagonal prism



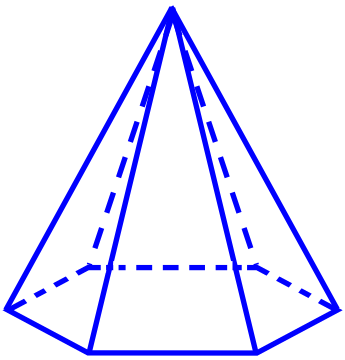
7 Draw a pentagonal pyramid



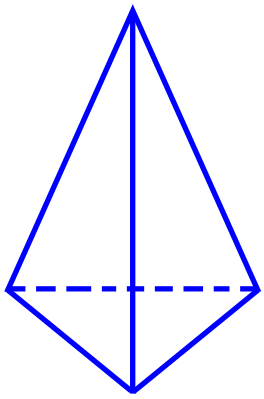
8 Draw a hexagonal prism



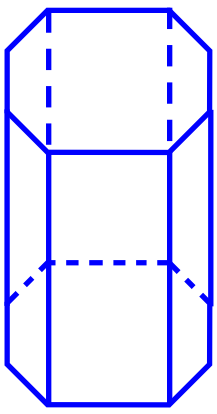
9 Draw a hexagonal pyramid



10 Draw a triangular pyramid



11 Draw an octagonal prism



Shapes in the Environment

This sheet deals with the different shapes that you have learnt and where you may find them in your world.

Column 1 starts with diagrams of objects and asks you to name the shapes/solids that make up the object. Some objects have more than one shape included in them, there will be two or more answer lines supplied when this is the case. The shapes can be plane shapes (2D) such as squares, rectangles, trapeziums, parallelograms etc, as well as solids (3D) such as cones, spheres and prisms.

Column 2 starts with questions on naming objects that may include the given shape/solid. Try and name objects that differ from those given in the previous column. List as many as you can in the space provided.

The bridge at the bottom of column 2 has steel beams which outline many different shapes, see if you can list 5 different shapes.

Column 3 starts with looking at bricks. Name the different shapes present in each brick then circle the letter of the brick with the most shapes. Question 16 shows an artists model and again you are asked to name all the shapes that you can see. Once you have done this, colour-in the shapes.

Shapes in the Environment

Tessellations

Tessellations are patterns made by the repeated use of a shape, without leaving gaps.

Question 1 in the first column features tessellated triangles. Colour the adjacent triangles (that share a common side) to build the shapes shown. Then colour the square in front of the shape's name the same colour. Like a key or legend in a map.

Column 1 then has three tessellated diagrams, complete the patterns. If you want to use different colours then print the second worksheet, which is unpainted.

Column 2 consists of irregular tessellations. This is when two or more different shapes are used. Colour them to form patterns.

The final tessellation requires you to complete it by using the dots as guides. Once you have drawn it colour in the stars that have been formed.

Tessellations

Axis of Symmetry 1

An axis of symmetry is a line which divides a shape into two identical shapes. The shapes have to be a mirror image of each other. To complete this sheet on paper cut the shapes out and fold the shape on top of itself, the crease made by the fold is the axis of symmetry, count the creases and write the number in the box inside the shape.

If working on screen, imagine a line cutting the shape and check whether the shape either side of the imaginary line is an identical image.

Axis of Symmetry 1

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Cut the shapes out and fold them. If the shape doubles back on itself so that the fold mark creates two shapes that are the same, then that is an axis of symmetry. Repeat until all are found. Then write the number found in the square of the shape and stick the shape and its name in your book.

Axis of Symmetry 2

The axis of symmetry is just like a fold line where the image on one side of the axis is reproduced on the other side. Remember that the position of the shape is the same distance away from the line on the reflected image, so be careful with questions where the shape isn't touching the axis.

To complete the first column reflect the shape across to the right hand side of the axis of symmetry. Using the grid, colour in the squares (or triangles) to make a reflection. Use a pencil so that you can remove any mistakes easily.

Column 2 has two axes, so reflect to the right then reflect down, then it is your choice how you get the bottom right image, either by reflecting across or reflecting down.

The shapes made are in black but your reflection can use all the different colours you want, this isn't an exact reflection but it is more fun. You can even recolour the original shape different colours then reflect an exact copy.

Column 3 has drawings that you complete with one or several reflected images. Reflect them and then colour them in!

Rotational and Point Symmetry

Rotational symmetry is shown by rotating a shape and having it appear as the same shape during the rotation, before completing a revolution. A shape isn't rotationally symmetrical if it matches only after full rotation.

Column 1 could be answered by tracing the shape and spinning the trace over the original and counting the number of times it matches the original shape, including when it returns to its original position. But this can also be attempted mentally by imagining the process.

Column 2 involves identifying point symmetry. Point symmetry is when a shape is identical after a 180° rotation (half a rotation). These questions can be answered by observation or you can choose to turn the page upside-down. If the upside-down image is identical to the original then the object is point symmetric.

To flip the sheet upside-down, select the "View" menu, then the rotate option then "counter clockwise" or "clockwise" but repeat a second time.

Column 3 involves identifying point symmetry, line symmetry and rotational symmetry. If a line can be drawn anywhere through the object creating a mirror image on each side then the object has line symmetry. Point symmetry and rotational symmetry can then be found using the previous methods. If the type of symmetry exists answer 'yes'.

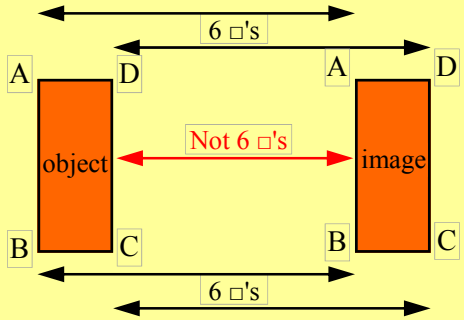
Transformations : Translation, Reflection and Rotation

When something is transformed it is changed in some way. In mathematics there are 3 different ways to transform a shape.

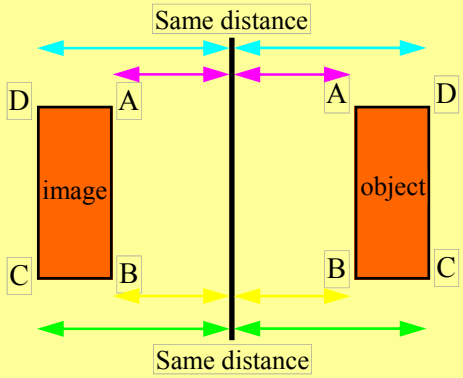
- Translation - this simply means to move, on the worksheet the shapes are on a grid and you are asked to move the object a certain number of squares on the grid.
- Refection - this is like a mirror image, the shape is reflected across a plane (line). The new shape will be the same distance away from the plane as the original, only upside-down or back-to-front.
- Rotation means to spin around a point, the point could be on the shape or away from the shape, this type of transformation requires the most thought.

With positioning the letters on the shape, the letters stay in the same position with translation, reversed in reflection and will be rotated in rotation, look at the examples below.

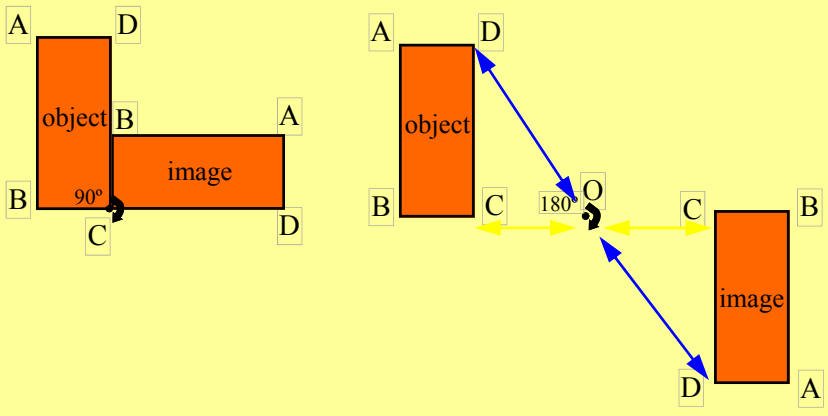
Translation means to move, the letters stay in the same position on the image. If you move the shape 6 □'s to the left then the distance between the same points is 6 □'s. The gap between the object and its image isn't 6 □'s, the most frequent mistake made.



Reflection means to copy back-to-front across a plane, the letters stay the same distance from the plane which means they appear to be reversed.



Rotation means to spin around a point, the point can be on the object or away from the object. The direction of rotation is given as either clockwise or anticlockwise. The distance of a point on the object from the rotation point remains the same once rotated.



Transformations : Translation, Reflection and Rotation

Nets of Solids 1

A net in mathematics refers to the way a solid would look if it were made from paper and unfolded. So to answer this sheet you have to look at the net and fold it up in your mind and decide what shape it makes when it is folded up.

For most students the difficulty comes when prisms and pyramids are involved. Think about this:

- If a net only has 2 triangles in the net, it will always be a triangular prism.
- If a net has more that 2 triangles in the net it will always be pyramid.
- If a net is of a pyramid then the name of the net will come from the shape in the net that isn't a triangle.
- If the net is of a prism then the name of the prism will come from the shape that isn't a rectangle or square. (except rectangular prisms)

Remember that a shape can't be a pyramid if it has no triangles in its net. A shape can't be a prism if it has more than two triangles in its net. To answer the sheet write the solid's name in the table at the bottom of the page next to the net's number.

Nets of Solids 1

13 Rectangular prism	14 Pentagonal pyramid	15 Cylinder	16 Cube
17 Triangular pyramid	18 Rectangular pyramid	19 Cone	20 Octagonal pyramid

Nets of Solids 2

Nets of solids are drawings of solids as though they are made from paper and unfolded. So to draw a net think of the solid unfolded. The previous sheet “Nets of Solids 1” can be referred to if you need help.

A prism will always have rectangles in its net and two other shapes as its base shape. So a pentagonal prism would have two pentagons and five rectangles, an octagonal prism would have two octagons and eight rectangles in its net.

A pyramid will always have triangles in its net and a different shape as its base shape (except triangular pyramids. So a hexagonal pyramid would have a single hexagon with six triangles, while a triangular pyramid would have a triangle with three triangles off it.

Use a pencil so that you can correct mistakes easily.

Views of Solids

When you look at a solid from the side, front or top you will see a plane (2D) shape. Imagine looking at a box from the top, side and front. You would have 3 views that would be either rectangles or squares.

Column 1 starts by giving you 3 views of a solid and asks you to name it. This exercise tests your visual skills and there aren't any helpful tips except that pyramids will have more than one view that includes a triangle, with that triangle being either isosceles or equilateral, not right or scalene.

Column 2 has diagrams of 5 solids and asks what shape you would see if you were looking from the direction of the arrow. The answers are all in the box at the bottom of the column, write in the letter (from A → I) that matches the object in the space provided. Note that the same letter can be used more than once.

Column 3 asks you to build you own shapes to show the view from the direction that is arrowed.

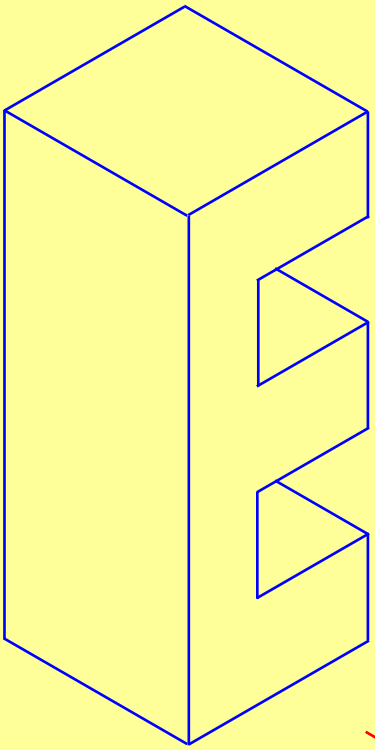
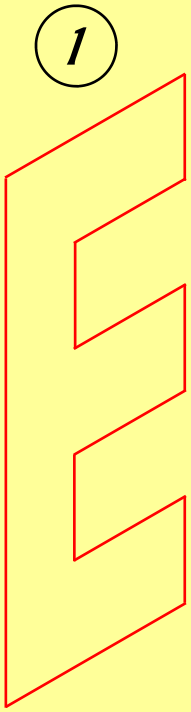
Isometric Drawing

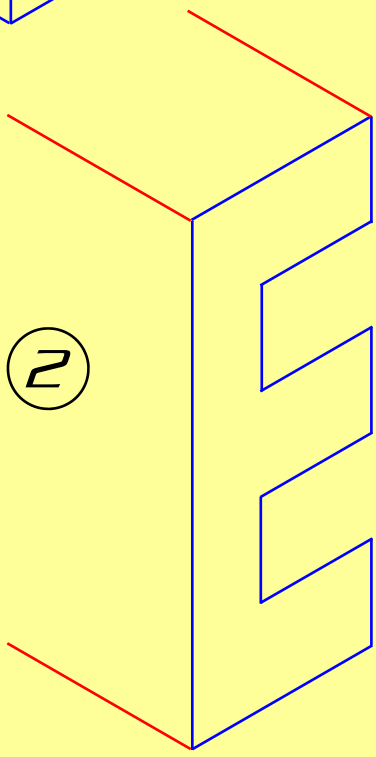
Isometric drawing is a method of showing a shape in a way that looks 3 dimensional. The bottom corner of the drawn shape has a BLUE COLOURED DOT, this is the point that you should start at and it is shown at the bottom of the page.

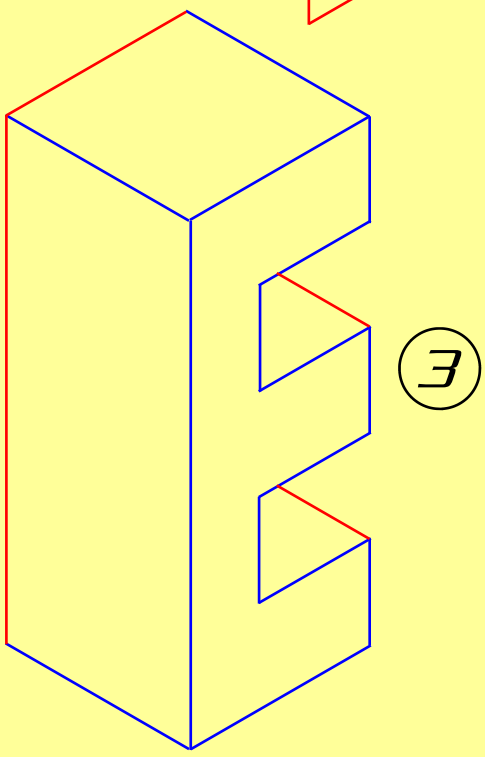
There is no 'best way' as it depends on how you visualise the solid, but one way is to try to complete one face first and then move on



So to draw the solid to the left, draw the front face first (right). Then take each corner back the required depth (bottom left). Join the edges and don't forget to take the two edges back as shown (bottom right)







Isometric Drawing - Sheet 1

Drawing Solids from Views

Isometric drawing is a method of drawing a solid in a way that it looks 3 dimensional. The bottom part of the sheet has a blue dot, this is the point that you should start from. The ‘front view’ arrow should be pointing at the front view, the object must be drawn in this way or it may not fit in the page.

Question 1 should be attempted first, Question 2 should be considered challenging.

“15 Isometric drawing” should have been completed before this Worksheet is attempted.

Euler's Formula

This formula relates the properties of a solid. The properties are the:

F - number of faces on the shape (the sides of the solid)
V - number of vertices on the shape (corners where edges meet)
E - number of edges on the shape (the lines that separate faces)

The Euler formula is: F + V - E = 2

To answer the questions look at each solid, the solids aren't numbered so start where you wish. Then:

- Write the name in the first column
- Count the faces and write the number in the next column
- Count the vertices and again, write it in the next column
- Count the edges and write in the next column
- Solve for F + V - E and it should equal 2.

This formula is a good check to see that you can accurately identify the properties of a shape as you know that if the answer isn't 2 you have to go back and find your mistake.

Cross-sections of Shapes

A cross-sectional view of a solid is like you are slicing through the solid and then looking at the surface that you have just cut. Imagine slicing a loaf of bread (rectangular prism) and looking at the slice (a square?). The important rule is that if you slice a prism you get a uniform cross-section, that is, the cross section is identical wherever you choose to cut through the solid. Just like slices of bread. But what if the cross sections aren't the same. That means the shape isn't a prism. It doesn't automatically mean that it is a pyramid though, as you will find out.

Columns 1 and 2 start with giving three cross sections, these sections are all cut in the same direction, like sliced bread, not any direction through the solid. You are asked to write the name of the solid that could have these cross sections. Question 1 has two possible answers.

Important - don't confuse cross sections with front, end and top views of a solid, all the sections are views from the one direction.

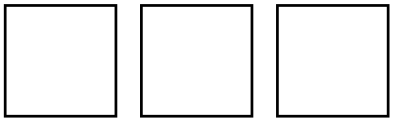
Column 3 shows a cross section and asks you to give some examples of solids that would have that section, the last part of the column asks you to name objects that would have cross sections that are rectangular, circular or triangular.

Cross-sections of Shapes

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

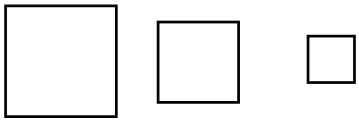
Name the 3-D shape(s) that would have these cross-sections.

1 1st section 2nd section 3rd section



2 solids possible for these sections

2 1st section 2nd section 3rd section



3 1st section 2nd section 3rd section

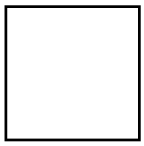
Hexagonal Pyramid

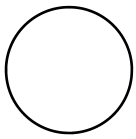
Name some solids that could have the cross sections shown below.

16



Cube, square pyramid, cylinder, rectangular prism, triangular prism (horizontal section)

17



Cone , cylinder, sphere, ellipsoid (vertical section in one direction)

18

Any prism could have this cross-section. Rectangular Pyramid.

Name objects in your environment that when sliced have cross-sections of….

19 Circles

Pipes, tree trunks, cans, sausages, tooth paste, drink in a glass

20 Rectangles

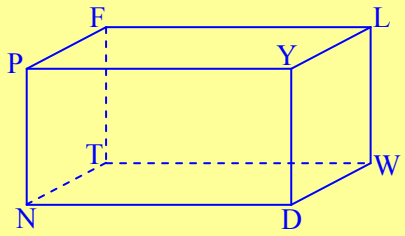
Bread, butter, block of cheese, any box unless it is a cube

21 Triangles

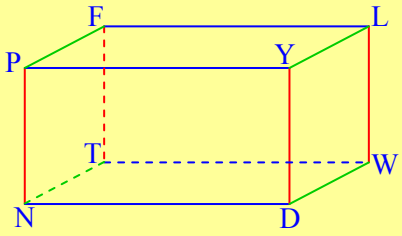
Toblerone, pyramids

Parallel, Perpendicular and Skew

Parallel means the same distance apart and not touching. This sheet deals with parallel faces and parallel edges. The rectangular prism shown below has three pairs of parallel faces.



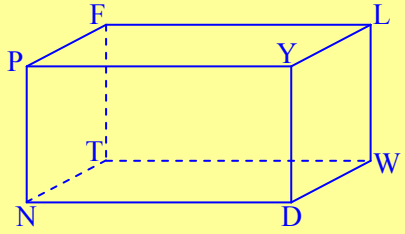
The top face PFLY is parallel to the bottom face NTWD.
The front face PYDN is parallel to the back face FLWT.
The LHS face PFTN is parallel to the RHS face YLWD.



There are parallel edges as well. On the diagram to the right, the edges that are the same colour are all parallel. You can show this using // :

PN // FT // LW // YD ND // PY // FL // TW PF // YL // DW // NT

Perpendicular means ‘at right angles to’ and touching. Again you can have perpendicular faces and also perpendicular edges. Faces first:

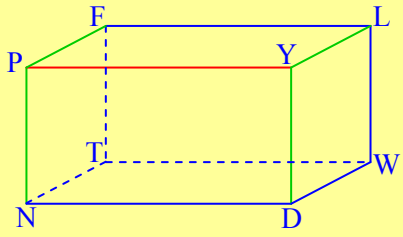


The top face PFLY and the bottom face NTWD are perpendicular to FLWT, YLWD, PYDN and PFTN.
The front face PYDN and the back face FLWT are perpendicular to PFLY, YLWD, WDNT and PFTN.
The side faces PFTN and YLWD are perpendicular to PFLY, FLWT, NTWD and PYDN.

Edges can also be parallel. With rectangular prisms and cubes there will be two perpendicular edges and the end of each edge.

So the edge PY (in red) has perpendicular edges (in green) YL, YD, PF and PN.

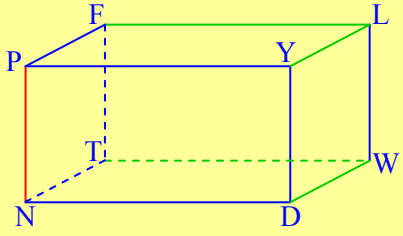
Not the perpendicular symbol is ⊥ .



Skew edges are edges that aren’t parallel and aren’t perpendicular. So if an edge is skew it won’t be parallel and it isn’t going to touch the given edge.

Name the skew edges to PN (shown in red).
The skew edges are shown in green and are FL, TW, YL and DW.

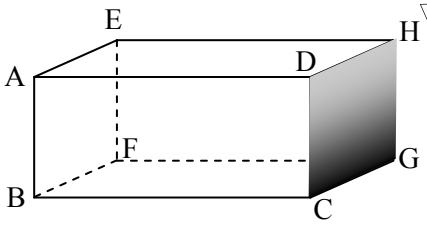
Note that none touch PN, and none are parallel to PN.



Parallel, Perpendicular and Skew

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Name the face(s) that ….



1 Is shaded. _____

2 Is parallel to BFGC.

BFGC // _____

3 Is parallel to the shaded face.

_____ // _____

4 Is parallel to ABCD.

_____

5 Is parallel to AEFB.

_____

6 Is perpendicular to ABCD & has an edge EH.

_____ ⊥ _____

7 Are perpendicular to EHGF & have an edge BF, (2 faces).

_____ ⊥ _____ ⊥ _____

8 Are perpendicular to BFGC & perpendicular to AEFB.

[ ] , [ ]

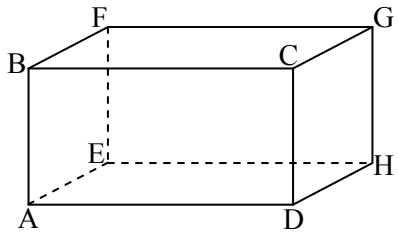
9 Are perpendicular to the shaded face and have edge GF.

10 Is perpendicular to ABCD & has vertices C & F.

11 Is perpendicular to DAEH & has edge BC.

_____ ⊥ _____

Name the edges that are parallel to, & perpendicular to, the edges on the rectangular prisms below.



12 3 edges parallel to AB are:

AB // [ ] // [ ] // [ ]

13 3 edges parallel to GC are:

GC // [ ] // [ ] // [ ]

14 3 edges parallel to EH are:

_____

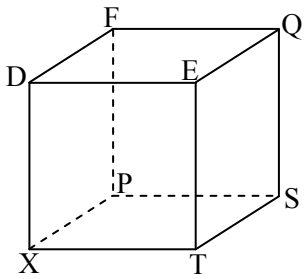
15 4 edges perpendicular to AB

[ ] , [ ] , [ ] , [ ]

16 4 edges perpendicular to GC

_____

Now use the cube shown below.



17 Name the face parallel to QFPS. _____

18 Name the edges parallel to FP. _____

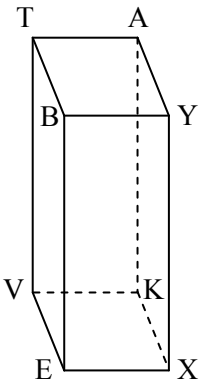
19 Name the horizontal faces perpendicular to DFPX.

_____

20 Name the vertical faces perpendicular to PFQS.

_____

What's skew with you? Name the skew edges in these questions.



21 Name 4 edges that are skew to YB: [ ], [ ], [ ], [ ].

22 Name 4 edges that are skew to VT: _____

23 Name 4 edges that are skew to KX: _____

24 Name two edges that are skew to EX and parallel to EB.

_____

25 Name two edges that are skew to AK and parallel to AT.

_____

26 Name an edge that is skew to VT and parallel to BY. _____

27 Name an edge that is skew to KV and parallel to YX. _____

28 Name an edge that is skew to EX and is on the face TBEV.

_____

29 Name two edges that are skew to AK and perpendicular to VT. _____

30 Name two edges that are skew to KV and perpendicular to EX. _____

31 Name two edges that are skew to XY and are on the face ATVK. _____

Parallel, Perpendicular and Skew

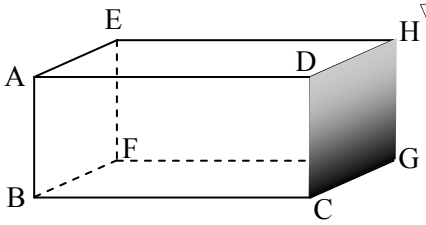
Name the face(s) that ….



1 Is shaded. GCDH

2 Is parallel to BFGC.

BFGC // AEHD

3 Is parallel to the shaded face.

GCDH // FBAE

4 Is parallel to ABCD.

ABCD // EFGH

5 Is parallel to AEFB.

AEFB // DHGC

6 Is perpendicular to ABCD & has an edge EH.

ABCD ⊥ AEHD

7 Are perpendicular to EHGF & have an edge BF, (2 faces).

EHGF ⊥ AEFB ⊥ BFGC

8 Are perpendicular to BFGC & perpendicular to AEFB.

ABCD, EHGF

9 Are perpendicular to the shaded face and have edge GF.

CDHG ⊥ CBFG ⊥ GFEH

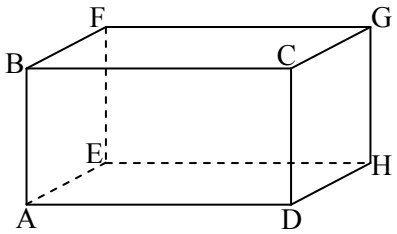
10 Is perpendicular to ABCD & has vertices C & F.

ABCD ⊥ CBFG

11 Is perpendicular to DAEH & has edge BC.

DAEH ⊥ ABCD

Name the edges that are parallel to, & perpendicular to, the edges on the rectangular prisms below.



12 3 edges parallel to AB are:

AB // EF // HG // DC

13 3 edges parallel to GC are:

GC // HD // EA // FB

14 3 edges parallel to EH are:

EH // AD // BC // FG

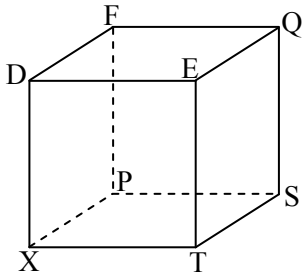
15 4 edges perpendicular to AB

AD , AE , BC , BF

16 4 edges perpendicular to GC

CB , CD , GH , GF

Now use the cube shown below.



17 Name the face parallel to QFPS. EDXT

18 Name the edges parallel to FP. FP // DX // ET // QS

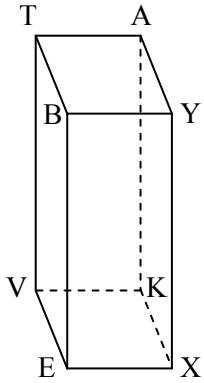
19 Name the horizontal faces perpendicular to DFPX.

DFQE, XPST

20 Name the vertical faces perpendicular to PFQS.

EQST, DFPX

What's skew with you? Name the skew edges in these questions.



21 Name 4 edges that are skew to YB: TV , AK , VE , KX .

22 Name 4 edges that are skew to VT: BY, EX, AY, KX.

23 Name 4 edges that are skew to KX: BY, TA, TV, BE.

24 Name two edges that are skew to EX and parallel to EB.

VT, KA.

25 Name two edges that are skew to AK and parallel to AT.

BY, EX.

26 Name an edge that is skew to VT and parallel to BY. EX

27 Name an edge that is skew to KV and parallel to YX. BE

28 Name an edge that is skew to EX and is on the face TBEV.

TB or TV

29 Name two edges that are skew to AK and perpendicular to VT. TB, VE.

30 Name two edges that are skew to KV and perpendicular to EX. BE, YX.

31 Name two edges that are skew to XY and are on the face ATVK. VK, TA.

Shapes - Find A Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don’t colour it in too dark (using a texta for example) so that you can still read it.

NUMBER THEORY

Odd and Even Numbers

Odd and even numbers separate each other and can be quickly identified, as:

- Odd numbers end in either a 1, 3, 5, 7 or 9
- Even numbers end in either a 0, 2, 4, 6, 8
- 0 is usually considered neither odd or even

Column 1 starts with 18 questions on classifying numbers as odd or even. The last digit of the number determines if it is odd or even, so ignore all the digits except the last one. The next four questions ask you to write the odd number before and after the number given. If the number is an even number then subtract 1 from it for the odd number before, add one to it for the odd number after. If the number is odd itself, subtract two from the number for the odd number before it, add two for the odd number after it. The last 4 questions involve even numbers before and after. Use the same method, if the number is odd subtract/add one to get the even numbers before and after and if it is even, subtract/add two.

Column 2 starts with listing all the odd numbers between two given numbers. One of the most asked questions from students is “does between include the numbers in the question?”, no it doesn’t. So look at the first number if it is even, the first odd number is one more than it, if it is odd, the first odd number is found by adding two to it. Then add two to get the next odd number and so on until the last odd number written is less than the larger number in the question. Repeat the same process for even numbers. Separate the numbers with a comma.

The last part of column 2 is circling the odd numbers and placing a square around the even numbers.

Column 3 starts with three questions on completing the pattern, if the numbers are even write in the next three even numbers, if they are odd put in the next three odd numbers. The rest of the column is devoted to showing properties of odd and even numbers. These are:

- Multiply (×) an even number with an even number you get an even number as the answer
- Multiply (×) an odd number with odd number you get an odd number as the answer
- Multiply (×) and even number with an odd number (or the reverse) you get an even number as the answer
- The sum (+) of an even number with an even number gives an even numbered answer
- The sum (+) of an odd number with an odd number gives an even numbered answer
- The sum (+) of an odd number with an even number (or the reverse) will give an odd number as the answer

When students are asked “What is an odd number times an even number" in a test and don't answer it they usually say "I forgot the rules", you don't have to remember them, just use 2 as your even number and 3 as your odd number and answer the question in your head. You get the answer 6 so its “even”.

Odd and Even Numbers

State whether the numbers below are odd or even.

1 3 ____ 2 11 ____

3 8 ____ 4 17 ____

5 30 ____ 6 57 ____

7 43 ____ 8 102 ____

9 95 ____ 10 230 ____

11 333 ____ 12 507 ____

13 896 ____ 14 439 ____

15 771 ____ 16 603 ____

17 813 ____ 18 400 ____

Give the odd number before and after the number given below

19 234 Before ____ After ____

20 1 050 Before ____ After ____

21 499 Before ____ After ____

22 5 000 Before ____ After ____

Now give the even number immediately before and after these

23 711 Before ____ After ____

24 1 677 Before ____ After ____

25 3 894 Before ____ After ____

26 9 999 Before ____ After ____

Write all the odd numbers between these 2 numbers

27 768 and 776

28 809 and 816

29 495 and 506

30 444 and 455

31 291 and 301

Give the even numbers between these 2 numbers

32 611 and 622

33 838 and 852

34 992 and 1 003

35 9 895 and 9 903

Circle the odd numbers and put a square around the even numbers

36

		181	800	39
	198			
			776	70
555		459		
11	221		663	
		302		
152	107	308	930	

Complete the patterns below

37 76, 78, 80, ___, ___, ___

38 185, 187, 189, ___, ___, ___

39 293, 295, 297, ___, ___, ___

Carry out the operations then state if each answer is odd or even

Example

5 (odd) + 9 (odd) = 14 even

40 11 (odd) × 5 (odd) = ____ ____

41 33 (odd) + 17 (odd) = ____ ____

From the above you can say:

42 an odd + an odd = ____

43 an odd × an odd = ____

44 6 (even) × 12 (even) = ____ ____

45 66 (even) + 14 (even) = ____ ____

From the above you can say:

46 an even + an even = ____

47 an even × an even = ____

48 7 (odd) × 6 (even) = ____ ____

49 8 (even) × 5 (odd) = ____ ____

50 17 (odd) + 8 (even) = ____ ____

51 24 (even) + 13 (odd) = ____ ____

From the above you can say:

52 an odd × an even =
an even × an odd = ____

53 an odd + an even =
an even + an odd = ____

Odd and Even Numbers

State whether the numbers below are odd or even.

1	3	odd	2	11	odd
3	8	even	4	17	odd
5	30	even	6	57	odd
7	43	odd	8	102	even
9	95	odd	10	230	even
11	333	odd	12	507	odd
13	896	even	14	439	odd
15	771	odd	16	603	odd
17	813	odd	18	400	even

Give the odd number before and after the number given below

		Before	After
19	234	233	235
20	1 050	1 049	1 051
21	499	497	501
22	5 000	4 999	5 001

Now give the even number immediately before and after these

		Before	After
23	711	710	712
24	1 677	1 676	1 678
25	3 894	3 892	3 896
26	9 999	9 998	10 000

Write all the odd numbers between these 2 numbers

27 768 and 776
769, 771, 773, 775

28 809 and 816
811, 813, 815

29 495 and 506
497, 499, 501, 503, 505

30 444 and 455
445, 447, 449, 451, 453

31 291 and 301
293, 295, 297, 299

Give the even numbers between these 2 numbers

32 611 and 622
612, 614, 616, 618, 620

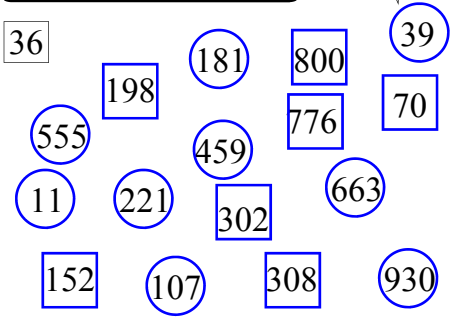
33 838 and 852
840, 842, 844, 846, 848, 850

34 992 and 1 003
994, 996, 998, 1 000, 1 002

35 9 895 and 9 903
9 896, 9 898, 9 900, 9 902

Circle the odd numbers and put a square around the even numbers

36



Complete the patterns below

37 76, 78, 80, 82 , 84 , 86

38 185, 187, 189, 191 , 193 , 195

39 293, 295, 297, 299 , 301 , 303

Carry out the operations then state if each answer is odd or even

Example

5 (odd) + 9 (odd) = 14 even

40 11 (odd) × 5 (odd) = 55 odd

41 33 (odd) + 17 (odd) = 40 even

From the above you can say:

42 an odd + an odd = even

43 an odd × an odd = odd

44 6 (even) × 12 (even) = 72 even

45 66 (even) + 14 (even) = 80 even

From the above you can say:

46 an even + an even = even

47 an even × an even = even

48 7 (odd) × 6 (even) = 42 even

49 8 (even) × 5 (odd) = 40 even

50 17 (odd) + 8 (even) = 25 odd

51 24 (even) + 13 (odd) = 37 odd

From the above you can say:

52 an odd × an even =
an even × an odd = even

53 an odd + an even =
an even + an odd = odd

Triangular Numbers, Square Numbers and Square Roots

Part of understanding number theory is understanding number patterns. Triangular numbers are the result of a pattern that can be easily represented graphically by dots which form triangles (look at the top of the first column). The first line is 1 dot, increase the next line by a dot so on the next line has 2 dots, the third line increases it by another dot and you get 3 dots, and so on, adding another dot to each new line. Square numbers could be seen as adding a dot to its width and adding a dot to its height. See half way down the column, before Q. 4.

In column 1 the first 3 questions deal with triangular numbers. You can work out the number mentally then 'do the dots' or the reverse, its your choice. Just add a row that is 1 greater than the previous row. With square numbers you can use a similar method, just add a dot to the width and a dot to the height to make the next largest square.

Column 2 involves exercises to make sure you understand how you get a square number. Some students forget and incorrectly think that when you square a number you multiply it by 2, like $4^2 = 4 \times 2 = 8$. It is important that you remember that squared means "times itself" ie. $4^2 = 4 \times 4 = 16$. You should know your 10 times table and so these should be just a mental exercise. Others know higher squares but many don't, so use the working spaces to calculate the next 10 square numbers.

Column 3 from Q. 28 involves square roots. A square root is the opposite to squaring a number. It is asking "what number multiplied by itself equals the number in the square root sign". You know that $2 \times 2 = 4$, that would mean that the $\sqrt{4}$ is 2. Or what number multiplied by itself equals 4? Well $2 \times 2 = 4$, so its 2. All the square roots asked for in these questions are within the first 20 square numbers. That means you have all the answers in the previous questions, just look at the previous answers and work backwards. Note that you can take square roots of non-square numbers, the answers will be in decimals however, a job for a calculator.

Palindromic, Fibonacci Numbers and Number Patterns

Palindromic numbers can be read the same way forwards or backwards. For example some word palindromes are: rotor, radar, mum and dad. The same applies with numbers, examples are: 121, 54 145, 11, 444 and 7 227.

Column 1 asks you to circle the palindromic numbers. To check them look at the first number and the last number, if they are different the number isn't palindromic. If they are the same look at the second number and the second last number and compare. Do this until you reach the middle number(s). If you have matching pairs of numbers all the way through, (if there is a middle number alone it is as if it has a matching pair) then the number is palindromic or a palindrome.

Questions 2 through 17 have numbers missing that you need to fill in to make the numbers palindromes. Compare the position of the box with the same position from the other end, if it's the first number compare it with the last number, if it's the second number compare it with the second last position or the reverse. The last question asks you to find the next 11 palindromic years after 2002, the first one being given to you (2112).

Column 2 introduces Fibonacci numbers. This is an unusual number pattern because it has the number 1 twice! The numbers are 0, 1, 1, 2, 3, 5, 8, 13, … each number is found by adding the previous two numbers, this is shown at the top of the second column. So 0 and the first 1 don't fit this rule (they don't have 2 numbers in front of them) but the second 1 is part of the method and from then on the rule applies. (0 + 1 = 1), (1 + 1 = 2) etc. This column asks you to find the next 10 numbers. From question 32 working spaces are supplied to help with the harder addition.

Column 3 is about number patterns. The first section deals with addition or subtraction. Look at the first two numbers. If they are increasing in size its an addition. To solve, subtract the first number from the second and that's the amount that you need to add to get the next number. If the numbers are reducing in size you know it's a subtraction, subtract the second number from the first number to find the amount to subtract.

The next group is multiplication and division, if they increase its multiplication, if they decrease its division. Find the number you multiply the first number by to get the second. Then, apply this to find the missing number. Division will have the numbers decreasing in size and so find the number that the first number was divided by to get the second number. Note that if the numbers are too large or difficult use the 2nd and 3rd numbers.

The last section is more difficult. This time you apply two operations (× or ÷ with + or -). Instead of just using the first 2 numbers make sure that the solution applies to all the given numbers. So investigate further into each question when you have a mixture of different types of patterns.

54 5, 20, 50, 110, 230 , 470

Factors - Finding the HCF

Factors are numbers that divide into another number without a remainder. All numbers have factors, the number itself and 1. If a number has only these two factors then it is classified as being prime. If additional factors are found then the number is called composite.

Column 1 asks you to list the factors of the numbers. Follow this method:

- Write 1 straight away then see if 2 is a factor and test each number 3, 4, 5, etc
- Once you get to half of the number you can stop and write the number itself, there are no factors greater than half the number except itself
- Perform a check, the first number × the last number = the number, the second number × the second last number = the number and work your way into the middle. The middle two numbers when multiplied = the number. Note that if the number is a square number then the middle number is the square root.

A common mistake is students finding the smaller factors and missing the larger factors. If you perform the check you won't miss them. When you list the numbers separate them with a comma.

Column 2 asks you to find the HCF (Highest Common Factor). When given 2 numbers (or more) the largest factor that is a factor of both numbers is the HCF. The process is the same as column 1 only you perform it twice, for the 2 numbers. The bottom of the column asks you to state whether the numbers are prime or composite. Note that 0 and 1 are usually considered neither prime or composite and 2 is the only even prime number.

Column 3 is an introduction to factor trees. Factor trees are used to break a number down into its prime factors. The first nine questions give a number at the top of the 'tree', then another number is given below it, divide the top number by the lower number and write the answer in the box. Or ask yourself what number times the lower number equals the top number? The next four questions use the same process only it is extended a further branch. Find the missing number as with the earlier questions, then break these numbers down to the two (prime) factors that multiply together to equal it. If the number is prime it doesn't have any factors so a single branch and circle are below it, just rewrite the same number in the circle.

To list the prime factors write the numbers that are in the bottom row of the tree, you only write each number once. That means that if there are, for example, three 2's and a five you only write 2 and 5, there isn't space for you to write all the numbers.

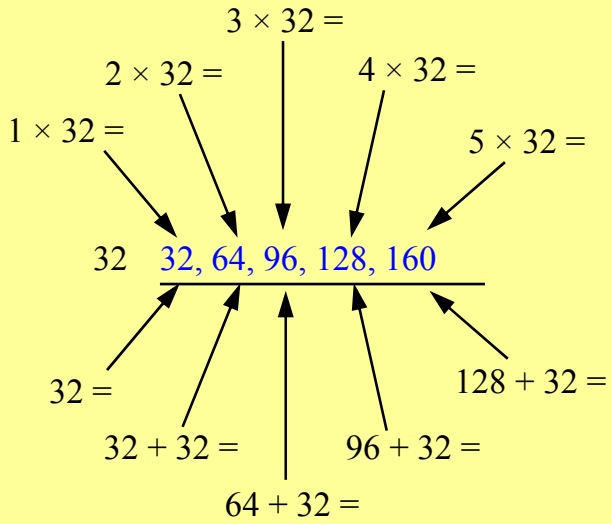
Multiples - Finding the LCM

When you think of multiples think of being given a number and multiplying it by 1, 2, 3,.etc. So the first multiple of a number is itself, as 1 × a number doesn't change it. But while it is multiplication it is often easier to add. Look at the example below finding the multiples of 32.



By Multiplying

By Adding

Column 1 deals with finding the first five multiples of a number. Write the number then add the number to itself and find the total, then add the number again and find the new total and so on. Or multiply by 1, 2, 3, 4 and 5, the addition is usually easier.

Column 2 asks for multiples of a number between 25 and 45. Remember between doesn't include the numbers, if a multiple is 25 or 45 they aren't between. You should be able to complete the additions mentally. Eg. the number 7...would start with 7 then 14 then 21 then 28 ….that's above 25 so that's my first number, write in 28 then add 7's….28 + 7 = 35, write 35….35 + 7 = 42, write 42….42 + 7 = 49 that's above 45 so we don't include it, so you're done. The next 5 questions ask for the next 3 multiples above 100. The method would be to count mentally in your head the numbers given until they pass 100, then write the next 3 multiples. Rather than counting from the start you should be able to multiply the numbers by a number of your choice to get it close to 100. For example if the number was 12...I know that 7 × 12 = 84….. so start from there 84 + 12 = 96…. so 96 + 12 = 108 that is my first number. Then away you go!

What is the LCM? LCM (Lowest Common Multiple) is the smallest multiple that is shared by two or more numbers. Column 2, Q. 28 through to the end of the sheet all use the same method. You are given 2 (or 3) numbers, list the multiples until you think you have the LCM covered. When you list the multiples for the second number stop once you spot the match. Then circle the matching LCM's and write the answer. An example is below.

5 5, 10, 15, (20) 25, 30 ← List the multiples of 5

4 4, 8, 12, 16, (20) ← List the multiples of 4, stop when you get a match (20). Circle the 2 numbers, then write your answer on the line.

The LCM is 20

List the first 5 multiples of the numbers below

Example

4 4, 8, 12, 16, 20

1 10 10, 20, 30, 40, 50

2 3 3, 6, 9, 12, 15

3 5 5, 10, 15, 20, 25

4 7 7, 14, 21, 28, 35

5 12 12, 24, 36, 48, 60

6 9 9, 18, 27, 36, 45

7 15 15, 30, 45, 60, 75

8 20 20, 40, 60, 80, 100

9 11 11, 22, 33, 44, 55

10 25 25, 50, 75, 100, 125

11 8 8, 16, 24, 32, 40

12 100 100, 200, 300, 400, 500

13 150 150, 300, 450, 600, 750

14 135 135, 270, 405, 540, 675

15 160 160, 320, 480, 640, 800

16 202 202, 404, 606, 808, 1 010

17 250 250, 500, 750, 1 000, 1 250

List the multiples of the numbers below that are between 25 and 45

18 3 27, 30, 33, 36, 39, 42

19 5 30, 35, 40

20 4 28, 32, 36, 40, 44

21 6 30, 36, 42

22 12 36

List the next 3 multiples of the given numbers that are greater than 100

23 5 105, 110, 115

24 10 110, 120, 130

25 8 104, 112, 120

26 9 108, 117, 126

27 22 110, 132, 154

List the multiples for each number then circle the LCM of each.

28 4 4, 8, 12, 16, (20) 24

10 (10), 20, 30, 40

The LCM is 20

29 8 8, 16, (24) 32, 40

6 6, 12, 18, (24) 30

The LCM is 24

30 11 11, 22, (33) 44

33 (33) 66, 99

The LCM is 33

31 20 20, 40, (60) 80, 100

15 15, 30, 45, (60) 75

The LCM is 60

32 9 9, 18, 27, 36, (45)

15 15, 30, (45) 60, 75

The LCM is 45

33 35 35, 70, (105) 140, 175

21 21, 42, 63, 84, (105)

The LCM is 105

34 12 12, 24, 36, 48, (60)

20 20, 40, (60) 80, 100

The LCM is 60

35 14 14, 28, 42, (56) 70

8 8, 16, 24, 32, 40, 48, (56)

The LCM is 56

36 12 12, 24, 36, 48, (60) 72

15 15, 30, 45, (60) 75

The LCM is 60

37 24 24, 48, (72) 96, 120

18 18, 36, 54, (72) 90

The LCM is 72

38 30 30, 60, (90) 120

15 15, 30, 45, 60, 75, (90)

45 45, (90) 135

The LCM is 90

39 9 9, 18, 27, (36) 45, 54

6 6, 12, 18, 24, 30, (36)

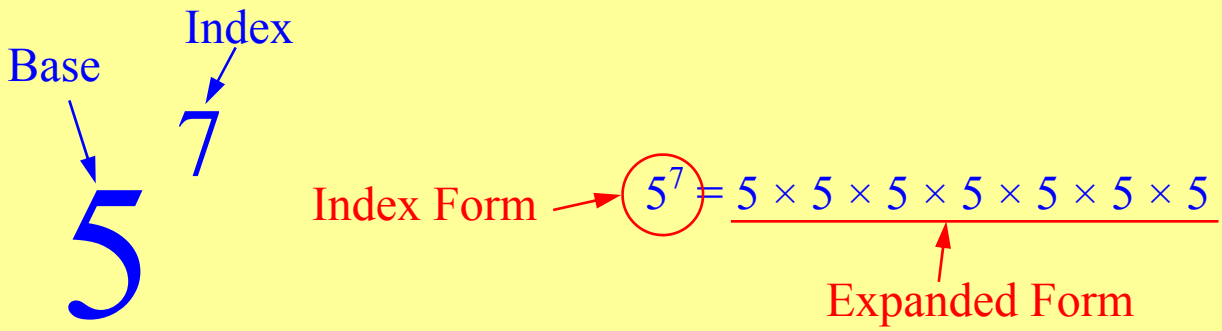
12 12, 24, (36)

The LCM is 36

Indexed Numbers

This sheet has some questions written sideways. To read these questions click on the "View" menu, select the rotate option then "counter clockwise".

Indexed numbers have a base and an index. The index tells you how many times the base is multiplied by itself. So 5^2 is $= 5 \times 5$ and $5^4 = 5 \times 5 \times 5 \times 5$. When a number is shown with an index it is in 'index form', when it is shown with the '×' between the numbers it is said to be in 'expanded' form (that means pulled apart).



Column 1 involves changing numbers from expanded form to index form. Look at the base and write this normal size, then count how many of the numbers there are and write that number next to the base number, as a smaller raised number.

Column 2 is an extension of this, with finding the expansion and then solving for the answer. An example is at the top of the column. Strokes can be used to total along the line (as in the example) or answer it mentally. The next section of column 2 deals with indices with a base of 10. With these you don't need to expand, the answer is just 1 with the index number of zeros after it. For example 10^5 would be a 1 with 5 zeros or 100 000. That means $10^1 = 10$ (a 1 with 1 zero after it). Numbers are then introduced, for example 6×10^5 would be a 6 with 5 zeros or 600 000, and $9 \times 10^1 = 90$.

Column 3 from Q. 43 is the reverse process, look at the number and write it as the first digit in the answer then a '× 10', then the power. Count the number of zeros after the first digit and that's your power!

Indexed Numbers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Write these numbers in index form don't multiply to get the answer

Example

$8 \times 8 \times 8 \times 8 \times 8 = 8^5$ (1 2 3 4 5)

1 $6 \times 6 \times 6$ = _____

2 $4 \times 4 \times 4 \times 4 \times 4$ = _____

3 5×5 = _____

4 $7 \times 7 \times 7 \times 7$ = _____

5 $10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10$ = _____

6 $1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1$ = _____

7 $9 \times 9 \times 9 \times 9 \times 9$ = _____

8 $3 \times 3 \times 3 \times 3 \times 3 \times 3 \times 3 \times 3$ = _____

Now the reverse, expand these !

16 10^7 =

15 1^{11} =

14 19^6 =

13 8^8 =

12 2^{13} =

11 123^7 =

10 10^9 =

9 5^{12} =

Calculate the numbers that these indexed numbers represent, you may wish to expand them first.

Example

$2^5 = \not{2} \times \not{2} \times \not{2} \times \not{2} \times 2 = 32$ (4 8 16)

17 3^3 = _____ = _____

18 10^3 = _____ = _____

19 8^2 = _____ = _____

20 1^4 = _____ = _____

21 4^3 = _____ = _____

22 5^3 = _____ = _____

23 2^4 = _____ = _____

24 2^6 = _____ = _____

Write these indexed base 10 numbers as numbers without working out

25 10^3 = _____

26 10^2 = _____

27 10^6 = _____

28 10^7 = _____

29 1×10^4 = _____

30 2×10^4 = _____

31 6×10^4 = _____

32 2×10^2 = _____

33 9×10^2 = _____

34 7×10^3 = _____

35 5×10^2 = _____

36 8×10^5 = _____

37 9×10^6 = _____

38 5×10^1 = _____

39 2×10^7 = _____

40 4×10^5 = _____

41 2×10^1 = _____

42 7×10^2 = _____

Write these as a single digit number × a base 10 indexed number

Example

$60\,000 = 6 \times 10^4$

43 400 = _____

44 9 000 = _____

45 20 000 = _____

46 4 000 000 = _____

47 700 000 = _____

48 3 000 = _____

49 90 000 000 = _____

50 70 = _____

51 6 000 = _____

52 500 000 = _____

53 200 = _____

54 8 000 000 = _____

55 30 = _____

Indexed Numbers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Write these numbers in index form don't multiply to get the answer

Example

$8 \times 8 \times 8 \times 8 \times 8 = 8^5$ (1 2 3 4 5)

1 $6 \times 6 \times 6 = 6^3$

2 $4 \times 4 \times 4 \times 4 \times 4 = 4^5$

3 $5 \times 5 = 5^2$

4 $7 \times 7 \times 7 \times 7 = 7^4$

5 $10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10 = 10^7$

6 $1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 = 1^9$

7 $9 \times 9 \times 9 \times 9 \times 9 = 9^5$

8 $3 \times 3 \times 3 \times 3 \times 3 \times 3 \times 3 \times 3 = 3^8$

Now the reverse, expand these !

9 $5^{12} = 5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5$

10 $10^9 = 10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10$

11 $123^7 = 123 \times 123 \times 123 \times 123 \times 123 \times 123 \times 123$

12 $2^{13} = 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$

13 $8^8 = 8 \times 8 \times 8 \times 8 \times 8 \times 8 \times 8 \times 8$

14 $19^6 = 19 \times 19 \times 19 \times 19 \times 19 \times 19$

15 $1^{11} = 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1$

16 $10^7 = 10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10$

Calculate the numbers that these indexed numbers represent, you may wish to expand them first.

Example

$2^5 = \cancel{2} \times \cancel{2} \times \cancel{2} \times \cancel{2} \times 2 = 32$ (4 8 16)

17 $3^3 = \cancel{3} \times \cancel{3} \times 3 = 27$ (9)

18 $10^3 = \cancel{10} \times \cancel{10} \times 10 = 1\,000$ (100)

19 $8^2 = 8 \times 8 = 64$

20 $1^4 = 1 \times 1 \times 1 \times 1 = 1$

21 $4^3 = \cancel{4} \times \cancel{4} \times 4 = 64$ (16)

22 $5^3 = \cancel{5} \times \cancel{5} \times 5 = 125$ (25)

23 $2^4 = \cancel{2} \times \cancel{2} \times \cancel{2} \times 2 = 16$ (4 8)

24 $2^6 = \cancel{2} \times \cancel{2} \times \cancel{2} \times \cancel{2} \times \cancel{2} \times 2 = 64$ (4 8 16 32)

Write these indexed base 10 numbers as numbers without working out

25 $10^3 = 1\,000$

26 $10^2 = 100$

27 $10^6 = 1\,000\,000$

28 $10^7 = 10\,000\,000$

29 $1 \times 10^4 = 10\,000$

30 $2 \times 10^4 = 20\,000$

31 $6 \times 10^4 = 60\,000$

32 $2 \times 10^2 = 200$

33 $9 \times 10^2 = 900$

34 $7 \times 10^3 = 7\,000$

35 $5 \times 10^2 = 500$

36 $8 \times 10^5 = 800\,000$

37 $9 \times 10^6 = 9\,000\,000$

38 $5 \times 10^1 = 50$

39 $2 \times 10^7 = 20\,000\,000$

40 $4 \times 10^5 = 400\,000$

41 $2 \times 10^1 = 20$

42 $7 \times 10^2 = 700$

Write these as a single digit number × a base 10 indexed number

Example

$60\,000 = 6 \times 10^4$

43 $400 = 4 \times 10^2$

44 $9\,000 = 9 \times 10^3$

45 $20\,000 = 2 \times 10^4$

46 $4\,000\,000 = 4 \times 10^6$

47 $700\,000 = 7 \times 10^5$

48 $3\,000 = 7 \times 10^3$

49 $90\,000\,000 = 9 \times 10^7$

50 $70 = 7 \times 10^1$

51 $6\,000 = 6 \times 10^3$

52 $500\,000 = 5 \times 10^5$

53 $200 = 2 \times 10^2$

54 $8\,000\,000 = 8 \times 10^6$

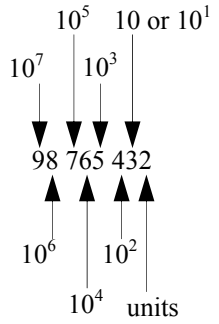
55 $30 = 3 \times 10^1$

Expanded Notation with Indices

This sheet has some questions written sideways. To read these questions click on the "View" menu, select the rotate option then "counter clockwise".

When numbers are written in expanded notation the number is broken up into its place values. Instead of using numbers to represent the millions, hundred thousands etc. indices are used, a list of which is below. You should have attempted 'Indexed Numbers' prior to this worksheet.

The Top 8 Indices Chart



So this number would be:

$9 \times 10^7 + 8 \times 10^6 + 7 \times 10^5 + 6 \times 10^4 + 5 \times 10^3 + 4 \times 10^2 + 3 \times 10 + 2$

In column 1 a number has been expressed in expanded notation (in index form). You are asked to write the number in basic numerals. The best way to attempt these problems is to look at them digit by digit. In the example at the top of the column you have :

$7 \times 10^5 + 4 \times 10^3 + 8 \times 10^2 + 6$, follow these steps:

- Write the 7 straight away, note that its power is 10^5
- Is the next number $\times 10^4$, no it isn't so write a zero
- Is the next number $\times 10^3$, yes it is, so write a 4
- Is the next number $\times 10^2$, yes it is, so write an 8
- Is the next number $\times 10$ (or $\times 10^1$), no it isn't so write a zero
- Are there any single units (or $\times 1$), yes there is, so write a 6
- You now have 704 806.

If you have trouble remembering the powers, remember that with base 10 indices the power is the number of zeros behind the one, i.e. $10^3 = 1\,000$, a 1 with three zeros.

Column 2 works in the reverse, just start at the first digit and work through, remember if it's a zero, write nothing. Count the number of digits behind the first number to find the first base 10 index.

Expanded Notation with Indices

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Change from expanded notation to basic numerals

Example

10^5 10^4 10^3 10^2 10 units

$7 \times 10^5 + 4 \times 10^3 + 8 \times 10^2 + 6 = 704\,806$

1. $2 \times 10^3 + 9 \times 10^2 + 5 \times 10 + 6 =$ _____
2. $3 \times 10^4 + 1 \times 10^3 + 6 \times 10^2 + 3 =$ _____
3. $5 \times 10^5 + 2 \times 10^4 + 7 \times 10 + 1 =$ _____
4. $6 \times 10^5 + 2 \times 10^4 + 6 \times 10^2 =$ _____
5. $7 \times 10^4 + 3 \times 10^2 + 2 \times 10 + 8 =$ _____
6. $8 \times 10^5 + 5 \times 10^4 + 3 \times 10^2 + 5 =$ _____
7. $9 \times 10^7 + 4 \times 10^3 =$ _____
8. $6 \times 10^4 + 2 \times 10^3 + 6 \times 10^2 + 2 =$ _____
9. $7 \times 10^5 + 7 \times 10^4 + 7 \times 10 + 7 =$ _____
10. $3 \times 10^6 + 9 \times 10^5 + 6 \times 10^3 + 8 \times 10^2 + 8 \times 10 + 6 =$ _____
11. $1 \times 10^7 + 4 \times 10^5 + 8 \times 10^4 + 6 \times 10^3 + 3 \times 10^2 + 3 =$ _____
12. $8 \times 10^5 + 6 \times 10^4 + 9 \times 10^3 + 7 \times 10 + 5 =$ _____
13. $2 \times 10^6 + 7 \times 10^4 + 7 \times 10^3 + 6 \times 10^2 + 9 \times 10 + 6 =$ _____
14. $9 \times 10^7 + 3 \times 10^6 + 9 \times 10^5 + 3 \times 10^4 + 6 \times 10^2 + 4 =$ _____
15. $1 \times 10^6 + 3 \times 10^5 + 1 \times 10^4 + 2 \times 10^2 + 2 \times 10 + 7 =$ _____
16. $2 \times 10^7 + 1 \times 10^6 + 5 \times 10^3 + 1 \times 10^2 + 2 \times 10 + 8 =$ _____
17. $8 \times 10^6 + 5 \times 10^5 + 4 \times 10^4 + 6 \times 10^3 + 5 \times 10^2 =$ _____
18. $3 \times 10^7 + 7 \times 10^6 + 2 \times 10^4 + 1 \times 10^3 + 6 \times 10^2 + 9 =$ _____
19. $4 \times 10^6 + 5 \times 10^4 + 1 \times 10^2 + 5 \times 10 + 3 =$ _____
20. $9 \times 10^7 + 6 \times 10^4 + 6 \times 10^2 + 5 \times 10 + 4 =$ _____

Now the reverse, write these numbers in expanded notation

Example

$59\,003\,007 = 5 \times 10^7 + 9 \times 10^6 + 3 \times 10^3 + 6$

21. $6\,610 =$ _____
22. $271\,004 =$ _____
23. $45\,096 =$ _____
24. $5\,010\,072 =$ _____
25. $86\,090 =$ _____
26. $4\,700\,000 =$ _____
27. $396 =$ _____
28. $107\,902 =$ _____
29. $7\,430\,007 =$ _____
30. $2\,934\,049 =$ _____
31. $5\,773\,088 =$ _____
32. $653\,310 =$ _____
33. $52\,400\,032 =$ _____
34. $3\,756\,407 =$ _____
35. $4\,986\,020 =$ _____
36. $911\,690 =$ _____
37. $1\,804\,125 =$ _____

Expanded Notation with Indices

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Change from expanded notation to basic numerals

Example

10^5 10^4 10^3 10^2 10 units

$7 \times 10^5 + 4 \times 10^3 + 8 \times 10^2 + 6 = 704\,806$

1. $2 \times 10^3 + 9 \times 10^2 + 5 \times 10 + 6 = 2\,956$
2. $3 \times 10^4 + 1 \times 10^3 + 6 \times 10^2 + 3 = 31\,603$
3. $5 \times 10^5 + 2 \times 10^4 + 7 \times 10 + 1 = 520\,071$
4. $6 \times 10^5 + 2 \times 10^4 + 6 \times 10^2 = 620\,600$
5. $7 \times 10^4 + 3 \times 10^2 + 2 \times 10 + 8 = 70\,328$
6. $8 \times 10^5 + 5 \times 10^4 + 3 \times 10^2 + 5 = 850\,305$
7. $9 \times 10^7 + 4 \times 10^3 = 90\,004\,000$
8. $6 \times 10^4 + 2 \times 10^3 + 6 \times 10^2 + 2 = 62\,602$
9. $7 \times 10^5 + 7 \times 10^4 + 7 \times 10 + 7 = 770\,077$
10. $3 \times 10^6 + 9 \times 10^5 + 6 \times 10^3 + 8 \times 10^2 + 8 \times 10 + 6 = 3\,906\,886$
11. $1 \times 10^7 + 4 \times 10^5 + 8 \times 10^4 + 6 \times 10^3 + 3 \times 10^2 + 3 = 10\,486\,303$
12. $8 \times 10^5 + 6 \times 10^4 + 9 \times 10^3 + 7 \times 10 + 5 = 869\,075$
13. $2 \times 10^6 + 7 \times 10^4 + 7 \times 10^3 + 6 \times 10^2 + 9 \times 10 + 6 = 2\,077\,696$
14. $9 \times 10^7 + 3 \times 10^6 + 9 \times 10^5 + 3 \times 10^4 + 6 \times 10^2 + 4 = 93\,930\,604$
15. $1 \times 10^6 + 3 \times 10^5 + 1 \times 10^4 + 2 \times 10^2 + 2 \times 10 + 7 = 1\,310\,227$
16. $2 \times 10^7 + 1 \times 10^6 + 5 \times 10^3 + 1 \times 10^2 + 2 \times 10 + 8 = 21\,005\,128$
17. $8 \times 10^6 + 5 \times 10^5 + 4 \times 10^4 + 6 \times 10^3 + 5 \times 10^2 = 8\,546\,500$
18. $3 \times 10^7 + 7 \times 10^6 + 2 \times 10^4 + 1 \times 10^3 + 6 \times 10^2 + 9 = 37\,021\,609$
19. $4 \times 10^6 + 5 \times 10^4 + 1 \times 10^2 + 5 \times 10 + 3 = 4\,050\,153$
20. $9 \times 10^7 + 6 \times 10^4 + 6 \times 10^2 + 5 \times 10 + 4 = 90\,060\,654$

Now the reverse, write these numbers in expanded notation

Example

$59\,003\,007 = 5 \times 10^7 + 9 \times 10^6 + 3 \times 10^3 + 6$

21. $6\,610 = 6 \times 10^3 + 6 \times 10^2 + 1 \times 10$
22. $271\,004 = 2 \times 10^5 + 7 \times 10^4 + 1 \times 10^3 + 4$
23. $45\,096 = 4 \times 10^4 + 5 \times 10^3 + 9 \times 10 + 6$
24. $5\,010\,072 = 5 \times 10^6 + 1 \times 10^4 + 7 \times 10 + 2$
25. $86\,090 = 8 \times 10^4 + 6 \times 10^3 + 9 \times 10$
26. $4\,700\,000 = 4 \times 10^6 + 7 \times 10^5$
27. $396 = 3 \times 10^2 + 9 \times 10 + 6$
28. $107\,902 = 1 \times 10^5 + 7 \times 10^3 + 9 \times 10^2 + 2$
29. $7\,430\,007 = 7 \times 10^6 + 4 \times 10^5 + 3 \times 10^4 + 7$
30. $2\,934\,049 = 2 \times 10^6 + 9 \times 10^5 + 3 \times 10^4 + 4 \times 10^3 + 4 \times 10 + 9$
31. $5\,773\,088 = 5 \times 10^6 + 7 \times 10^5 + 7 \times 10^4 + 3 \times 10^3 + 8 \times 10 + 8$
32. $653\,310 = 6 \times 10^5 + 5 \times 10^4 + 3 \times 10^3 + 3 \times 10^2 + 1 \times 10$
33. $52\,400\,032 = 5 \times 10^7 + 2 \times 10^6 + 4 \times 10^5 + 3 \times 10 + 2$
34. $3\,756\,407 = 3 \times 10^6 + 7 \times 10^5 + 5 \times 10^4 + 6 \times 10^3 + 4 \times 10^2 + 7$
35. $4\,986\,020 = 4 \times 10^6 + 9 \times 10^5 + 8 \times 10^4 + 6 \times 10^3 + 2 \times 10$
36. $911\,690 = 9 \times 10^5 + 1 \times 10^4 + 1 \times 10^3 + 6 \times 10^2 + 9 \times 10$
37. $1\,804\,125 = 1 \times 10^6 + 8 \times 10^5 + 4 \times 10^3 + 1 \times 10^2 + 2 \times 10 + 5$
38. $558\,027 = 5 \times 10^5 + 5 \times 10^4 + 8 \times 10^3 + 2 \times 10 + 7$
39. $8\,023\,962 = 8 \times 10^6 + 2 \times 10^4 + 3 \times 10^3 + 9 \times 10^2 + 6 \times 10 + 2$
40. $45\,770\,000 = 4 \times 10^7 + 5 \times 10^6 + 7 \times 10^5 + 7 \times 10^4$

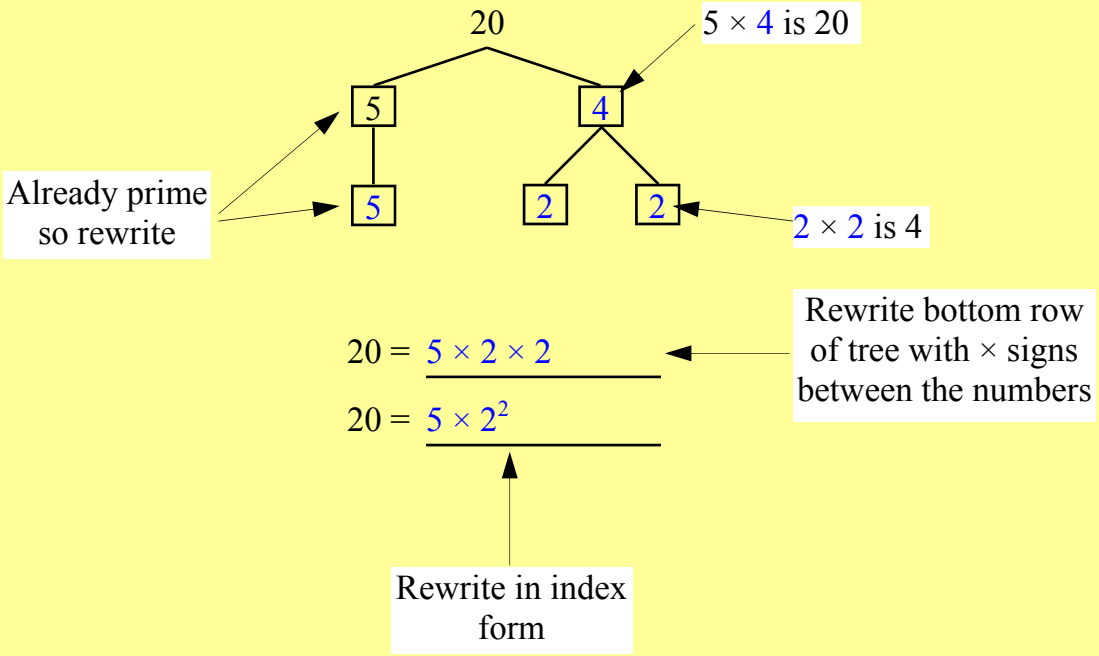
Factor Trees

Factor trees are used to reduce a number down to a multiplication of its prime factors. These factors can be used to find the LCM and HCF of two numbers. This sheet asks you to find the answer as a multiplication of the primes and to also write the answer in index form. Factor trees have the number to be reduced at the top, this is split into two branches and from then on is split again into 2 branches or extended with a single branch if it is a prime number, until all the numbers are prime (don't have factors other than 1 and itself).

Column 1 has factor trees already constructed with a number given on the first tier (first split branch) to help you get started. Here is the method:

- Look at the number to be reduced and divide it by the number on the first tier, that will give you the answer for the other first tier box.
- Then look at the numbers you now have and break them down, if a single branch is provided that means you can't reduce the number so just rewrite it in the box below, if you have another pair of branches then select 2 numbers that multiply together to give the number. Note that you never use 1 in a factor tree.
- Column 1 only has one solution method, where there is a choice, a number is supplied so that there is only one answer.
- Once you have the boxes completed look at the numbers across the bottom row and multiply them to get the answer, it should equal the number at the top of the tree. Then write the numbers in the space provided, then rewrite them in index form, which you should know from the previous sheet.

Column 2 and 3 require you to build the tree without hints. Pick two numbers that multiply to get the top number, you should pick two numbers that are close together to reduce the number in the minimum number of steps. So if the number was say 100 you would use 10 and 10 not 25 and 4.



Factor Trees

1 12

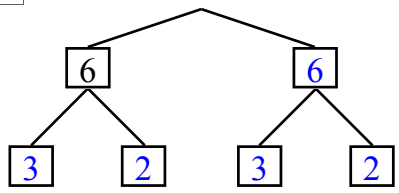
$12 = 2 \times 2 \times 3$

$12 = 2^2 \times 3$

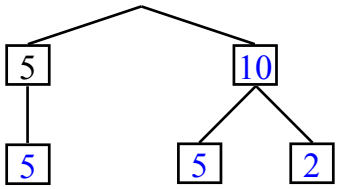
2 36



$36 = 3 \times 2 \times 3 \times 2$

$36 = 3^2 \times 2^2$

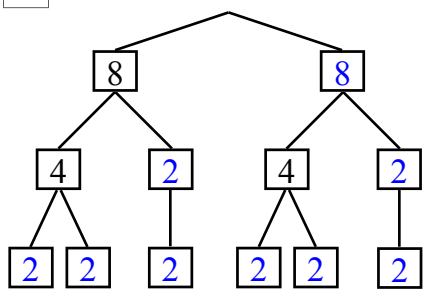
3 50



$50 = 5 \times 5 \times 2$

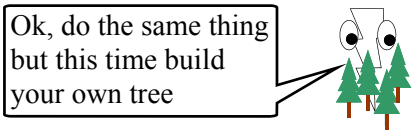
$50 = 5^2 \times 2$

4 64

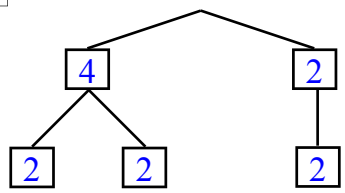


$64 = 2 \times 2 \times 2 \times 2 \times 2 \times 2$

$64 = 2^6$



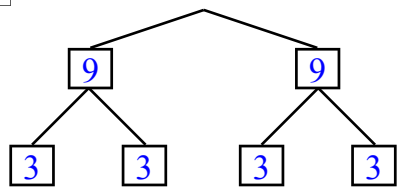
5 8



$8 = 2 \times 2 \times 2$

$8 = 2^3$

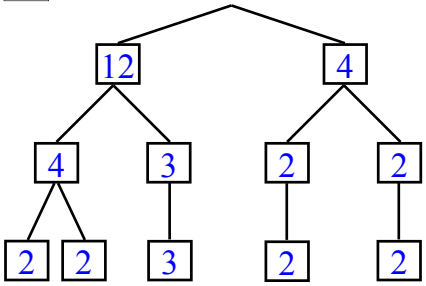
6 81



$81 = 3 \times 3 \times 3 \times 3$

$81 = 3^4$

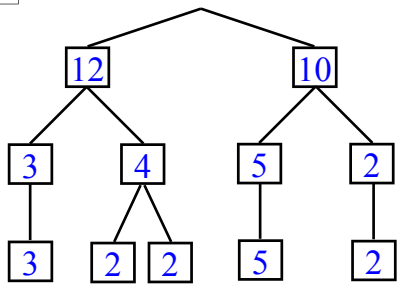
7 48



$48 = 2 \times 2 \times 3 \times 2 \times 2$

$48 = 2^4 \times 3$

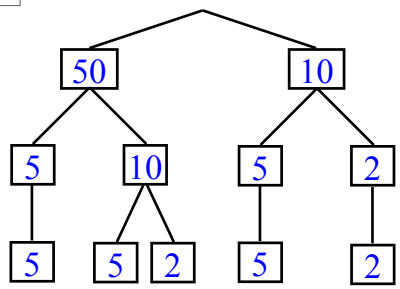
8 120



$120 = 3 \times 2 \times 2 \times 5 \times 2$

$120 = 3 \times 2^3 \times 5$

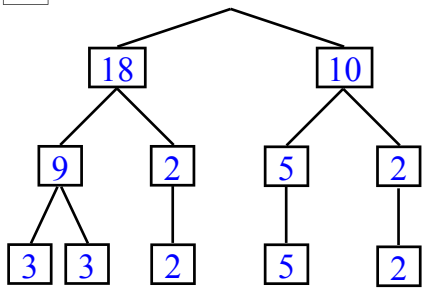
9 500



$500 = 5 \times 5 \times 2 \times 5 \times 2$

$500 = 5^3 \times 2^2$

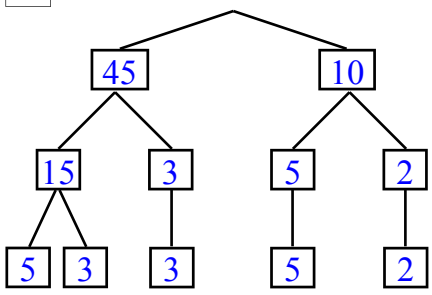
10 180



$180 = 3 \times 3 \times 2 \times 5 \times 2$

$180 = 3^2 \times 2^2 \times 5$

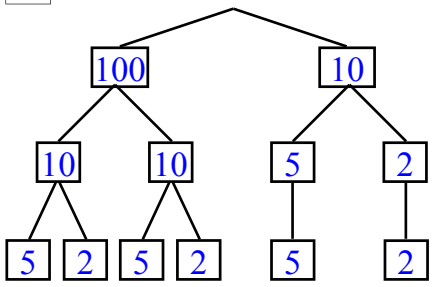
11 450



$450 = 5 \times 3 \times 3 \times 5 \times 2$

$450 = 5^2 \times 3^2 \times 2$

12 1 000



$1\,000 = 5 \times 2 \times 5 \times 2 \times 5 \times 2$

$1\,000 = 5^3 \times 2^3$

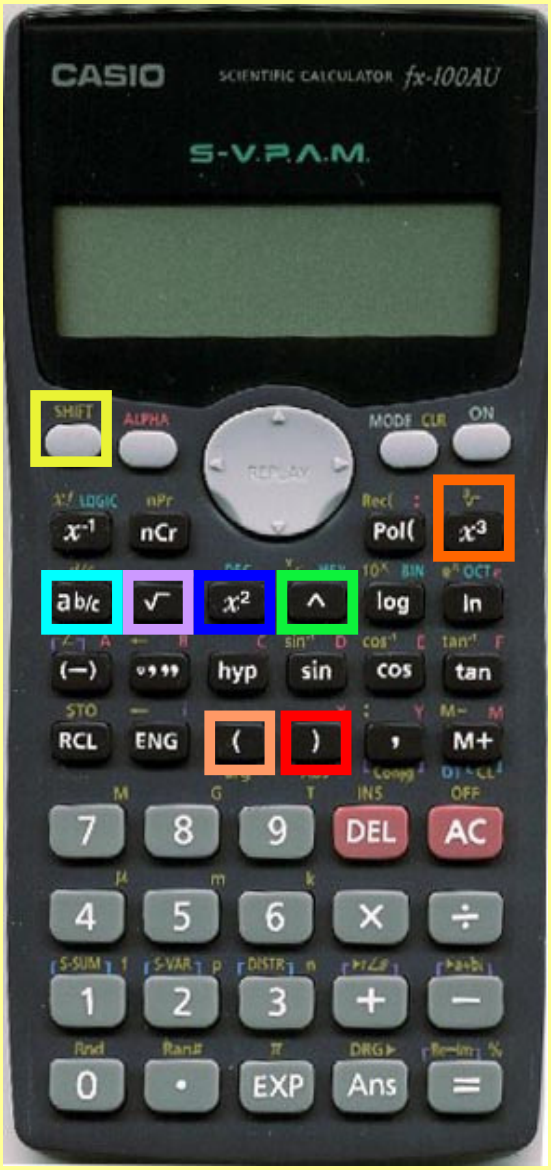
Powers, Roots and the Power Key - Calculator

This sheet is about the use of powers and roots on a calculator. There are examples on the next sheet with a calculator image showing you the buttons. This calculator may be different from your model but the symbols used on the keys should be the same, just look for the symbols.

Column 1 is all square roots, some calculators require you to type the number then the square root, the steps for these calculators are different than those shown, try your calculator on the examples on the next page and see the method you use to get the correct answer. The first part of the column doesn't require brackets, the second part does. Your calculator needs brackets to force order of operations on it, otherwise it will take the square root of the first number only.

Column 2 deals with squares (power of 2) and cubes (power of 3). Some calculators may not have a cube key, if this is your case then use the power key with a power of 3. Some calculators experience difficulty with fractions and powers, with the power being considered on the last number entered only (the denominator), so you may have to put fractions in brackets before entering the power. The second part of the column deals with using brackets. Your teacher may ask you to avoid using brackets, instead using the equals key at selected times, this is just as valid. When dividing, bracket the top operation then divide it by the bracketed bottom operation then press =.

Column 3 starts with using the power key, look at the examples. Single number cube roots are then covered briefly, leading to the more complicated cube roots with brackets. Teachers will ask you to ignore the cube root sign and evaluate the inside first, then cube root it. This simplifies the operation and should be considered as an easier alternative, done in 2 steps. You don't have to solve these calculations in one step, and the use of 3 sets of brackets may lead to mistakes being made.



Examples of steps in calculating square roots

$\sqrt{85}$ = √ 8 5 = = 9.22

$\sqrt{5\ ^2/_7}$ = √ 5 a b/c 2 a b/c 7 = a b/c = 2.30

$\sqrt{13.4 + 22 \times 3.6}$ These answers to 2 d.p.

= √ (1 3 . 4 + 2 2 × 3 . 6) = = 9.62

$\sqrt{\dfrac{34}{45 + 19.7}}$

= √ (3 4 ÷ (4 5 + 1 9 . 7)) = = 0.72

Use the same method with the cube root key only press Shift first

Examples of steps in calculating squares and cubes

5.6^2 = 5 . 6 x^2 = = 31.36

$(5\ ^2/_7)^2$ = (5 a b/c 2 a b/c 7) x^2 = a b/c = 27.94

Use the same method with the cube key x^3

These answers to 2 d.p.

Examples of steps using the power key

5.6^8 = 5 . 6 ^ 8 = = 967 173.12

These answers to 2 d.p.

$(5\ ^2/_7)^9$ = (5 a b/c 2 a b/c 7) ^ 9 = a b/c = 3 220 573.07

60 $\sqrt[3]{452 \times 17.3} = 19.85$

61 $\sqrt[3]{88^3 + 88^3} = 110.87$

62 $\sqrt[3]{5\ 833 - 18^3} = 1$

Careful with this one

63 $\sqrt[3]{\frac{5^3 + 2^7}{11^2}} = 1.45$

Further Factor Trees - Finding the HCF

This sheet and the one that follows it are challenging.

Finding the Highest Common Factors of larger numbers can be found using factor trees. The method is as follows:

- Build a factor tree, you should have completed the previous sheet on factor trees and so the process of finding prime factors won't be readdressed.
- Write the number and its prime factors in the table then match off pairs of numbers against each other, one for one, by circling them.
- Write one set of the matching prime factors on the first line separated by × signs
- Evaluate the multiplication and write your answer in the space, this is the HCF.

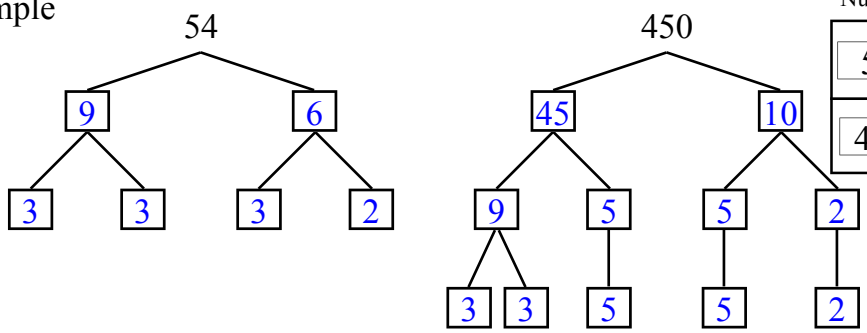
An example is at the top of the worksheet.

Further Factor Trees - Finding the HCF (or GCF)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Complete the trees to find the prime factors, put the prime factors in the table, circle factor pairs in both lists, multiply these factors to get the HCF (or GCF)

Example



Number	List of Prime Factors
54	3 3 3 2
450	3 3 5 5 2

HCF = $3 \times 3 \times 2$

HCF = 18

HCF = 3×2

HCF = 6

Further Factor Trees - Finding the LCM

This sheet is a challenging sheet.

Finding the Lowest Common Multiple of larger numbers can be done by using factor trees. The method is as follows:

- Build two factor trees, you should have completed the Factor Tree sheet and so the process of finding prime factors won't be readdressed.
- Write the number and its prime factors in the table for both trees then if a number is in the top list and also in the bottom list strike out the number in the bottom list only.
- Note that this doesn’t mean if you have a 2 in the top list you strike out all the 2's in the bottom list, you just strike out one number for one number. If there are 2 threes in the top list and 4 threes in the bottom then you only strike out 2 threes in the bottom list.
- Write all the non-struck out numbers from both lists, separated by × signs
- Evaluate the multiplication and write your answer in the space, this is the LCM.

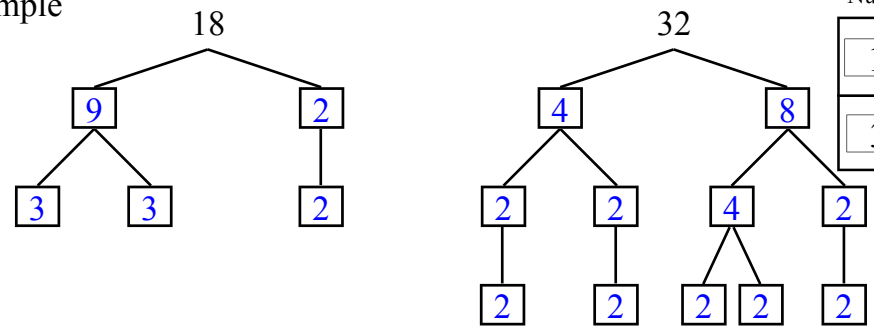
The multiplication is performed by trying to multiply numbers together to come up with two large numbers. These larger numbers can then be multiplied. In the example the 3's and the 2's are multiplied separately, leaving 9 × 72. If the numbers are too large then you may have to complete a few multiplication steps.

Further Factor Trees - Finding the LCM

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the prime factors, put the factors in the table, then strike out all the numbers in the bottom list that are in the top list, multiply all non-stroked numbers

Example



Number	List of Prime Factors
18	3 3 2
32	2 2 2 2 2

LCM = ~~9~~ × ~~3~~ × ~~4~~ × ~~2~~ × ~~8~~ × ~~2~~ × ~~16~~ × ~~2~~ × ~~32~~

LCM = 288

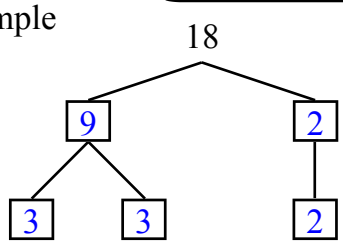
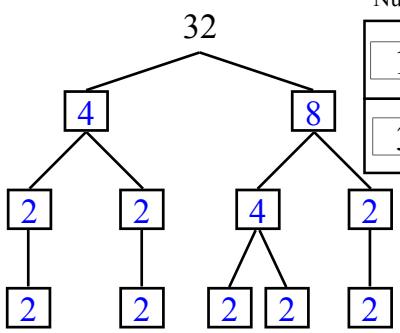
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the prime factors, put the factors in the table, then strike out all the numbers in the bottom list that are in the top list, multiply all non-stroked numbers

Example



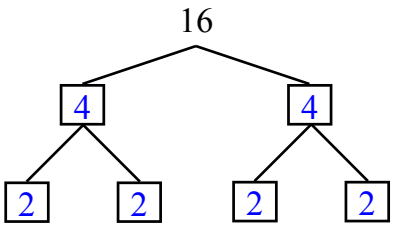


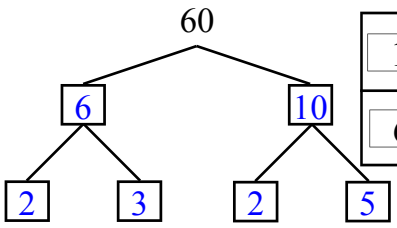
Number	List of Prime Factors
18	3 3 2
32	2 2 2 2 2

LCM = $\cancel{3} \times \cancel{3}^{9} \times \cancel{2} \times \cancel{2}^{4} \times \cancel{2}^{8} \times \cancel{2}^{16} \times \cancel{2}^{32}$

LCM = 288

1



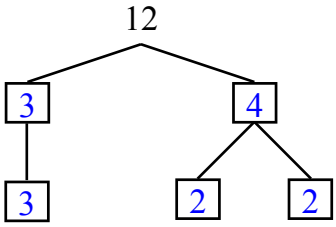


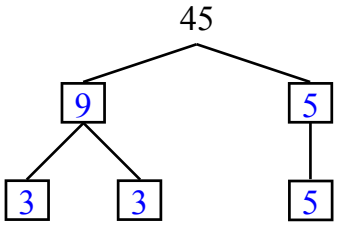
Number	List of Prime Factors
16	2 2 2 2
60	2 3 2 5

LCM = $\cancel{2} \times \cancel{2} \times \cancel{2} \times \cancel{2}^{16} \times \cancel{3} \times \cancel{5}^{15}$

LCM = 240

2



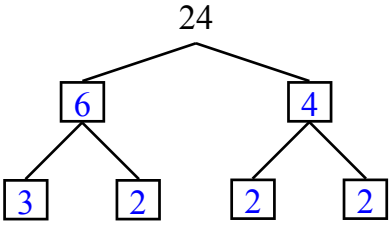


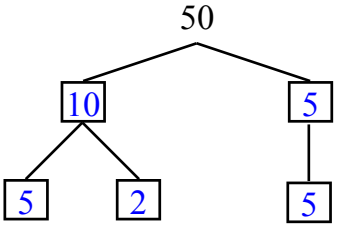
Number	List of Prime Factors
12	3 2 2
45	3 3 5

LCM = $\cancel{3} \times \cancel{2} \times \cancel{2} \times \cancel{3}^{36} \times 5$

LCM = 180

3



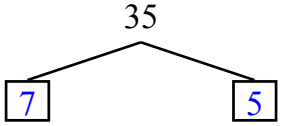


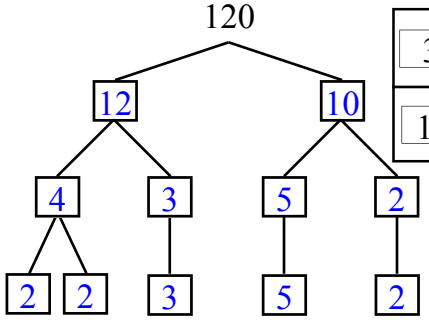
Number	List of Prime Factors
24	3 2 2 2
50	5 2 5

LCM = $\cancel{3} \times \cancel{2} \times \cancel{2} \times \cancel{2}^{24} \times \cancel{5} \times \cancel{5}^{25}$

LCM = 600

4





Number	List of Prime Factors
35	5 7
120	2 2 3 5 2

LCM = $\cancel{5} \times \cancel{7}^{35} \times \cancel{2} \times \cancel{2} \times \cancel{3} \times \cancel{2}^{24}$

LCM = 840

Divisibility Tests - 2, 4, 5 and 10

Divisibility tests are rules that check if a number can be divided by another number, without attempting the division to see if there is a remainder. The rules for this sheet are below.

- A number is divisible by 2 if its last digit is a 0, 2, 4, 6, or 8
- A number is divisible by 4 if its last two digits are divisible by 4, this doesn't mean each digit separately, it is the number formed by the 2 digits. For example 32 is divisible by 4, so 532, 1 032 and 77 732 would be also.
- A number is divisible by 5 if its last digit is a 0 or a 5
- A number is divisible by 10 if its last digit is a 0

So the tests all work on the last digit only, with the exception of the 4 test which requires the last 2 digits.

These questions have different ways of being answered. You may have to write the answer. If there is a yes or no answer required, either colour in the circle or strike out the wrong answer.

Divisibility Rules

2 : last digit is 0, 2, 4, 6, 8

4 : last 2 digits form a number divisible by 4

5 : last digit is either 0 or 5

10 : last digit must be 0

Divisibility Tests - 2, 4, 5 and 10

Answer the following questions

Find the next 2 numbers that are greater than these numbers that are divisible by 2, 4, 5 and 10:

50	45	60	80
51	1 00	120	140
52	1 963	1 980	2 000
53	594	600	620

54 Claudia believes that only when a number is a multiple of 20, is it divisible by 2, 4, 5 and 10. What do you think?

I stopped listening to her years ago ○

I knew her before she was President ●

Divisibility Tests - 3, 6 and 9

Divisibility tests for numbers can be used rather than division. The tests for 3, 6 and 9 are:

- 3: Find the sum of the digits (add them up) that form the number and if the sum is a multiple of 3 then the number in the question is divisible by 3.
- 6: The number must be divisible by both 2 and 3. The test for 2 is the last digit is even (0, 2, 4, 6 or 8). So use the same method as with 3 but the number given in the question must also be even (not the sum).
- 9: Find the sum of the digits and if the number is a multiple of 9 then the number in the question is divisible by 9.

A card with the rules of divisibility is also below

Divisibility Rules

3 : sum of digits is a multiple of 3

6 : number is divisible by both 3 and 2 (must be even & digit sum is multiple of 3)

9 : sum of digits is a multiple of 9

Divisibility Tests - 3, 6 and 9

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Test these numbers for divisibility by 3, fill in yes or no

Example

8 + 0 + 2 + 2

		Sum digits	Yes	No
	8 022	12	●	○
1	78	____	○	○
2	93	____	○	○
3	112	____	○	○
4	108	____	○	○

46	5 232	12	●	●	○

Further Divisibility Tests - 7, 11 and 13

These tests are more difficult than the previous tests. Follow the steps outlined below.
In column 1, to test for divisibility of 7:

- Take the last digit off the number and double it (×2).
- Subtract the number (found above) from the original number in the question without its last digit.
- The above subtraction can be reversed to avoid subtracting a larger number from a smaller number (this occurs in question 1).
- If the subtraction results in a number that is 0 or a multiple of 7 then the number is divisible by 7.
- There is an example at top of the column.

Test for divisibility of 11:

- Counting from left to right add all the odd digits together, that is, the 1st, 3rd, 5th, 7th …. (write the value in the box below the words 'odd digit')
- Then add all the even digits together, that is, 2nd, 4th, 6th, 8th ….(write the value in the box below the words 'even digit')
- Subtract one from the other, space for subtraction is provided though you probably won't need it, if the answer is 0 or a multiple of 11 then it is divisible by 11.
- There is an example at top of the column.

Test for divisibility of 13:

- Complete the multiplications to give the first 9 multiples of 13, you can use these to help you identify the multiples
- This test is similar to the 7 test in that the last digit is removed, only it is multiplied by 9.
- This number is then subtracted from the number in the question without its last digit, this subtraction can be reversed if required.
- If the subtraction results in a number that is 0 or a multiple of 13 then the number is divisible by 13.
- There is an example before question 23.

The card to the right is there if you need it.

Divisibility Rules

7 : Remove the last digit off the number, from it subtract 2 × the last digit. Divisible if the answer is 0 or a multiple of 7.

11 : Add all the odd numbered digits and then the even numbered digits. Subtract them, if answer is 0 or a multiple of 11, it is divisible by 11.

13 : Remove the last digit off the number and from it subtract 9 times the last digit. Divisible if the answer is 0 or a multiple of 13.

CALCULATOR

THESE SHEETS ARE IN THIS FOLDER AND THEIR CHAPTER FOLDER

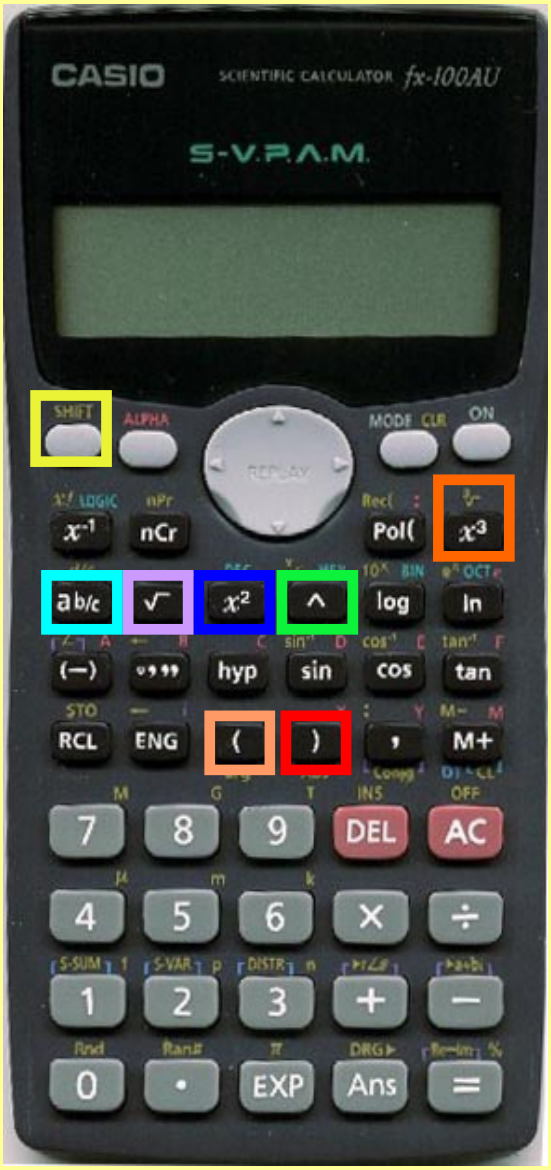
Powers, Roots and the Power Key - Calculator

This sheet is about the use of powers and roots on a calculator. There are examples on the next sheet with a calculator image showing you the buttons. This calculator may be different from your model but the symbols used on the keys should be the same, just look for the symbols.

Column 1 is all square roots, some calculators require you to type the number then the square root, the steps for these calculators are different than those shown, try your calculator on the examples on the next page and see the method you use to get the correct answer. The first part of the column doesn't require brackets, the second part does. Your calculator needs brackets to force order of operations on it, otherwise it will take the square root of the first number only.

Column 2 deals with squares (power of 2) and cubes (power of 3). Some calculators may not have a cube key, if this is your case then use the power key with a power of 3. Some calculators experience difficulty with fractions and powers, with the power being considered on the last number entered only (the denominator), so you may have to put fractions in brackets before entering the power. The second part of the column deals with using brackets. Your teacher may ask you to avoid using brackets, instead using the equals key at selected times, this is just as valid. When dividing, bracket the top operation then divide it by the bracketed bottom operation then press =.

Column 3 starts with using the power key, look at the examples. Single number cube roots are then covered briefly, leading to the more complicated cube roots with brackets. Teachers will ask you to ignore the cube root sign and evaluate the inside first, then cube root it. This simplifies the operation and should be considered as an easier alternative, done in 2 steps. You don't have to solve these calculations in one step, and the use of 3 sets of brackets may lead to mistakes being made.



Examples of steps in calculating square roots

$\sqrt{85}$ = √ 8 5 = = 9.22

$\sqrt{5\ ^2/_7}$ = √ 5 a b/c 2 a b/c 7 = a b/c = 2.30

$\sqrt{13.4 + 22 \times 3.6}$ These answers to 2 d.p.

= √ (1 3 . 4 + 2 2 × 3 . 6) = = 9.62

$\sqrt{\dfrac{34}{45 + 19.7}}$

= √ (3 4 ÷ (4 5 + 1 9 . 7)) = = 0.72

Use the same method with the cube root key only press Shift first

Examples of steps in calculating squares and cubes

5.6^2 = 5 . 6 x^2 = = 31.36

$(5\ ^2/_7)^2$ = (5 a b/c 2 a b/c 7) x^2 = a b/c = 27.94

Use the same method with the cube key x^3

These answers to 2 d.p.

Examples of steps using the power key

5.6^8 = 5 . 6 ^ 8 = = 967 173.12

These answers to 2 d.p.

$(5\ ^2/_7)^9$ = (5 a b/c 2 a b/c 7) ^ 9 = a b/c = 3 220 573.07

52 $2^{12} = 4\ 096$

53 $(1^2/_7)^6 = 4.52$

54 $8^9 - 8^8 = 117\ 440\ 512$

55 $2^{15} \div 2^{13} = 4$

Use the cube root key [$\sqrt[3]{}$] to answer these. Express your answer to 2 d.p. when required

56 $\sqrt[3]{216} = 6$

57 $\sqrt[3]{343} = 7$

58 $\sqrt[3]{1\ 000} = 10$

Brackets now required

59 $\sqrt[3]{\frac{5\ 375}{43}} = 5$

60 $\sqrt[3]{452 \times 17.3} = 19.85$

61 $\sqrt[3]{88^3 + 88^3} = 110.87$

62 $\sqrt[3]{5\ 833 - 18^3} = 1$

Careful with this one

63 $\sqrt[3]{\frac{5^3 + 2^7}{11^2}} = 1.45$

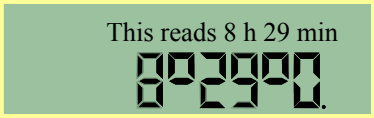
Time Calculations (Calculator)

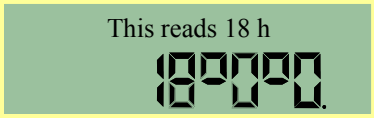
Time calculations are performed every day, …..how long until lunch?, ….the bus arrives? When you become a wage earner it is important to be able to check that your hours worked are correct, but because minutes and hours are in groups of 60 min this is not always straight forward. But a calculator makes it easy.

The calculator image on the next page shows the DMS key or the 'bubble button' (the key has an orange border). This key allows you work with hours and minutes.

IMPORTANT YOU MUST ENTER A 0 (THEN DMS KEY) IF DEALING ONLY WITH MINUTES (NO HOURS).

The calculator will always show the hours, minutes and seconds (we won't be using seconds) separated by a degree sign (a small raised o) →°.



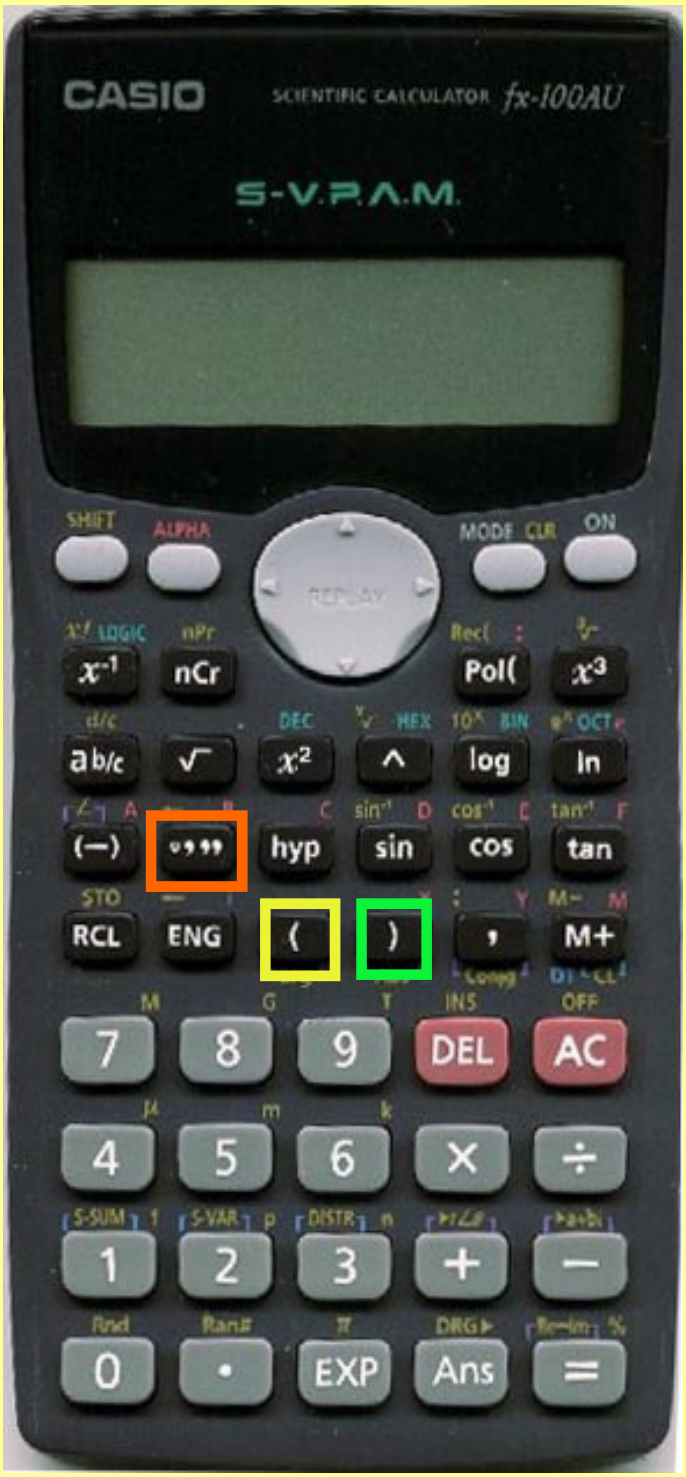


In column 1 you are asked to convert the times given in minutes to hours and minutes. This is done by pressing 0 then the DMS key, then the minutes in the question then the DMS key and then press = and the answer will be displayed. Example, change 338 min to hours and minutes.

In the 2nd column times are to be added together, put the first time into the calculator then a + then the second time in, press =, done. Finding the difference between two times is done by subtraction, using the same method as above, with one exception YOU MUST CONVERT P.M. TIME TO 24 H TIME. If they are both a.m. times or both p.m. times no conversion is necessary, as soon as a question involves both a p.m. and an a.m. time convert the p.m. time to 24 h format. See the example before Q 18.

The time sheet at the bottom of the column 2 requires you to find the time difference for each day between start and finish times, put them in the spaces provided then add them. Monday is already done for you, check you get the same answer and don't forget to include it in your addition.

The 3rd column is using × and ÷ these are done no differently just remember that you are multiplying by a number not a time and so only use the DMS on the time. The calculation of an average time (Q 31) can be done in two ways refer to the text box below the calculator image for the full key stroke method on the next page.



Example of steps in calculating average time
of 11h 12 min, 8 h 57 min and 10 h 9 min

Using Brackets

(1 1 °’’’ 1 2 °’’’ + 8 °’’’ 5 7 °’’’ + 1 0 °’’’ 9 °’’’) ÷ 3 =

Using = to avoid order of operations

1 1 °’’’ 1 2 °’’’ + 8 °’’’ 5 7 °’’’ + 1 0 °’’’ 9 °’’’ = ÷ 3 =

if you get 10 h 6 min for the question above you are correct

Time Calculations (Calculator)

Rewrite the calculator displays in h and min.

1 

2 

3 

4 

Convert the following times in min to h and min, remember to put a zero in for the hours first.

5 211 min

6 173 min

7 245 min

8 727 min

9 341 min

10 360 min

11 568 min

12 540 min

13 1331 min

14 1080 min

Add these times together using your calculator

15 8 h 27 min + 11 h 36 min

16 8 h 19 min + 4 h 48 min + 2 h 37 min

17 4 h 39 min + 5 h 25 min + 11 h 56 min

Find the time difference between these times that are on the same day. Use 24 hour time format

Example

1853 h in 24 h

11.17 a.m. and 6.53 p.m.

1 8 ''' 5 3 ''' - 1 1 ''' 1 7 ''' = 7 h 36 min

18 10.30 a.m. and 3.56 p.m.

19 3.52 a.m. and 11.27 a.m.

20 4.23 a.m. and 6.17 p.m.

21 1.09 p.m. and 10.57 p.m.

Complete the time sheet below, then find the total hours worked.

22 A. Jolie Time Sheet

Day	Start	Finish	Hours
Mon	9.30 a.m.	4.45 p.m.	7 h 15 min
Tues	10.45 a.m.	2.30 p.m.	h min
Wed	9.30 a.m.	5.00 p.m.	h min
Thur	9.30 a.m.	3.45 p.m.	h min
Fri	1.15 p.m.	6.00 p.m.	h min
		Total hours for the week	h min

Now use × and ÷ with these times

23 3 × 17 min

24 8 × 23 min

25 7 × 1 h 46 min

26 1 h 55 min ÷ 5

27 19 h 57 min ÷ 9

28 54 min × 6 + 3 h 7 min ÷ 11 + 1 h 27 min

29 8 h 45 min ÷ 5 + 5 min × 17 + 1 h 31 min

Try these time problems

30 Sean watches 3 movies at a 6 h movie marathon, if two of the films were 1h 46 min and 1h 50 min, find the duration of the other.

31 Julie's time for return travel to school for 3 days were: 1h 15 min, 56 min and 1h 22 min. Find the average time for her return trip.

32 It takes Jemma 43 min to wash a car, and 11 min to vacuum a car. How long does she take to wash 5 cars and vacuum 3 of them? Jemma has 40 min for lunch, if she started at 10.25 a.m. estimate her finish time.

Time taken _____ Estimated finish time _____

Time Calculations (Calculator)

Rewrite the calculator displays in h and min.

1 

52 min

2 

1 h 17 min

3 

3 h

4 

31 h 34 min

Convert the following times in min to h and min, remember to put a 0° in for the hours first.

5 211 min — 3 h 31 min

6 173 min — 2 h 53 min

7 245 min — 4 h 5 min

8 727 min — 12 h 7 min

9 341 min — 5 h 41 min

10 360 min — 6 h

11 568 min — 9 h 28 min

12 540 min — 9 h

13 1331 min — 22 h 11 min

14 1080 min — 18 h

Add these times together using your calculator

15 8 h 27 min + 11 h 36 min

20 h 3 min

16 8 h 19 min + 4 h 48 min + 2 h 37 min — 15 h 44 min

17 4 h 39 min + 5 h 25 min + 11 h 56 min — 22 h

Find the time difference between these times that are on the same day. Use 24 hour time format

Example

1853 in 24 h time

11.17 a.m. and 6.53 p.m.

1 8 °'" 5 3 °'" - 1 1 °'" 1 7 °'" =

7 h 36 min

18 10.30 a.m. and 3.56 p.m.

5 h 26 min

19 3.52 a.m. and 11.27 a.m.

7 h 35 min

20 4.23 a.m. and 6.17 p.m.

13 h 54 min

21 1.09 p.m. and 10.57 p.m.

9 h 48 min

Complete the time sheet below, then find the total hours worked.

22 A. Jolie Time Sheet

Day	Start	Finish	Hours
Mon	9.30 a.m.	4.45 p.m.	7 h 15 min
Tues	10.45 a.m.	2.30 p.m.	3 h 45 min
Wed	9.30 a.m.	5.00 p.m.	7 h 30 min
Thur	9.30 a.m.	3.45 p.m.	6 h 15 min
Fri	1.15 p.m.	6.00 p.m.	4 h 45 min

Total hours for the week 29 h 30 min

Now use × and ÷ with these times

23 3 × 17 min — 51 min

24 8 × 23 min — 3 h 4 min

25 7 × 1 h 46 min — 12h 22 min

26 1 h 55 min ÷ 5 — 23 min

27 19 h 57 min ÷ 9 — 2 h 13 min

28 54 min × 6 + 3 h 7 min ÷ 11 + 1 h 27 min — 7 h 8 min

29 8 h 45 min ÷ 5 + 5 min × 17 + 1 h 31 min — 4 h 41 min

Try these time problems

30 Sean watches 3 movies at a 6 h movie marathon, if two of the films were 1h 46 min and 1h 50 min, find the duration of the other.

2 h 24 min

31 Julie's time for return travel to school for 3 days were: 1h 15 min, 56 min and 1h 22 min. Find the average time for her return trip.

1 h 11 min

32 It takes Jemma 43 min to wash a car, and 11 min to vacuum a car. How long does she take to wash 5 cars and vacuum 3 of them? Jemma has 40 min for lunch, if she started at 10.25 a.m. estimate her finish time.

Time taken: 4 h 8 min

Estimated finish time: 3.13 p.m.

Comparing Fractions (Calculator)

Using a calculator to compare fractions is done by changing the fractions to decimals and comparing the decimals instead. If all rounded to the same decimal place, the decimals can be easily compared, e.g. 0.308, 0.471, 0.235. It is easy to see the largest and smallest decimal, or if they are equal, if you look at the numbers behind the decimal point.

Column 1 asks you to convert the fractions to decimals, the calculator image on the next page shows you how to do this. If you have a decimal 0.100 then write it as 0.100 don't change it to 0.1 as this may lead you to make an error when comparing other numbers that are 3 d.p. (You may look at it as 1 instead of 100).

The rest of the sheet is attempted the same way, by finding the decimal for the fraction then comparing decimals. In the example below, two fractions are being compared, the method is:

- Find the decimals for both
- Compare decimals and put a < or > or = sign in between the decimals
- If this sign matches the one above it then write true, if not, write false.

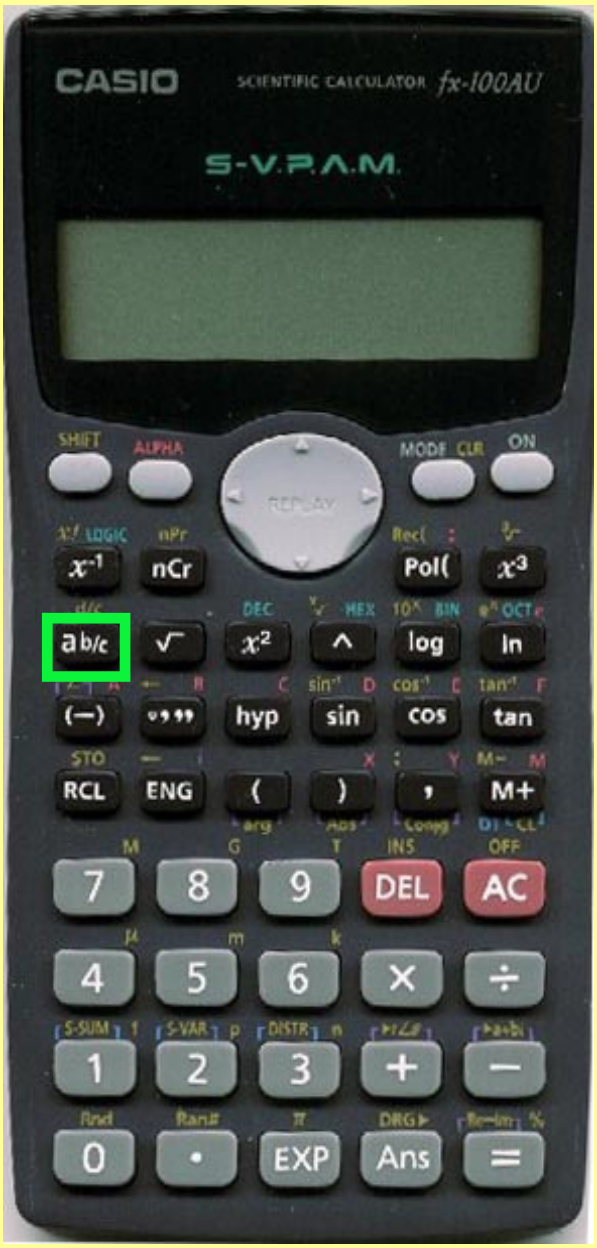
$$\frac{4}{5} > \frac{7}{8} \quad \text{False}$$
$$0.800 < 0.875$$

In the 2nd column, from Q. 31 on, use the same method only this time just write the sign into the box rather than stating true/false.

The third column asks you to compare fractions and arrange them in descending order, use the decimal system then write the fractions again in descending order. In a test the most common mistake is rewriting the decimals in descending order, the question asks for the fractions to be written, not the decimals.

How do you remember the difference between < and >? Imagine they are arrowheads and point them at the smallest number. E.g. $5 < 6$ and $15 > 10$, the arrow points to the smallest one.

Descending order? Remember going down.



Example of how to convert fractions to decimals

$\frac{6}{7} = \_\_\_\_ ?$

Don't forget the 'equals' sign

Method 1: Using Fraction Key [6] [a b/c] [7] [=] [a b/c]

Method 2: Using ÷ Key [6] [÷] [7] [=]

if you get 0.857 (rounded) you have answered it correctly

Comparing Fractions (Calculator)

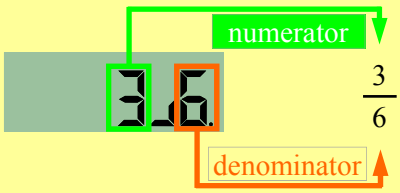
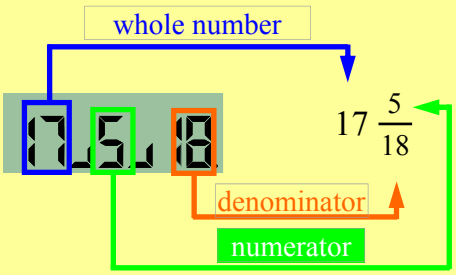
Changing Between Mixed Numerals and Improper Fractions (Calculator)

This sheet is designed for you to learn how to change between mixed numerals and improper fractions using your calculator. A calculator separates the numerator and the denominator by a reversed 'L' (or sometimes an ‘r’), for mixed numerals the whole number is also separated by the 'L' (or ‘r’). See example below.



$\frac{3}{6}$



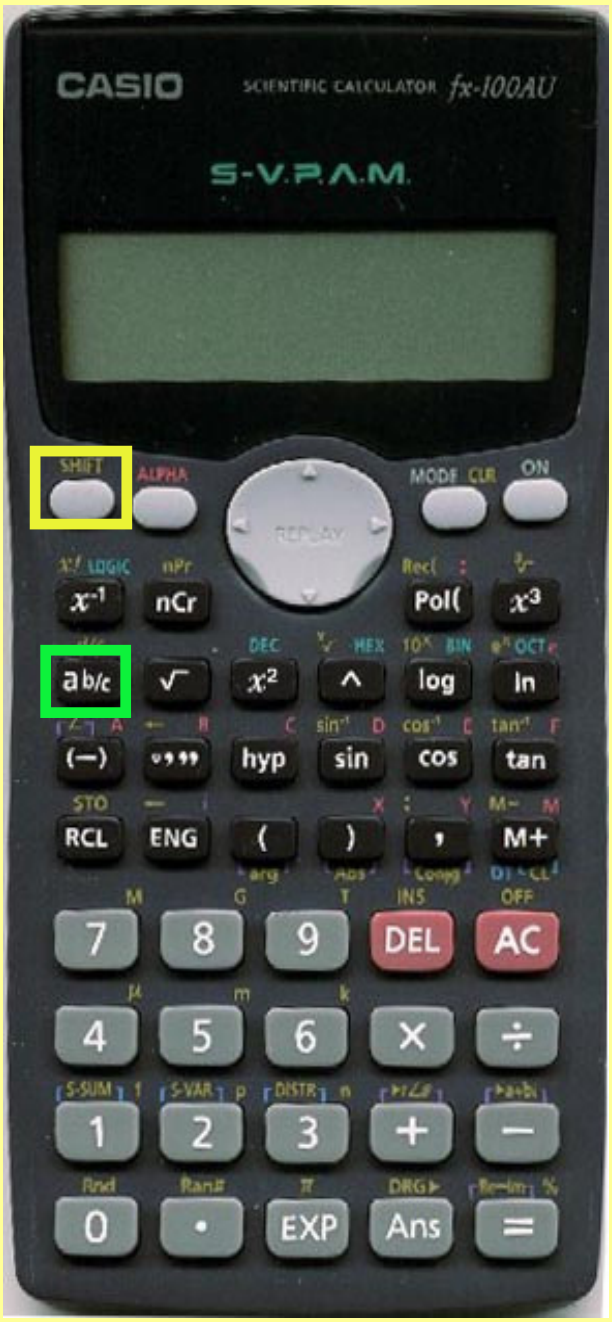
$17\frac{5}{18}$

The first column starts with the way your calculator displays fractions. If there are 2 numbers the first number is the numerator (number on top) the second number is the denominator (number on the bottom). These numbers are separated by the "reversed L". Don’t write fractions the calculator way, write the fractions separated by a line (as above). From Q. 6 on, you are asked to change mixed numerals to improper fractions. The method required is described on the next sheet, in words - type the fraction into the calculator, press =, then press shift and the fraction button.

Column 2 reverses the process and asks you to change improper fractions to mixed numerals, to answer these put the fraction in the calculator and press =, the mixed numeral will be displayed. Question 46 through 53 asks you to repeat the same process, if you use the ÷ sign then you will get a decimal answer, press the fraction key and it will change it to a fraction. Or a quicker step is to use the fraction key instead of the ÷ sign this will give the answer as a fraction straight away.

Note: These are all the same: $8\overline{)3}$ $\frac{3}{8}$ $3 \div 8$

The last column asks you to compare the improper fractions with the mixed numerals. Put the improper fraction into your calculator and press the ‘equals’ key. If the fraction displayed on the screen is the same as the answer supplied write 'true', if it isn't, write ‘false’. At the bottom of the column you are asked to show the pairs that ‘match’ (an improper and a mixed number) by using pairs of shapes (a smaller shape for the improper fractions, larger one for mixed).



Example of how to convert Mixed numerals to Improper Fractions

$3\ \frac{6}{7} = \frac{\quad}{\quad}$?

Don't forget the 'equals' sign

SHIFT

$\boxed{3}\ \boxed{a\,b/c}\ \boxed{6}\ \boxed{a\,b/c}\ \boxed{7}\ \boxed{=}\ \boxed{}\ \boxed{a\,b/c}$

if you get $\frac{27}{7}$ as your answer you have done it correctly

Mixed Operations - Calculator

This sheet is for calculator use so there are no working spaces provided.

The method is simple for this sheet, use your calculator. You don't have to worry about reciprocals or simplifying, the calculator does it all for you. Mistakes made using the calculator can occur anywhere due to keystroke error, there is one more common mistake made though, that is the entering of mixed numbers. Remember that you have to press the fraction key twice to enter a mixed number.

Your calculator should obey order of operations rules in the exercises in column 3, just don't press '=' until you key in the entire question otherwise the calculator may give the wrong answer.

14 $3\frac{2}{5} + 4\frac{7}{10} + 2\frac{5}{12} = 10\frac{31}{60}$

15 $5\frac{1}{4} - 2\frac{2}{3} - 1\frac{1}{2} = 1\frac{1}{12}$

16 $9\frac{2}{3} - 3\frac{6}{7} + 1\frac{5}{6} = 7\frac{9}{14}$

Multiply or divide these fractions

17 $\frac{3}{5} \times \frac{1}{4} = \frac{3}{20}$

18 $\frac{7}{12} \div \frac{2}{3} = \frac{7}{8}$

19 $\frac{2}{3} \div \frac{8}{9} = \frac{3}{4}$

20 $\frac{3}{5} \times \frac{7}{6} = \frac{7}{10}$

21 $\frac{4}{5} \div \frac{1}{3} \times \frac{8}{9} = 2\frac{2}{15}$

22 $\frac{1}{7} \div \frac{3}{10} \times \frac{18}{5} = 1\frac{5}{7}$

23 $\frac{3}{4} \times \frac{17}{10} \div \frac{1}{8} = 10\frac{1}{5}$

24 $\frac{4}{7} \div \frac{1}{10} \div \frac{2}{5} = 14\frac{2}{7}$

25 $\frac{3}{8} \times 4\frac{1}{6} \times \frac{2}{3} = 1\frac{1}{24}$

26 $5\frac{11}{12} \div \frac{3}{4} \times \frac{1}{2} = 3\frac{17}{18}$

27 $3\frac{1}{2} \times 6 \times \frac{4}{5} = 16\frac{4}{5}$

28 $7\frac{3}{4} \times \frac{2}{5} \div 2\frac{2}{3} = 1\frac{13}{80}$

29 $7 \div 1\frac{1}{4} \div 2\frac{3}{5} = 2\frac{2}{13}$

30 $4\frac{5}{6} \times 3\frac{3}{10} \div 2\frac{2}{5} = 6\frac{31}{48}$

31 $5\frac{3}{14} \div 8 \times 4\frac{4}{5} = 3\frac{9}{70}$

32 $2\frac{3}{7} \div 1\frac{2}{3} \times 3 = 4\frac{13}{35}$

These are all mixed up

33 $\frac{1}{3} + \frac{3}{4} \times \frac{9}{5} = 1\frac{41}{60}$

34 $\frac{1}{5} \div \frac{2}{15} + \frac{2}{3} = 2\frac{1}{6}$

35 $5\frac{1}{6} \times 3 - 4\frac{6}{7} = 10\frac{9}{14}$

36 $7\frac{3}{8} \div 9\frac{1}{4} + \frac{3}{2} = 2\frac{11}{37}$

37 $\frac{5}{4} + 3\frac{1}{2} \div \frac{5}{6} = 5\frac{9}{20}$

38 $5 \div \frac{7}{10} \times \frac{8}{9} = 6\frac{22}{63}$

39 $\frac{1}{2} \times \frac{7}{11} + \frac{3}{4} = 1\frac{3}{44}$

40 $7\frac{5}{6} - \frac{11}{12} \times 1\frac{2}{3} = 6\frac{11}{36}$

41 $3\frac{3}{4} \div \frac{5}{9} - \frac{5}{12} = 6\frac{1}{3}$

42 $2\frac{5}{8} \times 3\frac{1}{6} \div 5 = 1\frac{53}{80}$

43 $9\frac{1}{2} - 3\frac{2}{3} \div 1\frac{4}{5} = 7\frac{25}{54}$

44 $3\frac{8}{9} \times 1\frac{2}{5} \times 3\frac{1}{2} = 19\frac{1}{18}$

45 $\frac{2}{5} \times \frac{8}{3} + \frac{1}{2} = 1\frac{17}{30}$

46 $4\frac{7}{10} \div \frac{1}{4} \div 1\frac{1}{5} = 15\frac{2}{3}$

47 $2\frac{2}{5} + \frac{3}{4} \div \frac{1}{2} = 3\frac{9}{10}$

48 $5\frac{7}{8} \div 2\frac{1}{3} - 1\frac{1}{4} = 1\frac{15}{56}$

Calculating Percentages - Calculator

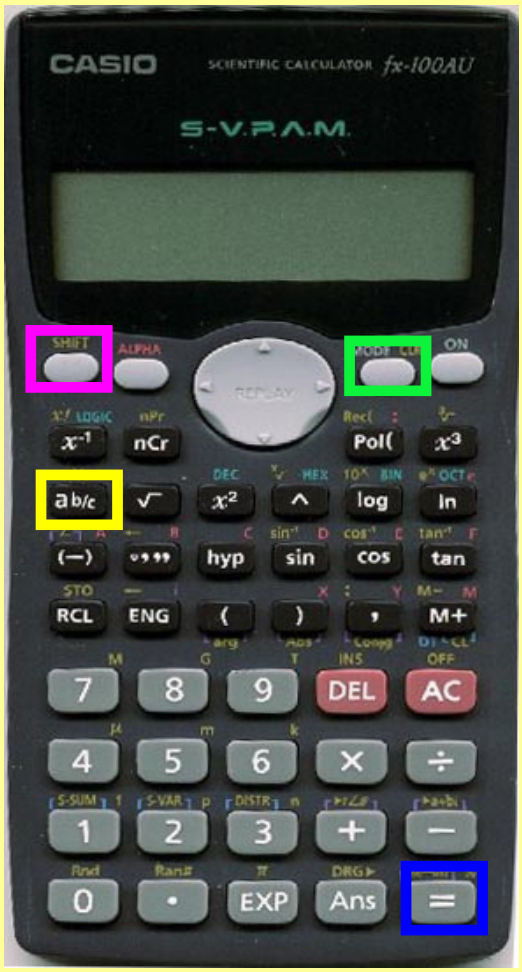
The method of calculating a percentage from a decimal or fraction is to multiply the decimal or fraction by 100. To change a percentage to a decimal or fraction you divide by 100.

A picture of a calculator is shown with below with keys highlighted. The methods used for each column are also listed on the following pages. Where there is a alternative method it is shown, so you can select the method that makes the most sense to you.

Column 1 asks you to convert fractions to percentages to 2 decimal places, then to a specified number of decimal places (in brackets). Multiply the fractions by 100 for the answer. Note that if writing a whole number, such as 45%, when asked to give to 2 d.p. then the answer can be 45% or 45.00%.

Column 2 asks you to convert the decimals to percentages. Again multiply the question by 100.

Column 3 deals with changing percentages back to fractions or decimals. In this case divide by 100.



Column 2

Example of calculating a decimal percentage from a decimal

Convert 0.206 to a percentage

Using × 100

0 . 2 0 6 × 1 0 0 =

if you get 20.6 for the question above you are correct

Column 1

Example of calculating a decimal percentage from a fraction

Convert $^{7}/_{8}$ to a percentage

Using % key (not recommended)

7 ÷ 8 Shift %

Using × 100

7 ÷ 8 × 1 0 0 =

Using fraction key

7 $a^b/_c$ 8 × 1 0 0 = $a^b/_c$

if you get 87.5 (no fix) for the question above you are correct

Example of calculating a fraction percentage from a fraction

Convert $^{7}/_{8}$ to a percentage

Using fraction key

7 $a^b/_c$ 8 × 1 0 0 =

Using × 100

7 ÷ 8 × 1 0 0 = $a^b/_c$

if you get 87 ½ for the question above you are correct
note that this style of question isn't on the sheet

Example of calculating a decimal percentage from a mixed numeral

Convert $2\ ^{7}/_{8}$ to a percentage

Using fraction key

2 $a^b/_c$ 7 $a^b/_c$ 8 × 1 0 0 = $a^b/_c$

Using × 100

2 + 7 ÷ 8 = × 1 0 0 =

if you get 287.5 for the question above you are correct

Column 3

Example of converting a decimal percentage to a decimal

Convert 56.32% to a decimal

Using ÷ 100

5 6 . 3 2 ÷ 1 0 0 =

if you get 0.5632 (no fix) for the question above you are correct

Example of converting a fraction percentage to a decimal

Convert 56 ¼% to a decimal

Using the fraction key

5 6 $a^b/_c$ 1 $a^b/_c$ 4 ÷ 1 0 0 = $a^b/_c$

if you get 0.5625 (no fix) for the question above you are correct

Example of converting a decimal percentage to a fraction

Convert 56.25% to a fraction

Using the fraction key Note that the featured calculator can convert decimals to fractions, this may not be a feature on your calculator

5 6 . 2 5 ÷ 1 0 0 = $a^b/_c$

If your calculator has a fraction key but can't convert decimals to fractions then use this method (note you need some mental skills)

5 6 $a^b/_c$ 2 5 $a^b/_c$ 1 0 0 ÷ 1 0 0 =

if you get $^9/_{16}$ for the question above you are correct

Example of converting a fraction percentage to a fraction

Convert 56 ¼% to a fraction

Using the fraction key

5 6 $a^b/_c$ 1 $a^b/_c$ 4 ÷ 1 0 0 =

if you get $^9/_{16}$ for the question above you are correct

ALTITUDE

MEASUREMENT & PERIMETER

Using Scales

One method of measuring weight is to use scales. The faces of these scales are shown in 100 g intervals with larger divisions every 500 g. The kilogram readings have a number assigned. Starting at zero through to 5 kg, the scale travels past 5 kg but doesn't reach 6 kg, the maximum reading being 5.5 kg.

Column 1 asks you to read the weight displayed on the scales. The pointers are on an exact division. So answer in kg, but to one decimal place, ie: readings such as 3.2 kg or 4.1 kg.

Column 2 is the reverse, position the pointers so that they represent the given weights. Note that you are required to approximate the position of the needle as it may have to be positioned in between divisions, (Q.7 and Q.10). It also asks questions in grams.

Column 3 is similar to Column 2 except that an addition is required first. The table describes a certain number of 100 g, 250 g and 1 kg weights that are on a particular scale. Add them across the row of the table and then write the total next to the question number, then point that pointer.

Using Scales

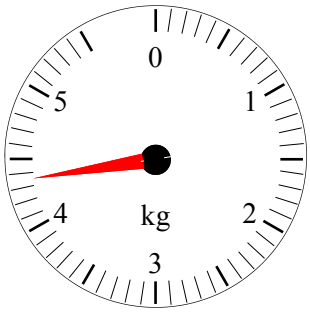
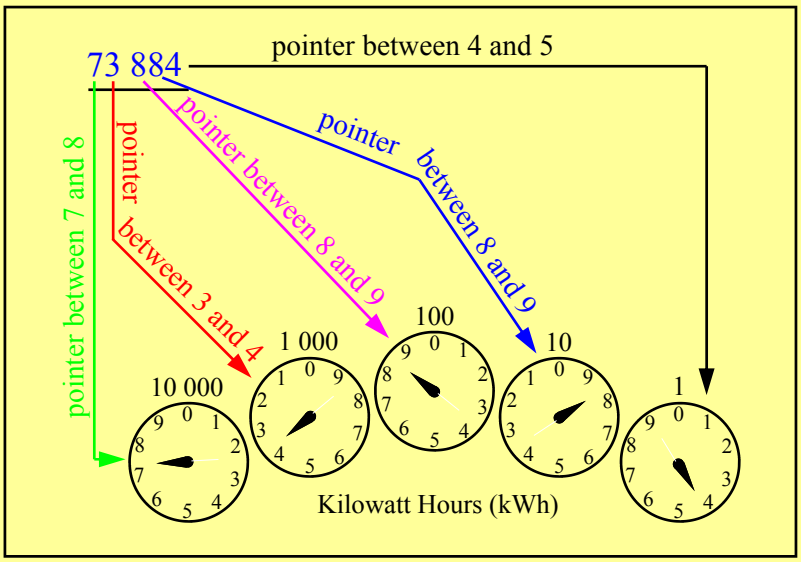
14 4.35 kg



Reading Water and Electricity Meters

The water and electricity supplied to your home passes through meters which record the amount used. Electricity meters are gear-driven, the scales changing between clockwise and anti-clockwise rotation. So the adjacent pointers spin in opposite directions. There is an easy way to read the scales, just look where the needle is and the number it represents is the smallest of the two numbers the needle is between. Note that zero is both 10 and zero. If the pointer is between the 9 and 0 the smallest number is 9, (zero = 10). If the pointer is between 0 and 1 the smallest number is 0, as zero = 0.

Column 1 starts with 4 questions reading the meters shown. The meters give a 5 digit reading from 10 thousands down to units (1's), the units are in kWh (kilowatt-hours). Read each from left to right and build the five digit number. The next 4 questions ask you to put the pointers in the correct position. Start with the 10 000's first and work your way left to the right.



Column 2 are water meters, these are more standard in layout. The meters measure water usage in kL (kilolitres). The end 4 digits are inversed (white on red). These end digits represent 4 decimal places in kL. If measuring in L, the last digit is tenths of a L (1 d.p). The first 3 questions compare a 'before' and 'after' reading and then require subtraction to calculate the amount of water used. Note that these meters deal with large units, some numbers are not required in the calculation due to them not changing, a short cut - but be careful!

The last 3 questions give the 'before reading' and then require this reading to be added to the usage to get the 'current reading'. After completing the sum, write the answer in the spaces on the meter.

Fuel Gauges

Fuel gauges are an indication of how much fuel is in a car's petrol tank. Most commonly fuel gauges have divisions at empty, ¼ of a tank, ½ a tank, ¾ of a tank and full. In the city, gauges aren't that critical, with 24 hr petrol stations in great numbers. In the country away from the conveniences of the city, the understanding of a fuel gauge is more important.

In column 1 the fuel gauges are shown, put the fraction that the gauge's pointer indicates into the spaces provided. Note that the pointers are meant to be pointing exactly at a division or exactly half way between a division. When the pointer is halfway between divisions the reading will be in 'eighths'. Look at the gauge below, it has the eighths marked.

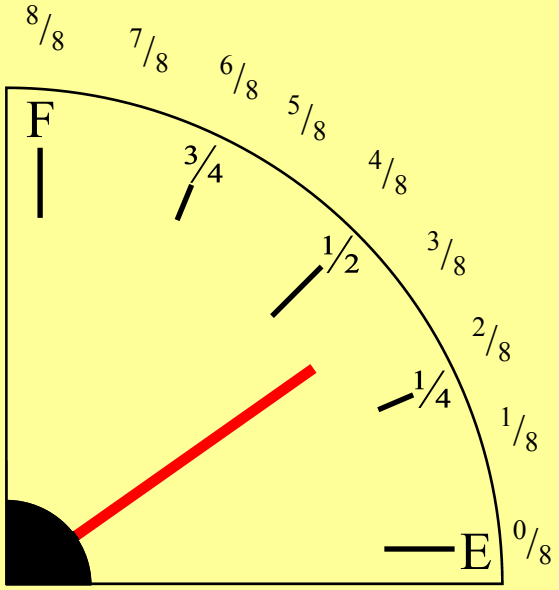
Column 2 is the reverse, given the fraction draw the pointers to the correct position.

Column 3 asks you to use a fuel gauge to estimate the fuel that remains in the tank as well as the distance that the car can continue until it will run out of fuel. This requires some multiplication of fractions skills, the method is as follows:

- To calculate the litres that remain divide 32 L (tank capacity) by the denominator and multiply by the numerator. This means divide 32 by the bottom number in the fraction, then multiply this number by the top number.
- The same method is used for the distance that the car can still travel. Divide 400 (max km) by the denominator (bottom number in fraction) and then multiply the answer by the numerator (top number in the fraction).

For the gauge below the reading is $^{3}/_{8}$. This means that if a car has a 32 L tank and a maximum travel distance on the tank of 400 km (city), then:

Fuel left is $32 \div 8 \times 3 = 4 \times 3 = 12$ L
Distance until empty is $400 \div 8 \times 3 = 50 \times 3 = 150$ km



Fuel Gauges

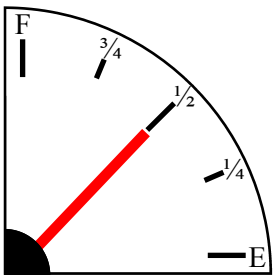
Fuel Gauges

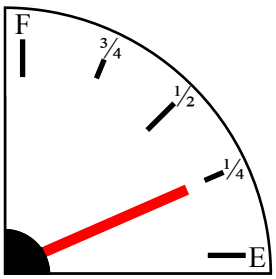
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Estimate the fraction of a fuel tank that remains on the gauges below

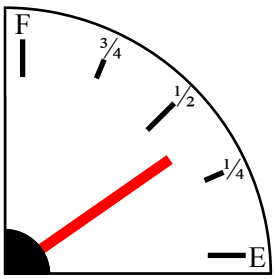
1 $\frac{1}{2}$



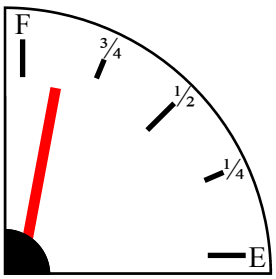
2 $\frac{1}{4}$



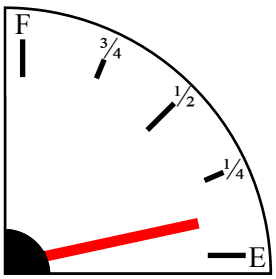
3 $\frac{3}{8}$



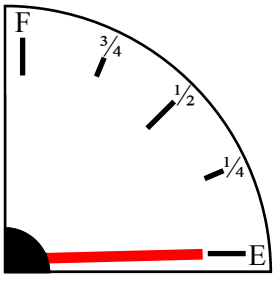
4 $\frac{7}{8}$



5 $\frac{1}{8}$

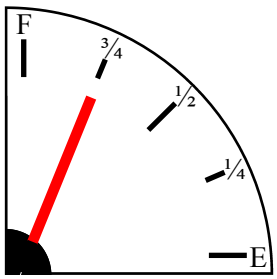


6 $\frac{0}{4}$

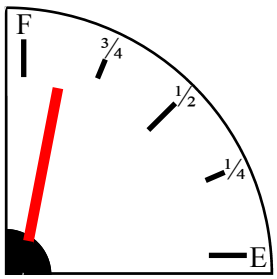


This time the fraction is given, place the needle in the correct position.

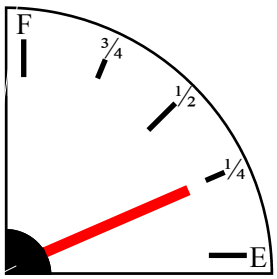
7 $\frac{3}{4}$



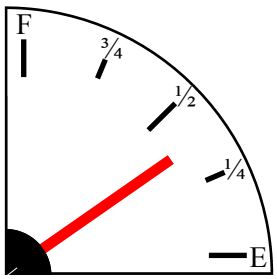
8 $\frac{7}{8}$



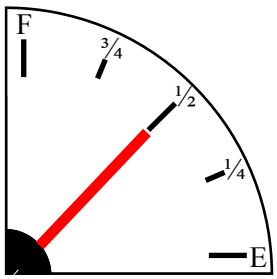
9 $\frac{1}{4}$



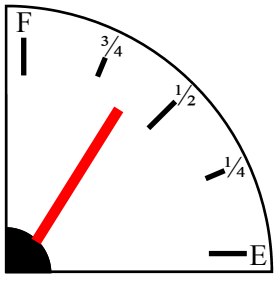
10 $\frac{3}{8}$



11 $\frac{1}{2}$

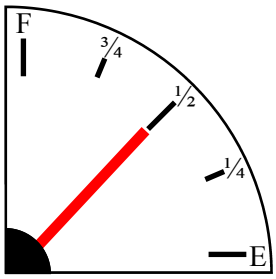


12 $\frac{5}{8}$

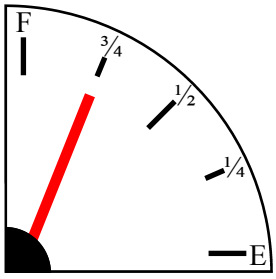


A full tank holds 32 L and travels 400 km (city). Use the gauges to estimate the unused fuel and km that can still be travelled.

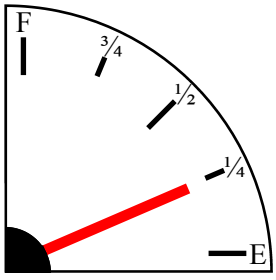
13 L: 16 km: 200



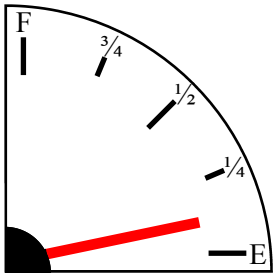
14 L: 24 km: 300



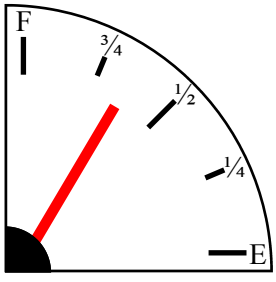
15 L: 8 km: 100



16 L: 4 km: 50



17 L: 20 km: 250



Using a Ruler - Line Measurement

This sheet has lines of a set length. When you print this sheet you must select 'No Scaling' when you print it, otherwise your answers will be wrong.

When a line is measured using a ruler the answer can be expressed in mm or cm. If the ruler has both units on it you can use the side needed for the answer. However you should also be able to convert between the two units. You should know that:

1 cm = 10 mm, so 2 cm = 20 mm, and decimals 3.8 cm = 38 mm etc.

Column 1 has horizontal lines and vertical lines. It is the thick (blue) lines you are measuring, don't confuse them with the thin black lines for writing your answer on. The first column asks for answers in cm (to 1 d.p.), that means 3.7 cm, 11.2 cm and so on. The screw and nut at the bottom of the page can be measured either across the object or use the lines with the double-ended arrow between them. The second column is much the same except the lines are angled, note that measurement for this column are in mm.

Use the same method with column 3 only write the size of each side and then add all the numbers together for the perimeter, the distance around the outside.

Using a Compass

A compass is used as a measure of direction. A compass needle always points to Magnetic North, so on this sheet the red section of the needle is pointing North and the white and red striped end is pointing South. The view is as if you are holding the compass against your chest looking down at it.

The compasses all have the blue ring with N (North) straight up. To find the direction you are facing count how many divisions (triangles and circles) that the red pointer is from North. Then count back the same number of divisions the opposite way from North and that is the direction you are facing.

The readings on this sheet will be one of the readings on the dial below. If you are not familiar with the 16 directions of the compass take the time to look at the dial, as the dials on the sheet don't have all the directions (shown in blue letters) that you need to know.

Car Gauges

This sheet asks you to put information on the gauges, a representation of a car's instrument cluster.

This is the method:

- The fuel gauge is on the left hand side of the instrument cluster. Draw a needle to the amount of fuel specified. Remember that between ¼'s are $^{1}/_{8}$'s of a tank, see the fuel gauge sheet if you need to.
- The speedometer is numbered 0 - 200 km/h. The speed increases by 10 km/h divisions with numbers at every 20 km/h. The odometer is the top set of boxes in the speedometer, while the tripmeter is the bottom set.
- The tachometer is the next large faced gauge. It displays engine speed with divisions at every 500 rpm with numbers at every 1 000 rpm. Note that car manufacturers use '× 1 000' so that single numbers are used. So 1 on the dial is 1 000 rpm. 2.5 would be 2 500 rpm. Note there is an LCD readout to show what gear the car is in.
- The temperature gauge is very simple, it has a green section to show the engine is cold, a blue section to indicate normal temperature and a red section to show if the engine is hot.
- The odometer is the record of the distance traveled during the life of your car it is the 6-digit number in your speedometer. So its largest reading is '999 999' km, then it resets to '000 000'. Write the numbers in the spaces.
- The tripmeter also records the distance traveled but it can be reset. It is often reset when the petrol tank is filled to calculate fuel economy or the distance covered on holidays. It has 4 digits but the last digit is tenths of a km. So its maximum reading is 999.9 km before it resets. Write the numbers in the spaces, note that the last digit is often in inverse (white on black) to show it is tenths of a kilometre.
- Some cars have an LCD readout to show the gear you are in, so that you don't have to look down at the gear shift. Cars usually have 5 or 6 gears. Colour the LCD bars.
- When turning at an intersection or overtaking you should use your indicator, colour the arrow, they are usually green or orange.

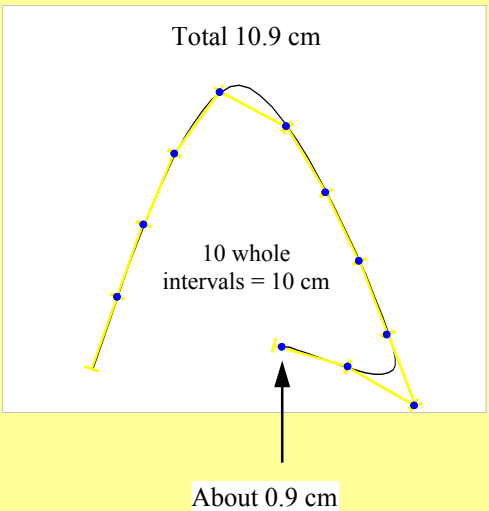
Curved Line Measurement

This sheet outlines the measurement of curved lines. Follow this method:

- Cut a length of string 30 cm long
- Use a felt tip pen to mark off 1 cm intervals along the string by lying the string alongside a ruler.
- Using a glue stick spread a thin film of glue over the first of the printed lines, the idea being not to stick the string to the page but to make it tacky enough to hold the string in place.
- Count the number of 1 cm intervals to get the number of cm then add the portion of the last interval, this will be tenths of a cm at the end, i. e: halfway into the last segment = 0.5 etc.
- Write the answer in the space provided

If you have no glue or string use a compass or set of dividers opened to 1 cm and 'step off' the curve. Or measure straight line lengths of 1 cm with a ruler.

Note that you can leave the line to make up for a corner you have previously cut (see example below). Decide if you are going to reduce the measurement at the corner or increase the measurement at the corner. You can alternate to reduce the error. The answer sheet for this sheet cuts all corners to give the minimum distance you should get for each line.



Using String or Intervals - Curved Line Measurement

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use a piece of string with 1 cm intervals marked on it with a small amount of glue on the page so that the string doesn't wander about too much. No string? Use a compass and mark off 1 cm intervals. No compass? Use a ruler and mark off 1 cm intervals. Find the length and write it in the space next to the question. Express your answer in cm to 1 d. p.

Units of Measurement

When units of measurement are changed, multiply or divide by 10, 100, 1 000 or more. To change to a smaller unit multiply, to convert to a larger unit divide. Some students have difficulty with this, they think that if the unit is larger you must multiply. This isn't the case. Imagine you have 1 m or 100 cm, both are the same distance, there are more of the smaller unit, 1→100, so:

- changing to a smaller unit means - multiply
- changing to a larger unit means - divide

The number used to multiply or divide is the number of small units in the larger unit. For example 2 m to cm, there are 100 cm in a metre, changing to a smaller unit so multiply…so multiply by 100. As only 10, 100 or 1 000 are used to get the answer … move the decimal point. Multiply by 10 moves the decimal place 1 position to the right, 100 move 2 positions and 1 000 move the decimal place 3 positions to the right.

Division is the same number of moves, only this time it's to the left. Divide by 10 and move the decimal place 1 position to the left, 100 move it 2 positions and 1 000 moves 3 positions to the left. A reminder is at the top of each column.

Column 1 starts with changing mm to cm. You should be able to talk it through to your-self….mm to cm is changing to a larger unit...that means division….there are 10 mm in a cm that means I divide by 10….divide by 10 means I move the decimal point 1 place to the left. That means 18 mm = 1.8 cm 113 mm = 11.3 cm and 0.9 mm = 0.09 cm. The next part of the column is the reverse, multiply by 10 means move the decimal place 1 position to the right. So 54 cm = 540 mm, 1.3 cm = 13 mm and 123 cm = 1 230 mm.

Column 2 deals with converting between cm and m. This time the change is by dividing or multiplying by 100. That means a 2 decimal place movement. For cm to m (divide by 100) 12 cm = 0.12 m, 106 cm = 1.06 m and 5.78 cm = 0.0578 m. Then the reverse, m to cm means multiplying by 100 or a 2 decimal place shift to the right: 3 m = 300 cm, 0.7 m = 70 cm and 10.05 m = 1 005 cm.

Column 3 is m to km, this involves multiplying or dividing by 1 000, or a 3 decimal place movement. That would mean 300 m = 0.3 km, 2 305 m = 2.305 km and 4.7 m = 0.0047 km. Then the reverse, changing km to m. That's 3 decimal places to the right: 1.2 km = 1 200m, 0.85 km = 850 m and 0.02 km = 20 m.

Further Units of Measurement

The processes are the same as on the previous sheet 'Units of Measurement' except that this time the conversions aren't in groups of units and multiplication/division. Its all jumbled so you need to know whether you divide or multiply and how many decimal places you shift the decimal point. There is also the inclusion of mm to m and the reverse. This is a 3 decimal place shift (× or ÷ by 1 000).

Perimeter of Shapes

The perimeter of a shape is the distance around the outside of the shape. The units of measurement are mm, cm, m and km. Shapes often have side lengths that are the same, rather than writing this distance out again a mark is put on the identical sides to show they are the same length. If there are a number of different pairs of sides that are the same length, 2 marks together will be used and so on, such as with a rectangle.

To answer columns 1 and 2 use the same method, this is:

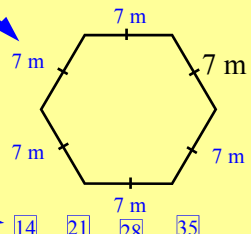
- Look at the side markings and write side lengths on every side. It is up to you if you write the units as well.
- The first line of working is the sum of the sides of the shape, write 'P =' then the lengths separated by + signs. Note that to avoid missing sides don't jump around in the addition. Start on a side then move around the shape in a clockwise or anti-clockwise direction.
- If the sum is challenging to complete mentally, total the sum as you move through, look at the example below.
- The second line is the answer line, again write 'P =' then the answer, then the units, either mm, cm or m.

Column 3 introduces formulae used for squares and rectangles. These are:

- Squares: $P = 4l$ (which is 4 times the side length)
- Rectangles: $P = 2l + 2b$ (which is 2 times the length + 2 times the breadth)

The questions are in tables. With squares, multiply the side length by 4 and write the answer with units. The rectangles are completed in stages, l is given and you double it to get the value of $2l$, b is given and you double it to get the value of $2b$. Then add the values for $2l$ and $2b$ together to get the answer, write in the units (all of which are cm.)

Fill in all the side lengths to avoid missing them



If you have trouble solving the sum mentally use canceling strokes and total as you go through

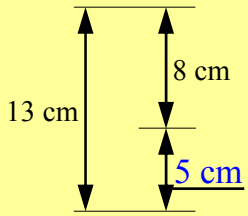
Perimeter - Finding a Missing Side

Sometimes before the perimeter of a shape can be calculated the missing sides have to be found. The missing sides will either have side markings that indicate that they are the same size as another side or they will be found by adding or subtracting sides that you know the value for. Note that this applies due to all the angles being right angles, the corners are not marked as right angles but you can assume that they are all 90º.

In column 1 Q. 1 - 5, two different ways are used to measure the same distance. This means that they must be equal. Use addition or subtraction to find the value. In the example here a distance is measured as 13 cm. The same distance is then broken up into to parts, one of those parts is 8 cm. Ask yourself, 'What number adds to 8 to give 13?'
The answer is 5, so the missing length is 5 cm.



From Q. 6, through the column, shapes are given and you use the same method to find the missing sides. The method is:

- If the shape has side markings write in all the sides that you know.
- Use the given lengths to then calculate the other side lengths

Columns 2 and 3 add one step to column 1, the perimeter is calculated. Use 2 lines of working, the first line being the addition of all the sides and the second line being the answer with the units (mm, cm, m etc). Writing the side lengths on all sides of the shape will help avoid mistakes. Some students like to miss this step because they know the value of the side and don't need to write it, the problem is that when they add the sides to get the perimeter they often forget to include them. A method to avoid this problem is to label every side with its measurement then look at the addition and check off the numbers against the numbers on the sides of the shape. If there are different numbers or there are too many or too few you have to find the problem.

Note that if you add around the sides of the shape in the same way, clockwise or an anti-clockwise direction, it makes it less confusing.

Be careful with question 19 it is different and may trick you.

Perimeter Problems

These problems are an extension of the exercises covered earlier with an inclusion of cost. A common use of perimeter is in the calculation of cost of fences and walls. To calculate this cost calculate the perimeter first, then multiply the answer by the cost of the fence/wall by its unit cost, (the cost per metre).

In all the problems two lines of working are expected. The first line being the sum of the side lengths:
P = _ + _ + _ + etc

the second line being the total length and the units
P = _____ m (or cm).

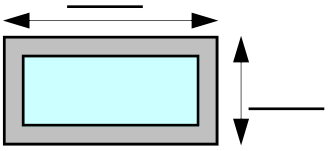
Perimeter Problems

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Answer the perimeter problems below.

1 A rectangular swimming pool has sides with lengths 12 m and 4 m. Find the distance around the pool.

2 A path 1 m wide surrounds the same pool (Q1) calculate the length and breadth of the pool and the path combined, put the dimensions on the diagram below and find the perimeter



3 If the pool above has a safety fence around the outside of the path find the cost of fencing the pool when the fence costs $27 per metre. ×

4 In a science experiment Travis noted that on average an ant stopped every 5 cm. If the viewing tray was 30 cm by 20 cm, find its perimeter.

How many times would the ant stop:

i) in 1 lap

ii) in 5 laps

iii) over a 9 m distance

5 Three hobby farmers are each given small garden areas. The plots all occupy the same land area (16 m²) but have different side lengths, find the perimeter of each.

Plot 1 : 16 m by 1 m

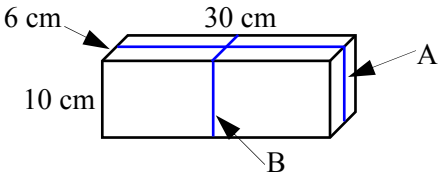
Plot 2 : 8 m by 2 m

Plot 3 : 4 m by 4 m

6 If you were offered a plot and had to pay to fence the area, would it be cheaper to have a square area or a rectangular area?

Circle : square or rectangle

7 A parcel has 2 strings around it as shown below. Calculate the length of the string A and string B, then add them to find the total length.



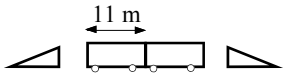
A:

B:

8 Scott says that when you double the side length of a square you get 4 times the perimeter, is he right?

For Not a

9 Dare-devil Dan is about to jump 2 buses, lined up end to end (see below). Dan is superstitious and walks 1 lap around the buses before the jump, how far does he walk?



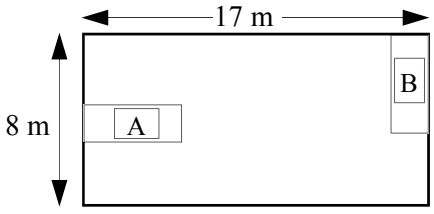
The buses are 11 m long and 3 m wide

10 An inventor created a synthetic material that will stretch to 18 times its length before breaking. If the original length is 7 m, find its maximum length. Will it stretch around a rectangular building with sides 25 m and 35 m? (Find P then circle answer)

Max length ×

Yes / No

11 Leon's dog 'Oblong' always runs around the perimeter of the backyard when he sees Leon arrive home. Find the distance he runs around the empty yard. Then calculate the distances he runs when Leon's car is in position A or in position B, (not both together). Leon's car is 2 m wide and 5 m long.



Position A is in the centre of the yard

No car:

Car A :

Car B :

Perimeter Problems

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

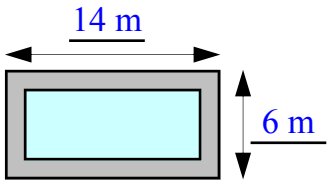
Answer the perimeter problems below.

1 A rectangular swimming pool has sides with lengths 12 m and 4 m. Find the distance around the pool.

$P = 12 + 12 + 4 + 4$

$P = 32$ m

2 A path 1 m wide surrounds the same pool (Q1) calculate the length and breadth of the pool and the path combined, put the dimensions on the diagram below and find the perimeter



$P = 14 + 6 + 14 + 6$

$P = 40$ m

3 If the pool above has a safety fence around the outside of the path find the cost of fencing the pool when the fence costs $27 per metre.

$\text{Cost} = 40 \times 27$

$\text{Cost} = \$1\,080$

$$\begin{array}{r} {\scriptstyle 2} \\ 27 \\ \times\ 40 \\ \hline 1\,080 \end{array}$$

4 In a science experiment Travis noted that on average an ant stopped every 5 cm. If the viewing tray was 30 cm by 20 cm, find its perimeter.

$P = 30 + 30 + 20 + 20$

$P = 100$ cm

How many times would the ant stop:

i) in 1 lap — 20 times

ii) in 5 laps — 100 times

iii) over a 9 m distance — 180 times

5 Three hobby farmers are each given small garden areas. The plots all occupy the same land area (16 m²) but have different side lengths, find the perimeter of each.

Plot 1 : 16 m by 1 m

$P = 16 + 16 + 1 + 1$

$P = 34$ m

Plot 2 : 8 m by 2 m

$P = 8 + 8 + 2 + 2$

$P = 20$ m

Plot 3 : 4 m by 4 m

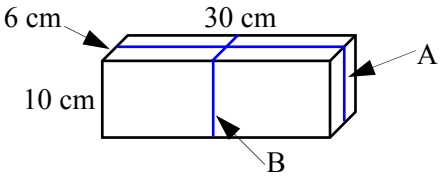
$P = 4 + 4 + 4 + 4$

$P = 16$ m

6 If you were offered a plot and had to pay to fence the area, would it be cheaper to have a square area or a rectangular area?

Circle : (square) or rectangle

7 A parcel has 2 strings around it as shown below. Calculate the length of the string A and string B, then add them to find the total length.



A: $P = 30 + 30 + 10 + 10$

$P = 80$ cm

B: $P = 10 + 10 + 6 + 6$

$P = 32$ cm

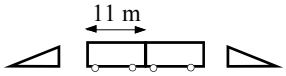
$P = 80 + 32$

$P = 112$ cm

8 Scott says that when you double the side length of a square you get 4 times the perimeter, is he right?

For ○ Not a ●

9 Dare-devil Dan is about to jump 2 buses, lined up end to end (see below). Dan is superstitious and walks 1 lap around the buses before the jump, how far does he walk?



The buses are 11 m long and 3 m wide

$P = 11 + 11 + 3 + 11 + 11 + 3$

$P = 50$ m

10 An inventor created a synthetic material that will stretch to 18 times its length before breaking. If the original length is 7 m, find its maximum length. Will it stretch around a rectangular building with sides 25 m and 35 m? (Find P then circle answer)

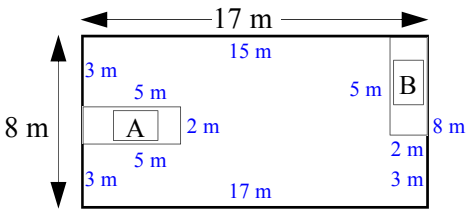
Max length 126 m

$P = 35 + 35 + 25 + 25$

$P = 120$ m (Yes) / No

$$\begin{array}{r} {\scriptstyle 5} \\ 18 \\ \times\ 7 \\ \hline 126 \end{array}$$

11 Leon's dog 'Oblong' always runs around the perimeter of the backyard when he sees Leon arrive home. Find the distance he runs around the empty yard. Then calculate the distances he runs when Leon's car is in position A or in position B, (not both together). Leon's car is 2 m wide and 5 m long.



Position A is in the centre of the yard

No car: $P = 17 + 17 + 8 + 8$

$P = 50$ m

Car A :

$P = 17 + 3 + 5 + 2 + 5 + 3 + 17 + 8$

$P = 60$ m

Car B :

$P = 17 + 8 + 15 + 5 + 2 + 3$

$P = 50$ m

ALTITUDE

AREA

Grid Area of Shapes

This sheet uses areas of 1 cm^2. When you print this sheet you must select 'No Scaling' when you print it, otherwise the grid areas will be scaled and incorrect.

One method of determining area within a shape is to use a grid system in which the space inside a shape is broken up into squares. This sheet uses a 1 cm grid system. The shapes either fit the grid exactly or cross the grid diagonally using ½ a grid space.

The top section of the sheet (Q 1 - 9) requires you to calculate the areas of the nine shapes shown. This is done by counting the number of 1 cm² grid squares inside the shape and writing the answer. Some of the shapes have diagonals that cut the squares in half. Remember that ½ + ½ = 1, an even number of ½'s will give a whole number and an odd number of ½ squares will have the answer being a mixed number with a ½ as the proper fraction part. Or use decimals 0.5 cm² is half a square. Remember to give your answer in cm².

With Q 10 - 13 there are no grid lines on the shapes. This is overcome by either of these two methods:

- Use a grid overlay on a transparent sheet (such as an overhead projector sheet), or
- Rule lines 1 cm apart and create the grid on the paper

A worksheet is supplied that has the grids drawn for you if you can't print a transparent sheet.

The 2nd column asks you to use the same method with the grid overlay to calculate the area. But this time write in the side lengths. Then multiply the two side lengths together and see if this number relates to the area.

The third column then uses the side multiplication method to calculate the area of the shapes in the questions.

Area = 57 m²

Designing Flooring on a House Plan

This sheet deals with area in a practical use, the floor coverings of a house. The depth to which you complete this sheet depends on your time and creativity. The grid on the third page is used to represent the floor of your house, looking down through a roof that has vanished.

The method of the sheet is as follows:

- Wall off the rooms.
- Try to create: 3 bedrooms, bathroom, kitchen, laundry, lounge room, dining room and a hallway.
- Colour the squares in each room a particular colour to represent a different floor covering, then the basics, fill the house with furniture. This can either be drawn in or the pieces on the next page can be coloured, cut out and stuck on.
- Once you have finished the house complete the last page which is used to find the total cost for flooring. Multiply the length and breadth of the room to get the area, if rooms are rectangular or square, otherwise just count the squares. Multiply this by the cost of the floor covering used, to find the cost of each room. Add the costs to get the total.

There are 3 bedroom spaces on the calculation sheet, you may have a 2 bedroom house though, so leave one blank, or create another room that you may have. There is also one additional space at the bottom of the page if you wish to put in another room. You may like to include a garage and park your car in it.

House Pieces

Designing Flooring on a House Plan

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

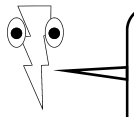
Below is a blank floor Plan for a house that is still in design. Consider it your job to put in the walls to make rooms, naming and fitting out each room (adding furniture). Then using the next page calculate the cost of flooring for each room and then total. The rooms you need to include are:

Up to 3 Bedrooms (MBR, BR2 and BR3) Dining Room (DR) Lounge Room (LR)
Bathroom (Bath) Laundry (LDY) Hallway (HALL)
Kitchen (KN) [+ Pantry (P) optional]

Make sure you use a pencil. The separating walls should be on the grid lines, but thick enough to see. If you have extra room to fill in include rooms like: extra toilet, photographic darkroom, car garage or an additional bedroom. The scale used is 1 cm = 1 m.

Floor Coverings for the Plan

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE



Measure the sides (length and breadth) of each room and multiply to get the area. If the room is not square or rectangular just count the squares. Select the type of flooring, ensure that it matches the type of room you are dealing with. Then multiply the area by the cost to get the cost for the room. Then add all the rooms to get total cost. Remember that 1 square = 1 m². Coverings to choose from:

1. Wool carpet	$95 per m²	2. Hard wear carpet	$32 per m²
3. Tiles	$27 per m²	4. Cork tiles	$48 per m²
5. Polished boards	$38 per m²	6. Vinyl	$12 per m²

Master Bedroom Length _____ × Breadth _____ = _____ m²

Number of flooring type __ Cost per m² _____ Cost for room _____

Bedroom 2 Length _____ × Breadth _____ = _____ m²

Number of flooring type __ Cost per m² _____ Cost for room _____

Bedroom 3 Length _____ × Breadth _____ = _____ m²

Number of flooring type __ Cost per m² _____ Cost for room _____

Dining Room Length _____ × Breadth _____ = _____ m²

Number of flooring type __ Cost per m² _____ Cost for room _____

Lounge Room Length _____ × Breadth _____ = _____ m²

5. Polished boards	$38 per m²	6. Vinyl	$12 per m²

Master Bedroom Length 6 × Breadth 7 = 42 m²

Number of flooring type 1 Cost per m² 95 Cost for room $3 990

Bedroom 2 Length 3 × Breadth 6 = 18 m²

Number of flooring type 1 Cost per m² 95 Cost for room $1 710

Bedroom 3 Length 3 × Breadth 6 = 18 m²

Number of flooring type 1 Cost per m² 95 Cost for room $1 710

Dining Room Length 4 × Breadth 4 = 16 m²

Number of flooring type 5 Cost per m² 38 Cost for room $608

Lounge Room Length 5 × Breadth 8 = 40 m²

Number of flooring type 5 Cost per m² 38 Cost for room $1 520

Kitchen Length 4 × Breadth 4 = 16 m²

Number of flooring type 3 Cost per m² 27 Cost for room $432

Laundry Length 2 × Breadth 4 = 8 m²

Number of flooring type 3 Cost per m² 27 Cost for room $216

Hallway Length 15 × Breadth 1 = 15 m²

Number of flooring type 2 Cost per m² 32 Cost for room $480

Bathroom Length 4 × Breadth 4 = 16 m²

Number of flooring type 3 Cost per m² 27 Cost for room $432

Ensuite Length 2 × Breadth 6 = 12 m²

Number of flooring type 3 Cost per m² 27 Cost for room $324

TOTAL COST: $11 422

Area of Squares

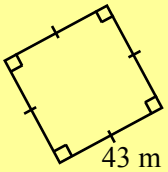
Area is the measurement of space within a shape. The units of measurement are square units, which can be mm², cm², m² and so on. This sheet deals solely with squares. The formula used is $A = l^2$. The l referring to the side length of the square.

Some students have a difficulty with squaring numbers (²). They forget that it means the number times itself and instead think it is the number times 2. You can use the formula $A = l \times l$ if this makes it easier to remember. Note that there are 3 lines of working. The first being the formula, the second being the substitution of values and the third being the answer with square units.

Column 1 questions have sides with 2 digit numbers. Column 2 has sides with 1 or 2 digits plus 1 decimal place. Use the same method as with Column 1, just remember that you will have an answer with 2 decimal places. Column 3 are written problems, solve these in the same way just without the diagram.

Make sure you place the ² on the units. Some students forget and place the ² on the number in the answer instead of the units, eg. instead of writing 14 m² they write 14² m, which is incorrect.

Show 3 lines of working : formula, substitution and answer



$A = l^2$

$= 43^2$

$A = 1\ 849\ m^2$

Area of Rectangles

Area is the measurement of space within the shape. The units of measurement are square units, which can be mm², cm², m² and so on. This sheet deals solely with rectangles. The equation used is A = *lb*. The *l* is the side length, *b* is the breadth. It doesn't matter which you choose as *l* and which as *b*, the answer will still be the same, but generally *l* is the longest length.

Note that there are 3 lines of working. The first being the formula, the second being the substitution of values and the third being the answer with units.

Column 1 questions have sides with 2 digit numbers. Write the first 2 lines of working then use the multiplication working space. Then answer using the third line.

Column 2 has sides with 1 or 2 digits plus 1 decimal place. Use the same method as with Column 1 just remember that you will have an answer with 2 decimal places. Multiply the numbers without the decimal point, then put it back in at the end.

Column 3 has written problems solve these in the same way, just without the diagram.

The most common mistake made is misusing the ², some students forget and put the ² on the number in the answer instead of the units, instead of 14 m² they incorrectly write 14² m.

Show 3 lines of working: formula, substitution and answer.

$= 1.1 \times 2.6$

$A = 2.86 \text{ m}^2$

$$\begin{array}{r} 26 \times \\ 11 \\ \hline 26 \\ 260 \\ \hline 2.86 \end{array}$$

13 A foyer of a building is to be tiled. If the area is rectangular with sides 25 m and 48 m, find the area.

$A = lb$

$= 25 \times 48$

$A = 1\,200 \text{ m}^2$

$$\begin{array}{r} {\scriptstyle 1} \\ 48 \times \\ 25 \\ \hline {\scriptstyle 1} \\ 240 \\ 960 \\ \hline 1\,200 \end{array}$$

14 If 2 tilers can lay 80 m² per day, calculate the time taken to complete the job

$$\begin{array}{r} 15 \\ 80 \overline{)\ 1\,200} \\ 80 \\ \hline 400 \\ 400 \\ \hline 0 \end{array}$$

It will take 15 days.

Area of Triangles

Area is the measurement of space within a shape. The units of measurement are square units, which can be mm², cm², m² and so on. This sheet deals solely with triangles. The formula used is A = ½*bh*. The *b* referring to triangle's base length, the *h* referring to the triangle's perpendicular height.

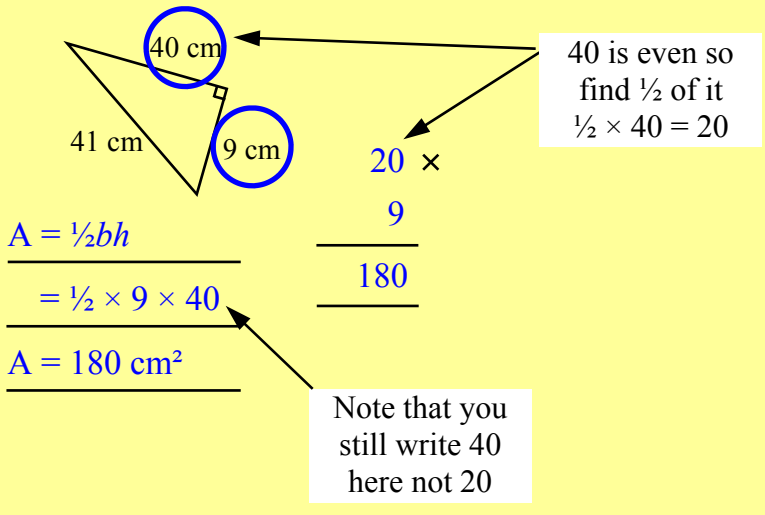
Triangles confuse some students due to there being 3 sides but only 2 measurements being used in the formula. If given 3 sides some students multiply ½ by all 3 sides, this is incorrect. Other students use the horizontal measurement always as the base, this isn't the case with rotated triangles. The critical thing to remember is that the measurements MUST be at right angles (perpendicular) to each other ALWAYS. So long as you never use sides that don't have a right angle between them you will be correct.

With Column 1 the triangles have 3 or more dimensions (measurements) on them. Remember that you only need 2 of the lengths. Circle the sides to be used in the formula. Then find the area using those 2 sides. Note that there are 3 lines of working, the first being the formula, the second being the substitution of values and the third being the answer with units.

Column 1 features triangles with sides having 2 digit numbers. Write the first 2 lines of working then use the multiplication working space. Then write the answer in the third line. With triangles save yourself time by dividing one of the sides by 2 and using it in the multiplication. All the questions have at least one even side which can be divided by 2. See the example below. When you divide a decimal imagine the point isn't there. E.g. 3.4 as 34 half of 34 is 17 so it is 1.7 and 8.8 as 88, half of 88 is 44 so it is 4.4.

Column 2 questions have decimal sides with 1 digit plus 1 decimal place. Use the same method as with column 1 just remember that you will have an answer with 2 decimal places.

Column 3 are written problems solve these in the same way, just without the diagram.



Area of Triangles

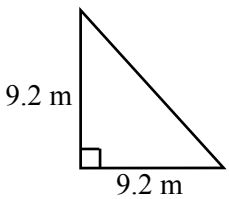
10



Now find the area in the following problems

11 A triangular sun shade has perpendicular sides of 3.8 m and 6.2 m. Calculate the area

12 A triangular section of glass has a base of 4.8 m and a perpendicular height of 7.6 m. Calculate the area.

13 A triangular sail has vertical height of 5.2 m and a horizontal base length of 3 m. Calculate its area.

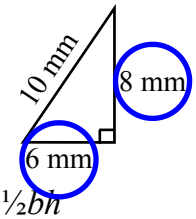
14 A triangular garden bed has perpendicular sides of 86 cm and 94 cm. Calculate the bed's area.

Area of Triangles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Select the 2 measurements to use, circle them, then find the triangle's area.

1

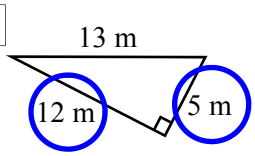


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 6 \times 8$

$A = 24$ mm²

2



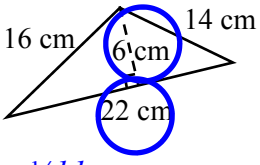
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 5 \times 12$

$A = 30$ m²

6 × 5 = 30

3



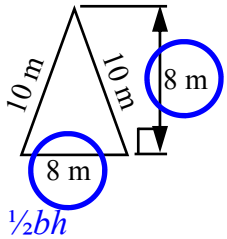
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 22 \times 6$

$A = 66$ cm²

11 × 6 = 66

4

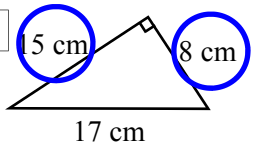


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 8 \times 8$

$A = 32$ m²

5



$A = \frac{1}{2}bh$

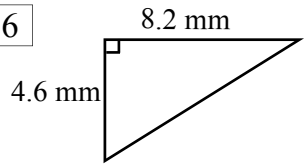
$= \frac{1}{2} \times 8 \times 15$

$A = 60$ cm²

^{2}15 × 4 = 60

Find the area now using decimals

6



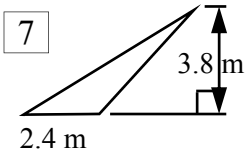
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 4.6 \times 8.2$

$A = 18.86$ mm²

82 × 23 = 246 + 1 640 = 18.86

7



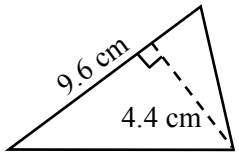
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 2.4 \times 3.8$

$A = 4.56$ m²

38 × 12 = 76 + 380 = 4.56

8



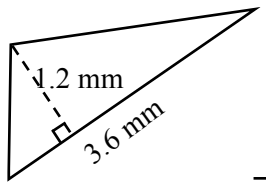
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 9.6 \times 4.4$

$A = 21.12$ cm²

48 × 44 = 192 + 1 920 = 21.12

9



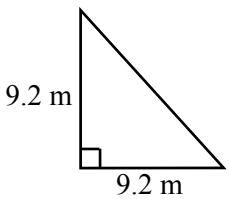
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 3.6 \times 1.2$

$A = 2.16$ cm²

18 × 12 = 36 + 180 = 2.16

10



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 9.2 \times 9.2$

$A = 42.32$ m²

92 × 46 = 552 + 3 680 = 42.32

Now find the area in the following problems

11 A triangular sun shade has perpendicular sides of 3.8 m and 6.2 m. Calculate the area

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 6.2 \times 3.8$

$A = 11.78$ m²

^{2}38 × 31 = 38 + 1 140 = 11.78

12 A triangular section of glass has a base of 4.8 m and a perpendicular height of 7.6 m. Calculate the area.

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 4.8 \times 7.6$

$A = 9.12$ m²

^{1}76 × 24 = 304 + 1 520 = 18.24

13 A triangular sail has vertical height of 5.2 m and a horizontal base length of 3 m. Calculate its area.

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 3 \times 5.2$

$A = 7.8$ m²

52 × 15 = 260 + 520 = 7.80

14 A triangular garden bed has perpendicular sides of 86 cm and 94 cm. Calculate the bed's area.

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 86 \times 94$

$A = 4\,042$ cm²

^{1}94 × 43 = ^{1}282 + 3 760 = 4 042

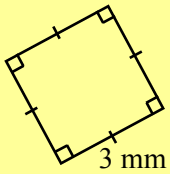
Areas of Squares, Rectangles and Triangles

Area is the measurement of space within a shape. The units of measurement are square units, which can be mm², cm², m² and so on. Note that if you are ever given a question without units, then express your answer in units². The last questions in each column require you to do this.

Column 1 deals solely with squares. The formula used is $A = l^2$. The l referring to the side length. Some students have a difficulty with squaring numbers (²). They forget that it means the number times itself and instead think it is the number times 2. You can use the formula $A = l \times l$ if it easier for you to remember. The answer is obtained by multiplying the side length by itself. Note that there are 3 lines of working. The first being the formula, the second being the substitution of values and the third being the answer with units.

Column 2 is all rectangles. The equation is $A = lb$, the length is normally the longest distance, but it doesn't actually matter which you choose because the answer will be the same. So multiply the two different sides together in any order.

Column 3 are all triangles. The equation is $A = \frac{1}{2}bh$, or 'half times the base times the height'. When you multiply these there is an easier way. The more difficult way is to multiply the two numbers then divide by 2, only use this method if both numbers are odd. The easier way, if at least one side is even, is divide one of the numbers by 2 (usually pick the largest even number) get the answer and then multiply it by the other side. This sheet has been designed to be done mentally, so no working spaces are provided.

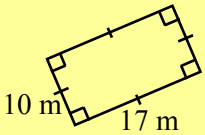


$A = l^2$

$= 3^2$

$A = 9$ mm²

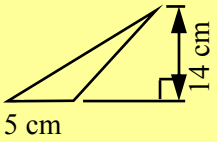
Don't forget to put a 'squared' (²) in the answer



$A = lb$

$= 17 \times 10$

$A = 170$ m²



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 5 \times 14$

$A = 35$ cm²

Calculate like this:
"a half of 14 is 7, 7 times 5 is 35

$A = 26 \text{ units}^2$

Finding Area with Different Units

This sheet deals with shapes that have measurements in different units on their sides, for example one side in metres and the other in cm. With these the method is to change the larger units to match the smaller units. To convert, multiply the measurement by:

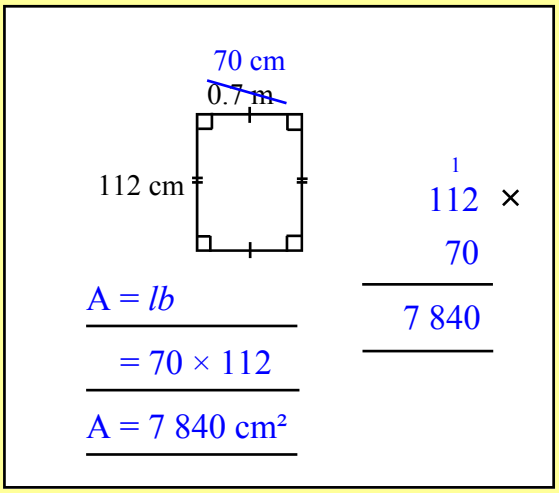
- 10 if converting from cm → mm, e.g. 3 cm = 30 mm, 5.9 cm = 59 mm
- 100 if converting from m → cm, e.g. 3 m = 300 cm, 1.9 m = 190 cm

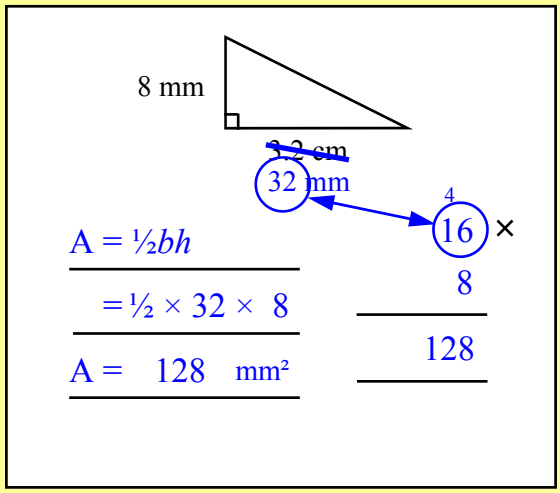
The reverse applies changing from a smaller unit to a larger unit, convert by dividing the measurement by:

- 10 if converting from mm → cm, e.g. 56 mm = 5.6 cm, 134 mm = 13.4 cm
- 100 if converting from cm → m, e.g. 35 cm = 0.35 m, 128 cm = 1.28 m

Column 1 asks you first to convert units, note that some ask for a conversion that jumps a unit m → mm, you may like to do these in 2 stages convert to cm mentally then to mm. The rest of the column and column 2 are rectangle problems. Change the larger unit to the smaller unit and write the conversion next to the measurement, then strike out the old measurement. Show 3 lines of working: formula, substitution and answer with units, follow the method shown in Q. 13. There is a working space provided for your multiplication.

Column 3 deals with triangles. The method is the same except that there is a ½ in the formula. All the numbers in the questions have at least 1 even number, divide it by 2 and then multiply.





Finding Area with Different Units

Finding Area with Different Units

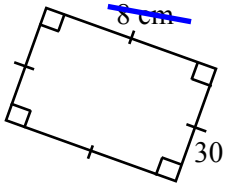
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Change the measurements given on the left to the units on the right hand side

1	0.8 m	=	80	cm
2	7.5 cm	=	75	mm
3	1.6 m	=	160	cm
4	30 mm	=	3	cm
5	1.9 cm	=	19	mm
6	43 cm	=	0.43	m
7	0.11 m	=	11	cm
8	0.4 m	=	400	mm
9	0.37 m	=	370	mm
10	273 mm	=	0.273	m
11	0.673 m	=	67.3	cm
12	2.03 m	=	203	cm

Change the larger units to the smaller units of the other side. Find the area.

13



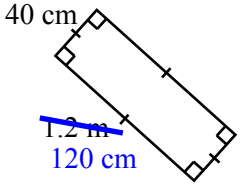
$A = lb$

$= 80 \times 30$

$A = 2\,400$ mm²

80 × 30 = 2 400

14



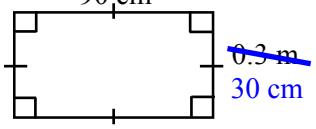
$A = lb$

$= 120 \times 40$

$A = 4\,800$ cm²

120 × 40 = 4 800

15



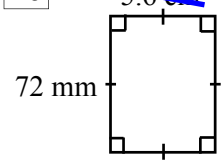
$A = lb$

$= 90 \times 30$

$A = 2\,700$ cm²

90 × 30 = 2 700

16



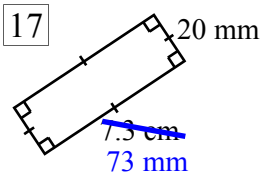
$A = lb$

$= 56 \times 72$

$A = 4\,032$ mm²

72 × 56 = 432 + 3 600 = 4 032

17



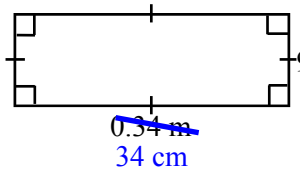
$A = lb$

$= 73 \times 20$

$A = 1\,460$ mm²

73 × 20 = 1 460

18



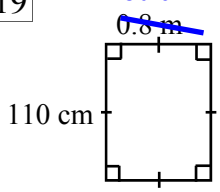
$A = lb$

$= 34 \times 9$

$A = 306$ mm²

34 × 9 = 306

19



$A = lb$

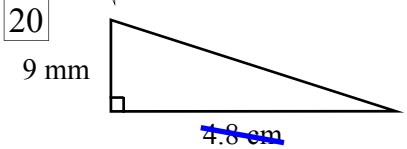
$= 80 \times 110$

$A = 8\,800$ cm²

110 × 80 = 8 800

Now lets try triangles

20



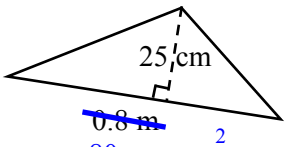
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 48 \times 9$

$A = 216$ mm²

24 × 9 = 216

21



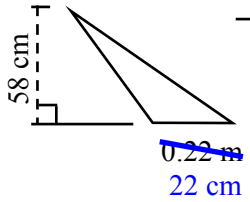
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 80 \times 25$

$A = 1\,000$ cm²

25 × 40 = 1 000

22



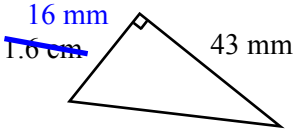
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 58 \times 22$

$A = 638$ cm²

58 × 11 = 58 + 580 = 638

23



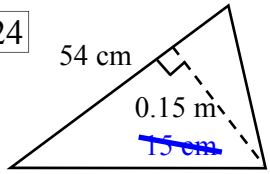
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 16 \times 43$

$A = 344$ cm²

43 × 8 = 344

24



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 54 \times 15$

$A = 405$ cm²

27 × 15 = 135 + 270 = 405

Area Problems

These problems calculate the area of squares, rectangles and triangles and then use the area to involve money, time or a quantity (such as litres). As with areas of shapes, use three lines of working: the formula, substitute the values and the answer including units. Don't forget the ² on the units.

In Column 2, Q. 9 to 16 introduce hectares (ha). Unlike the other units ha doesn't have a ² on it as it isn't a distance unit it is just an area unit. The unit is used for large areas (usually land) such as with farms and parkland. The conversion is:

1 hectare (ha) = 10 000 m².

This means that 20 000 m² = 2 ha, 50 000 m² = 5 ha and so on. These questions ask you to convert the m² units to ha. When you divide by 10 000 you move the decimal point 4 places to the left.

The third column deals with area problems using measurements in metres. Answer the questions in m² then convert the answer to ha using the 10 000 division.

Area Problems

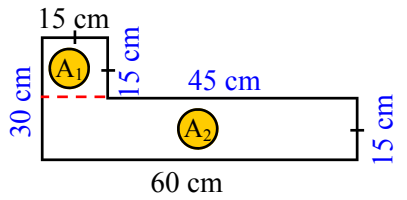
21 What percentage of the land is taken up by the barn? 25%

Composite Area - Addition

Composite areas are shapes that are made from two or more shapes. To calculate the area the shapes are broken up into geometric shapes, in this case squares, rectangles and triangles. The shapes have their areas calculated separately then they are added together to get the total area. Questions 1 to 7 can be broken into 2 shapes, questions 8 and 9 into three shapes. Note that all angles that appear to be right angles are right angles.

The method for the sheet is the same throughout, follow this method:

- Find all the missing side lengths for the shapes and write them on the diagrams
- Draw a line to cut the shape up into basic shapes. Label the separate areas A_1, A_2 … to show which area is which.
- Answer the questions showing full working out, follow the method shown in question 1 and the example below.



$A_1 = l^2$

$= 15^2$

$A_1 = 225 \text{ cm}^2$

$A_2 = lb$

$= 60 \times 15$

$A_2 = 900 \text{ cm}^2$

$A = A_1 + A_2 = 225 + 900$

$A = 1\,125 \text{ cm}^2$

$= 18 \times 6$ $= 36 + 72 + 108$

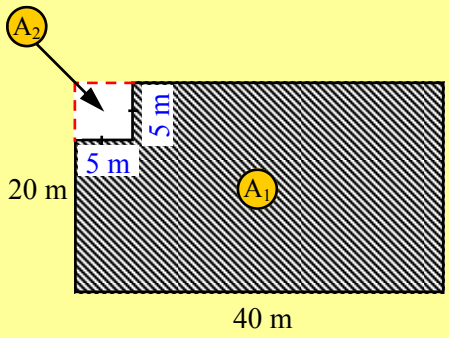
$A_1 = 108$ mm² $A = 216$ mm²

Composite Area - Subtraction

Composite areas are shapes that are composed (made up) of two or more shapes. These shapes can be broken up into geometric shapes, in this case squares, rectangles and triangles to help calculation of area. The shapes have their areas calculated separately then the smaller shapes are subtracted from the larger shape. Questions 1 to 7 have one shape subtracted from the other, Q 8 and 9 have 2 shapes subtracted.

The method for the sheet is the same throughout, follow this method:

- Find all the missing side lengths for the shapes and write them on the diagrams
- If the inside shape touches the perimeter to make an opening draw a broken line across the opening to close it off. Question 3 will need 2 lines.
- Label the areas A_1, A_2 (and A_3 for questions 8 & 9) to show which area is which. Let A_1 be the outside or largest shape area then use A_2 and A_3 for the other areas.
- Answer the questions showing full working out, follow the method shown in question 1 or the example below.



$A_1 = lb$

$= 40 \times 20$

$A_1 = 800\ m^2$

$A_2 = l^2$

$= 5^2$

$A_2 = 25\ m^2$

$A = A_1 - A_2$

$= 800 - 25$

$A = 775\ m^2$

Composite Area - Subtraction

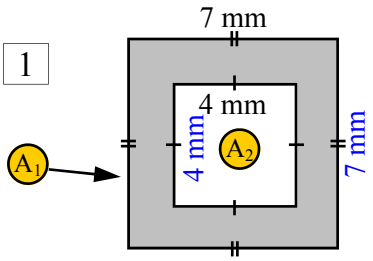
Composite Area - Subtraction

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the shaded areas of the following shapes

1



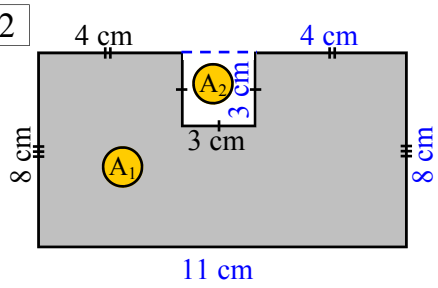
$A_1 = l^2$ $= 7^2$ $A_1 = 49$ mm²

$A_2 = l^2$ $= 4^2$ $A_1 = 16$ mm²

$A = A_1 - A_2 = 49 - 16$

$A = 33$ mm²

2



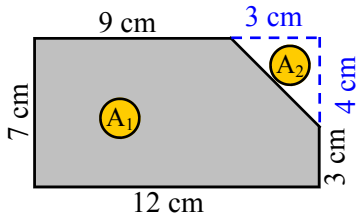
$A_1 = lb$ $= 11 \times 8$ $A_1 = 88$ cm²

$A_2 = l^2$ $= 3^2$ $A_2 = 9$ cm²

$A = A_1 - A_2 = 88 - 9$

$A = 79$ cm²

3



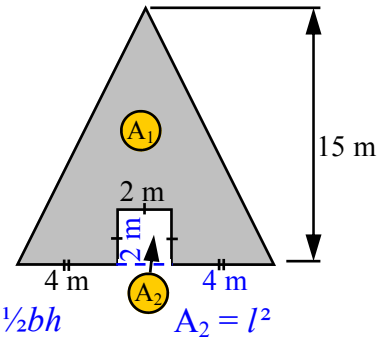
$A_1 = lb$ $= 12 \times 7$ $A_1 = 84$ cm²

$A_2 = \frac{1}{2}bh$ $= \frac{1}{2} \times 4 \times 3$ $A_2 = 6$ cm²

$A = A_1 - A_2 = 84 - 6$

$A = 78$ cm²

4



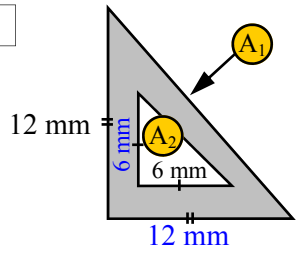
$A_1 = \frac{1}{2}bh$ $= \frac{1}{2} \times 10 \times 15$ $A_1 = 75$ m²

$A_2 = l^2$ $= 2^2$ $A_2 = 4$ m²

$A = A_1 - A_2 = 75 - 4$

$A = 71$ m²

5



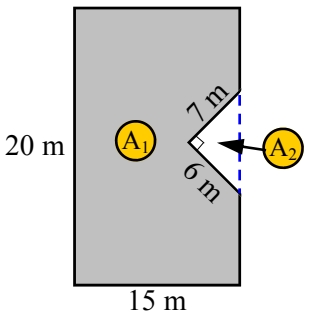
$A_1 = \frac{1}{2}bh$ $= \frac{1}{2} \times 12 \times 12$ $A_1 = 72$ mm²

$A_2 = \frac{1}{2}bh$ $= \frac{1}{2} \times 6 \times 6$ $A_2 = 18$ mm²

$A = A_1 - A_2 = 72 - 18$

$A = 54$ mm²

6



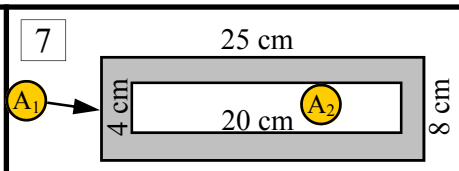
$A_1 = lb$ $= 15 \times 20$ $A_1 = 300$ m²

$A_2 = \frac{1}{2}bh$ $= \frac{1}{2} \times 6 \times 7$ $A_2 = 21$ m²

$A = A_1 - A_2 = 300 - 21$

$A = 279$ m²

7



$A_1 = lb$ $= 25 \times 8$ $A_1 = 200$ cm²

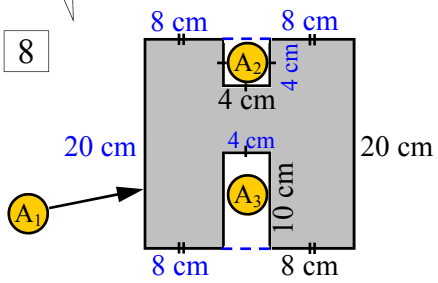
$A_2 = lb$ $= 20 \times 4$ $A_2 = 80$ cm²

$A = A_1 - A_2 = 200 - 80$

$A = 120$ cm²

Now subtract two areas

8



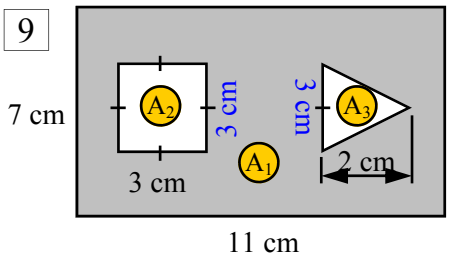
$A_1 = l^2$ $= 20^2$ $A_1 = 400$ cm²

$A_2 = l^2$ $= 4^2$ $A_2 = 16$ cm²

$A_3 = lb$ $= 4 \times 10$ $A_3 = 40$ cm²

$A = A_1 - A_2 - A_3$ $= 400 - 16 - 40$ $A = 344$ cm²

9



$A_1 = lb$ $= 11 \times 7$ $A_1 = 77$ cm²

$A_2 = l^2$ $= 3^2$ $A_2 = 9$ cm²

$A_3 = \frac{1}{2}bh$ $= \frac{1}{2} \times 3 \times 2$ $A_3 = 3$ cm²

$A = A_1 - A_2 - A_3$ $= 77 - 9 - 3$ $A = 65$ cm²

Changing Units of Area

This is perhaps the most difficult part of area calculations, with students often forgetting this work. The reason is that because there are 10 mm in 1 cm, students automatically use this to convert mm^2 to cm^2, but this isn't the case. There is 100 mm^2 in 1 cm^2. The same with converting cm^2 to m^2, there is 10 000 cm^2 in a m^2, not 100.

Column 1 first converts areas from cm^2 to mm^2. Note the diagram at the top of the column. A 1 cm square is redrawn with grid lines at each millimetre. The square has 10 mm sides and as you know the area of a square is its side length squared. As $10^2 = 100$ there are 100 1 mm^2 squares in a square cm. So to convert the measurements multiply each number by 100. This means move the decimal point 2 places to the right. So 5 cm^2 would be 500 mm^2, 5.5 cm^2 would be 550 mm^2 and 5.05 cm^2 would be 505 mm^2. Questions 11- 20 are the reverse, move the decimal point 2 places to the left. So 8 mm^2 is 0.08 cm^2, 130 mm^2 is 1.3 cm^2 and 130.02 mm^2 would be 1.3002 cm^2.

Column 2 then deals with converting between m^2 and cm^2. Look at the diagram and note that there are (100×100) 10 000 cm^2 in 1 m^2. So to change cm^2 to m^2 multiply the number by 10 000 or move the decimal point 4 places to the right. So 8 m^2 would be 80 000 cm^2 and 8.02 m^2 would be 80 200 cm^2. Then the method is reversed for the second part of the column. When you divide by 10 000 move the decimal place 4 places to the left. So 9 cm^2 would be 0.0009 m^2 and 136 cm^2 would be 0.0136 m^2.

Column 3 are problems that you solve using the units as given in the question. Then after you answer the question express the answer in the other unit that is requested. Working spaces are supplied.

Answer these problems using the methods from the first two columns

41 A rectangular piece of fabric is size 1.5 m × 2.7 m. Find its area in both m² and cm².

$A = lb$

$= 1.5 \times 2.7$

$A = 4.05$ m²

Fabric area:

m²: 4.05 m²

cm²: 40 500 cm²

$$\begin{array}{r} 27 \times \\ 15 \\ \hline {}^{1}135 \\ 270 \\ \hline 4.05 \end{array}$$

42 A square steel plate with sides 8 cm has a rectangular slot cut into it with sides 35 mm and 15 mm. Find:
i) the size of the plate without the slot in mm² (A_1)
ii) the size of the slot in mm² (A_2)
iii) the cut plate area in mm² and cm²

i) $A_1 = l^2$

$= 8^2$

$A_1 = 64$ cm²

Plate area = 6 400 mm²

ii)

$A_2 = lb$

$= 35 \times 15$

$A_2 = 525$ mm²

Slot area = 525 mm²

$$\begin{array}{r} 35 \times \\ 15 \\ \hline {}^{1}175 \\ 350 \\ \hline 525 \end{array}$$

iii)

$A = A_1 - A_2$

$= 6\,400 - 525$

$A = 5\,875$ mm²

Cut Plate area:

mm²: 5 875 mm²

cm²: 58.75 cm²

$$\begin{array}{r} 6\,400 \; - \\ 525 \\ {}^{1\;1\;1} \\ \hline 5\,875 \end{array}$$

Finding a Side Given Area

This sheet is difficult as it uses skills that are learnt in the Algebra 2 folder. It is essentially working in reverse, given an area and a side (except with squares) you are asked to find the unknown side. Note that there is up to 5 lines of working, when you may be able to complete the problem mentally, so why all the working? These exercises use whole numbers throughout, but the method can be used for decimals also and the use of decimals would make the exercises too difficult to solve mentally.

Column 1 deals with calculating a square's side length given its area. The first 5 questions test that you understand what a square root is. Eg. $10^2 = 100$ so $\sqrt{100} = 10$. To find the length of a side given the area you square root the area. So if an area was 4 cm² then its side length is 2 cm. As the $\sqrt{4} = 2$. The 3 lines used are again the formula, the substitution then the solution with units matching the area units only without the ².

Column 2 deals with the area of a rectangle, this time given an area and a side. The first line is the formula for a rectangle written backwards $lb = A$. Then the second line has the values substituted in, in the example at the top of the column: $A = 20$ mm² and $b = 5$ mm. The third line divides each side by b (5) to get l by itself (from Algebra 2 folder).

Column 3 involves triangles, it is an extension of column 2 in that a ½ is used. But the method is just the same, look at the example. The formula is written backwards, then the substitution is made, the ½ × the side is calculated then the method is the same as above.

$lb = A$

$6 \times b = 72$

$b = 72 \div 6$

$b = 12$ cm

19

A = 88 mm²

$l = 8$ mm

$lb = A$

$8 \times b = 88$

$b = 88 \div 8$

$b = 11$ mm

20

A = 140 cm²

$b = 7$ cm

$lb = A$

$l \times 7 = 140$

$l = 140 \div 7$

$l = 20$ cm

Find the height (or base) of the triangles below given their area and base (height)

Example

A = 40 mm²

$b = 10$ mm

$\frac{1}{2}bh = A$

$\frac{1}{2} \times 10 \times h = 40$

$5 \times h = 40$

$h = 40 \div 5$

$h = 8$ mm

21

A = 48 cm²

$b = 6$ cm

$\frac{1}{2}bh = A$

$\frac{1}{2} \times 6 \times h = 48$

$3 \times h = 48$

$h = 48 \div 3$

$h = 16$ cm

22

A = 60 m²

$b = 12$ m

$\frac{1}{2}bh = A$

$\frac{1}{2} \times 12 \times h = 60$

$6 \times h = 60$

$h = 60 \div 6$

$h = 10$ m

23

A = 100 mm²

$b = 20$ mm

$\frac{1}{2}bh = A$

$\frac{1}{2} \times 20 \times h = 100$

$10 \times h = 100$

$h = 100 \div 10$

$h = 10$ mm

24

A = 80 cm²

$h = 10$ cm

$\frac{1}{2}bh = A$

$\frac{1}{2} \times b \times 10 = 80$

$5 \times b = 80$

$b = 80 \div 5$

$b = 16$ cm

25

A = 120 m²

$h = 6$ m

$\frac{1}{2}bh = A$

$\frac{1}{2} \times b \times 6 = 120$

$3 \times b = 120$

$b = 120 \div 3$

$b = 40$ m

26

A = 56 mm²

$h = 8$ mm

$\frac{1}{2}bh = A$

$\frac{1}{2} \times b \times 8 = 56$

$4 \times b = 56$

$b = 56 \div 4$

$b = 14$ mm

ALTITUDE

TIME

Writing and Reading Time

Writing the time is usually done in one of two ways. The first is the hour then the minutes, such as seven thirty-eight (7.38) or six fifteen (6.15). The other method is to treat the two halves of the clock differently.

- There is a 'past half' (0 - 29 minutes) such as twelve minutes past six (6.12), twenty-five minutes past nine (9.25).
- There is a 'to half' (31 - 59 minutes) such ten to eleven (6.50), twenty-five to three (2.35)
- There is also half past (30 minutes), quarter past (15 minutes) and a quarter to (45 minutes). Such as a quarter past three (3.15), half past eleven (11.30), quarter to one (12.45).

Column 1 gives you the time in words and asks for the time in number form as well as placing and positioning of the hands on the analogue clocks. Then there is the time of day it is, is it morning, night, afternoon, day, evening etc. These words all have a.m./ p.m. meanings and you are asked to write in the a.m. or p.m. as well.

Column 2 asks for the time to be written in words. Also give the time of day as morning, night, afternoon etc.

The 3rd column is using dates, writing the dates in words and then also in numerical form as the example at the top of the column shows you. The calendars below may be of assistance.

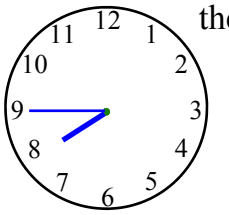
Writing and Reading Time

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Put the hands on the clock and write these times

Example a quarter to eight in the morning



7.45 a.m.

1 twenty-five past one in the day

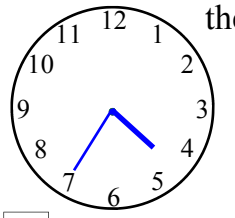
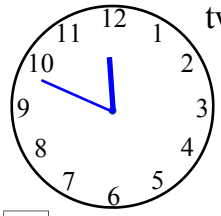
1.25 p.m.

2 four thirty-five in the afternoon



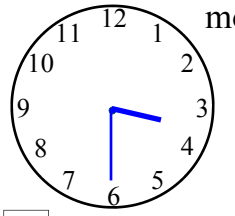
4.35 p.m.

3 twelve minutes to twelve at night



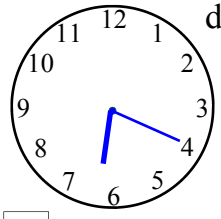
11.48 p.m.

4 half past three in the morning



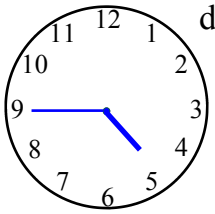
3.30 a.m.

5 twenty past six at dusk



6.20 p.m.

6 a quarter to five at dawn



4.45 a.m.

Write two ways of telling the time from the clocks shown. E.g. 7.35 is seven thirty-five or twenty-five to eight. Write morning, afternoon or night as well.

7 
a) eleven thirty-seven at night

b) twenty-three minutes to midnight

8 
a) six forty-nine in the morning

b) Eleven minutes to seven in the morning

9 

a) twelve fifty-three in the morning

b) seven minutes to one in the morning

10 
a) Five thirty in the afternoon

b) half past five in the afternoon

11 
a) twelve forty-five in the day

b) a quarter to one in the day

Write these days and their dates on the calendar in words then the date in numerical form.

AUGUST 2013

S	M	T	W	T	F	S
				1	2	3
4	5	6	7	8	9	10
11	12	13	14	15	16	17
18	19	20	21	22	23	24
25	26	27	28	29	30	31

Example Thursday 29th August, 2013

29/08/13

12 Wednesday 21st August, 2013

21/08/13

13 Sunday 11th August, 2013

11/08/13

14 Friday 9th August, 2013

09/08/13

15 The date 9 days before Wednesday 31st July, 2013

31/07/13

16 The date 15 days after Thursday 5th September, 2013

05/09/13

17 The date 10 days after Sunday 8th September, 2013

08/09/13

18 The date 20 days before Monday 22nd July, 2013

02/07/13

Converting to 24 Hour Time

This time format is used mainly in the armed forces and the travel industry. If you buy computerised tickets at railway stations the time will be usually written in 24 hour time format. It reduces confusion particularly with electronic machinery.

The first 2 digits of 24 hour time are the hours, the second 2 digits are the minutes.
The time starts at 0000 hours (midnight) and ends at 2359 (1 minute before midnight). Note that there is no full stop separating hours and minutes. So:

- The time is 0000 hours at 12 a.m. (midnight), 12.30 a.m. is 0030 hours
- Then each hour adds 100 so 1 a.m. is 0100 hours, 2 a.m. is 0200 hours etc
- Noon is 1200 hours and 1 p.m. is 1300 hours

So once the time reaches 1 p.m. add 12 hours to the normal time to get your answer in 24 hr time format, e.g. 4.45 p.m. = 1645 hours (hours = 4 + 12 = 16, minutes stay the same)

Note that the word 'hours' is written after the time. When the time is spoken there is no reference to minutes. E.g. 0400 is "O four hundred hours, Sir!" and the time 1640 is "sixteen hundred and forty hours, Sir!" (The Sir! is optional)

Time of day in the 3rd column refers to morning, afternoon, evening, night or any other words that describe the time of day

Converting to 24 Hour Time

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Change these times to 24 hour time format, (from 1 p.m. add 12 hours)

Example

4.45 p.m. 1645 hours

1 3 a.m.

2 7 a.m.

3 5 p.m.

4 11.25 a.m.

5 3.52 p.m.

6 5.17 p.m.

7 8.47 p.m.

8 noon

9 4.56 a.m.

10 12.19 a.m.

11 10.25 p.m.

12 midnight

13 8.20 p.m.

14 9.55 a.m.

15 11.39 p.m.

16 
17 
Change the times to a.m./ p.m. format. If the time starts with 13 or more, subtract 12 and write p.m.

Example

1548 hours 3.48 p.m.

18 0400 hours

19 0945 hours

20 1320 hours

21 1717 hours

22 2002 hours

23 2211 hours

24 1539 hours

25 2347 hours

26 0016 hours

27 0303 hours

28 1956 hours

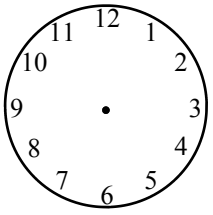
29 2200 hours

30 0000 hours

31 0222 hours

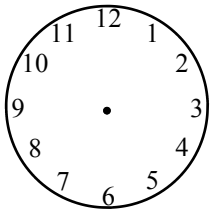
32 1833 hours

33 2008 hours



Circle: am pm

34 0505 hours



Circle: am pm

Write the times below in 24 hour format

35  afternoon

36  evening

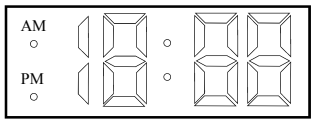
37 A quarter to ten at night

38 Eleven forty-seven (day)

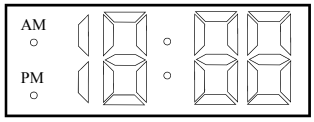
39 Half past twelve at night

Write/colour the times in a.m./ p.m. format

40 1556 hours



41 0147 hours



42  2218 hours

time of day (words)

43 0855 hours

write answer in words & the time of the day
e.g. afternoon, evening, morning etc

Converting to 24 Hour Time

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Change these times to 24 hour time format, (from 1 p.m. add 12 hours)

Example

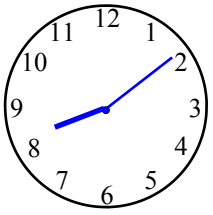
4.45 p.m. — 1645 hours

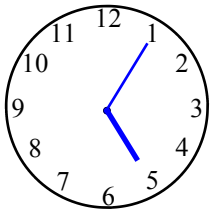
1. 3 a.m. — 0300 hours
2. 7 a.m. — 0700 hours
3. 5 p.m. — 1700 hours
4. 11.25 a.m. — 1125 hours
5. 3.52 p.m. — 1552 hours
6. 5.17 p.m. — 1717 hours
7. 8.47 p.m. — 2047 hours
8. noon — 1200 hours
9. 4.56 a.m. — 0456 hours
10. 12.19 a.m. — 0019 hours
11. 10.25 p.m. — 2225 hours
12. midnight — 0000 hours
13. 8.20 p.m. — 2020 hours
14. 9.55 a.m. — 0955 hours
15. 11.39 p.m. — 2339 hours
16. 
1527 hours
17. 
0038 hours

Change the times to a.m./ p.m. format. If the time starts with 13 or more, subtract 12 and write p.m.

Example

1548 hours — 3.48 p.m.

18. 0400 hours — 4 a.m.
19. 0945 hours — 9.45 a.m.
20. 1320 hours — 1.20 p.m.
21. 1717 hours — 5.17 p.m.
22. 2002 hours — 8.02 p.m.
23. 2211 hours — 10.11 p.m.
24. 1539 hours — 3.39 p.m.
25. 2347 hours — 11.47 p.m.
26. 0016 hours — 12.16 a.m.
27. 0303 hours — 3.03 a.m.
28. 1956 hours — 7.56 p.m.
29. 2200 hours — 10 p.m.
30. 0000 hours — 12 a.m.
31. 0222 hours — 2.22 a.m.
32. 1833 hours — 6.33 p.m.
33. 2008 hours


Circle: am (pm)
34. 0505 hours


Circle: (am) pm

Write the times below in 24 hour format

35. afternoon
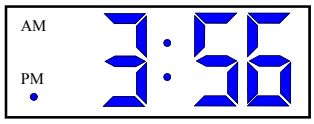
1450 hours
36. 
evening
1907 hours
37. A quarter to ten at night
2145 hours
38. Eleven forty-seven (day)
1147 hours
39. Half past twelve at night
0030 hours

Write/colour the times in a.m./ p.m. format

40. 1556 hours



41. 0147 hours

42. 2218 hours
night
time of day (words)
43. 0855 hours
Five to nine in the morning
write answer in words & the time of the day
e.g. afternoon, evening, morning etc

Units of Time

This sheet deals with the changing from one unit of time to another. Time is measured in: seconds (s), minutes (min), hours (h), days, weeks, years, and so on. In business and especially in the construction industry units such as years have to be broken into smaller units like weeks or even days, so that accurate scheduling can occur.

Column 1 outlines common time units and asks you to convert these to the larger unit above it, or the smaller unit below it. These should be done mentally, no working spaces have been provided. Some answers will need to be given in decimal or fraction form.

Column 2 requires the conversion of larger time periods to smaller time periods. These questions involve larger numbers, so working spaces are supplied for each question. The method is to convert one of the larger unit to smaller units, then multiply this by the number of larger units. So if converting 6 years to weeks for example, follow these steps:

- State the number of weeks in one year …. 52
- Multiply 52 by 6 and you get your answer …. 312 weeks (a working space is provided with each of these questions)
- State your answer… "There are 312 weeks in 6 years", and you are done.

You may think that the working spaces aren't adequate, Q 23 for example, remember that when you multiply by 60 it is easier to multiply by 6 and just add a zero, just don't forget to add it.

Column 3 adds a step, instead of moving to the next unit down, jump 2 units down. The questions are the same style as Column 2 only you need to make two conversions and multiply them.

Units of Time

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Convert these times to the unit of time on the right.

1 4 weeks = ____ days

2 1 year = ____ weeks

3 3 days = ____ h

4 ¼ h = ____ min

5 26 weeks = ____ years

6 6 min = ____ s

7 2 h = ____ min

8 1 leap year = ____ days

9 6 h = ____ days

10 3 decades = ____ years

11 4 min = ____ s

12 24 months = ____ years

13 4 centuries = ____ decades

14 ¼ year = ____ months

15 ¾ min = ____ s

16 2 fortnights = ____ weeks

17 300 s = ____ min

18 156 weeks = ____ years

19 September = ____ days

20 2 millennia = ____ years

21 March + May = ____ days

Convert to different units. These are harder, break them into parts.

22 Change 7 days → hours

1 day = ____ h

State your answer in words

There are ____ hours in seven days

23 Change 17 min → seconds

1 min = ____ s

State your answer in words

24 Change 18 days → hours

1 day = ____ h

State your answer in words

25 Change 9 years → weeks

1 year = ____ weeks

26 Change 15 years → months

1 year = ____ months

State your answer in words

Jumping from unit to unit requires thought. Change these units, in steps.

27 Change 1 day → min

1 day = ____ h

1 h = ____ min

28 Change 8 weeks → hours

1 week = ____ days

8 weeks = ____ days

1 day = ____ h

29 Change 1 hour → seconds

1 h = ____ min

1 min = ____ s

30 Change 2½ years → days

1 year = ____ weeks +

½ year = ____ weeks

So 2½ years = ____ weeks

1 week = ____ days

Units of Time

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Convert these times to the unit of time on the right.

1 4 weeks = 28 days

2 1 year = 52 weeks

3 3 days = 72 h

4 ¼ h = 15 min

5 26 weeks = ½ years

6 6 min = 360 s

7 2 h = 120 min

8 1 leap year = 366 days

9 6 h = ¼ days

10 3 decades = 30 years

11 4 min = 240 s

12 24 months = 2 years

13 4 centuries = 40 decades

14 ¼ year = 3 months

15 ¾ min = 45 s

16 2 fortnights = 4 weeks

17 300 s = 5 min

18 156 weeks = 3 years

19 September = 30 days

20 2 millennia = 2000 years

21 March + May = 62 days

Convert to different units. These are harder, break them into parts.

22 Change 7 days to hours

1 day = 24 h

State your answer in words

There are 168 hours in seven days

$$\begin{array}{r} {}^{2} \\ 24 \\ \times\ 7 \\ \hline 168 \end{array}$$

23 Change 17 min to seconds

1 min = 60 s

State your answer in words

There are 1 020 s in 17 minutes

$$\begin{array}{r} {}^{4} \\ 17 \\ \times\ 60 \\ \hline 1\,020 \end{array}$$

24 Change 18 days to hours

1 day = 24 h

State your answer in words

There are 432 h in 18 days.

$$\begin{array}{r} 24 \\ \times\ 18 \\ \hline {}^{1} \\ 192 \\ 240 \\ \hline 432 \end{array}$$

25 Change 9 years to weeks

1 year = 52 weeks

There are 468 weeks in 9 years

$$\begin{array}{r} {}^{1} \\ 52 \\ \times\ 9 \\ \hline 468 \end{array}$$

26 Change 15 years to months

1 year = 12 months

State your answer in words

There are 180 months in 15 years

$$\begin{array}{r} 15 \\ \times\ 12 \\ \hline 30 \\ 150 \\ \hline 180 \end{array}$$

Jumping from unit to unit requires thought. Change these units, in steps.

27 Change 1 day to min

1 day = 24 h

1 h = 60 min

There are 1 440 min in 1 day

$$\begin{array}{r} {}^{2} \\ 24 \\ \times\ 60 \\ \hline 1\,440 \end{array}$$

28 Change 8 weeks to hours

1 week = 7 days

8 weeks = 56 days

1 day = 24 h

There are 1 344 h in 8 weeks

$$\begin{array}{r} {}^{1} \\ 56 \\ \times\ 24 \\ \hline 224 \\ 1\,120 \\ \hline 1\,344 \end{array}$$

29 Change 1 hour to seconds

1 h = 60 min

1 min = 60 s

There are 3 600 s in 1 hour

$$\begin{array}{r} 60 \\ \times\ 60 \\ \hline 3\,600 \end{array}$$

30 Change 2½ years to days

1 year = 52 weeks

½ year = 26 weeks

So 2½ years = 130 weeks

1 week = 7 days

There are 910 days in 2.5 years

$$\begin{array}{r} {}^{1} \\ 52 \\ +\ 52 \\ 26 \\ \hline 130 \end{array}$$

$$\begin{array}{r} {}^{2} \\ 130 \\ \times\ 7 \\ \hline 910 \end{array}$$

Using Timetables

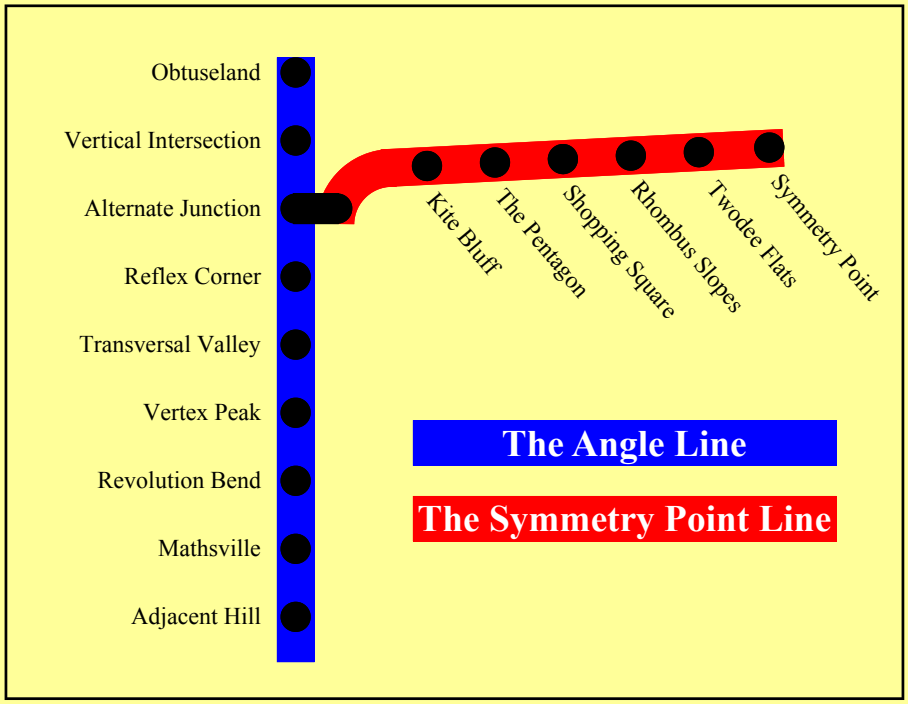
Reading timetables not only helps you to catch your train but it also avoids wasting time. Public transport runs whether you use it or not. By using it your travel is environmentally sound plus it helps maintain the service. The problem with public transport is that it is not flexible with time. But by using a timetable you can keep wasted time to a minimum. In these problems it is outlined that the latest time you can arrive at a station is when the train departs. This is true but not practical, it is always best to arrive early to have spare time in case the train is early, there is a queue for a ticket or a difference in the driver's watch and your own.

In Column 1 the Angle Line timetable is used, read the times from the timetable to answer the questions. Alternate Junction and Mathsville are major stations with branch lines and so the train stops on the platform and waits for 1 minute before departing.

In Column 2 the Symmetry Point Line joins the Angle Line at Alternate Junction station. The train terminates (stops) at Alternate Junction and returns back to Symmetry Point. It doesn't continue along the Angle Line. The questions for this column involve travel on the Symmetry Point Line then changing trains at Alternate Junction to meet the next Angle Line service. So both timetables will be needed! You are asked to complete missing entries on the timetable, enter the times (note you don't need to put a.m. or p.m. as they are at the top of the column).

Column 3 deals just with the Symmetry Point Line. This time a return timetable is used for a return trip. This is the Saturday timetable for the small branch line and only one train operates the service. While answering these questions keep in mind how the trip could have been made more enjoyable by using a timetable and using your skills at measuring time.

There is a schematic map of the two lines below.



Using Timetables

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use the timetable below for this column.

The Angle Line

Station		a.m.	a.m.	a.m.	a.m.
Obtuseland		7.45	8.05	8.25	8.45
Vertical Intersection		7.49	8.09	8.29	8.49
Alternate Junction	arr.	7.53	8.13	8.33	8.53
	dep.	7.54	8.14	8.34	8.54
Reflex Corner		7.56	8.16	8.36	8.56
Transversal Valley		8.02	8.22	8.42	9.02
Vertex Peak		8.07	8.27	8.47	9.07
Revolution Bend		8.10	8.30	8.50	9.10
Mathsville	arr.	8.15	8.35	8.55	9.15
	dep.	8.16	8.36	8.56	9.16
Adjacent Hill		8.18	8.38	8.58	9.18

1 Will leaves home at 8.00 a.m. and arrives at Obtuseland Station at 8.08 a.m., find the time:

a) the first train arrives _____

b) he could have left home to catch the same train _____

c) he arrives at Mathsville _____

d) he arrives at school, a 5 min walk from Mathsville Stn. _____

e) the train travel takes _____

f) the entire trip takes _____

2 At 8 a.m. Will tries for the earlier train. He can run to Obtuseland Stn. in 6 min or to Vertical Intersection in 9 min, which is successful? _____

3 At what time would he arrive at school now? _____

4 Find the duration of the total trip to school. _____

5 Will wants to see his friend Jerome. If Jerome catches the same train as Will at 8.27 a.m., at what station was he waiting? _____

6 Will wants to buy a hot chocolate at the Alternate Junction platform vending machine. If it is 9 s away how much time does the machine have to fill the cup? _____

The Symmetry Point Line connects to the Angle Line at Alternate Junction so both timetables will be used for this column

The Symmetry Point Line

Station	a.m.	a.m.	a.m.	a.m.
Symmetry Point	7.25	7.45	7.55	8.25
Twodee Flats	7.28	...	7.58	
Rhombus Slopes	7.31	...		
Shopping Square	7.36	7.52	8.06	
The Pentagon	7.40	7.56	8.10	
Kite Bluff	7.44	...		
Alternate Junction	7.50x	8.02x	8.20x	8.50x

... denotes doesn't stop at this station

x denotes terminates here, change here for Angle Line

7 Alicia's timetable was unreadable from rain damage. Complete the table for the Symmetry Point 7.55 and 8.25 a.m. services.

8 Alicia lives at Symmetry Point and wants to catch the 8.14 a.m. Angle Line service which train should she catch? _____

9 Alicia attends the same school as Will. At what time would she arrive at Mathsville? _____

10 If it takes Alicia 5 min to walk to school at what time does she arrive at school? _____

11 If Alicia misses the 7.45 a.m. train will she be late if school starts at 9 a.m.? Circle: Yes / No

12 Calculate Alicia's total travel time for both the 7.45 and 7.55 a.m. services if her house is 4 min away from Symmetry Point Stn. (assume no waiting at Symm Pt.)

7.45 a.m. train _____ 7.55 a.m. train _____

13 Ann lives at Isosceles Hill, an 8 min drive from Kite Bluff. If she wants to catch the 8.14 a.m. Angle Line train find the latest time she can arrive at Kite Bluff and the time she must leave home.

Latest Arrival _____ Time left home _____

On Saturdays one train operates the Symmetry Pt line. A return timetable is included.

Symmetry Pt. → Alternate Jnct

Station	a.m.	a.m.	p.m.	p.m.
Symmetry Point	10.30	11.30	12.30	1.30
Twodee Flats	10.33	11.33	12.33	1.33
Rhombus Slopes	10.36	11.36	12.36	1.36
Shopping Square	10.41	11.41	12.41	1.41
The Pentagon	10.45	11.45	12.45	1.45
Kite Bluff	10.49	11.49	12.49	1.49
Alternate Junction	10.55x	11.55x	12.55x	1.55x

Alternate Jnct → Symmetry Pt.

Station	a.m.	p.m.	p.m.	p.m.
Alternate Junction	11.00	12.00	1.00	2.00
Kite Bluff	11.06	12.06	1.06	2.06
The Pentagon	11.10	12.10	1.10	2.10
Shopping Square	11.14	12.14	1.14	2.14

1 Will leaves home at 8.00 a.m. and arrives at Obtuseland Station at 8.08 a.m., find the time:

a) the first train arrives 8.25 a.m.

b) he could have left home to catch the same train 8.17 a.m.

c) he arrives at Mathsville 8.55 a.m.

d) he arrives at school, a 5 min walk from Mathsville Stn. 9.00 a.m.

e) the train travel takes 30 min

f) the entire trip takes 1 h

2 At 8 a.m. Will tries for the earlier train. He can run to Obtuseland Stn. in 6 min or to Vertical Intersection in 9 min, which is successful? Vertical Intersection

3 At what time would he arrive at school now? 8.40 a.m.

4 Find the duration of the total trip to school. 40 min

5 Will wants to see his friend Jerome. If Jerome catches the same train as Will at 8.27 a.m., at what station was he waiting? Vertex Peak

6 Will wants to buy a hot chocolate at the Alternate Junction platform vending machine. If it is 9 s away how much time does the machine have to fill the cup? 42 s

The Symmetry Point Line connects to the Angle Line at Alternate Junction so both timetables will be used for this column

The Symmetry Point Line

Station	a.m.	a.m.	a.m.	a.m.
Symmetry Point	7.25	7.45	7.55	8.25
Twodee Flats	7.28	...	7.58	8.28
Rhombus Slopes	7.31	...	8.01	8.31
Shopping Square	7.36	7.52	8.06	8.36
The Pentagon	7.40	7.56	8.10	8.40
Kite Bluff	7.44	...	8.14	8.44
Alternate Junction	7.50x	8.02x	8.20x	8.50x

... denotes doesn't stop at this station

x denotes terminates here, change here for Angle Line

7 Alicia's timetable was unreadable from rain damage. Complete the table for the Symmetry Point 7.55 and 8.25 a.m. services.

8 Alicia lives at Symmetry Point and wants to catch the 8.14 a.m. Angle Line service which train should she catch? 7.45 a.m.

9 Alicia attends the same school as Will. At what time would she arrive at Mathsville? 8.35 a.m.

10 If it takes Alicia 5 min to walk to school at what time does she arrive at school? 8.40 a.m.

11 If Alicia misses the 7.45 a.m. train will she be late if school starts at 9 a.m.? Circle: Yes / (No)

12 Calculate Alicia's total travel time for both the 7.45 and 7.55 a.m. services if her house is 4 min away from Symmetry Point Stn. (assume no waiting at Symm Pt.)

7.45 a.m. train: 59 min

7.55 a.m. train: 1 h 9 min

13 Ann lives at Isosceles Hill, an 8 min drive from Kite Bluff. If she wants to catch the 8.14 a.m. Angle Line train find the latest time she can arrive at Kite Bluff and the time she must leave home.

Latest Arrival: 7.44 a.m.

Time left home: 7.36 a.m.

On Saturdays one train operates the Symmetry Pt line. A return timetable is included.

Symmetry Pt. → Alternate Jnct

Station	a.m.	a.m.	p.m.	p.m.
Symmetry Point	10.30	11.30	12.30	1.30
Twodee Flats	10.33	11.33	12.33	1.33
Rhombus Slopes	10.36	11.36	12.36	1.36
Shopping Square	10.41	11.41	12.41	1.41
The Pentagon	10.45	11.45	12.45	1.45
Kite Bluff	10.49	11.49	12.49	1.49
Alternate Junction	10.55x	11.55x	12.55x	1.55x

Alternate Jnct → Symmetry Pt.

Station	a.m.	p.m.	p.m.	p.m.
Alternate Junction	11.00	12.00	1.00	2.00
Kite Bluff	11.06	12.06	1.06	2.06

Twodee Flats	11.22	12.22	1.22	2.22
Symmetry Point	11.25x	12.25x	1.25x	2.25x

x denotes terminates here

14 Ian wants to catch a train from Twodee Flats to Shopping Square. Reaching the station at 10.50 a.m. how long does he wait? 43 min

15 Does Ian see his train travelling in the opposite direction? If so, at what time? Circle: (Yes) / No

11.22 a.m.

16 If he spends 2 h at the shops (with walking time included), when does the next train arrive to return home and how long does he wait?

Time of train: 2.14 p.m.

Waiting time: 33 min

17 How long is the train journey home? 8 min

18 If it takes Ian 15 min to walk between home and the station, at what time did he leave home and arrive back? How much time has elapsed during his trip?

Left home: 10.35 a.m.

Arrived home: 2.37 a.m.

Elapsed time: 4 h 2 min

Time Calculations 1

Often times are given in a way that you find difficult to use. One example is a movie on video with its duration given in minutes. If a movie is 173 minutes long, how do you convert it to hours and minutes?

In Column 1 the exercises involves changing min to h and min. Multiples of 60 are required, so $1 \times 60 = 60$ and so on, from then on add 60 to the previous answer to get the next.

To answer Q 2 - 7 find the largest multiple of 60 that is below the number of min in the question and then put the remainder, the amount left over, in the 2nd box. Then change the multiple of 60 to hours and then write the remainder in min. Look at the example above Q.2.

Column 2 requires times to be added. Using the addition space add the two times together, ignoring the fact that the min may exceed 60 min. Then rewrite your answer again in the smaller outlined box. If the minutes exceed 60 convert the min to hours by deducting 60 min off the min total and adding 1 h to the hour total. Of course if the min total is greater than 120 min you have to deduct 120 min off and add 2 hours, and so on for each multiple of 60. See the example at the top of the column.

The 3rd Column requires the method to be reversed. Before subtracting there must be enough min to perform the subtraction (the first time must have more min than the second time). If it doesn't, take an hour off the first time and add 60 min to the minutes. For example 4 h 11 min would become 3 h 71 min, 1 h 35 min would become 95 min etc. There is an example at the top of the column.

Time Calculations 1

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

List the first 12 multiples of 60, this will help you convert min to h and min.

1

$1 \times 60 =$ ____ $7 \times 60 =$ ____

$2 \times 60 =$ ____ $8 \times 60 =$ ____

$3 \times 60 =$ ____ $9 \times 60 =$ ____

$4 \times 60 =$ ____ $10 \times 60 =$ ____

$5 \times 60 =$ ____ $11 \times 60 =$ ____

$6 \times 60 =$ ____ $12 \times 60 =$ ____

Using the answers in question 1, convert these times in min to h and min

Example

435 min = 420 + 15 min

= 7 h 15 min

2 157 min = ____ + ____ min

= ____

3 203 min = ____ + ____ min

= ____

4 347 min = ____ + ____ min

= ____

5 577 min = ____ + ____ min

= ____

6 756 min = ____ + ____ min

= ____

7 686 min = ____ + ____ min

= ____

Add these times together. If the min exceed 60 change them to h.

Example

3 h 42 min and 7 h 39 min

1 1
3 42 +
7 39
10 81

10 h 81 min = 11 h 21 min

The total is 11 h 21 min

8 3 h 27 min and 8 h 46 min

+ ____ ____

The total is

9 11 h 52 min and 7 h 35 min

+ ____ ____

10 6 h 49 min and 8 h 44 min

+ ____ ____

11 7 h 56 min and 2 h 48 min

+ ____ ____

12 3 h 43 min, 3 h 37 min and 7 h 51 min

+ ____ ____

Subtract these times, you may have to convert an h to 60 min first (or more).

Example

7 h 15 min - 4 h 57 min

6 75 -
4 57
1
2 18

7 h 15 min = 6 h 75 min

Difference is 2 h 18 min

13 8 h 47 min - 5 h 11 min

- ____ ____

Difference is

14 17 h 25 min - 6 h 52 min

- ____ ____

15 26 h 37 min - 13 h 48 min

- ____ ____

16 16 h 43 min - 9 h 56 min

- ____ ____

17 7 h - 3 h 41 min - 1 h 57 min

- ____ ____

Time Calculations 1

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

List the first 12 multiples of 60, this will help you convert min to h and min.

1

1 × 60 =	60	7 × 60 =	420
2 × 60 =	120	8 × 60 =	480
3 × 60 =	180	9 × 60 =	540
4 × 60 =	240	10 × 60 =	600
5 × 60 =	300	11 × 60 =	660
6 × 60 =	360	12 × 60 =	720

Using the answers in question 1, convert these times in min to h and min

Example

435 min = 420 + 15 min

= 7 h 15 min

2 157 min = 120 + 37 min

= 2 h 37 min

3 203 min = 180 + 23 min

= 3 h 23 min

4 347 min = 300 + 47 min

= 5 h 47 min

5 577 min = 540 + 37 min

= 9 h 37 min

6 756 min = 720 + 36 min

= 12 h 36 min

7 686 min = 660 + 26 min

= 11 h 26 min

Add these times together. If the min exceed 60 change them to h.

Example

3 h 42 min and 7 h 39 min

1 1			
3 42	+	10 h 81 min	= 11 h 21 min
7 39			
10 81			

The total is 11 h 21 min

8 3 h 27 min and 8 h 46 min

1 1			
3 27	+	11 h 73 min	= 12 h 13 min
8 46			
11 73			

The total is 12 h 13 min

9 11 h 52 min and 7 h 35 min

11 52	+	18 h 87 min	= 19 h 27 min
7 35			
18 87			

The total is 19 h 27 min

10 6 h 49 min and 8 h 44 min

1 1			
6 49	+	14 h 93 min	= 15 h 33 min
8 44			
14 93			

The total is 15 h 33 min

11 7 h 56 min and 2 h 48 min

1 1			
7 56	+	9 h 104 min	= 10 h 44 min
2 48			
9 104			

The total is 10 h 44 min

12 3 h 43 min, 3 h 37 min and 7 h 51 min

1 1 1			
3 43	+		
3 37		13 h 131 min	= 15 h 11 min
7 51			
13 131			

The total is 15 h 11 min

Subtract these times, you may have to convert an h to 60 min first (or more).

Example

7 h 15 min - 4 h 57 min

6 75	-	7 h 15 min	= 6 h 75 min
4 57			
1			
2 18			

Difference is 2 h 18 min

13 8 h 47 min - 5 h 11 min

8 47	-		
5 11			
3 36			

Difference is 3h 36 min

14 17 h 25 min - 6 h 52 min

16 85	-	17 h 25 min	= 16 h 85 min
6 52			
10 33			

Difference is 10 h 33 min

15 26 h 37 min - 13 h 48 min

25 97	-	26 h 37 min	= 25 h 97 min
13 48			
1			
12 49			

Difference is 12 h 49 min

16 16 h 43 min - 9 h 56 min

15 103	-	16 h 43 min	= 15 h 103 min
9 56			
1 1 1			
6 47			

Difference is 6 h 47 min

17 7 h - 3 h 41 min - 1 h 57 min

5 120	-	7 h	= 5 h 120 min
3 41			
1 57			
1 1			
1 22			

Difference is 1 h 22 min

Time Calculations 2

Often the time until an event occurs is required to be calculated for planning or scheduling.

In column 1 the time in days between two dates is required, count these off to answer them. With Q 4 and 5 add the separate amounts, the number of days to: get to the end of the month, the complete month in-between and then the days in the 3rd month.

Column 2, Q 13 to 16, again use the same counting system. But from Q 17 on a new method is required. The steps are as follows:

- convert the times to 24 h format (add 12 to hours to times after 1 p.m.)
- the later time must have more minutes that the earlier time to be able to subtract, so if the minutes are less take an hour off and add 60 to the minutes column
- Carry out the subtraction and then write the answer in words.

For example 3.35 p.m. = 1535 h to move an hour across take an hour off the 15 h (15 - 1 = 14) and add 60 to the minutes (35 + 60 = 95), thus 1495 h. Look at the example before Q 17.

In the third column these require a further step, use the same method but because the times are on the following day add 24 h for each day that is advanced. For example 5.16 p.m. on the next day would be 1716 + 24 = 4116 h, then perform the subtraction. See the example at the top of the column.

With Q 22 and 23 find the sum (addition), then if the minutes are greater than 60 take 60 min off and add 1 to the hours. For example,

3 h 43 min + 5 h 23 min = 8 h 66 min = 9 h 6 min.

Time Calculations 2

Find the time difference in days between the following dates.

1 8th June and the 23rd June — 15 days

2 17th September and the 3rd September — 14 days

3 18th March and the 9th April — 22 days

4 16th July and the 28th August — 43 days

5 15/12/02 and 02/02/03

16 + 31 + 2 = 49 days

6 02/02/02 and 05/04/02

26 + 31 + 5 = 62 days

Find the time difference in weeks between the following dates.

7 3rd March and 31st March — 4 weeks

8 20th November and Christmas day — 5 weeks

9 New Years day and 26th February — 8 weeks

Find the time in years represented by the following words.

10 Millennium — 1000 years

11 Century — 100 years

12 Decade — 10 years

Find the time difference in hours between the following times.

13 3 a.m. Tuesday and 11 p.m. Tuesday — 20 h

14 12 p.m. Thursday and 6 a.m. Friday — 18 h

15 1 a.m. Monday and 6 p.m. Tuesday — 41 h

16 6.15 a.m. Sunday and 4.15 a.m. Monday — 22 h

Find the time difference. Take an hour off and change it to minutes.

Example

11.27 a.m. and 4.17 p.m.

15 77 - (4.17 p.m. = 1617 h (24h); 1617 h = 1577 (1h →min))

11 27

4 50

The difference is 4 h 50 min.

17 12.45 p.m. and 3.16 p.m.

14 76 - (3.16 p.m.= 1516 h (24h); 1516 = 1476 h (h →min))

12 45

2 31

The difference is 2 h 31 min.

18 7.37 a.m. and 5.28 p.m.

16 88 - (5.28 p.m.= 1728 h (24h); 1728 = 1688 h (h →min))

07 37

1

9 51

The difference is 9 h 51 min.

19 4.19 a.m. and 7.53 p.m.

19 53 - (7.53 p.m.= 1953 h (24h))

04 19

1

15 34

The difference is 15 h 34 min.

Add 24 hours for every day that you advance. These are harder!

Example 7.26 a.m. Friday and 3.52 p.m. Saturday

39 52 - (3.52 p.m. = 1552 h (24h); 1552 = 3952 h (+ 24h))

07 26

1

32 26

The difference is 32 h 26 min.

20 7.17 p.m. Monday and 4.53 a.m. Tuesday

28 53 - (4.53 am = 0453 h (24 h); 0453 = 2853 (+24 h))

19 17

1 1

9 36

The difference is 9 h 36 min.

21 10.08 p.m. Wednesday and 1.37 a.m. Friday

49 37 - (1.37 am = 0137 h (24h); 0137 = 4937 h (+ 48h))

22 08

1

27 29

The difference is 27 h 29 min.

Add these times, if the minutes exceed 60 change them to hours

22 8 h 47 min and 5 h 39 min

1

8 47 +

5 39

13 86 (13 h 86 min = 14 h 26 min)

The total is 14 h 26 min

23 6 h 57 min, 3 h 43 min, 2 h 16 min and 4 h 28 min

2

6 57 +

3 43

2 16

4 28

15 144 (15 h 144 min = 17 h 24 min)

The total is 17 h 24 min

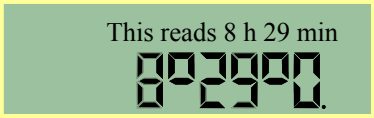
Time Calculations (Calculator)

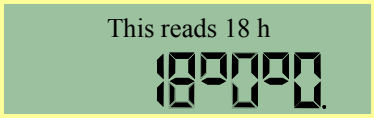
Time calculations are performed every day, …..how long until lunch?, ….the bus arrives? When you become a wage earner it is important to be able to check that your hours worked are correct, but because minutes and hours are in groups of 60 min this is not always straight forward. But a calculator makes it easy.

The calculator image on the next page shows the DMS key or the 'bubble button' (the key has an orange border). This key allows you work with hours and minutes.

IMPORTANT YOU MUST ENTER A 0 (THEN DMS KEY) IF DEALING ONLY WITH MINUTES (NO HOURS).

The calculator will always show the hours, minutes and seconds (we won't be using seconds) separated by a degree sign (a small raised o) →°.



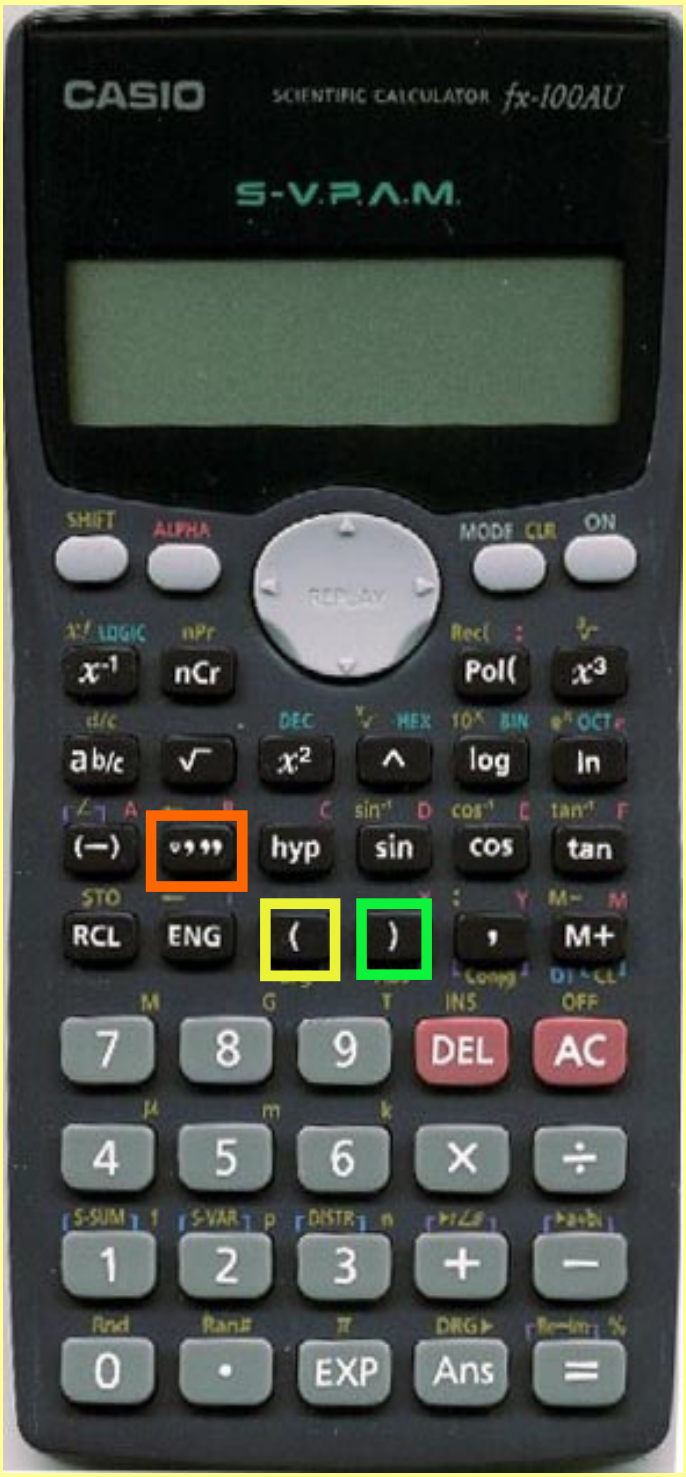


In column 1 you are asked to convert the times given in minutes to hours and minutes. This is done by pressing 0 then the DMS key, then the minutes in the question then the DMS key and then press = and the answer will be displayed. Example, change 338 min to hours and minutes.

In the 2nd column times are to be added together, put the first time into the calculator then a + then the second time in, press =, done. Finding the difference between two times is done by subtraction, using the same method as above, with one exception YOU MUST CONVERT P.M. TIME TO 24 H TIME. If they are both a.m. times or both p.m. times no conversion is necessary, as soon as a question involves both a p.m. and an a.m. time convert the p.m. time to 24 h format. See the example before Q 18.

The time sheet at the bottom of the column 2 requires you to find the time difference for each day between start and finish times, put them in the spaces provided then add them. Monday is already done for you, check you get the same answer and don't forget to include it in your addition.

The 3rd column is using × and ÷ these are done no differently just remember that you are multiplying by a number not a time and so only use the DMS on the time. The calculation of an average time (Q 31) can be done in two ways refer to the text box below the calculator image for the full key stroke method on the next page.



Example of steps in calculating average time
of 11h 12 min, 8 h 57 min and 10 h 9 min

Using Brackets

(1 1 °’’’ 1 2 °’’’ + 8 °’’’ 5 7 °’’’ + 1 0 °’’’ 9 °’’’) ÷ 3 =

Using = to avoid order of operations

1 1 °’’’ 1 2 °’’’ + 8 °’’’ 5 7 °’’’ + 1 0 °’’’ 9 °’’’ = ÷ 3 =

if you get 10 h 6 min for the question above you are correct

Time Calculations (Calculator)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Rewrite the calculator displays in h and min.

1 

2 

3 

4 

Convert the following times in min to h and min, remember to put a zero in for the hours first.

5 211 min

6 173 min

7 245 min

8 727 min

9 341 min

10 360 min

11 568 min

12 540 min

13 1331 min

14 1080 min

Add these times together using your calculator

15 8 h 27 min + 11 h 36 min

16 8 h 19 min + 4 h 48 min + 2 h 37 min

17 4 h 39 min + 5 h 25 min + 11 h 56 min

Find the time difference between these times that are on the same day. Use 24 hour time format

Example

1853 h in 24 h

11.17 a.m. and 6.53 p.m.

1 8 ''' 5 3 ''' - 1 1 ''' 1 7 ''' = 7 h 36 min

18 10.30 a.m. and 3.56 p.m.

19 3.52 a.m. and 11.27 a.m.

20 4.23 a.m. and 6.17 p.m.

21 1.09 p.m. and 10.57 p.m.

Complete the time sheet below, then find the total hours worked.

22 A. Jolie Time Sheet

Day	Start	Finish	Hours
Mon	9.30 a.m.	4.45 p.m.	7 h 15 min
Tues	10.45 a.m.	2.30 p.m.	h min
Wed	9.30 a.m.	5.00 p.m.	h min
Thur	9.30 a.m.	3.45 p.m.	h min
Fri	1.15 p.m.	6.00 p.m.	h min
		Total hours for the week	h min

Now use × and ÷ with these times

23 3 × 17 min

24 8 × 23 min

25 7 × 1 h 46 min

26 1 h 55 min ÷ 5

27 19 h 57 min ÷ 9

28 54 min × 6 + 3 h 7 min ÷ 11 + 1 h 27 min

29 8 h 45 min ÷ 5 + 5 min × 17 + 1 h 31 min

Try these time problems

30 Sean watches 3 movies at a 6 h movie marathon, if two of the films were 1h 46 min and 1h 50 min, find the duration of the other.

31 Julie's time for return travel to school for 3 days were: 1h 15 min, 56 min and 1h 22 min. Find the average time for her return trip.

32 It takes Jemma 43 min to wash a car, and 11 min to vacuum a car. How long does she take to wash 5 cars and vacuum 3 of them? Jemma has 40 min for lunch, if she started at 10.25 a.m. estimate her finish time.

Time taken _____ Estimated finish time _____

Time Calculations (Calculator)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Rewrite the calculator displays in h and min.

1 

52 min

2 

1 h 17 min

3 

3 h

4 

31 h 34 min

Convert the following times in min to h and min, remember to put a 0° in for the hours first.

5 211 min — 3 h 31 min

6 173 min — 2 h 53 min

7 245 min — 4 h 5 min

8 727 min — 12 h 7 min

9 341 min — 5 h 41 min

10 360 min — 6 h

11 568 min — 9 h 28 min

12 540 min — 9 h

13 1331 min — 22 h 11 min

14 1080 min — 18 h

Add these times together using your calculator

15 8 h 27 min + 11 h 36 min

20 h 3 min

16 8 h 19 min + 4 h 48 min + 2 h 37 min — 15 h 44 min

17 4 h 39 min + 5 h 25 min + 11 h 56 min — 22 h

Find the time difference between these times that are on the same day. Use 24 hour time format

Example

1853 in 24 h time

11.17 a.m. and 6.53 p.m.

1 8 °'" 5 3 °'" - 1 1 °'" 1 7 °'" =

7 h 36 min

18 10.30 a.m. and 3.56 p.m.

5 h 26 min

19 3.52 a.m. and 11.27 a.m.

7 h 35 min

20 4.23 a.m. and 6.17 p.m.

13 h 54 min

21 1.09 p.m. and 10.57 p.m.

9 h 48 min

Complete the time sheet below, then find the total hours worked.

22 A. Jolie Time Sheet

Day	Start	Finish	Hours
Mon	9.30 a.m.	4.45 p.m.	7 h 15 min
Tues	10.45 a.m.	2.30 p.m.	3 h 45 min
Wed	9.30 a.m.	5.00 p.m.	7 h 30 min
Thur	9.30 a.m.	3.45 p.m.	6 h 15 min
Fri	1.15 p.m.	6.00 p.m.	4 h 45 min

Total hours for the week 29 h 30 min

Now use × and ÷ with these times

23 3 × 17 min — 51 min

24 8 × 23 min — 3 h 4 min

25 7 × 1 h 46 min — 12h 22 min

26 1 h 55 min ÷ 5 — 23 min

27 19 h 57 min ÷ 9 — 2 h 13 min

28 54 min × 6 + 3 h 7 min ÷ 11 + 1 h 27 min — 7 h 8 min

29 8 h 45 min ÷ 5 + 5 min × 17 + 1 h 31 min — 4 h 41 min

Try these time problems

30 Sean watches 3 movies at a 6 h movie marathon, if two of the films were 1h 46 min and 1h 50 min, find the duration of the other.

2 h 24 min

31 Julie's time for return travel to school for 3 days were: 1h 15 min, 56 min and 1h 22 min. Find the average time for her return trip.

1 h 11 min

32 It takes Jemma 43 min to wash a car, and 11 min to vacuum a car. How long does she take to wash 5 cars and vacuum 3 of them? Jemma has 40 min for lunch, if she started at 10.25 a.m. estimate her finish time.

Time taken: 4 h 8 min

Estimated finish time: 3.13 p.m.

Regional Time Difference

Australia has 3 time zones:

Eastern Standard Time (EST):	Queensland, New South Wales, Australian Capital Territory, Victoria and Tasmania.
Central Standard Time (CST):	Northern Territory and South Australia
Western Standard Time (WST):	Western Australia

New Zealand mainland has a single time zone, but the Chatham Islands are +45 min ahead of NZ mainland time. The Chatham Island's population are the first in the world to see the sunrise each new day.

Time is subtracted when moving west, (so it is earlier) and time is added when moving west (it is later). The amount added/subtracted varies. The arrows at the top and bottom of the map, tell you how much to add or subtract when you step between adjacent time zones.

Column 1 gives you a time in Perth and asks for the current time in other centres.
Example : Perth local time is 4.45 a.m., the time in Canberra is?

To get from Perth to Canberra add a ½ hr to get to CST then 1½ hr to get from CST to EST, a total of 2 hours to be added. So the time in Canberra is 4.45 a.m. + 2 hr = 6.45 a.m.

Column 2 selects Wellington (NZ) as the comparison, this time movement west (deduct time) is involved. Crossing the Tasman Sea to Australia. Remember that the arrows at the top of the map help you to answer these questions.

The last question in the first 2 columns asks you to write in your location (city or town) and calculate the local time.

With the 3rd column the time is required to be written and also placed on the analogue clocks.

Remember that a time requires a.m. or p.m. written after it. (unless in 24 hour time format) and that 12 noon is 12 p.m. and 12 midnight is 12 a.m.

Auckland

12.47 a.m.

World Time Difference

Time difference in the world is based on GMT, Greenwich Meridian Time. With locations that are west of GMT time is subtracted. (This means it is earlier than in the U.K.). With locations east time is added (this means it is later than in the U.K.). GMT is now also referred to as UTC (Coordinated Universal Time) but this is not as well known.

Column 1 requires use of the map. Cities have been shown with the time ahead (+) or behind (-) GMT. So to calculate the time in a city in column 1, deduct the time (if -) or add the time (if +) in hours from/to the GMT time. Note that with New Delhi you add 5½ hours.

With column 2 instead of U.K. local time it is now New York time. If it is 10.00 am in New York what is the GMT? Once you know the GMT time you can use the same method as the first column!

Remember that due to cities being up to 12 hours ahead of the U.K. this means than the date in Auckland (and other cities to the east) could actually be different (ahead) of the U.K. and so could be the next day. The opposite could be said for cities to the west, the date could be behind the U.K. and a day earlier.

With column 3, again convert the time in Japan to GMT and then apply the same method as the previous columns. Remember a time requires a.m. or p.m. written after it, unless in 24 hour time format and that 12 noon is 12 p.m. and 12 midnight is 12 a.m.

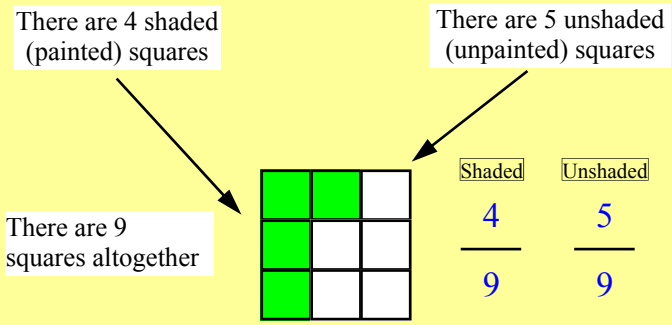
ALTITUDE

FRACTIONS

Fractions of Shapes

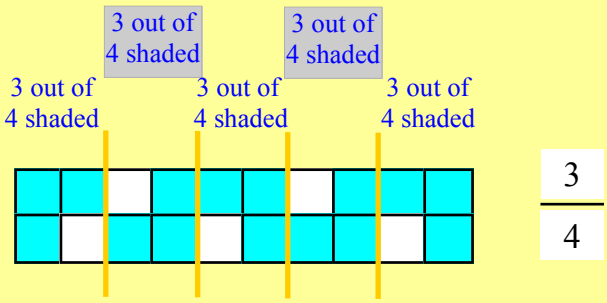
Fractions deal with parts of a number or item. The most important thing to remember is: 'take ____ parts from _____' meaning that for the fraction ¾ you take 3 parts from 4.

In column 1 you are asked to find the fraction of the shape that is both shaded and unshaded. Count the shaded (darkened) sections of the diagram and write this in the top box, then count the total number of sections (both shaded and unshaded) and put this number in the bottom box. The same process is done for the unshaded fraction for the question, count the unshaded sections and put that number in the top box then count the total number of sections (which you have already done) and put that in the bottom box. An example is below.



Column 2 reverses the process, now you are given the fraction and you are asked to shade the fraction on the diagram. The denominators all match the number of parts in the shape, so that means you shade the number of parts that match the top number of the fraction.

In Column 3 is the bottom number of the fraction doesn't match the number of sections in the shape. What you do now is remember to 'take ____ parts from _____". In the example below there are 20 squares and you are asked to find ¾ of them, this means 'take 3 parts from 4' which translates to: count off 4 squares and shade 3 of them. Then count off another 4 squares and shade 3 more and keep going until the you count off the last 4. How many 4's are there in 20? There are 5 lots of 4, and as you are shading 3 out of every 4 that means there is 5 lots of 3 sections to be shaded, so expect to shade 15 squares.



Fractions of Shapes

21 2/3 
22 6/6 
23 5/6 
24  5/20

25  5/25

Graphing and Comparing Fractions

This sheet divides a unit length (between 0 and 1) into fractions and asks you to compare the fractions using the same length interval as a guide. As the fractions are placed directly below each other, the fractions can be compared more easily.

Column 1 asks you to fill in the missing spaces, the first interval is in two halves, the next in three thirds and so on. The denominator (the bottom number) stays the same on each line, the numerator (the top line) counts off starting at 1. Once you have filled the spaces answer the exercises. If a fraction is to the left of another it is less than it (<), if it is to the right it is greater than it (>) and if it is in the same position it is equal (=) to it. For some fractions that are close it may be difficult to tell with your eye, a ruler may need to be used.

With column 2 you are given <, > and = signs. You have to place in the numbers that make the statement true. Sometimes more than one answer will be possible, if that is the case use the first fraction that is less than or greater than. Questions 25 through 32 ask you to answer true or false, again use a ruler if the fractions are difficult to separate with your eye.

Column 3 asks you to arrange the fractions in descending and later ascending order. Remember that descending starts with a 'd' just like the word 'down'. When you go down you go from a high position to a lower position, that means that descending order starts with the highest (largest) fraction and ends with the lowest (smallest) fraction. How do you remember ascending? "Who cares!" Because if you know descending goes from highest to lowest then ascending must be the opposite, lowest to highest. It may make it easier if you strike out the fractions on the top line as you put them in order in the line below.

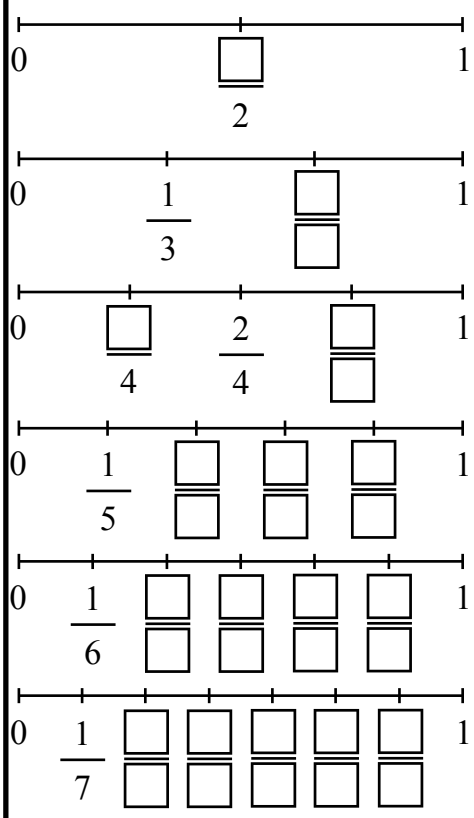
Remember :

$$1 = \frac{2}{2} = \frac{3}{3} = \frac{4}{4} = \frac{5}{5} = \frac{6}{6} = \frac{7}{7}$$

Graphing and Comparing Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Complete the fractions which divide the intervals below.



Now using the intervals above (and a ruler?), answer the questions.

Fill the box with <, >, or = to make these true.

1 $\frac{2}{3} \square \frac{1}{3}$ 2 $\frac{5}{7} \square \frac{6}{7}$

3 $\frac{3}{4} \square \frac{1}{4}$ 4 $\frac{2}{4} \square \frac{2}{3}$

5 $\frac{1}{3} \square \frac{2}{6}$ 6 $\frac{3}{5} \square \frac{4}{6}$

7 $\frac{4}{7} \square \frac{1}{2}$ 8 $\frac{6}{7} \square \frac{5}{6}$

9 $\frac{2}{3} \square \frac{4}{6}$ 10 $\frac{3}{6} \square \frac{1}{2}$

11 $\frac{2}{5} \square \frac{3}{7}$ 12 $\frac{1}{2} \square \frac{2}{4}$

Find the closest number that makes these true.

13 $\frac{\square}{3} < \frac{2}{5}$ 14 $\frac{\square}{4} > \frac{5}{7}$

15 $\frac{2}{5} < \frac{\square}{3}$ 16 $\frac{2}{3} = \frac{4}{\square}$

17 $\frac{3}{4} < \frac{\square}{6}$ 18 $\frac{3}{\square} > \frac{1}{2}$

19 $\frac{1}{2} > \frac{\square}{7}$ 20 $\frac{3}{5} < \frac{2}{\square}$

21 $\frac{\square}{6} = \frac{\square}{2}$ 22 $\frac{1}{\square} = \frac{\square}{4}$

23 $\frac{\square}{5} > \frac{5}{7}$ 24 $\frac{3}{\square} = \frac{\square}{4}$

State if the following are true or false.

25 $\frac{1}{4} < \frac{1}{7}$ _____

26 $\frac{1}{2} > \frac{3}{7}$ _____

27 $\frac{3}{4} = \frac{4}{6}$ _____

28 $\frac{2}{7} > \frac{1}{4}$ _____

29 $\frac{4}{4} > \frac{3}{3}$ _____

30 $\frac{2}{4} = \frac{3}{6}$ _____

31 $\frac{4}{5} < \frac{4}{7}$ _____

32 $\frac{1}{3} > \frac{2}{6}$ _____

Arrange these fractions in descending order.

33 $\frac{2}{7}, \frac{5}{7}, \frac{3}{7}, \frac{6}{7}$

Rewrite in order → $\frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}$

34 $\frac{1}{5}, \frac{3}{6}, \frac{4}{5}, \frac{4}{6}$

Rewrite in order → $\frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}$

35 $\frac{1}{3}, \frac{1}{6}, \frac{3}{5}, \frac{2}{4}$

Rewrite in order → $\frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}$

36 $\frac{5}{7}, \frac{1}{2}, \frac{2}{3}, \frac{1}{4}$

Rewrite in order → $\frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}$

Arrange these fractions in ascending order.

37 $\frac{3}{4}, \frac{3}{5}, \frac{6}{7}, \frac{1}{2}$

Rewrite in order → $\frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}$

38 $\frac{4}{6}, \frac{1}{2}, \frac{3}{7}, \frac{1}{5}$

Rewrite in order → $\frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}$

39 $\frac{6}{7}, \frac{1}{3}, \frac{3}{5}, \frac{2}{4}$

Rewrite in order → $\frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}, \frac{\square}{\square}$

3. $\frac{3}{4} > \frac{1}{4}$
4. $\frac{2}{4} < \frac{2}{3}$
5. $\frac{1}{3} = \frac{2}{6}$
6. $\frac{3}{5} < \frac{4}{6}$
7. $\frac{4}{7} > \frac{1}{2}$
8. $\frac{6}{7} > \frac{5}{6}$
9. $\frac{2}{3} = \frac{4}{6}$
10. $\frac{3}{6} = \frac{1}{2}$
11. $\frac{2}{5} < \frac{3}{7}$
12. $\frac{1}{2} = \frac{2}{4}$

Find the closest number that makes these true.

13. $\frac{1}{3} < \frac{2}{5}$
14. $\frac{3}{4} > \frac{5}{7}$
15. $\frac{2}{5} < \frac{2}{3}$
16. $\frac{2}{3} = \frac{4}{6}$
17. $\frac{3}{4} < \frac{5}{6}$
18. $\frac{3}{5} > \frac{1}{2}$
19. $\frac{1}{2} > \frac{3}{7}$
20. $\frac{3}{5} < \frac{2}{3}$
21. $\frac{3}{6} = \frac{1}{2}$
22. $\frac{1}{2} = \frac{2}{4}$
23. $\frac{4}{5} > \frac{5}{7}$
24. $\frac{3}{6} = \frac{2}{4}$

State if the following are true or false.

25. $\frac{1}{4} < \frac{1}{7}$ False
26. $\frac{1}{2} > \frac{3}{7}$ True
27. $\frac{3}{4} = \frac{4}{6}$ False
28. $\frac{2}{7} > \frac{1}{4}$ True
29. $\frac{4}{4} > \frac{3}{3}$ False
30. $\frac{2}{4} = \frac{3}{6}$ True
31. $\frac{4}{5} < \frac{4}{7}$ False
32. $\frac{1}{3} > \frac{2}{6}$ False

Arrange these fractions in descending order.

33. $\frac{2}{7}, \frac{5}{7}, \frac{3}{7}, \frac{6}{7}$
Rewrite in order → $\frac{6}{7}, \frac{5}{7}, \frac{3}{7}, \frac{2}{7}$
34. $\frac{1}{5}, \frac{3}{6}, \frac{4}{5}, \frac{4}{6}$
Rewrite in order → $\frac{4}{5}, \frac{4}{6}, \frac{3}{6}, \frac{1}{5}$
35. $\frac{1}{3}, \frac{1}{6}, \frac{3}{5}, \frac{2}{4}$
Rewrite in order → $\frac{3}{5}, \frac{2}{4}, \frac{1}{3}, \frac{1}{6}$
36. $\frac{5}{7}, \frac{1}{2}, \frac{2}{3}, \frac{1}{4}$
Rewrite in order → $\frac{5}{7}, \frac{2}{3}, \frac{1}{2}, \frac{1}{4}$

Arrange these fractions in ascending order.

37. $\frac{3}{4}, \frac{3}{5}, \frac{6}{7}, \frac{1}{2}$
Rewrite in order → $\frac{1}{2}, \frac{3}{5}, \frac{3}{4}, \frac{6}{7}$
38. $\frac{4}{6}, \frac{1}{2}, \frac{3}{7}, \frac{1}{5}$
Rewrite in order → $\frac{1}{5}, \frac{3}{7}, \frac{1}{2}, \frac{4}{6}$
39. $\frac{6}{7}, \frac{1}{3}, \frac{3}{5}, \frac{2}{4}$
Rewrite in order → $\frac{1}{3}, \frac{2}{4}, \frac{3}{5}, \frac{6}{7}$

Types of Fractions

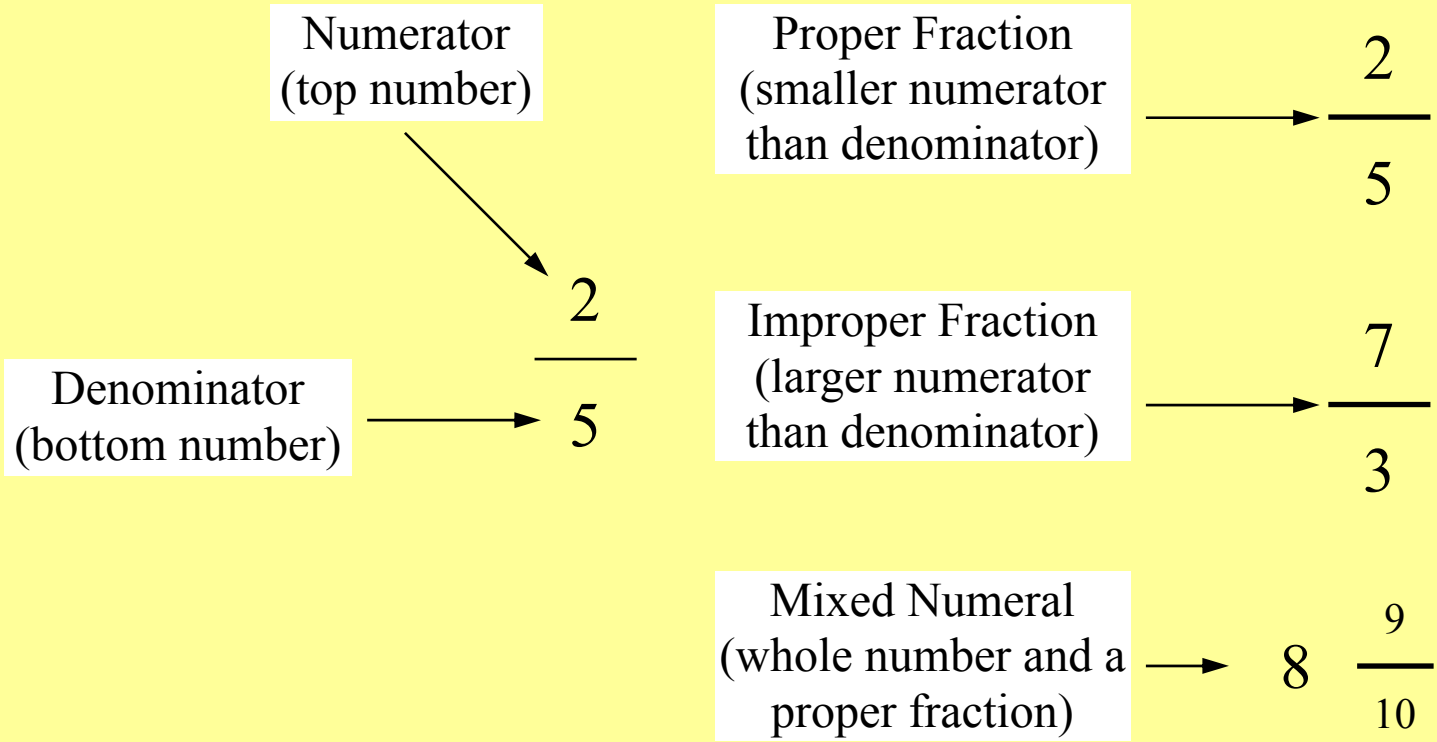
A fraction is composed of one number ‘over’ or ‘on top of’ another. The number on top is called the numerator, the number on the bottom is called the denominator. How do you remember these? Remember that denominator starts with a 'd' as does the word 'down'. So you should remember that the denominator is down below and the numerator is up on top.

Column 1 asks you to write the fraction that has been spelt out then pick the numerator and the denominator and put these in the boxes. Note that the boxes change their position and so don't write the numerator in the denominator box. Questions 9 through 13 are the reverse, this tests your spelling. You can look at the spelling in the questions above to assist you.

Column 2 introduces proper fractions, improper fractions and mixed numerals (or mixed numbers). A proper fraction is 'the way you would expect a fraction to be' with the numerator smaller than the denominator, (the number on top smaller than the number below it). An improper fraction is different because the numerator is larger than the denominator, and a mixed numeral has a whole number and a proper fraction together, so it's mixed up!

Note that because improper fractions have a larger top number they will have a value that is greater than 1. Questions 24, 25 and 26 ask you to build fractions using the numbers 2, 4 and 7. The idea being that with the mixed numbers you use 3 different numbers not one number twice.

The third column has some worded questions about fractions that test your knowledge of them, then the last 3 questions ask you to sort through the fractions at the bottom of the column and rewrite them below the type of fraction that they are.



Types of Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Write the fraction given in words as numbers and put the numerator and the denominator in the spaces

Example

six sevenths $\frac{6}{7}$ (num 6, denom 7)

1 a half — (denom, num)

2 two quarters — (num, denom)

3 three eighths — (num, denom)

4 seven tenths — (denom, num)

5 ten twelfths — (denom, num)

6 five sixths — (num, denom)

7 ten thirds — (denom, num)

8 six fourths — (num, denom)

Now write the fractions given below in words

9 $\frac{5}{7}$ _____

10 $\frac{3}{12}$ _____

11 $\frac{5}{20}$ _____

12 A fraction has a numerator of 5 and a denominator of 8

_____

13 A fraction has a numerator of 9 and a denominator of 4

_____

Describe the fractions below as either proper, improper or mixed

14 $\frac{3}{11}$ _____

15 $4\frac{5}{6}$ _____

16 $7\frac{1}{2}$ _____

17 $\frac{88}{89}$ _____

18 $\frac{43}{34}$ _____

19 $6\frac{8}{10}$ _____

20 $\frac{11}{7}$ _____

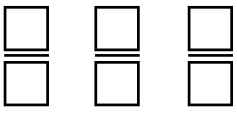
21 $12\frac{5}{6}$ _____

22 $\frac{12}{13}$ _____

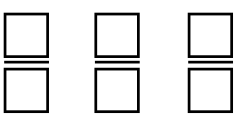
23 $\frac{56}{13}$ _____

Use the numbers 2, 4, or 7 to construct:

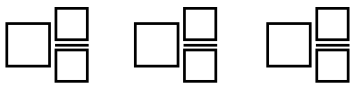
24 3 proper fractions



25 3 improper fractions



26 3 mixed numerals



Name the type or part of a fraction that is being described below.

27 This fraction has a denominator larger than its numerator

_____

28 This fraction can have a value greater than 1

_____

29 This has a proper fraction and a whole number.

_____

30 An answer of 1 occurs when the denominator equals this.

_____

From the fractions below select the:

31 Proper fractions

32 Improper fractions

33 Mixed numerals

$\frac{3}{5}$ $2\frac{3}{7}$ $\frac{67}{63}$ $\frac{11}{3}$ $6\frac{2}{5}$ $\frac{55}{56}$ $\frac{12}{5}$ $8\frac{9}{10}$ $\frac{13}{19}$ $\frac{17}{12}$

Types of Fractions

Write the fraction given in words as numbers and put the numerator and the denominator in the spaces

Example

six sevenths $\frac{6}{7}$ (num 6, denom 7)

1 a half $\frac{1}{2}$ (denom 2, num 1)

2 two quarters $\frac{2}{4}$ (num 2, denom 4)

3 three eighths $\frac{3}{8}$ (num 3, denom 8)

4 seven tenths $\frac{7}{10}$ (denom 10, num 7)

5 ten twelfths $\frac{10}{12}$ (denom 12, num 10)

6 five sixths $\frac{5}{6}$ (num 5, denom 6)

7 ten thirds $\frac{10}{3}$ (denom 3, num 10)

8 six fourths $\frac{6}{4}$ (num 6, denom 4)

Now write the fractions given below in words

9 $\frac{5}{7}$ five sevenths

10 $\frac{3}{12}$ three twelfths

11 $\frac{5}{20}$ five twentieths

12 A fraction has a numerator of 5 and a denominator of 8

five eighths

13 A fraction has a numerator of 9 and a denominator of 4

nine quarters (or fourths)

Describe the fractions below as either proper, improper or mixed

14 $\frac{3}{11}$ Proper

15 $4\frac{5}{6}$ Mixed

16 $7\frac{1}{2}$ Mixed

17 $\frac{88}{89}$ Proper

18 $\frac{43}{34}$ Improper

19 $6\frac{8}{10}$ Mixed

20 $\frac{11}{7}$ Improper

21 $12\frac{5}{6}$ Mixed

22 $\frac{12}{13}$ Proper

23 $\frac{56}{13}$ Improper

Use the numbers 2, 4, or 7 to construct:

24 3 proper fractions

$\frac{2}{4}$ $\frac{2}{7}$ $\frac{4}{7}$

25 3 improper fractions

$\frac{7}{2}$ $\frac{7}{4}$ $\frac{4}{2}$

26 3 mixed numerals

$7\frac{2}{4}$ $4\frac{2}{7}$ $2\frac{4}{7}$

Name the type or part of a fraction that is being described below.

27 This fraction has a denominator larger than its numerator

Proper fraction

28 This fraction can have a value greater than 1

Improper fraction

29 This has a proper fraction and a whole number.

Mixed Numeral

30 An answer of 1 occurs when the denominator equals this.

numerator

From the fractions below select the:

31 Proper fractions

$\frac{3}{5}$ $\frac{55}{56}$ $\frac{13}{19}$

32 Improper fractions

$\frac{12}{5}$ $\frac{67}{63}$ $\frac{17}{12}$ $\frac{11}{3}$

33 Mixed numerals

$8\frac{9}{10}$ $6\frac{2}{5}$ $2\frac{3}{7}$

Converting between Mixed Numerals and Improper Fractions

Changing between mixed numerals and improper fractions is a skill that must be developed for operations with fractions (+, -, ×, ÷). The first column is an introduction to the process of changing mixed numerals to improper fractions. Questions 1 to 3 are connected and then Questions 4 to 6 are connected. This is to help show you how the action of converting fractions is done. It is important that you realise that $1 = {}^{2}/_{2} = {}^{3}/_{3} = {}^{4}/_{4} = {}^{5}/_{5} = {}^{6}/_{6}$ etc.

Questions 7 through 9 are a graphical representation of mixed numerals, with each separate shape being equal to 1. This means that if the shape is split into 3 parts then it is in ${}^{1}/_{3}$'s. In the example below there are two shapes fully shaded that means 2, then there are 5 triangles shaded in the third shape which has 6 parts, that means ${}^{5}/_{6}$. So we have $2{}^{5}/_{6}$ as the mixed numeral. To write it as an improper fraction look at the shape, it is in 6 parts, so in all we have ${}^{?}/_{6}$. Count all the parts up, the first shape has 6 parts, the next another 6, that's 12, then the 5 makes 17. So the improper fraction would be ${}^{17}/_{6}$.

$\frac{6}{6} = \boxed{1}$ $\frac{6}{6} = \boxed{1}$ $\frac{5}{6}$

Mixed Numeral = $2\frac{5}{6}$ Improper Fraction = $\frac{17}{6}$

The entire 2nd column is about converting mixed numerals to improper fractions. The top of the column shows you how this is done. In words the process is as follows:

- write the denominator for the mixed numeral the same as the denominator in the improper fraction
- multiply the denominator of the mixed numeral by the whole number then add it to the numerator
- write this number as the numerator, and you're done

Converting improper to mixed is just like dividing, column 3 shows the method with an example, but in words:

- write the same denominator in the improper fraction as given in the mixed number
- divide the numerator by the denominator (it must 'go into it' as it is an improper fraction) the answer is the whole number in the mixed numeral, the remainder becomes the numerator.

Converting between Mixed Numerals and Improper Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Try these, remember that fractions are equal parts of a whole number

1 How many ½ 's are there in 1?

2 How many ½ 's are there in a ½?

3 So how many ½ 's are there in 1½?

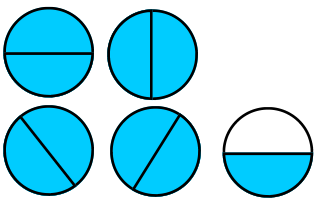
4 How many ¼ 's are there in 1?

5 How many ¼ 's are there in ¾ ?

6 So how many ¼ 's are there in 1¾?

Write the shaded area as a mixed numeral and an improper fraction

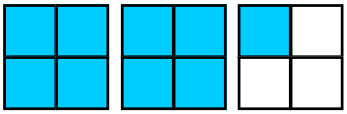
Example



$4\frac{1}{2}$

$\frac{9}{2}$

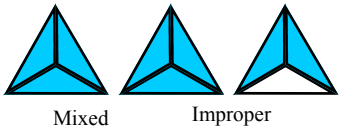
7



Mixed

Improper

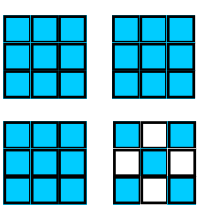
8



Mixed

Improper

9

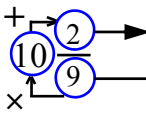


Mixed

Improper

Fill in the missing spaces then find the improper fraction for these.

Example



$\frac{9 \times 10 + 2}{9} = \frac{92}{9}$

10 $2\frac{2}{3} = \frac{\square \times \square + \square}{\square} = \frac{\square}{\square}$

11 $4\frac{3}{5} = \frac{\square \times \square + \square}{\square} = \frac{\square}{\square}$

12 $5\frac{5}{7} = \frac{\square \times \square + \square}{\square} = \frac{\square}{\square}$

13 $6\frac{7}{9} = \frac{\square \times \square + \square}{\square} = \frac{\square}{\square}$

14 $10\frac{3}{8} = \frac{\square \times \square + \square}{\square} = \frac{\square}{\square}$

Now change these to improper fractions without working out spaces

15 $2\frac{3}{4} = \frac{\square}{\square}$

16 $3\frac{3}{5} = \frac{\square}{\square}$

17 $1\frac{6}{7} = \frac{\square}{\square}$

18 $4\frac{3}{4} = \frac{\square}{\square}$

19 $8\frac{2}{3} = \frac{\square}{\square}$

20 $6\frac{2}{5} = \frac{\square}{\square}$

21 $4\frac{9}{10} = \frac{\square}{\square}$

22 $8\frac{2}{7} = \frac{\square}{\square}$

23 $3\frac{5}{6} = \frac{\square}{\square}$

24 $6\frac{3}{8} = \frac{\square}{\square}$

25 $2\frac{6}{13} = \frac{\square}{\square}$

26 $4\frac{3}{7} = \frac{\square}{\square}$

27 $2\frac{5}{16} = \frac{\square}{\square}$

28 $3\frac{7}{20} = \frac{\square}{\square}$

Follow the arrows and put your answer in the square

29 How many 3 's go into 8?

30 What is the remainder?

$\frac{8}{3} = \square\ 3$

31 How many 2 's go into 9?

32 What is the remainder?

$\frac{9}{2} = \square$

33 How many 4 's go into 19?

34 What is the remainder?

$\frac{19}{4} = \square$

Now try converting improper fractions to mixed numerals.

35 $\frac{5}{3} = \square\frac{\square}{\square}$

36 $\frac{7}{2} = \square\frac{\square}{\square}$

37 $\frac{11}{4} = \square\frac{\square}{\square}$

38 $\frac{22}{5} = \square\frac{\square}{\square}$

39 $\frac{17}{2} = \square\frac{\square}{\square}$

40 $\frac{21}{4} = \square\frac{\square}{\square}$

41 $\frac{19}{6} = \square\frac{\square}{\square}$

42 $\frac{25}{8} = \square\frac{\square}{\square}$

43 $\frac{33}{10} = \square\frac{\square}{\square}$

44 $\frac{38}{9} = \square\frac{\square}{\square}$

45 $\frac{41}{4} = \square\frac{\square}{\square}$

46 $\frac{37}{8} = \square\frac{\square}{\square}$

47 $\frac{47}{12} = \square\frac{\square}{\square}$

48 $\frac{60}{11} = \square\frac{\square}{\square}$

49 $\frac{55}{9} = \square\frac{\square}{\square}$

50 $\frac{60}{19} = \square\frac{\square}{\square}$

Converting between Mixed Numerals and Improper Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Try these, remember that fractions are equal parts of a whole number

1 How many ½ 's are there in 1? 2

2 How many ½ 's are there in a ½? 1

3 So how many ½ 's are there in 1½? 3

4 How many ¼ 's are there in 1? 4

5 How many ¼ 's are there in ¾ ? 3

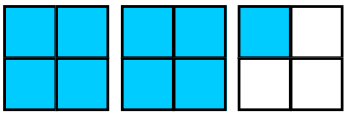
6 So how many ¼ 's are there in 1¾? 7

Write the shaded area as a mixed numeral and an improper fraction

Example

$4\frac{1}{2}$ $\frac{9}{2}$

7

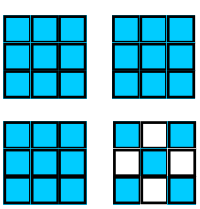


Mixed $2\frac{1}{4}$ Improper $\frac{9}{4}$

8

Mixed $2\frac{2}{3}$ Improper $\frac{8}{3}$

9



Mixed $3\frac{5}{9}$ Improper $\frac{32}{9}$

Fill in the missing spaces then find the improper fraction for these.

Example

$+$ 2, 10, $\times$ 9 → $\frac{9 \times 10 + 2}{9} = \frac{92}{9}$

10 $2\frac{2}{3} = \frac{3 \times 2 + 2}{3} = \frac{8}{3}$

11 $4\frac{3}{5} = \frac{5 \times 4 + 3}{5} = \frac{23}{5}$

12 $5\frac{5}{7} = \frac{7 \times 5 + 5}{7} = \frac{40}{7}$

13 $6\frac{7}{9} = \frac{9 \times 6 + 7}{9} = \frac{61}{9}$

14 $10\frac{3}{8} = \frac{8 \times 10 + 3}{8} = \frac{83}{8}$

Now change these to improper fractions without working out spaces

15 $2\frac{3}{4} = \frac{11}{4}$ 16 $3\frac{3}{5} = \frac{18}{5}$

17 $1\frac{6}{7} = \frac{13}{7}$ 18 $4\frac{3}{4} = \frac{19}{4}$

19 $8\frac{2}{3} = \frac{26}{3}$ 20 $6\frac{2}{5} = \frac{32}{5}$

21 $4\frac{9}{10} = \frac{49}{10}$ 22 $8\frac{2}{7} = \frac{58}{7}$

23 $3\frac{5}{6} = \frac{23}{6}$ 24 $6\frac{3}{8} = \frac{51}{8}$

25 $2\frac{6}{13} = \frac{32}{13}$ 26 $4\frac{3}{7} = \frac{31}{7}$

27 $2\frac{5}{16} = \frac{37}{16}$ 28 $3\frac{7}{20} = \frac{67}{20}$

Follow the arrows and put your answer in the square

29 How many 3 's go into 8?

30 What is the remainder?

$\frac{8}{3} = 2\frac{2}{3}$

31 How many 2 's go into 9?

32 What is the remainder?

$\frac{9}{2} = 4\frac{1}{2}$

33 How many 4 's go into 19?

34 What is the remainder?

$\frac{19}{4} = 4\frac{3}{4}$

Now try converting improper fractions to mixed numerals.

35 $\frac{5}{3} = 1\frac{2}{3}$ 36 $\frac{7}{2} = 3\frac{1}{2}$

37 $\frac{11}{4} = 2\frac{3}{4}$ 38 $\frac{22}{5} = 4\frac{2}{5}$

39 $\frac{17}{2} = 8\frac{1}{2}$ 40 $\frac{21}{4} = 5\frac{1}{4}$

41 $\frac{19}{6} = 3\frac{1}{6}$ 42 $\frac{25}{8} = 3\frac{1}{8}$

43 $\frac{33}{10} = 3\frac{3}{10}$ 44 $\frac{38}{9} = 4\frac{2}{9}$

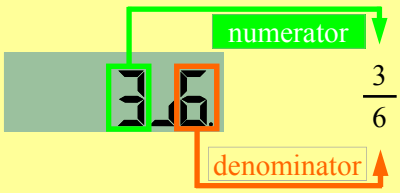
45 $\frac{41}{4} = 10\frac{1}{4}$ 46 $\frac{37}{8} = 4\frac{5}{8}$

47 $\frac{47}{12} = 3\frac{11}{12}$ 48 $\frac{60}{11} = 5\frac{5}{11}$

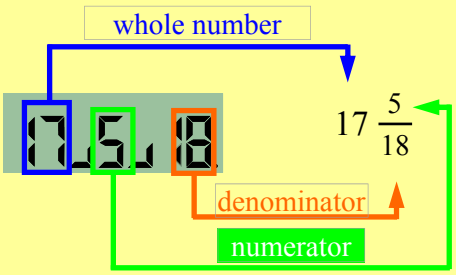
49 $\frac{55}{9} = 6\frac{1}{9}$ 50 $\frac{60}{19} = 3\frac{3}{19}$

Changing Between Mixed Numerals and Improper Fractions (Calculator)

This sheet is designed for you to learn how to change between mixed numerals and improper fractions using your calculator. A calculator separates the numerator and the denominator by a reversed 'L' (or sometimes an ‘r’), for mixed numerals the whole number is also separated by the 'L' (or ‘r’). See example below.



$\frac{3}{6}$



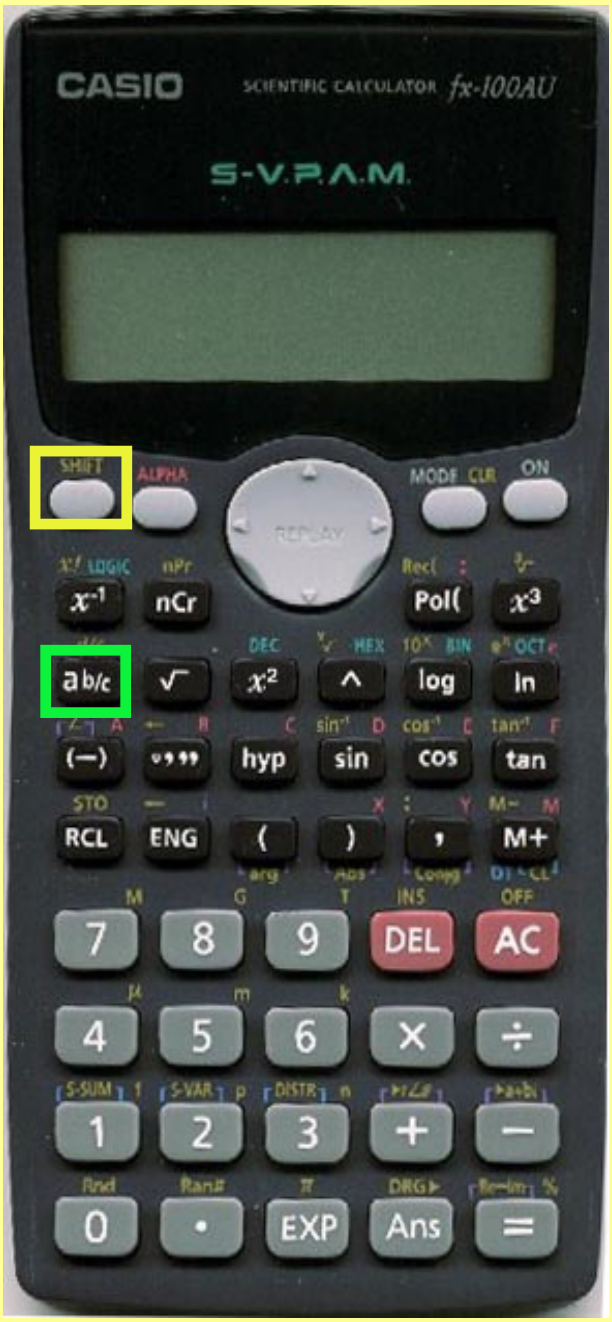
$17\frac{5}{18}$

The first column starts with the way your calculator displays fractions. If there are 2 numbers the first number is the numerator (number on top) the second number is the denominator (number on the bottom). These numbers are separated by the "reversed L". Don’t write fractions the calculator way, write the fractions separated by a line (as above). From Q. 6 on, you are asked to change mixed numerals to improper fractions. The method required is described on the next sheet, in words - type the fraction into the calculator, press =, then press shift and the fraction button.

Column 2 reverses the process and asks you to change improper fractions to mixed numerals, to answer these put the fraction in the calculator and press =, the mixed numeral will be displayed. Question 46 through 53 asks you to repeat the same process, if you use the ÷ sign then you will get a decimal answer, press the fraction key and it will change it to a fraction. Or a quicker step is to use the fraction key instead of the ÷ sign this will give the answer as a fraction straight away.

Note: These are all the same: $8\overline{)3}$ $\frac{3}{8}$ $3 \div 8$

The last column asks you to compare the improper fractions with the mixed numerals. Put the improper fraction into your calculator and press the ‘equals’ key. If the fraction displayed on the screen is the same as the answer supplied write 'true', if it isn't, write ‘false’. At the bottom of the column you are asked to show the pairs that ‘match’ (an improper and a mixed number) by using pairs of shapes (a smaller shape for the improper fractions, larger one for mixed).



Example of how to convert Mixed numerals to Improper Fractions

$3\ \frac{6}{7} = \frac{\quad}{\quad}$?

Don't forget the 'equals' sign

SHIFT

$\boxed{3}\ \boxed{a\,b/c}\ \boxed{6}\ \boxed{a\,b/c}\ \boxed{7}\ \boxed{=}\ \boxed{}\ \boxed{a\,b/c}$

if you get $\frac{27}{7}$ as your answer you have done it correctly

Simplifying Fractions

Simplifying a fraction is the same as expressing a fraction in its simplest form, the fraction you are being given is expressed with smaller numbers. The process of simplifying is finding the largest number that divides into the numerator and the denominator and dividing them both by it. The largest number is the HCF the Highest Common Factor.

In column 1 questions 1 through 20 ask you to find the HCF of two numbers. Look at the two numbers and find the largest number that goes into both of them. Questions 21 through 26 use the HCF to simplify the fraction. In the example (above question 21) the fraction $^{3}/_{12}$ is to be simplified. The HCF is found to be 3, the numerator and denominator are then divided by 3 (the HCF) and the answer placed in the fraction boxes.

Column 2 is all simplification exercises. Find the HCF of the numerator and denominator and divide through. When you complete each question look at your answer and see whether it can be further simplified, if it can be, simplify it again or look at the question again to get the HCF that you have missed and try again from the start.

Column 3 is the same process except the numbers used are larger, make sure that you check your answer to see whether it can be further simplified. Question 79 through 86 asks you to draw a line between the fraction and the simplified fraction. After you calculate the simplified fraction draw a line between it and the question, joining the dots.

Simplifying Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the HCF, the largest number that goes into both of these 2 numbers.

1	3, 9	2	6, 9
3	2, 4	4	8, 10
5	5, 10	6	10, 25
7	8, 16	8	6, 16
9	9, 30	10	12, 30
11	12, 24	12	20, 12
13	4, 14	14	7, 14
15	22, 8	16	50, 15
17	32, 16	18	30, 18
19	14, 42	20	18, 42

Now lets apply this skill to simplifying fractions

Example

$\frac{3}{12}$ HCF 3

$3 \div 3 = 1$

$12 \div 3 = 4$

21 $\frac{3}{9}$ HCF ☐

$3 \div$ ☐ = ☐

$9 \div$ ☐ = ☐

22 $\frac{6}{18}$ HCF ☐

$6 \div$ ☐ = ☐

$18 \div$ ☐ = ☐

23 $\frac{8}{20}$ HCF ☐

$8 \div$ ☐ = ☐

$20 \div$ ☐ = ☐

24 $\frac{10}{25}$ HCF ☐

$10 \div$ ☐ = ☐

$25 \div$ ☐ = ☐

25 $\frac{12}{30}$ HCF ☐

$12 \div$ ☐ = ☐

$30 \div$ ☐ = ☐

26 $\frac{24}{32}$ HCF ☐

$24 \div$ ☐ = ☐

$32 \div$ ☐ = ☐

Now simplify these. Look at your answer, if you can further simplify it you missed the HCF.

27	$\frac{5}{15} = \frac{\square}{\square}$	28	$\frac{4}{8} = \frac{\square}{\square}$
29	$\frac{6}{9} = \frac{\square}{\square}$	30	$\frac{5}{20} = \frac{\square}{\square}$
31	$\frac{9}{15} = \frac{\square}{\square}$	32	$\frac{12}{18} = \frac{\square}{\square}$
33	$\frac{15}{20} = \frac{\square}{\square}$	34	$\frac{18}{30} = \frac{\square}{\square}$
35	$\frac{21}{35} = \frac{\square}{\square}$	36	$\frac{12}{15} = \frac{\square}{\square}$
37	$\frac{16}{20} = \frac{\square}{\square}$	38	$\frac{15}{40} = \frac{\square}{\square}$
39	$\frac{16}{28} = \frac{\square}{\square}$	40	$\frac{30}{50} = \frac{\square}{\square}$
41	$\frac{9}{12} = \frac{\square}{\square}$	42	$\frac{20}{65} = \frac{\square}{\square}$
43	$\frac{19}{38} = \frac{\square}{\square}$	44	$\frac{18}{54} = \frac{\square}{\square}$
45	$\frac{16}{40} = \frac{\square}{\square}$	46	$\frac{45}{60} = \frac{\square}{\square}$
47	$\frac{35}{42} = \frac{\square}{\square}$	48	$\frac{8}{12} = \frac{\square}{\square}$
49	$\frac{2}{50} = \frac{\square}{\square}$	50	$\frac{12}{26} = \frac{\square}{\square}$
51	$\frac{15}{60} = \frac{\square}{\square}$	52	$\frac{18}{27} = \frac{\square}{\square}$
53	$\frac{63}{81} = \frac{\square}{\square}$	54	$\frac{42}{50} = \frac{\square}{\square}$
55	$\frac{56}{64} = \frac{\square}{\square}$	56	$\frac{12}{60} = \frac{\square}{\square}$

Now try larger numbers

57	$\frac{100}{200} = \frac{\square}{\square}$	58	$\frac{350}{500} = \frac{\square}{\square}$
59	$\frac{120}{300} = \frac{\square}{\square}$	60	$\frac{180}{200} = \frac{\square}{\square}$
61	$\frac{90}{210} = \frac{\square}{\square}$	62	$\frac{140}{210} = \frac{\square}{\square}$
63	$\frac{75}{150} = \frac{\square}{\square}$	64	$\frac{400}{500} = \frac{\square}{\square}$
65	$\frac{110}{440} = \frac{\square}{\square}$	66	$\frac{204}{612} = \frac{\square}{\square}$
67	$\frac{80}{150} = \frac{\square}{\square}$	68	$\frac{125}{500} = \frac{\square}{\square}$
69	$\frac{35}{120} = \frac{\square}{\square}$	70	$\frac{195}{200} = \frac{\square}{\square}$
71	$\frac{180}{240} = \frac{\square}{\square}$	72	$\frac{150}{360} = \frac{\square}{\square}$

Draw lines between fractions and their simplified match

73	$\frac{35}{40}$	A	$\frac{1}{2}$
74	$\frac{10}{12}$	B	$\frac{4}{5}$
75	$\frac{12}{24}$	C	$\frac{5}{6}$
76	$\frac{15}{45}$	D	$\frac{3}{4}$
77	$\frac{20}{28}$	E	$\frac{7}{8}$
78	$\frac{9}{12}$	F	$\frac{5}{7}$
79	$\frac{8}{12}$	G	$\frac{2}{3}$
80	$\frac{60}{75}$	H	$\frac{1}{3}$

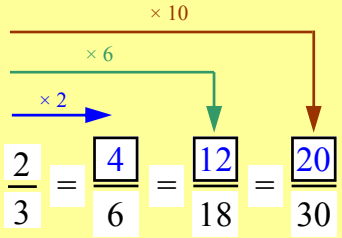
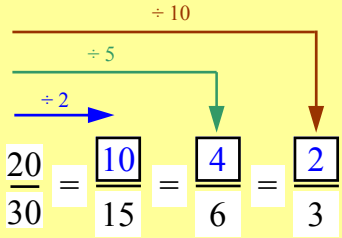
Equivalent and Comparing Fractions

An equivalent fraction is a fraction that is equal to another fraction but has a different denominator and numerator. For example if you scored $^{9}/_{10}$ in a test it would be equivalent to scoring $^{18}/_{20}$ or $^{90}/_{100}$. Equivalent fractions are calculated by multiplying (or dividing) the numerator and the denominator by the same number. To change $^{9}/_{10}$ to $^{18}/_{20}$ we multiplied the top and bottom numbers in the fraction by 2. To change $^{9}/_{10}$ to $^{90}/_{100}$ we multiplied the top and bottom numbers by 10.

Column 1 starts by asking you to find two fractions that represent the shaded area. The first fraction will be found by counting the shaded parts and making that the numerator, and counting the total number of parts and making that number the denominator. Then either multiply both of these numbers by any other number, or simplify to find an equivalent fraction. A hint, do you notice that the shading goes all the way down the columns of the shape? Then if you cover the rows of the shape except for top row you will get an equivalent fraction. Note that if the shading is scattered stick to the multiply or divide method.

The next part of column 1 asks you to find equivalent fractions to the one given. Look at the example below to the left, we are given $^{2}/_{3}$ so the denominator is 3. The first question has a denominator of 6, what do you multiply 3 by to get 6? The answer is 2, so multiply the numerator by 2 and you get $2 \times 2 = 4$ so the first answer is 4. The 2nd question has a denominator of 18, what do you multiply 3 by to get 18? The answer is 6, so multiply the numerator by 6 and you get $2 \times 6 = 12$, so the 2nd answer is 12. The same method again will give you × 10 and thus 20 for the last fraction.





Column 2 uses the same theory but with division. To make smaller equivalent fractions divide the top and bottom numbers in the fraction by another number. Of course when you divide you must find a number than can divide into both numbers exactly without a remainder. Questions 16 to 22 give you a fraction and a different denominator to make an equivalent fraction. Find the number to divide by across the bottom of the fraction and then divide across the top by the same number. You are then given the numerator of equivalent fractions and asked to find the denominator. Exactly the same method is used. YOU NEVER ADD OR SUBTRACT TO GET EQUIVALENT FRACTIONS.

Column 3 asks you to compare fractions, look at the fraction at the right of the empty box, look at its denominator and change the fraction on the left to match that denominator, then compare and fill in the box with < , > or =. Remember point the arrow at the smallest fraction (number). See the example at the top of column 3. Questions 41 to 48 ask you to check if the fractions are equivalent, check the denominators first and find the number that has been used to divide or multiply to get the other fraction, then apply the same number to the top and see if they equal each other. Yes? ……..True, No? …….False.

Equivalent and Comparing Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Give two fractions that represent the shaded part of each shape

1 
2 
3 
4 
Find the equivalent fraction with the given denominator

5 $\frac{1}{3} = \frac{\square}{12}$ 6 $\frac{2}{5} = \frac{\square}{10}$

7 $\frac{4}{10} = \frac{\square}{50}$ 8 $\frac{3}{6} = \frac{\square}{18}$

9 $\frac{9}{10} = \frac{\square}{90}$ 10 $\frac{3}{20} = \frac{\square}{40}$

11 $\frac{4}{5} = \frac{\square}{30}$ 12 $\frac{1}{2} = \frac{\square}{50}$

13 $\frac{1}{2} = \frac{\square}{12} = \frac{\square}{20} = \frac{\square}{18} = \frac{\square}{48}$

14 $\frac{2}{3} = \frac{\square}{12} = \frac{\square}{30} = \frac{\square}{9} = \frac{\square}{15}$

15 $\frac{3}{4} = \frac{\square}{20} = \frac{\square}{12} = \frac{\square}{24} = \frac{\square}{32}$

Now use division to find the equivalent fraction

16 $\frac{12}{20} = \frac{\square}{10}$ 17 $\frac{6}{18} = \frac{\square}{6}$

18 $\frac{20}{50} = \frac{\square}{10}$ 19 $\frac{18}{42} = \frac{\square}{7}$

20 $\frac{20}{60} = \frac{\square}{6} = \frac{\square}{30} = \frac{\square}{15} = \frac{\square}{12}$

21 $\frac{12}{24} = \frac{\square}{12} = \frac{\square}{6} = \frac{\square}{2} = \frac{\square}{4}$

22 $\frac{12}{36} = \frac{\square}{9} = \frac{\square}{6} = \frac{\square}{18} = \frac{\square}{3}$

Now find the denominator given the numerator

23 $\frac{2}{3} = \frac{6}{\square}$ 24 $\frac{3}{5} = \frac{15}{\square}$

25 $\frac{4}{12} = \frac{2}{\square}$ 26 $\frac{5}{6} = \frac{20}{\square}$

27 $\frac{12}{18} = \frac{24}{\square} = \frac{6}{\square} = \frac{2}{\square} = \frac{4}{\square}$

28 $\frac{4}{6} = \frac{8}{\square} = \frac{2}{\square} = \frac{40}{\square} = \frac{12}{\square}$

29 $\frac{8}{12} = \frac{24}{\square} = \frac{4}{\square} = \frac{16}{\square} = \frac{2}{\square}$

Now they are all mixed up complete for the fractions

30 $\frac{6}{10} = \frac{\square}{20} = \frac{3}{\square} = \frac{30}{\square} = \frac{\square}{30}$

31 $\frac{6}{9} = \frac{\square}{90} = \frac{2}{\square} = \frac{\square}{18} = \frac{18}{\square}$

32 $\frac{8}{24} = \frac{16}{\square} = \frac{2}{\square} = \frac{\square}{12} = \frac{24}{\square}$

33 $\frac{15}{45} = \frac{1}{\square} = \frac{\square}{15} = \frac{\square}{9} = \frac{30}{\square}$

Use the equivalent fraction to compare the fractions. Use <, > or = to make true

Example

$\frac{4}{9} = \frac{12}{27} \square \frac{10}{27}$ (>)

34 $\frac{1}{2} = \frac{\square}{4} \square \frac{3}{4}$

35 $\frac{3}{5} = \frac{\square}{10} \square \frac{6}{10}$

36 $\frac{8}{90} = \frac{\square}{45} \square \frac{4}{45}$

37 $\frac{8}{12} = \frac{\square}{\square} \square \frac{30}{48}$

38 $\frac{3}{7} = \frac{\square}{\square} \square \frac{12}{28}$

39 $\frac{3}{4} = \frac{\square}{\square} \square \frac{70}{80}$

40 $\frac{63}{70} = \frac{\square}{\square} \square \frac{8}{10}$

Test these to see if these are equivalent. Answer true or false

41 $\frac{1}{2} = \frac{6}{12}$ _____

42 $\frac{3}{5} = \frac{6}{15}$ _____

43 $\frac{9}{30} = \frac{3}{10}$ _____

44 $\frac{2}{3} = \frac{14}{21}$ _____

45 $\frac{9}{12} = \frac{3}{4}$ _____

46 $\frac{15}{40} = \frac{5}{8}$ _____

47 $\frac{2}{5} = \frac{10}{25}$ _____

48 $\frac{5}{9} = \frac{45}{90}$ _____

11 $\frac{4}{5} = \frac{24}{30}$ 12 $\frac{1}{2} = \frac{25}{50}$

13 $\frac{1}{2} = \frac{6}{12} = \frac{10}{20} = \frac{9}{18} = \frac{24}{48}$

14 $\frac{2}{3} = \frac{8}{12} = \frac{20}{30} = \frac{6}{9} = \frac{10}{15}$

15 $\frac{3}{4} = \frac{15}{20} = \frac{9}{12} = \frac{18}{24} = \frac{24}{32}$

Now use division to find the equivalent fraction

16 $\frac{12}{20} = \frac{6}{10}$ 17 $\frac{6}{18} = \frac{2}{6}$

18 $\frac{20}{50} = \frac{4}{10}$ 19 $\frac{18}{42} = \frac{3}{7}$

20 $\frac{20}{60} = \frac{2}{6} = \frac{10}{30} = \frac{5}{15} = \frac{4}{12}$

21 $\frac{12}{24} = \frac{6}{12} = \frac{3}{6} = \frac{1}{2} = \frac{2}{4}$

22 $\frac{12}{36} = \frac{3}{9} = \frac{2}{6} = \frac{6}{18} = \frac{1}{3}$

Now find the denominator given the numerator

23 $\frac{2}{3} = \frac{6}{9}$ 24 $\frac{3}{5} = \frac{15}{25}$

25 $\frac{4}{12} = \frac{2}{6}$ 26 $\frac{5}{6} = \frac{20}{24}$

27 $\frac{12}{18} = \frac{24}{36} = \frac{6}{9} = \frac{2}{3} = \frac{4}{6}$

28 $\frac{4}{6} = \frac{8}{12} = \frac{2}{3} = \frac{40}{60} = \frac{12}{18}$

29 $\frac{8}{12} = \frac{24}{36} = \frac{4}{6} = \frac{16}{24} = \frac{2}{3}$

Now they are all mixed up complete for the fractions

30 $\frac{6}{10} = \frac{12}{20} = \frac{3}{5} = \frac{30}{50} = \frac{18}{30}$

31 $\frac{6}{9} = \frac{60}{90} = \frac{2}{3} = \frac{12}{18} = \frac{18}{27}$

32 $\frac{8}{24} = \frac{16}{48} = \frac{2}{6} = \frac{4}{12} = \frac{24}{72}$

33 $\frac{15}{45} = \frac{1}{3} = \frac{5}{15} = \frac{3}{9} = \frac{30}{90}$

Use the equivalent fraction to compare the fractions. Use <, > or = to make true

Example $\frac{4}{9} = \frac{12}{27} > \frac{10}{27}$

34 $\frac{1}{2} = \frac{2}{4} < \frac{3}{4}$

35 $\frac{3}{5} = \frac{6}{10} = \frac{6}{10}$

36 $\frac{8}{90} = \frac{4}{45} = \frac{4}{45}$

37 $\frac{8}{12} = \frac{32}{48} > \frac{30}{48}$

38 $\frac{3}{7} = \frac{12}{28} = \frac{12}{28}$

39 $\frac{3}{4} = \frac{60}{80} < \frac{70}{80}$

40 $\frac{63}{70} = \frac{9}{10} > \frac{8}{10}$

Test these to see if these are equivalent. Answer true or false

41 $\frac{1}{2} = \frac{6}{12}$ True

42 $\frac{3}{5} = \frac{6}{15}$ False

43 $\frac{9}{30} = \frac{3}{10}$ True

44 $\frac{2}{3} = \frac{14}{21}$ True

45 $\frac{9}{12} = \frac{3}{4}$ True

46 $\frac{15}{40} = \frac{5}{8}$ False

47 $\frac{2}{5} = \frac{10}{25}$ True

48 $\frac{5}{9} = \frac{45}{90}$ False

Comparing Fractions (Calculator)

Using a calculator to compare fractions is done by changing the fractions to decimals and comparing the decimals instead. If all rounded to the same decimal place, the decimals can be easily compared, e.g. 0.308, 0.471, 0.235. It is easy to see the largest and smallest decimal, or if they are equal, if you look at the numbers behind the decimal point.

Column 1 asks you to convert the fractions to decimals, the calculator image on the next page shows you how to do this. If you have a decimal 0.100 then write it as 0.100 don't change it to 0.1 as this may lead you to make an error when comparing other numbers that are 3 d.p. (You may look at it as 1 instead of 100).

The rest of the sheet is attempted the same way, by finding the decimal for the fraction then comparing decimals. In the example below, two fractions are being compared, the method is:

- Find the decimals for both
- Compare decimals and put a < or > or = sign in between the decimals
- If this sign matches the one above it then write true, if not, write false.

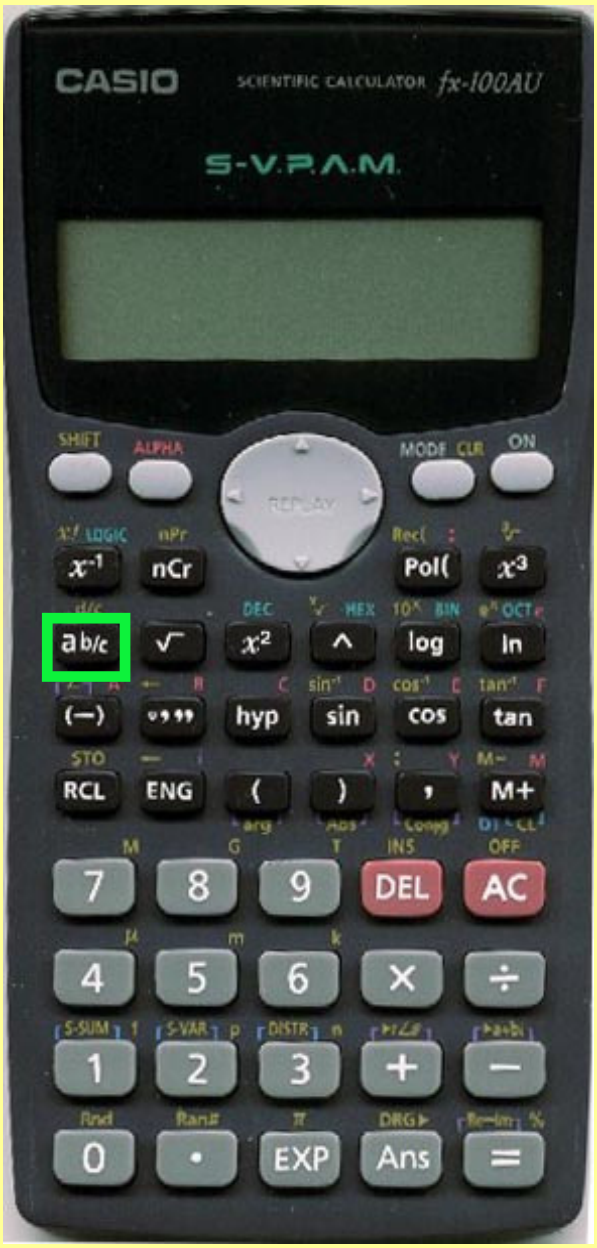
$$\frac{4}{5} > \frac{7}{8} \quad \text{False}$$
$$0.800 < 0.875$$

In the 2nd column, from Q. 31 on, use the same method only this time just write the sign into the box rather than stating true/false.

The third column asks you to compare fractions and arrange them in descending order, use the decimal system then write the fractions again in descending order. In a test the most common mistake is rewriting the decimals in descending order, the question asks for the fractions to be written, not the decimals.

How do you remember the difference between < and >? Imagine they are arrowheads and point them at the smallest number. E.g. $5 < 6$ and $15 > 10$, the arrow points to the smallest one.

Descending order? Remember going down.



Example of how to convert fractions to decimals

$\frac{6}{7} = \_\_\_\_ ?$

Don't forget the 'equals' sign

Method 1: Using Fraction Key [6] [a b/c] [7] [=] [a b/c]

Method 2: Using ÷ Key [6] [÷] [7] [=]

if you get 0.857 (rounded) you have answered it correctly

Adding and Subtracting Fractions (Same Denominator)

Fractions like whole numbers can be added and subtracted. The fractions on this sheet all have the same denominator so they can be added without finding equivalent fractions.

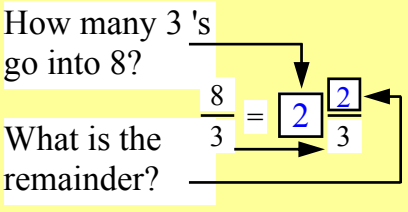
With column 1 the fractions are added and subtracted to give answers that can't be simplified. When you add fractions you add the numerator only, that is, the top numbers. The same with subtraction, you subtract the top numbers not the denominators (bottom numbers). In the example below an extra working step has been included. The top numbers are added but the bottom number is unchanged.

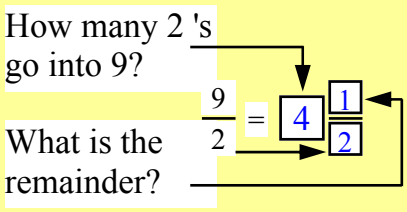
$$\frac{9}{21} + \frac{7}{21} = \frac{9+7}{21} = \frac{16}{21}$$

Column 2 involves the same style of exercise except this time the fractions can be simplified. Complete the addition or subtraction then look at your answer. Find the HCF, that is, the largest number that divides into both the top and bottom numbers. Then divide through by that number. Use canceling if you wish, or otherwise just write the simplified answer in the next fraction boxes. Remember that once you have simplified the answer, look at it again to ensure you can't reduce the fractions any further by dividing again. If you can further simplify that means that you missed the Highest Common Factor, look back and see whether you can find the HCF.

$$\frac{7}{15} - \frac{4}{15} = \frac{3}{15} = \frac{1}{5}$$

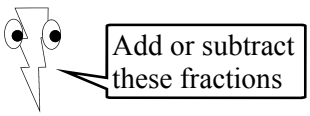
Column 3 is one extra step more, like the second column you are given exercises that will result in answers that can be simplified. But this time the answers will be improper fractions. The question asks for mixed numeral answers so you then have to convert them to mixed numbers. You should remember how to do this, if not, look at the example of converting to mixed numbers below. Note that you might like to convert to mixed numbers then simplify afterwards, both methods will result in the same answer.





Adding/Subtracting Fractions (Same Denominator)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE



1 $\frac{1}{10} + \frac{2}{10} = \frac{\square}{\square}$

2 $\frac{5}{8} - \frac{2}{8} = \frac{\square}{\square}$

3 $\frac{1}{5} + \frac{2}{5} = \frac{\square}{\square}$

4 $\frac{4}{7} - \frac{3}{7} = \frac{\square}{\square}$

5 $\frac{2}{11} + \frac{7}{11} = \frac{\square}{\square}$

6 $\frac{1}{9} + \frac{4}{9} = \frac{\square}{\square}$

7 $\frac{7}{5} - \frac{4}{5} = \frac{\square}{\square}$

8 $\frac{8}{6} - \frac{3}{6} = \frac{\square}{\square}$

9 $\frac{17}{12} - \frac{6}{12} = \frac{\square}{\square}$

10 $\frac{2}{13} + \frac{7}{13} = \frac{\square}{\square}$

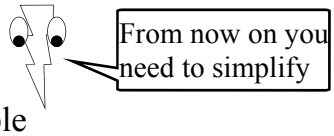
11 $\frac{5}{10} + \frac{4}{10} = \frac{\square}{\square}$

12 $\frac{14}{6} - \frac{9}{6} = \frac{\square}{\square}$

13 $\frac{15}{32} + \frac{12}{32} = \frac{\square}{\square}$

14 $\frac{13}{8} - \frac{6}{8} = \frac{\square}{\square}$

15 $\frac{9}{20} + \frac{4}{20} = \frac{\square}{\square}$



Example

$\frac{9}{10} - \frac{3}{10} = \frac{{}^{3}\not{6}}{{}^{5}\not{10}} = \frac{3}{5}$

16 $\frac{3}{4} - \frac{1}{4} = \frac{\square}{\square} = \frac{\square}{\square}$

17 $\frac{1}{6} + \frac{3}{6} = \frac{\square}{\square} = \frac{\square}{\square}$

18 $\frac{5}{10} + \frac{1}{10} = \frac{\square}{\square} = \frac{\square}{\square}$

19 $\frac{10}{9} - \frac{7}{9} = \frac{\square}{\square} = \frac{\square}{\square}$

20 $\frac{7}{12} - \frac{5}{12} = \frac{\square}{\square} = \frac{\square}{\square}$

21 $\frac{3}{8} + \frac{5}{8} = \frac{\square}{\square} = \square$

22 $\frac{13}{20} - \frac{7}{20} = \frac{\square}{\square} = \frac{\square}{\square}$

23 $\frac{4}{14} + \frac{3}{14} = \frac{\square}{\square} = \frac{\square}{\square}$

24 $\frac{7}{9} - \frac{1}{9} = \frac{\square}{\square} = \frac{\square}{\square}$

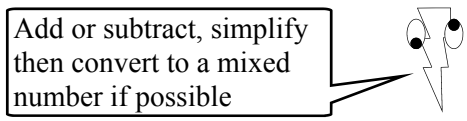
25 $\frac{8}{10} - \frac{3}{10} = \frac{\square}{\square} = \frac{\square}{\square}$

26 $\frac{13}{24} + \frac{7}{24} = \frac{\square}{\square} = \frac{\square}{\square}$

27 $\frac{5}{18} + \frac{4}{18} = \frac{\square}{\square} = \frac{\square}{\square}$

28 $\frac{13}{15} - \frac{3}{15} = \frac{\square}{\square} = \frac{\square}{\square}$

29 $\frac{7}{30} - \frac{4}{30} = \frac{\square}{\square} = \frac{\square}{\square}$



Example

Add: $\frac{9}{10} + \frac{9}{10} = \frac{{}^{9}\not{18}}{{}^{5}\not{10}}$ Simplify: $= \frac{9}{5}$

Change to mixed numeral $= 1\frac{4}{5}$

30 $\frac{9}{6} + \frac{5}{6} = \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

31 $\frac{9}{12} + \frac{7}{12} = \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

32 $\frac{29}{12} - \frac{5}{12} = \frac{\square}{\square} = \square$

33 $\frac{17}{10} + \frac{18}{10} = \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

34 $\frac{44}{9} - \frac{11}{9} = \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

35 $\frac{50}{18} - \frac{11}{18} = \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

36 $\frac{50}{8} + \frac{10}{8} = \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

3 $\frac{1}{5} + \frac{2}{5} = \frac{3}{5}$

4 $\frac{4}{7} - \frac{3}{7} = \frac{1}{7}$

5 $\frac{2}{11} + \frac{7}{11} = \frac{9}{11}$

6 $\frac{1}{9} + \frac{4}{9} = \frac{5}{9}$

7 $\frac{7}{5} - \frac{4}{5} = \frac{3}{5}$

8 $\frac{8}{6} - \frac{3}{6} = \frac{5}{6}$

9 $\frac{17}{12} - \frac{6}{12} = \frac{11}{12}$

10 $\frac{2}{13} + \frac{7}{13} = \frac{9}{13}$

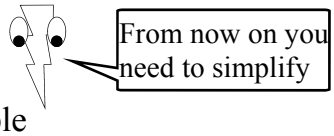
11 $\frac{5}{10} + \frac{4}{10} = \frac{9}{10}$

12 $\frac{14}{6} - \frac{9}{6} = \frac{5}{6}$

13 $\frac{15}{32} + \frac{12}{32} = \frac{27}{32}$

14 $\frac{13}{8} - \frac{6}{8} = \frac{7}{8}$

15 $\frac{9}{20} + \frac{4}{20} = \frac{13}{20}$



Example

$\frac{9}{10} - \frac{3}{10} = \frac{{}^{3}\cancel{6}}{{}^{5}10} = \frac{3}{5}$

16 $\frac{3}{4} - \frac{1}{4} = \frac{2}{4} = \frac{1}{2}$

17 $\frac{1}{6} + \frac{3}{6} = \frac{4}{6} = \frac{2}{3}$

18 $\frac{5}{10} + \frac{1}{10} = \frac{6}{10} = \frac{3}{5}$

19 $\frac{10}{9} - \frac{7}{9} = \frac{3}{9} = \frac{1}{3}$

20 $\frac{7}{12} - \frac{5}{12} = \frac{2}{12} = \frac{1}{6}$

21 $\frac{3}{8} + \frac{5}{8} = \frac{8}{8} = 1$

22 $\frac{13}{20} - \frac{7}{20} = \frac{6}{20} = \frac{3}{10}$

23 $\frac{4}{14} + \frac{3}{14} = \frac{7}{14} = \frac{1}{2}$

24 $\frac{7}{9} - \frac{1}{9} = \frac{6}{9} = \frac{2}{3}$

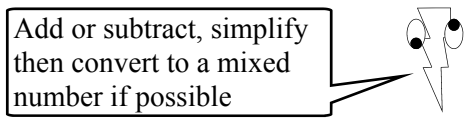
25 $\frac{8}{10} - \frac{3}{10} = \frac{5}{10} = \frac{1}{2}$

26 $\frac{13}{24} + \frac{7}{24} = \frac{20}{24} = \frac{5}{6}$

27 $\frac{5}{18} + \frac{4}{18} = \frac{9}{18} = \frac{1}{2}$

28 $\frac{13}{15} - \frac{3}{15} = \frac{10}{15} = \frac{2}{3}$

29 $\frac{7}{30} - \frac{4}{30} = \frac{3}{30} = \frac{1}{10}$



Example

Add: $\frac{9}{10} + \frac{9}{10} = \frac{{}^{9}18}{{}^{5}10}$ Simplify: $= \frac{9}{5}$

Change to mixed numeral $= 1\frac{4}{5}$

30 $\frac{9}{6} + \frac{5}{6} = \frac{14}{6} = \frac{7}{3} = 2\frac{1}{3}$

31 $\frac{9}{12} + \frac{7}{12} = \frac{16}{12} = \frac{4}{3} = 1\frac{1}{3}$

32 $\frac{29}{12} - \frac{5}{12} = \frac{24}{12} = 2$

33 $\frac{17}{10} + \frac{18}{10} = \frac{35}{10} = \frac{7}{2} = 3\frac{1}{2}$

34 $\frac{44}{9} - \frac{11}{9} = \frac{33}{9} = \frac{11}{3} = 3\frac{2}{3}$

35 $\frac{50}{18} - \frac{11}{18} = \frac{39}{18} = \frac{13}{6} = 2\frac{1}{6}$

36 $\frac{50}{8} + \frac{10}{8} = \frac{60}{8} = \frac{15}{2} = 7\frac{1}{2}$

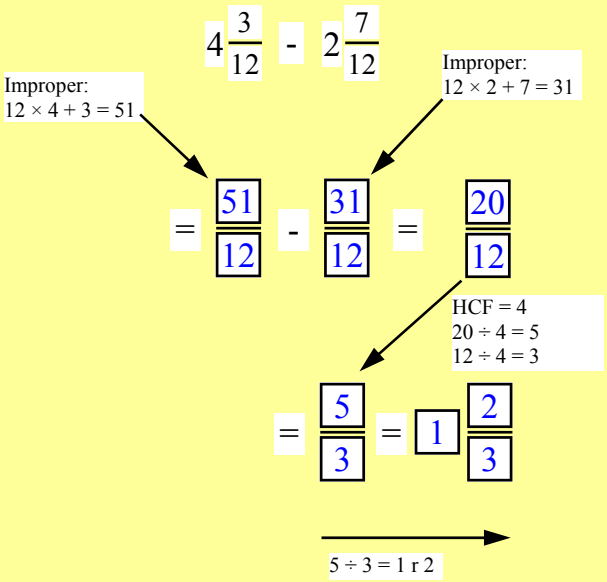
Adding and Subtracting Mixed Numerals
(Same denominator)

Adding and subtracting mixed numerals will be challenging for some students, follow the examples below, then try the exercises.

The entire sheet is done by the one method, you are given 2 mixed numerals and you have to add or subtract them. The method is:

- change the first mixed number into an improper fraction and rewrite it in the boxes below
- Repeat for the 2nd mixed numeral
- Add the numerators (the top numbers) and write the answer in the top box then write the denominator straight into the bottom box, don't add or subtract denominators
- Find the HCF, the largest number that divides into both the top and bottom numbers
- Divide through by this number and write the answer in the boxes on the 3rd line, in other words simplify the fraction
- Look at your answer, can it be further simplified? If it can try and simplify it and try to get the HCF that you missed in the first simplification.
- Change your answer to a mixed number

You are done! It's a long process and a mistake can be made at many of the stages so be careful and take your time. Note that you can drop a step, the simplifying, if you use canceling.



Adding/Subtracting Mixed Numerals (same denominator)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Solve these, write your answer as a mixed numeral

The whole sheet uses the same method. Convert to an improper fraction , add or subtract, simplify then change back to mixed numbers.

1 $3\frac{1}{4} - 1\frac{3}{4}$

Improper Improper Answer

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

Simplify Rewrite as mixed

2 $4\frac{3}{10} - 1\frac{7}{10}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

3 $3\frac{3}{8} + 2\frac{7}{8}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

4 $2\frac{5}{6} + 3\frac{5}{6}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

5 $6\frac{1}{4} - 2\frac{3}{4}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

6 $3\frac{4}{9} - 1\frac{1}{9}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

7 $6\frac{1}{6} - 1\frac{5}{6}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

8 $3\frac{3}{4} + 2\frac{3}{4}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

9 $3\frac{5}{12} - \frac{8}{12}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

10 $5\frac{3}{8} - 1\frac{7}{8}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

11 $1\frac{7}{10} + 2\frac{7}{10}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

12 $2\frac{7}{12} + 3\frac{9}{12}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

13 $5\frac{3}{4} + 3\frac{3}{4}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

14 $3\frac{3}{20} - 1\frac{8}{20}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

15 $2\frac{5}{16} - \frac{11}{16}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

16 $1\frac{6}{10} + 3\frac{9}{10}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

17 $3\frac{4}{9} + 1\frac{8}{9}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

Adding/Subtracting Mixed Numerals (same denominator)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Solve these, write your answer as a mixed numeral

The whole sheet uses the same method. Convert to an improper fraction , add or subtract, simplify then change back to mixed numbers.

1 $3\frac{1}{4} - 1\frac{3}{4}$

$= \frac{13}{4} - \frac{7}{4} = \frac{6}{4}$ (Improper, Improper, Answer)

$= \frac{3}{2} = 1\frac{1}{2}$ (Simplify, Rewrite as mixed)

2 $4\frac{3}{10} - 1\frac{7}{10}$

$= \frac{43}{10} - \frac{17}{10} = \frac{26}{10}$

$= \frac{13}{5} = 2\frac{3}{5}$

3 $3\frac{3}{8} + 2\frac{7}{8}$

$= \frac{27}{8} + \frac{23}{8} = \frac{50}{8}$

$= \frac{25}{4} = 6\frac{1}{4}$

4 $2\frac{5}{6} + 3\frac{5}{6}$

$= \frac{17}{6} + \frac{23}{6} = \frac{40}{6}$

$= \frac{20}{3} = 6\frac{2}{3}$

5 $6\frac{1}{4} - 2\frac{3}{4}$

$= \frac{25}{4} - \frac{11}{4} = \frac{14}{4}$

$= \frac{7}{2} = 3\frac{1}{2}$

6 $3\frac{4}{9} - 1\frac{1}{9}$

$= \frac{31}{9} - \frac{10}{9} = \frac{21}{9}$

$= \frac{7}{3} = 2\frac{1}{3}$

7 $6\frac{1}{6} - 1\frac{5}{6}$

$= \frac{37}{6} - \frac{11}{6} = \frac{26}{6}$

$= \frac{13}{3} = 4\frac{1}{3}$

8 $3\frac{3}{4} + 2\frac{3}{4}$

$= \frac{15}{4} + \frac{11}{4} = \frac{26}{4}$

$= \frac{13}{2} = 6\frac{1}{2}$

9 $3\frac{5}{12} - \frac{8}{12}$

$= \frac{41}{12} - \frac{8}{12} = \frac{33}{12}$

$= \frac{11}{4} = 2\frac{3}{4}$

10 $5\frac{3}{8} - 1\frac{7}{8}$

$= \frac{43}{8} - \frac{15}{8} = \frac{28}{8}$

$= \frac{7}{2} = 3\frac{1}{2}$

11 $1\frac{7}{10} + 2\frac{7}{10}$

$= \frac{17}{10} + \frac{27}{10} = \frac{44}{10}$

$= \frac{22}{5} = 4\frac{2}{5}$

12 $2\frac{7}{12} + 3\frac{9}{12}$

$= \frac{31}{12} + \frac{45}{12} = \frac{76}{12}$

$= \frac{19}{3} = 6\frac{1}{3}$

13 $5\frac{3}{4} + 3\frac{3}{4}$

$= \frac{23}{4} + \frac{15}{4} = \frac{38}{4}$

$= \frac{19}{2} = 9\frac{1}{2}$

14 $3\frac{3}{20} - 1\frac{8}{20}$

$= \frac{63}{20} - \frac{28}{20} = \frac{35}{20}$

$= \frac{7}{4} = 1\frac{3}{4}$

15 $2\frac{5}{16} - \frac{11}{16}$

$= \frac{37}{16} - \frac{11}{16} = \frac{26}{16}$

$= \frac{13}{8} = 1\frac{5}{8}$

16 $1\frac{6}{10} + 3\frac{9}{10}$

$= \frac{16}{10} + \frac{39}{10} = \frac{55}{10}$

$= \frac{11}{2} = 5\frac{1}{2}$

17 $3\frac{4}{9} + 1\frac{8}{9}$

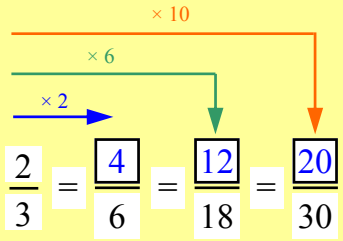
$= \frac{31}{9} + \frac{17}{9} = \frac{48}{9}$

$= \frac{16}{3} = 5\frac{1}{3}$

Adding/Subtracting Fractions
(Different Denominator)

The main requirement for adding fractions with different denominators is that you know how to get an equivalent fraction, this means multiplying the fraction's numerator and denominator (top and bottom number) by a number.

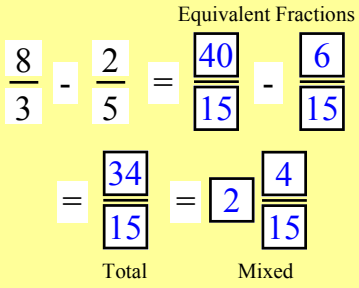
In column 1 you are asked in questions 1 through 7 to find equivalent fractions to the one given. Look at the example below, we are given $^2/_3$ so the denominator is 3. The first question has a denominator of 6, what do you multiply 3 by to get 6? The answer is 2, so multiply the numerator by 2 and you get $2 \times 2 = 4$ so the first answer is 4. The 2nd question has a denominator of 18, what do you multiply 3 by to get 18? The answer is 6, so multiply the numerator by 6 and you get $2 \times 6 = 12$, so the 2nd answer is 12. The same method again will give you 20 for the last question.



Questions 8 through 10 are additions with different denominators, you have to find the LCM (Lowest Common Multiple), in other words the smallest number that both numbers divide into. These three have the LCM found for you with the denominator typed in. In question 8 only one fraction needs to be changed, (because 2 and 8 both divide into 8), questions 9 and 10 require both fractions to be changed. Note that you don't just multiply the denominators together to get the LCM, an example would be 6 & 10 the LCM is 30 not $6 \times 10 = 60$.

The 2nd column are additions which will give a proper fraction answer, the last two questions will need to be simplified. In Column 3 the answer will be an improper fraction and so an extra step is required to change it to a mixed number. An example is below.

Example



Adding/Subtracting Fractions (Different Denominator)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the numerator for these fractions to make them equivalent fractions.

1 $\frac{1}{2} = \frac{\square}{4} = \frac{\square}{8} = \frac{\square}{20}$

2 $\frac{1}{3} = \frac{\square}{6} = \frac{\square}{12} = \frac{\square}{18}$

3 $\frac{2}{3} = \frac{\square}{9} = \frac{\square}{12} = \frac{\square}{21}$

4 $\frac{3}{5} = \frac{\square}{10} = \frac{\square}{15} = \frac{\square}{25}$

5 $\frac{4}{6} = \frac{\square}{3} = \frac{\square}{30} = \frac{\square}{24}$

6 Change these to eighths

$\frac{1}{2} = \frac{\square}{\square}$, $\frac{1}{4} = \frac{\square}{\square}$, $\frac{3}{4} = \frac{\square}{\square}$

7 Change these to twelfths

$\frac{1}{2} = \frac{\square}{\square}$, $\frac{2}{3} = \frac{\square}{\square}$, $\frac{3}{4} = \frac{\square}{\square}$

Add/subtract these. The denominator is given for the equivalent fractions

8 $\frac{1}{2} + \frac{3}{8}$

$= \frac{\square}{8} + \frac{\square}{8} = \frac{\square}{\square}$

9 $\frac{1}{2} + \frac{1}{3}$

$= \frac{\square}{6} + \frac{\square}{6} = \frac{\square}{\square}$

10 $\frac{3}{5} - \frac{1}{3}$

$= \frac{\square}{15} - \frac{\square}{15} = \frac{\square}{\square}$

Where possible simplify

11 $\frac{1}{2} + \frac{3}{10}$

Equivalent Fractions, Total, Simplify

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

12 $\frac{1}{2} - \frac{1}{3}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

13 $\frac{2}{3} + \frac{1}{4}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

14 $\frac{7}{10} - \frac{1}{4}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

15 $\frac{3}{5} + \frac{1}{6}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

16 $\frac{1}{4} - \frac{2}{9}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

17 $\frac{2}{5} + \frac{7}{20}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

18 $\frac{7}{10} - \frac{1}{6}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

The answer to these will be a mixed numeral

19 $\frac{3}{5} + \frac{1}{2} = \frac{\square}{\square} + \frac{\square}{\square}$

Equivalent Fractions

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

Total, Mixed

20 $\frac{4}{10} + \frac{5}{6} = \frac{\square}{\square} + \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

21 $\frac{10}{3} - \frac{4}{5} = \frac{\square}{\square} - \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

22 $\frac{12}{7} - \frac{2}{3} = \frac{\square}{\square} - \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

23 $\frac{7}{9} + \frac{1}{2} = \frac{\square}{\square} + \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

24 $\frac{22}{15} - \frac{1}{4} = \frac{\square}{\square} - \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

25 $\frac{2}{3} + \frac{8}{11} = \frac{\square}{\square} + \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

Adding/Subtracting Fractions (Different Denominator)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the numerator for these fractions to make them equivalent fractions.

1 $\frac{1}{2} = \frac{\boxed{2}}{4} = \frac{\boxed{4}}{8} = \frac{\boxed{10}}{20}$

2 $\frac{1}{3} = \frac{\boxed{2}}{6} = \frac{\boxed{4}}{12} = \frac{\boxed{6}}{18}$

3 $\frac{2}{3} = \frac{\boxed{6}}{9} = \frac{\boxed{8}}{12} = \frac{\boxed{14}}{21}$

4 $\frac{3}{5} = \frac{\boxed{6}}{10} = \frac{\boxed{9}}{15} = \frac{\boxed{15}}{25}$

5 $\frac{4}{6} = \frac{\boxed{2}}{3} = \frac{\boxed{20}}{30} = \frac{\boxed{16}}{24}$

6 Change these to eighths

$\frac{1}{2} = \frac{\boxed{4}}{\boxed{8}}$, $\frac{1}{4} = \frac{\boxed{2}}{\boxed{8}}$, $\frac{3}{4} = \frac{\boxed{6}}{\boxed{8}}$

7 Change these to twelfths

$\frac{1}{2} = \frac{\boxed{6}}{\boxed{12}}$, $\frac{2}{3} = \frac{\boxed{8}}{\boxed{12}}$, $\frac{3}{4} = \frac{\boxed{9}}{\boxed{12}}$

Add/subtract these. The denominator is given for the equivalent fractions

8 $\frac{1}{2} + \frac{3}{8}$

$= \frac{\boxed{4}}{\boxed{8}} + \frac{\boxed{3}}{\boxed{8}} = \frac{\boxed{7}}{\boxed{8}}$

9 $\frac{1}{2} + \frac{1}{3}$

$= \frac{\boxed{3}}{\boxed{6}} + \frac{\boxed{2}}{\boxed{6}} = \frac{\boxed{5}}{\boxed{6}}$

10 $\frac{3}{5} - \frac{1}{3}$

$= \frac{\boxed{9}}{\boxed{15}} - \frac{\boxed{5}}{\boxed{15}} = \frac{\boxed{4}}{\boxed{15}}$

Where possible simplify

11 $\frac{1}{2} + \frac{3}{10}$

Equivalent Fractions, Total, Simplify

$= \frac{\boxed{5}}{\boxed{10}} + \frac{\boxed{3}}{\boxed{10}} = \frac{\boxed{8}}{\boxed{10}} = \frac{\boxed{4}}{\boxed{5}}$

12 $\frac{1}{2} - \frac{1}{3}$

$= \frac{\boxed{3}}{\boxed{6}} - \frac{\boxed{2}}{\boxed{6}} = \frac{\boxed{1}}{\boxed{6}}$

13 $\frac{2}{3} + \frac{1}{4}$

$= \frac{\boxed{8}}{\boxed{12}} + \frac{\boxed{3}}{\boxed{12}} = \frac{\boxed{11}}{\boxed{12}}$

14 $\frac{7}{10} - \frac{1}{4}$

$= \frac{\boxed{14}}{\boxed{20}} - \frac{\boxed{5}}{\boxed{20}} = \frac{\boxed{9}}{\boxed{20}}$

15 $\frac{3}{5} + \frac{1}{6}$

$= \frac{\boxed{18}}{\boxed{30}} + \frac{\boxed{5}}{\boxed{30}} = \frac{\boxed{23}}{\boxed{30}}$

16 $\frac{1}{4} - \frac{2}{9}$

$= \frac{\boxed{9}}{\boxed{36}} - \frac{\boxed{8}}{\boxed{36}} = \frac{\boxed{1}}{\boxed{36}}$

17 $\frac{2}{5} + \frac{7}{20}$

$= \frac{\boxed{8}}{\boxed{20}} + \frac{\boxed{7}}{\boxed{20}} = \frac{\boxed{15}}{\boxed{20}} = \frac{\boxed{3}}{\boxed{4}}$

18 $\frac{7}{10} - \frac{1}{6}$

$= \frac{\boxed{21}}{\boxed{30}} - \frac{\boxed{5}}{\boxed{30}} = \frac{\boxed{16}}{\boxed{30}} = \frac{\boxed{8}}{\boxed{15}}$

The answer to these will be a mixed numeral

19 $\frac{3}{5} + \frac{1}{2}$

Equivalent Fractions

$= \frac{\boxed{6}}{\boxed{10}} + \frac{\boxed{5}}{\boxed{10}}$

$= \frac{\boxed{11}}{\boxed{10}} = \boxed{1}\frac{\boxed{1}}{\boxed{10}}$

Total, Mixed

20 $\frac{4}{10} + \frac{5}{6}$

$= \frac{\boxed{12}}{\boxed{30}} + \frac{\boxed{25}}{\boxed{30}}$

$= \frac{\boxed{37}}{\boxed{30}} = \boxed{1}\frac{\boxed{7}}{\boxed{30}}$

21 $\frac{10}{3} - \frac{4}{5}$

$= \frac{\boxed{50}}{\boxed{15}} - \frac{\boxed{12}}{\boxed{15}}$

$= \frac{\boxed{38}}{\boxed{15}} = \boxed{2}\frac{\boxed{8}}{\boxed{15}}$

22 $\frac{12}{7} - \frac{2}{3}$

$= \frac{\boxed{36}}{\boxed{21}} - \frac{\boxed{14}}{\boxed{21}}$

$= \frac{\boxed{22}}{\boxed{21}} = \boxed{1}\frac{\boxed{1}}{\boxed{21}}$

23 $\frac{7}{9} + \frac{1}{2}$

$= \frac{\boxed{14}}{\boxed{18}} + \frac{\boxed{9}}{\boxed{18}}$

$= \frac{\boxed{23}}{\boxed{18}} = \boxed{1}\frac{\boxed{5}}{\boxed{18}}$

24 $\frac{22}{15} - \frac{1}{4}$

$= \frac{\boxed{88}}{\boxed{60}} - \frac{\boxed{15}}{\boxed{60}}$

$= \frac{\boxed{73}}{\boxed{60}} = \boxed{1}\frac{\boxed{13}}{\boxed{60}}$

25 $\frac{2}{3} + \frac{8}{11}$

$= \frac{\boxed{22}}{\boxed{33}} + \frac{\boxed{24}}{\boxed{33}}$

$= \frac{\boxed{46}}{\boxed{33}} = \boxed{1}\frac{\boxed{13}}{\boxed{33}}$

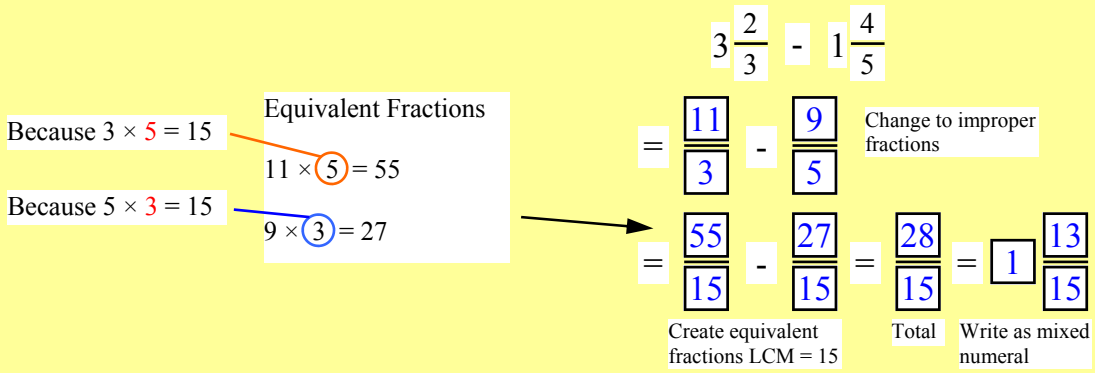
Adding and Subtracting Mixed Numerals (Different Denominators)

This is a challenging sheet and some students may experience difficulty with it. The method for each question is the same and is:

- Change both fractions to improper fractions
- Find the LCM (Lowest Common Multiple) of the 2 denominators
- Create equivalent fractions with the matching denominators
- Add or subtract, you will get an improper fraction as the answer
- Convert the improper fraction to a mixed numeral, and you are done.

Look at the steps below in the example, the first question has the denominators filled in for you to get started.

Example



Adding and Subtracting Mixed Numerals (Different Denominators)

$= \frac{37}{10} - \frac{9}{5}$

$= \frac{37}{10} - \frac{18}{10} = \frac{19}{10} = 1\frac{9}{10}$

5 $5\frac{4}{9} - 2\frac{2}{3}$

$= \frac{49}{9} - \frac{8}{3}$

$= \frac{49}{9} - \frac{24}{9} = \frac{25}{9} = 2\frac{7}{9}$

6 $1\frac{1}{5} + 1\frac{2}{7}$

$= \frac{6}{5} + \frac{9}{7}$

$= \frac{42}{35} + \frac{45}{35} = \frac{87}{35} = 2\frac{17}{35}$

7 $2\frac{3}{4} + 3\frac{2}{12}$

$= \frac{11}{4} + \frac{38}{12}$

$= \frac{33}{12} + \frac{38}{12} = \frac{71}{12} = 5\frac{11}{12}$

8 $4\frac{3}{4} - 2\frac{7}{10}$

$= \frac{19}{4} - \frac{27}{10}$

$= \frac{95}{20} - \frac{54}{20} = \frac{41}{20} = 2\frac{1}{20}$

9 $5\frac{5}{6} + 2\frac{1}{4}$

$= \frac{35}{6} + \frac{9}{4}$

$= \frac{70}{12} + \frac{27}{12} = \frac{97}{12} = 8\frac{1}{12}$

10 $4\frac{2}{5} - 2\frac{1}{2}$

$= \frac{22}{5} - \frac{5}{2}$

$= \frac{44}{10} - \frac{25}{10} = \frac{19}{10} = 1\frac{9}{10}$

11 $3\frac{3}{4} - 1\frac{4}{5}$

$= \frac{15}{4} - \frac{9}{5}$

$= \frac{75}{20} - \frac{36}{20} = \frac{39}{20} = 1\frac{19}{20}$

12 $5\frac{1}{3} - 3\frac{2}{5}$

$= \frac{16}{3} - \frac{17}{5}$

$= \frac{80}{15} - \frac{51}{15} = \frac{29}{15} = 1\frac{14}{15}$

13 $4\frac{3}{10} + 2\frac{4}{5}$

$= \frac{43}{10} + \frac{14}{5}$

$= \frac{43}{10} + \frac{28}{10} = \frac{71}{10} = 7\frac{1}{10}$

14 $6\frac{3}{7} - 4\frac{1}{2}$

$= \frac{45}{7} - \frac{9}{2}$

$= \frac{90}{14} - \frac{63}{14} = \frac{27}{14} = 1\frac{13}{14}$

15 $4\frac{1}{4} - 2\frac{5}{6}$

$= \frac{17}{4} - \frac{17}{6}$

$= \frac{51}{12} - \frac{34}{12} = \frac{17}{12} = 1\frac{5}{12}$

16 $3\frac{2}{7} + 1\frac{1}{3}$

$= \frac{23}{7} + \frac{4}{3}$

$= \frac{69}{21} + \frac{28}{21} = \frac{97}{21} = 4\frac{13}{21}$

17 $5\frac{1}{2} + 2\frac{2}{3}$

$= \frac{11}{2} + \frac{8}{3}$

$= \frac{33}{6} + \frac{16}{6} = \frac{49}{6} = 8\frac{1}{6}$

Multiplying Fractions

When fractions are multiplied, multiply straight across the top (the numerators) and straight across the bottom (the denominators). Unlike addition and subtraction the denominators are included in the operation.

Column 1 asks you first to multiply a whole number and a fraction. A whole number has no denominator so just multiply the number and the numerator (top number) of the fraction. A whole number written as a fraction is just the number over 1. For example $3 = {}^{3}/_{1}$ and $136 = {}^{136}/_{1}$. An example is below.

$$\frac{3}{19} \times 3 = \frac{9}{19} \quad \leftarrow 3 \times 3 = 9$$

From question 4 on, the column is all done the same way. The top numbers multiplied together and the denominators multiplied together. It doesn't matter if there are two fractions or six fractions multiplied, the process will still be the same. There will also be whole numbers mixed in, make sure you multiply the whole number only with the numerators (top numbers), not the denominator. Note that none of these questions can be simplified.

Column 2 is the same as column 1 only the fraction answer can be simplified.

Column 3 is a further extension, simplify the fractions and convert them to mixed or whole numbers.

$$\frac{2}{3} \times \frac{4}{7} = \frac{8}{21}$$

$2 \times 4 = 8$

$3 \times 7 = 21$

$$\frac{5}{6} \times \frac{3}{4} = \frac{15}{24} = \frac{5}{8}$$

HCF = 3
so ÷ top and bottom by 3

$$\frac{4}{5} \times \frac{10}{3} = \frac{40}{15} = \frac{8}{3} = 2\frac{2}{3}$$

Total — Simplify — Mixed Numeral

38 $\frac{11}{5} \times \frac{10}{11} = \frac{110}{55} = \frac{2}{1} = 2$

39 $\frac{9}{4} \times \frac{6}{5} = \frac{54}{20} = \frac{27}{10} = 2\frac{7}{10}$

Mixed Numeral

Fraction of a Quantity

Quantities can be litres, kg, even $, they are a measurement of anything, not just a volume. In column 1 two quantities are given and the fraction is required. Treat these problems as just simplification exercises. Create a fraction with the first value 'over' the second value, then simplify. Your answer will be a fraction with no units (see below left). Question 7 through 12 require a conversion to be made first so that both quantities are in the same units. Find the conversion, then follow the same method, form a fraction and simplify. (See below right)

HCF = 8
8 ÷ 8 = 1
24 ÷ 8 = 3

8 hr of 24 hr $= \frac{8}{24} = \frac{1}{3}$

900 mL of 2.4 L

2.4 L = 2 400 mL $= \frac{900}{2\,400} = \frac{3}{8}$

HCF = 300
900 ÷ 300 = 3
2 400 ÷ 300 = 8

In column 2 a fraction of a quantity is required. These problems are the same as multiplying fractions with whole numbers. Multiply the numerator (top number) by the whole number, the denominator stays the same. The denominator will divide into the numerator and you will be left with a whole number answer, after you write the answer put the units on the end.

3 × 52 = 156

$\frac{3}{4} \times 52\text{ m} = \frac{156}{4} = 39\text{ m}$

156 ÷ 4 = 39

Question 18 through to the end of the sheet uses the same method, only a conversion is to take place first. Given a quantity, change that quantity to a lower unit (to get a whole number answer). Then multiply by the numerator and divide by the denominator to get the final answer. The example below is 1.2 t, change this to kg (in brackets) = 1 200 kg, multiply by the fraction then simplify.

$\frac{3}{4}$ of 1.2 t [kg]

$= \frac{3}{4} \times$ 1 200 kg ← 1.2 t = 1 200 kg

$= \frac{3\,600}{4} =$ 900 kg

3 600 ÷ 4 = 900 kg

$= \frac{2}{3} \times 60\text{ cm}$

$= \frac{120}{3} = 40\text{ cm}$

Multiplying Mixed Numerals

When fractions are multiplied, multiply across the top numbers and across the bottom numbers. As mixed numerals have whole numbers in them you first must change them to improper fractions. Once this has been done the same multiplication method is used.

In column 1 a mixed numeral is multiplied by a proper fraction. The method used is:

- change the mixed numeral to an improper fraction and leave the proper fraction as it is.
- multiply the numerators and write the answer then multiply the denominators and write the answer
- simplify by finding the HCF (Highest Common Factor), which is the largest number that goes into both numbers and divide through
- then rewrite as a mixed numeral or a whole number.

An example is at the top of column 1.

Columns 2 and 3 are done in exactly the same way except there are two mixed numerals so you have to convert both to improper fractions not just one of them. There is an example at the top of column 2.

Multiplying Mixed Numerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Multiply these fractions and mixed numbers.

Example

$4\frac{2}{3} \times \frac{5}{6}$ Simplified: ÷ by 2

$= \frac{14}{3} \times \frac{5}{6} = \frac{70}{18} = \frac{35}{9}$

Convert to Improper

$= 3\frac{8}{9}$

1 $\frac{2}{3} \times 2\frac{1}{2}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

2 $4\frac{3}{4} \times \frac{2}{5}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

3 $3\frac{1}{2} \times \frac{4}{5}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

4 $\frac{5}{12} \times 2\frac{3}{5}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

5 $6\frac{1}{2} \times \frac{2}{7}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

Try these, they will result in mixed or whole numbers.

6 $2\frac{3}{4} \times 1\frac{3}{5}$

Improper Fractions Total Simplify

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

Multiplying Mixed Numerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Multiply these fractions and mixed numbers.

Example

$4\frac{2}{3} \times \frac{5}{6}$

Simplified: ÷ by 2

$= \frac{14}{3} \times \frac{5}{6} = \frac{70}{18} = \frac{35}{9}$

Convert to Improper

$= 3\frac{8}{9}$

1 $\frac{2}{3} \times 2\frac{1}{2}$

$= \frac{2}{3} \times \frac{5}{2} = \frac{10}{6} = \frac{5}{3}$

$= 1\frac{2}{3}$

2 $4\frac{3}{4} \times \frac{2}{5}$

$= \frac{19}{4} \times \frac{2}{5} = \frac{38}{20} = \frac{19}{10}$

$= 1\frac{9}{10}$

3 $3\frac{1}{2} \times \frac{4}{5}$

$= \frac{7}{2} \times \frac{4}{5} = \frac{28}{10} = \frac{14}{5}$

$= 2\frac{4}{5}$

4 $\frac{5}{12} \times 2\frac{3}{5}$

$= \frac{5}{12} \times \frac{13}{5} = \frac{65}{60} = \frac{13}{12}$

$= 1\frac{1}{12}$

5 $6\frac{1}{2} \times \frac{2}{7}$

$= \frac{13}{2} \times \frac{2}{7} = \frac{26}{14} = \frac{13}{7}$

$= 1\frac{6}{7}$

Try these, they will result in mixed or whole numbers.

6 $2\frac{3}{4} \times 1\frac{3}{5}$

Improper Fractions — Total — Simplify

$= \frac{11}{4} \times \frac{8}{5} = \frac{88}{20} = \frac{22}{5}$

$= 4\frac{2}{5}$

Mixed Numeral

7 $5\frac{1}{3} \times 1\frac{1}{2}$

$= \frac{16}{3} \times \frac{3}{2} = \frac{48}{6} = \frac{8}{1}$

$= 8$

8 $1\frac{2}{3} \times 2\frac{1}{4}$

$= \frac{5}{3} \times \frac{9}{4} = \frac{45}{12} = \frac{15}{4}$

$= 3\frac{3}{4}$

9 $2\frac{2}{5} \times 2\frac{1}{2}$

$= \frac{12}{5} \times \frac{5}{2} = \frac{60}{10} = \frac{6}{1}$

$= 6$

10 $3\frac{1}{2} \times 1\frac{3}{5}$

$= \frac{7}{2} \times \frac{8}{5} = \frac{56}{10} = \frac{28}{5}$

$= 5\frac{3}{5}$

11 $1\frac{3}{10} \times 3\frac{1}{3}$

$= \frac{13}{10} \times \frac{10}{3} = \frac{130}{30} = \frac{13}{3}$

$= 4\frac{1}{3}$

12 $7\frac{1}{2} \times 1\frac{1}{7}$

$= \frac{15}{2} \times \frac{8}{7} = \frac{120}{14} = \frac{60}{7}$

$= 8\frac{4}{7}$

13 $1\frac{1}{4} \times 2\frac{2}{9}$

$= \frac{5}{4} \times \frac{20}{9} = \frac{100}{36} = \frac{25}{9}$

$= 2\frac{7}{9}$

14 $4\frac{1}{4} \times 1\frac{1}{3}$

$= \frac{25}{4} \times \frac{4}{3} = \frac{100}{12} = \frac{25}{3}$

$= 8\frac{1}{3}$

15 $1\frac{3}{7} \times 1\frac{4}{5}$

$= \frac{10}{7} \times \frac{9}{5} = \frac{90}{35} = \frac{18}{7}$

$= 2\frac{4}{7}$

16 $2\frac{2}{3} \times 1\frac{1}{4}$

$= \frac{8}{3} \times \frac{5}{4} = \frac{40}{12} = \frac{10}{3}$

$= 3\frac{1}{3}$

17 $3\frac{1}{3} \times 1\frac{2}{5}$

$= \frac{10}{3} \times \frac{7}{5} = \frac{70}{15} = \frac{14}{3}$

$= 4\frac{2}{3}$

18 $1\frac{3}{4} \times 1\frac{3}{5}$

$= \frac{7}{4} \times \frac{8}{5} = \frac{56}{20} = \frac{14}{5}$

$= 2\frac{4}{5}$

Multiplying Fractions Using Cancellation

When fractions are canceled they are simplified before multiplication, but instead of simplifying the fraction's numerator and denominator you simplify diagonally. This means that the numerator with one fraction is cancelled against the denominator of the other and vice versa.

In Column 1 the fractions are either proper or improper, you have to cancel across diagonals by finding the HCF, the largest number that divides into both numbers and dividing through. Once you divide, strike out the old number and write its replacement, then multiply and change to a mixed or whole number.

Questions 1 - 5 can only be cancelled across one diagonal, questions 6 - 12 can be cancelled across both diagonals.

Column 2 involves proper fractions and mixed numerals, on the line below change the mixed numeral to an improper fraction, rewrite the proper fraction below itself then start canceling. The first 4 questions can be cancelled on one diagonal only, then for the rest of the column canceling will be possible on both diagonals.

Column 3 is a further step again with two mixed numerals having to be multiplied. Convert both this time to improper, cancel, multiply and change back to mixed numerals. There is an example below.

Diagonals 6 and 9 have a HCF of 3:
6 ÷ 3 = 2
9 ÷ 3 = 3

Diagonals 5 and 25 have a HCF of 5:
5 ÷ 5 = 1
25 ÷ 5 = 5

$$\frac{\overset{2}{\cancel{6}}}{\underset{1}{\cancel{5}}} \times \frac{\overset{5}{\cancel{25}}}{\underset{3}{\cancel{9}}} = \frac{10}{3} = 3\frac{1}{3}$$

Convert improper fraction to a mixed numeral

$$1\frac{7}{11} \times 4\frac{1}{8}$$

Diagonals 18 and 8 have a HCF of 2:
18 ÷ 2 = 9
8 ÷ 2 = 4

Diagonals 11 and 33 have a HCF of 11:
11 ÷ 11 = 1
33 ÷ 11 = 3

$$= \frac{\overset{9}{\cancel{18}}}{\underset{1}{\cancel{11}}} \times \frac{\overset{3}{\cancel{33}}}{\underset{4}{\cancel{8}}} = \frac{27}{4} = 6\frac{3}{4}$$

Convert to mixed numerals

Convert improper fraction to a mixed numeral

Multiplying Fractions Using Cancellation

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use cancelling on one diagonal, then multiply and change from improper to mixed

Example

$\frac{\cancel{16}^{4}}{3} \times \frac{1}{\cancel{4}_{1}} = \frac{4}{3} = 1\frac{1}{3}$

1 $\frac{3}{2} \times \frac{11}{6} = \frac{\square}{\square} = \square\frac{\square}{\square}$

2 $\frac{21}{5} \times \frac{4}{7} = \frac{\square}{\square} = \square\frac{\square}{\square}$

3 $\frac{7}{6} \times \frac{18}{5} = \frac{\square}{\square} = \square\frac{\square}{\square}$

4 $\frac{5}{2} \times \frac{11}{15} = \frac{\square}{\square} = \square\frac{\square}{\square}$

5 $\frac{9}{14} \times \frac{7}{2} = \frac{\square}{\square} = \square\frac{\square}{\square}$

This time cancel across both diagonals

6 $\frac{5}{2} \times \frac{8}{15} = \frac{\square}{\square} = \square\frac{\square}{\square}$

7 $\frac{10}{3} \times \frac{9}{20} = \frac{\square}{\square} = \square\frac{\square}{\square}$

8 $\frac{12}{5} \times \frac{25}{6} = \frac{\square}{\square} = \square$

9 $\frac{3}{4} \times \frac{16}{9} = \frac{\square}{\square} = \square\frac{\square}{\square}$

10 $\frac{50}{7} \times \frac{7}{30} = \frac{\square}{\square} = \square\frac{\square}{\square}$

11 $\frac{55}{9} \times \frac{12}{35} = \frac{\square}{\square} = \square\frac{\square}{\square}$

12 $\frac{17}{20} \times \frac{40}{34} = \frac{\square}{\square} = \square$

Change to improper fractions, then answer as a mixed numeral.

13 $3\frac{1}{2} \times \frac{4}{5}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

14 $\frac{7}{9} \times 1\frac{4}{5}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

15 $2\frac{1}{3} \times \frac{11}{14}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

16 $\frac{8}{11} \times 3\frac{1}{4}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

17 $4\frac{4}{9} \times \frac{3}{10}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

18 $3\frac{3}{4} \times \frac{12}{25}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

19 $\frac{4}{5} \times 1\frac{7}{8}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

20 $5\frac{5}{6} \times \frac{3}{7}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

21 $\frac{20}{27} \times 3\frac{3}{5}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

Both are mixed numerals, solve these.

22 $1\frac{19}{26} \times 1\frac{3}{10}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

23 $1\frac{9}{35} \times 4\frac{1}{11}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

24 $2\frac{4}{5} \times 1\frac{3}{7}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square$

25 $1\frac{1}{12} \times 1\frac{5}{13}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

26 $2\frac{4}{5} \times 4\frac{1}{6}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

27 $1\frac{5}{7} \times 2\frac{5}{8}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

28 $2\frac{2}{5} \times 2\frac{7}{9}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

29 $3\frac{8}{9} \times 2\frac{7}{10}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

30 $2\frac{11}{12} \times 1\frac{11}{21}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

Multiplying Fractions Using Cancellation

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use cancelling on one diagonal, then multiply and change from improper to mixed

Example

$\frac{\cancel{16}^{4}}{3} \times \frac{1}{\cancel{4}_{1}} = \frac{4}{3} = 1\frac{1}{3}$

1 $\frac{\cancel{3}^{1}}{2} \times \frac{11}{\cancel{6}_{2}} = \frac{11}{4} = 2\frac{3}{4}$

2 $\frac{\cancel{21}^{3}}{5} \times \frac{4}{\cancel{7}_{1}} = \frac{12}{5} = 2\frac{2}{5}$

3 $\frac{7}{\cancel{6}_{1}} \times \frac{\cancel{18}^{3}}{5} = \frac{21}{5} = 4\frac{1}{5}$

4 $\frac{\cancel{5}^{1}}{2} \times \frac{11}{\cancel{15}_{3}} = \frac{11}{6} = 1\frac{5}{6}$

5 $\frac{9}{\cancel{14}_{2}} \times \frac{\cancel{7}^{1}}{2} = \frac{9}{4} = 2\frac{1}{4}$

This time cancel across both diagonals

6 $\frac{\cancel{5}^{1}}{\cancel{2}_{1}} \times \frac{\cancel{8}^{4}}{\cancel{15}_{3}} = \frac{4}{3} = 1\frac{1}{3}$

7 $\frac{\cancel{10}^{1}}{\cancel{3}_{1}} \times \frac{\cancel{9}^{3}}{\cancel{20}_{2}} = \frac{3}{2} = 1\frac{1}{2}$

8 $\frac{\cancel{12}^{2}}{\cancel{5}_{1}} \times \frac{\cancel{25}^{5}}{\cancel{6}_{1}} = \frac{10}{1} = 10$

9 $\frac{\cancel{3}^{1}}{\cancel{4}_{1}} \times \frac{\cancel{16}^{4}}{\cancel{9}_{3}} = \frac{4}{3} = 1\frac{1}{3}$

10 $\frac{\cancel{50}^{5}}{\cancel{7}_{1}} \times \frac{\cancel{7}^{1}}{\cancel{30}_{3}} = \frac{5}{3} = 1\frac{2}{3}$

11 $\frac{\cancel{55}^{11}}{\cancel{9}_{3}} \times \frac{\cancel{12}^{4}}{\cancel{35}_{7}} = \frac{44}{21} = 2\frac{2}{21}$

12 $\frac{\cancel{17}^{1}}{\cancel{20}_{1}} \times \frac{\cancel{40}^{2}}{\cancel{34}_{2}} = \frac{2}{2} = 1$

Change to improper fractions, then answer as a mixed numeral.

13 $3\frac{1}{2} \times \frac{4}{5}$

$= \frac{\cancel{7}^{1}}{\cancel{2}_{1}} \times \frac{\cancel{4}^{2}}{5} = \frac{14}{5} = 2\frac{4}{5}$

14 $\frac{7}{9} \times 1\frac{4}{5}$

$= \frac{7}{\cancel{9}_{1}} \times \frac{\cancel{9}^{1}}{5} = \frac{7}{5} = 1\frac{2}{5}$

15 $2\frac{1}{3} \times \frac{11}{14}$

$= \frac{\cancel{7}^{1}}{3} \times \frac{11}{\cancel{14}_{2}} = \frac{11}{6} = 1\frac{5}{6}$

16 $\frac{8}{11} \times 3\frac{1}{4}$

$= \frac{\cancel{8}^{2}}{11} \times \frac{13}{\cancel{4}_{1}} = \frac{26}{11} = 2\frac{4}{11}$

17 $4\frac{4}{9} \times \frac{3}{10}$

$= \frac{\cancel{40}^{4}}{\cancel{9}_{3}} \times \frac{\cancel{3}^{1}}{\cancel{10}_{1}} = \frac{4}{3} = 1\frac{1}{3}$

18 $3\frac{3}{4} \times \frac{12}{25}$

$= \frac{\cancel{15}^{3}}{\cancel{4}_{1}} \times \frac{\cancel{12}^{3}}{\cancel{25}_{5}} = \frac{9}{5} = 1\frac{4}{5}$

19 $\frac{4}{5} \times 1\frac{7}{8}$

$= \frac{\cancel{4}^{1}}{\cancel{5}_{1}} \times \frac{\cancel{15}^{3}}{\cancel{8}_{2}} = \frac{3}{2} = 1\frac{1}{2}$

20 $5\frac{5}{6} \times \frac{3}{7}$

$= \frac{\cancel{35}^{5}}{\cancel{6}_{2}} \times \frac{\cancel{3}^{1}}{\cancel{7}_{1}} = \frac{5}{2} = 2\frac{1}{2}$

21 $\frac{20}{27} \times 3\frac{3}{5}$

$= \frac{\cancel{20}^{4}}{\cancel{27}_{3}} \times \frac{\cancel{18}^{2}}{\cancel{5}_{1}} = \frac{8}{3} = 2\frac{2}{3}$

Both are mixed numerals, solve these.

22 $1\frac{19}{26} \times 1\frac{3}{10}$

$= \frac{\cancel{45}^{9}}{\cancel{26}_{2}} \times \frac{\cancel{13}^{1}}{\cancel{10}_{2}} = \frac{9}{4} = 2\frac{1}{4}$

23 $1\frac{9}{35} \times 4\frac{1}{11}$

$= \frac{\cancel{44}^{4}}{\cancel{35}_{7}} \times \frac{\cancel{45}^{9}}{\cancel{11}_{1}} = \frac{36}{7} = 5\frac{1}{7}$

24 $2\frac{4}{5} \times 1\frac{3}{7}$

$= \frac{\cancel{14}^{2}}{\cancel{5}_{1}} \times \frac{\cancel{10}^{2}}{\cancel{7}_{1}} = \frac{4}{1} = 4$

25 $1\frac{1}{12} \times 1\frac{5}{13}$

$= \frac{\cancel{13}^{1}}{\cancel{12}_{2}} \times \frac{\cancel{18}^{3}}{\cancel{13}_{1}} = \frac{3}{2} = 1\frac{1}{2}$

26 $2\frac{4}{5} \times 4\frac{1}{6}$

$= \frac{\cancel{14}^{7}}{\cancel{5}_{1}} \times \frac{\cancel{25}^{5}}{\cancel{6}_{3}} = \frac{35}{3} = 11\frac{2}{3}$

27 $1\frac{5}{7} \times 2\frac{5}{8}$

$= \frac{\cancel{12}^{3}}{\cancel{7}_{1}} \times \frac{\cancel{21}^{3}}{\cancel{8}_{2}} = \frac{9}{2} = 4\frac{1}{2}$

28 $2\frac{2}{5} \times 2\frac{7}{9}$

$= \frac{\cancel{12}^{4}}{\cancel{5}_{1}} \times \frac{\cancel{25}^{5}}{\cancel{9}_{3}} = \frac{20}{3} = 6\frac{2}{3}$

29 $3\frac{8}{9} \times 2\frac{7}{10}$

$= \frac{\cancel{35}^{7}}{\cancel{9}_{1}} \times \frac{\cancel{27}^{3}}{\cancel{10}_{2}} = \frac{21}{2} = 10\frac{1}{2}$

30 $2\frac{11}{12} \times 1\frac{11}{21}$

$= \frac{\cancel{35}^{5}}{\cancel{12}_{3}} \times \frac{\cancel{32}^{8}}{\cancel{21}_{3}} = \frac{40}{9} = 4\frac{4}{9}$

Dividing Fractions And Reciprocal

The reciprocal of a fraction is the fraction turned upside-down. The reciprocal is used to convert the division process to a multiplication process. When a fraction has a division sign before it turn the fraction upside and change the ÷ sign to a × sign.

Column 1 requires the reciprocal to be found. This is achieved by turning the fraction upside-down. In the case of improper fractions they become proper fractions, and proper fractions become improper fractions. So for example $^{10}/_{11}$ would have a reciprocal of $^{11}/_{10}$ which becomes $1^{1}/_{10}$. Write it as a mixed number for this column because it fully answers the question, but in the division process we would leave it as an improper fraction for calculations. Questions 9 through 15 require you to change mixed and whole numbers to improper fractions then find the reciprocal. A whole number is written as the number over 1, e.g. 23 would be $^{23}/_{1}$, then turn it upside-down and you get $^{1}/_{23}$. Look at the example at the top of the column.

Column 2 uses the reciprocal in the division process. Turn the fraction that is behind the division sign upside-down, then multiply. So there is no division process with fractions calculations, you always use multiplication. Questions 23 through 25 are an extension of this, turn the fractions that have a ÷ sign before them upside-down, make sure you don't turn fractions with a × sign before them upside-down! An example is below, it is done twice, the first time by simplifying, the second by canceling, if you can cancel then use that method.

Column 3 adds a further step in the process as the answer will be a mixed numeral. There is an example at the top of the column

Note that this sheet can be done by canceling or by simplifying after multiplication, the choice is yours. If you do use canceling you will find that the simplifying stage won't be required and you will have unused spaces.

$$\frac{6}{25} \div \frac{3}{10} = \frac{6}{25} \times \frac{10}{3} = \frac{60}{75} = \frac{4}{5}$$

$$\frac{6}{25} \div \frac{3}{10} = \frac{\overset{2}{\cancel{6}}}{\underset{5}{\cancel{25}}} \times \frac{\overset{2}{\cancel{10}}}{\underset{1}{\cancel{3}}} = \frac{4}{5} = \frac{\square}{\square}$$

Dividing Fractions And Reciprocal

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the reciprocal, answer as whole or mixed numbers where possible

Example 1 $\frac{55}{9} \rightarrow \frac{9}{55}$ Example 2 $\frac{7}{19} \rightarrow \frac{19}{7} = 2\frac{5}{7}$

1 $\frac{4}{3} \rightarrow$ 2 $\frac{9}{2} \rightarrow$

3 $\frac{4}{5} \rightarrow =$

4 $\frac{10}{3} \rightarrow$ 5 $\frac{73}{8} \rightarrow$

6 $\frac{1}{3} \rightarrow =$

7 $\frac{4}{13} \rightarrow =$

8 $\frac{1}{23} \rightarrow =$

Change to improper fractions then find the reciprocal.

9 $5 = \rightarrow$

10 $2\frac{2}{3} = \rightarrow$

11 $12 = \rightarrow$

12 $5\frac{3}{4} = \rightarrow$

13 $5\frac{3}{10} = \rightarrow$

14 $7 = \rightarrow$

15 $9\frac{1}{2} = \rightarrow$

Find the reciprocal of the fraction behind the ÷, then ×. Simplify if possible.

16 $\frac{1}{4} \div \frac{3}{5} = \times =$

17 $\frac{3}{8} \div \frac{4}{7} = \times =$

18 $\frac{1}{2} \div \frac{5}{9} = \times =$

19 $\frac{2}{5} \div \frac{7}{5} = \times = =$

20 $\frac{7}{11} \div \frac{3}{4} = \times =$

21 $\frac{4}{9} \div \frac{10}{15} = \times = =$

22 $\frac{2}{3} \div \frac{16}{21} = \times = =$

23 $\frac{1}{2} \div \frac{3}{4} \div \frac{5}{6} = \times \times = = =$

24 $\frac{2}{3} \times \frac{3}{10} \div \frac{3}{4} = \times \times = = =$

25 $\frac{5}{12} \div \frac{2}{7} \div 3 = \times \times = = =$

This time the answers will need to be changed to mixed or whole numbers

Example (with canceling) $\frac{3}{4} \div \frac{7}{12} = \frac{3}{\cancel{4}_{1}} \times \frac{\cancel{12}^{3}}{7} = \frac{9}{7}$

Simplify here if you have difficulty with canceling $= = 1\frac{2}{7}$

26 $\frac{3}{4} \div \frac{6}{11} = \times = = =$

27 $\frac{8}{5} \div \frac{8}{11} = \times = = =$

28 $\frac{15}{4} \div \frac{20}{7} = \times = = =$

29 $\frac{9}{8} \div \frac{1}{2} = \times = = =$

30 $\frac{5}{4} \div \frac{5}{7} \div \frac{7}{8} = \times \times = = =$

31 $\frac{2}{3} \times \frac{11}{4} \div \frac{22}{15} = \times \times = = =$

Dividing Fractions And Reciprocal

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the reciprocal, answer as whole or mixed numbers where possible

Example 1 Example 2

$\frac{55}{9} \rightarrow \frac{9}{55}$ $\frac{7}{19} \rightarrow \frac{19}{7} = 2\frac{5}{7}$

1 $\frac{4}{3} \rightarrow \frac{3}{4}$ 2 $\frac{9}{2} \rightarrow \frac{2}{9}$

3 $\frac{4}{5} \rightarrow \frac{5}{4} = 1\frac{1}{4}$

4 $\frac{10}{3} \rightarrow \frac{3}{10}$ 5 $\frac{73}{8} \rightarrow \frac{8}{73}$

6 $\frac{1}{3} \rightarrow \frac{3}{1} = 3$

7 $\frac{4}{13} \rightarrow \frac{13}{4} = 3\frac{1}{4}$

8 $\frac{1}{23} \rightarrow \frac{23}{1} = 23$

Change to improper fractions then find the reciprocal.

9 $5 = \frac{5}{1} \rightarrow \frac{1}{5}$

10 $2\frac{2}{3} = \frac{8}{3} \rightarrow \frac{3}{8}$

11 $12 = \frac{12}{1} \rightarrow \frac{1}{12}$

12 $5\frac{3}{4} = \frac{23}{4} \rightarrow \frac{4}{23}$

13 $5\frac{3}{10} = \frac{53}{10} \rightarrow \frac{10}{53}$

14 $7 = \frac{7}{1} \rightarrow \frac{1}{7}$

15 $9\frac{1}{2} = \frac{19}{2} \rightarrow \frac{2}{19}$

Find the reciprocal of the fraction behind the ÷, then ×. Simplify if possible.

16 $\frac{1}{4} \div \frac{3}{5} = \frac{1}{4} \times \frac{5}{3} = \frac{5}{12}$

17 $\frac{3}{8} \div \frac{4}{7} = \frac{3}{8} \times \frac{7}{4} = \frac{21}{32}$

18 $\frac{1}{2} \div \frac{5}{9} = \frac{1}{2} \times \frac{9}{5} = \frac{9}{10}$

19 $\frac{2}{5} \div \frac{7}{5} = \frac{2}{\cancel{5}_1} \times \frac{\cancel{5}^1}{7} = \frac{2}{7} = \frac{\square}{\square}$

20 $\frac{7}{11} \div \frac{3}{4} = \frac{7}{11} \times \frac{4}{3} = \frac{28}{33}$

21 $\frac{4}{9} \div \frac{10}{15} = \frac{\cancel{4}^2}{\cancel{9}_3} \times \frac{\cancel{15}^5}{\cancel{10}_5} = \frac{10}{15} = \frac{2}{3}$

22 $\frac{2}{3} \div \frac{16}{21} = \frac{\cancel{2}^1}{\cancel{3}_1} \times \frac{\cancel{21}^7}{\cancel{16}_8} = \frac{7}{8} = \frac{\square}{\square}$

23 $\frac{1}{2} \div \frac{3}{4} \div \frac{5}{6}$

$= \frac{1}{\cancel{2}_1} \times \frac{\cancel{4}^2}{\cancel{3}_1} \times \frac{\cancel{6}^2}{5} = \frac{4}{5} = \frac{\square}{\square}$

24 $\frac{2}{3} \times \frac{3}{10} \div \frac{3}{4}$

$= \frac{2}{\cancel{3}_1} \times \frac{\cancel{3}^1}{\cancel{10}_5} \times \frac{\cancel{4}^2}{3} = \frac{4}{15} = \frac{\square}{\square}$

25 $\frac{5}{12} \div \frac{2}{7} \div 3$

$= \frac{5}{12} \times \frac{7}{2} \times \frac{1}{3} = \frac{35}{72}$

This time the answers will need to be changed to mixed or whole numbers

Example (with canceling)

$\frac{3}{4} \div \frac{7}{12} = \frac{3}{\cancel{4}_1} \times \frac{\cancel{12}^3}{7} = \frac{9}{7}$

Simplify here if you have difficulty with canceling $= \frac{\square}{\square} = 1\frac{2}{7}$

26 $\frac{3}{4} \div \frac{6}{11} = \frac{\cancel{3}^1}{4} \times \frac{11}{\cancel{6}_2} = \frac{11}{8} = \frac{\square}{\square} = 1\frac{3}{8}$

27 $\frac{8}{5} \div \frac{8}{11} = \frac{\cancel{8}^1}{5} \times \frac{11}{\cancel{8}_1} = \frac{11}{5} = \frac{\square}{\square} = 2\frac{1}{5}$

28 $\frac{15}{4} \div \frac{20}{7} = \frac{\cancel{15}^3}{4} \times \frac{7}{\cancel{20}_4} = \frac{21}{16} = \frac{\square}{\square} = 1\frac{5}{16}$

29 $\frac{9}{8} \div \frac{1}{2} = \frac{9}{\cancel{8}_4} \times \frac{\cancel{2}^1}{1} = \frac{9}{4} = \frac{\square}{\square} = 2\frac{1}{4}$

30 $\frac{5}{4} \div \frac{5}{7} \div \frac{7}{8}$

$= \frac{\cancel{5}^1}{\cancel{4}_1} \times \frac{\cancel{7}^1}{\cancel{5}_1} \times \frac{\cancel{8}^2}{\cancel{7}_1} = \frac{2}{1} = \frac{\square}{\square} = 2$

31 $\frac{2}{3} \times \frac{11}{4} \div \frac{22}{15}$

$= \frac{\cancel{2}^1}{\cancel{3}_1} \times \frac{\cancel{11}^1}{\cancel{4}_2} \times \frac{\cancel{15}^5}{\cancel{22}_2} = \frac{5}{4} = \frac{\square}{\square} = 1\frac{1}{4}$

Dividing Mixed Numerals

Dividing mixed numerals is an extension on dividing fractions, the extra step required is to convert the mixed numeral to an improper fraction.

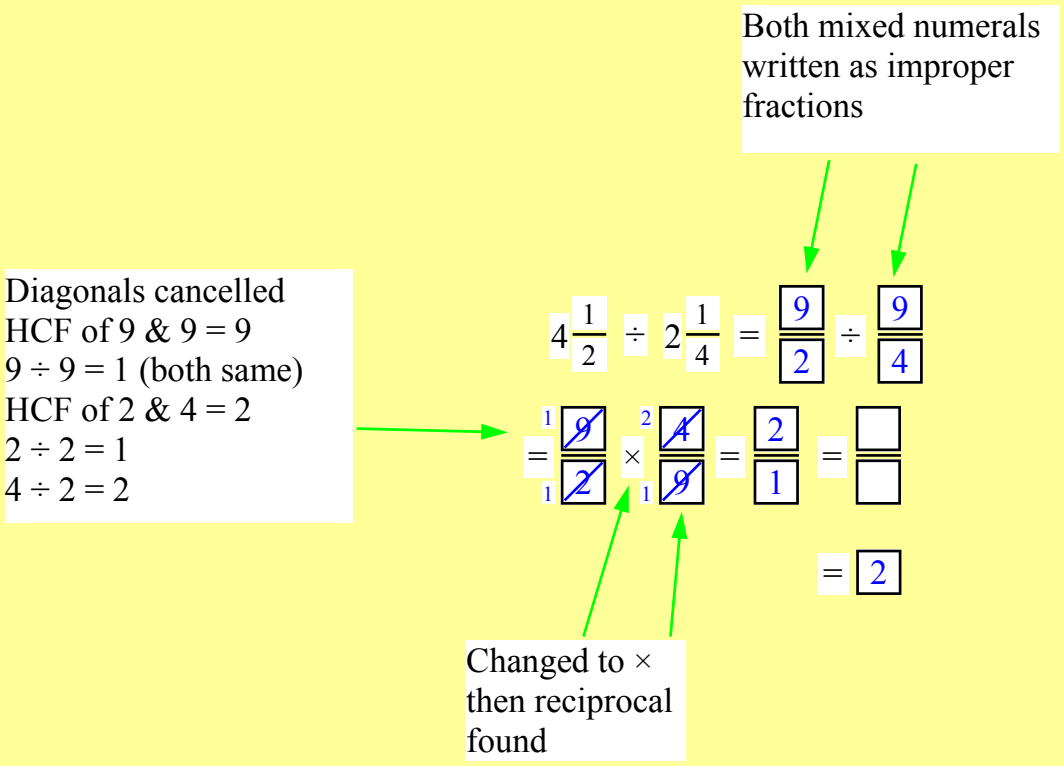
In column 1 a mixed numeral is divided by a proper fraction. To answer these questions follow these steps:

- Change the mixed numeral to an improper fraction
- Turn the proper fraction upside-down and write the reciprocal underneath the fraction
- Multiply across the top (numerators) and the bottom (denominators) to get the answer, it will be an improper fraction
- These questions can't be simplified so change the improper fraction answer to a mixed numeral and you are done.

An example is at the top of the column, note that you only invert (turn upside-down) the fractions that are behind a ÷ sign. In the lower questions multiplication is included to test that you are aware of this. Don't find the reciprocal of fractions that are behind a × sign.

Columns 2 and 3 are the same as column 1 except both are mixed numerals not just one of the numbers. An example is below. The steps are the same as above except that:

- Both must be converted from mixed numbers to improper fractions
- The answers will often need to be simplified
- As with previous sheets if you have difficultly with the concept of canceling there are additional spaces for simplifying your answer, if you are canceling you mostly won't need to use these spaces.
- If you don't use canceling you may find questions 16 and 17 difficult to simplify



Dividing Mixed Numerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Divide these fractions and whole numbers.

Example

$3\frac{1}{2} \div \frac{2}{3}$ Reciprocal

$= \frac{7}{2} \times \frac{3}{2} = \frac{21}{4} = 5\frac{1}{4}$

Convert to Improper

1 $2\frac{3}{4} \div \frac{4}{5}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

2 $1\frac{1}{4} \div \frac{2}{3}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

3 $2\frac{1}{2} \div \frac{7}{9}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

4 $5\frac{1}{3} \div \frac{3}{4}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

5 $1\frac{2}{5} \div \frac{3}{4} \times \frac{2}{3}$

$= \frac{\square}{\square} \times \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

6 $3\frac{1}{2} \div \frac{1}{3} \times \frac{1}{5}$

$= \frac{\square}{\square} \times \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

7 $3\frac{1}{3} \times \frac{2}{3} \div \frac{1}{4}$

$= \frac{\square}{\square} \times \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \square\frac{\square}{\square}$

Try these, they will result in mixed or whole numbers.

8 $4\frac{1}{2} \div 1\frac{2}{3} = \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

9 $2\frac{1}{4} \div 1\frac{3}{8} = \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

10 $3\frac{3}{4} \div 2\frac{1}{4} = \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

11 $1\frac{5}{7} \div 1\frac{3}{7} = \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

12 $9\frac{1}{2} \div 3\frac{1}{3} = \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

13 $1\frac{4}{5} \div 1\frac{3}{10} = \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

14 $2\frac{3}{7} \div 1\frac{7}{10} = \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

15 $4\frac{1}{3} \div 1\frac{2}{3} = \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

$= \square\frac{\square}{\square}$

16 $2\frac{1}{3} \div 1\frac{3}{4} \div \frac{2}{5}$

$= \frac{\square}{\square} \div \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

17 $1\frac{1}{2} \div 1\frac{5}{6} \div 1\frac{1}{11}$

$= \frac{\square}{\square} \div \frac{\square}{\square} \div \frac{\square}{\square}$

$= \frac{\square}{\square} \times \frac{\square}{\square} \times \frac{\square}{\square} = \frac{\square}{\square}$

$= \frac{\square}{\square} = \square\frac{\square}{\square}$

Dividing Mixed Numerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Divide these fractions and whole numbers.

Example

$3\frac{1}{2} \div \frac{2}{3}$ Reciprocal

$= \frac{7}{2} \times \frac{3}{2} = \frac{21}{4} = 5\frac{1}{4}$

Convert to Improper

1 $2\frac{3}{4} \div \frac{4}{5}$

$= \frac{11}{4} \times \frac{5}{4} = \frac{55}{16} = 3\frac{7}{16}$

2 $1\frac{1}{4} \div \frac{2}{3}$

$= \frac{5}{4} \times \frac{3}{2} = \frac{15}{8} = 1\frac{7}{8}$

3 $2\frac{1}{2} \div \frac{7}{9}$

$= \frac{5}{2} \times \frac{9}{7} = \frac{45}{14} = 3\frac{3}{14}$

4 $5\frac{1}{3} \div \frac{3}{4}$

$= \frac{16}{3} \times \frac{4}{3} = \frac{64}{9} = 7\frac{1}{9}$

5 $1\frac{2}{5} \div \frac{3}{4} \times \frac{2}{3}$

$= \frac{7}{5} \times \frac{4}{3} \times \frac{2}{3} = \frac{56}{45} = 1\frac{11}{45}$

6 $3\frac{1}{2} \div \frac{1}{3} \times \frac{1}{5}$

$= \frac{7}{2} \times \frac{3}{1} \times \frac{1}{5} = \frac{21}{10} = 2\frac{1}{10}$

7 $3\frac{1}{3} \times \frac{2}{3} \div \frac{1}{4}$

$= \frac{10}{3} \times \frac{2}{3} \times \frac{4}{1} = \frac{80}{9} = 8\frac{8}{9}$

Try these, they will result in mixed or whole numbers.

8 $4\frac{1}{2} \div 1\frac{2}{3} = \frac{9}{2} \div \frac{5}{3}$

$= \frac{9}{2} \times \frac{3}{5} = \frac{27}{10} = \square\square$

$= 2\frac{7}{10}$

9 $2\frac{1}{4} \div 1\frac{3}{8} = \frac{9}{4} \div \frac{11}{8}$

$= \frac{\cancel{9}^{1}}{\cancel{4}_{1}} \times \frac{\cancel{8}^{2}}{11} = \frac{18}{11} = \square\square$

$= 1\frac{7}{11}$

10 $3\frac{3}{4} \div 2\frac{1}{4} = \frac{15}{4} \div \frac{9}{4}$

$= \frac{\cancel{15}^{5}}{\cancel{4}_{1}} \times \frac{\cancel{4}^{1}}{\cancel{9}_{3}} = \frac{5}{3} = \square\square$

$= 1\frac{2}{3}$

11 $1\frac{5}{7} \div 1\frac{3}{7} = \frac{12}{7} \div \frac{10}{7}$

$= \frac{\cancel{12}^{6}}{\cancel{7}_{1}} \times \frac{\cancel{7}^{1}}{\cancel{10}_{5}} = \frac{6}{5} = \square\square$

$= 1\frac{1}{5}$

12 $9\frac{1}{2} \div 3\frac{1}{3} = \frac{19}{2} \div \frac{10}{3}$

$= \frac{19}{2} \times \frac{3}{10} = \frac{57}{20} = \square\square$

$= 2\frac{17}{20}$

13 $1\frac{4}{5} \div 1\frac{3}{10} = \frac{9}{5} \div \frac{13}{10}$

$= \frac{\cancel{9}^{1}}{\cancel{5}_{1}} \times \frac{\cancel{10}^{2}}{13} = \frac{18}{13} = \square\square$

$= 1\frac{5}{13}$

14 $2\frac{3}{7} \div 1\frac{7}{10} = \frac{17}{7} \div \frac{17}{10}$

$= \frac{\cancel{17}^{1}}{7} \times \frac{10}{\cancel{17}_{1}} = \frac{10}{7} = \square\square$

$= 1\frac{3}{7}$

15 $4\frac{1}{3} \div 1\frac{2}{3} = \frac{13}{3} \div \frac{5}{3}$

$= \frac{13}{\cancel{3}_{1}} \times \frac{\cancel{3}^{1}}{5} = \frac{13}{5} = \square\square$

$= 2\frac{3}{5}$

16 $2\frac{1}{3} \div 1\frac{3}{4} \div \frac{2}{5}$

$= \frac{7}{3} \div \frac{7}{4} \div \frac{2}{5}$

$= \frac{\cancel{7}^{1}}{3} \times \frac{\cancel{4}^{2}}{\cancel{7}_{1}} \times \frac{5}{\cancel{2}_{1}} = \frac{10}{3} = \square\square = 3\frac{1}{3}$

17 $2\frac{1}{2} \div 1\frac{5}{6} \div 1\frac{1}{11}$

$= \frac{5}{2} \div \frac{11}{6} \div \frac{12}{11}$

$= \frac{5}{2} \times \frac{\cancel{6}^{1}}{\cancel{11}_{1}} \times \frac{\cancel{11}^{1}}{\cancel{12}_{2}} = \frac{5}{4} = \square\square = 1\frac{1}{4}$

Mixed Operations - Calculator

This sheet is for calculator use so there are no working spaces provided.

The method is simple for this sheet, use your calculator. You don't have to worry about reciprocals or simplifying, the calculator does it all for you. Mistakes made using the calculator can occur anywhere due to keystroke error, there is one more common mistake made though, that is the entering of mixed numbers. Remember that you have to press the fraction key twice to enter a mixed number.

Your calculator should obey order of operations rules in the exercises in column 3, just don't press '=' until you key in the entire question otherwise the calculator may give the wrong answer.

11 $2\frac{4}{11} - 1\frac{1}{2} + \frac{5}{6} = 1\frac{23}{33}$

12 $4\frac{3}{5} + \frac{2}{3} - 1\frac{7}{10} = 3\frac{17}{30}$

13 $3\frac{5}{6} - 1\frac{1}{4} + 4\frac{7}{12} = 7\frac{1}{6}$

14 $3\frac{2}{5} + 4\frac{7}{10} + 2\frac{5}{12} = 10\frac{31}{60}$

15 $5\frac{1}{4} - 2\frac{2}{3} - 1\frac{1}{2} = 1\frac{1}{12}$

16 $9\frac{2}{3} - 3\frac{6}{7} + 1\frac{5}{6} = 7\frac{9}{14}$

Multiply or divide these fractions

17 $\frac{3}{5} \times \frac{1}{4} = \frac{3}{20}$

18 $\frac{7}{12} \div \frac{2}{3} = \frac{7}{8}$

19 $\frac{2}{3} \div \frac{8}{9} = \frac{3}{4}$

20 $\frac{3}{5} \times \frac{7}{6} = \frac{7}{10}$

21 $\frac{4}{5} \div \frac{1}{3} \times \frac{8}{9} = 2\frac{2}{15}$

22 $\frac{1}{7} \div \frac{3}{10} \times \frac{18}{5} = 1\frac{5}{7}$

23 $\frac{3}{4} \times \frac{17}{10} \div \frac{1}{8} = 10\frac{1}{5}$

24 $\frac{4}{7} \div \frac{1}{10} \div \frac{2}{5} = 14\frac{2}{7}$

25 $\frac{3}{8} \times 4\frac{1}{6} \times \frac{2}{3} = 1\frac{1}{24}$

26 $5\frac{11}{12} \div \frac{3}{4} \times \frac{1}{2} = 3\frac{17}{18}$

27 $3\frac{1}{2} \times 6 \times \frac{4}{5} = 16\frac{4}{5}$

28 $7\frac{3}{4} \times \frac{2}{5} \div 2\frac{2}{3} = 1\frac{13}{80}$

29 $7 \div 1\frac{1}{4} \div 2\frac{3}{5} = 2\frac{2}{13}$

30 $4\frac{5}{6} \times 3\frac{3}{10} \div 2\frac{2}{5} = 6\frac{31}{48}$

31 $5\frac{3}{14} \div 8 \times 4\frac{4}{5} = 3\frac{9}{70}$

32 $2\frac{3}{7} \div 1\frac{2}{3} \times 3 = 4\frac{13}{35}$

These are all mixed up

33 $\frac{1}{3} + \frac{3}{4} \times \frac{9}{5} = 1\frac{41}{60}$

34 $\frac{1}{5} \div \frac{2}{15} + \frac{2}{3} = 2\frac{1}{6}$

35 $5\frac{1}{6} \times 3 - 4\frac{6}{7} = 10\frac{9}{14}$

36 $7\frac{3}{8} \div 9\frac{1}{4} + \frac{3}{2} = 2\frac{11}{37}$

37 $\frac{5}{4} + 3\frac{1}{2} \div \frac{5}{6} = 5\frac{9}{20}$

38 $5 \div \frac{7}{10} \times \frac{8}{9} = 6\frac{22}{63}$

39 $\frac{1}{2} \times \frac{7}{11} + \frac{3}{4} = 1\frac{3}{44}$

40 $7\frac{5}{6} - \frac{11}{12} \times 1\frac{2}{3} = 6\frac{11}{36}$

41 $3\frac{3}{4} \div \frac{5}{9} - \frac{5}{12} = 6\frac{1}{3}$

42 $2\frac{5}{8} \times 3\frac{1}{6} \div 5 = 1\frac{53}{80}$

43 $9\frac{1}{2} - 3\frac{2}{3} \div 1\frac{4}{5} = 7\frac{25}{54}$

44 $3\frac{8}{9} \times 1\frac{2}{5} \times 3\frac{1}{2} = 19\frac{1}{18}$

45 $\frac{2}{5} \times \frac{8}{3} + \frac{1}{2} = 1\frac{17}{30}$

46 $4\frac{7}{10} \div \frac{1}{4} \div 1\frac{1}{5} = 15\frac{2}{3}$

47 $2\frac{2}{5} + \frac{3}{4} \div \frac{1}{2} = 3\frac{9}{10}$

48 $5\frac{7}{8} \div 2\frac{1}{3} - 1\frac{1}{4} = 1\frac{15}{56}$

Fractions - Find A Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don’t colour it in too dark (using a texta for example) so that you can still read it.

DECIMALS

Place Value of Decimals

The position of a digit in a decimal could be to the left of the decimal point: units (ones), tens, hundreds and upwards. Or to the right of the decimal point: tenths, hundredths, thousandths and so on. This location is its place value.

Column 1 asks you to place decimals that have been broken up into parts into the table. Read the question and place the digits in the table according to their place value. Once the digits are in, fill all the spaces between the digits with zeros, except in the decimal point column, just write in a '**.**' .

Column 2 asks you to give the place value of the '4' in all the numbers. Look at its location with the decimal point, the amount of digits either side of it doesn't matter, it is its location to the decimal point that determines its place value. Use the table if you have difficulty with the positions or the spelling. Once you have spelt the place value (just write '4' don't spell it) write the fraction or number that matches the answer.

The next part of column 2 asks you to write the number in decimal form and then expand it. The first decimal place will be a fraction 'over' 10, the second decimal place will be 'over' 100, the third 'over' 1 000. If there is a zero in the decimal then you don't include it in the expansion. So watch for zeros!

Column 3 asks you to state the number of decimal places that each number has. Again don't let the numbers trick you, look for the decimal point and count the number of digits behind (to the right of) it. If you had a number such as 4.200, while you could write it as 4.2 (which has 1 decimal place) the answer would still be that the decimal has 3 decimal places. Note that d.p. = decimal places.

The rest of Column 3 uses comparisons of decimals. Look at the numbers and add zeros to the number with less decimal places, until they have the same number of d.p. (match the number of decimal places). Then compare them, just imagine that there is no decimal point and they are whole numbers. This takes the error factor out of comparing. Remember with < and > you point the arrow to the smallest number (decimal).

A very common mistake when rewriting decimals in order is that you write the altered decimals in order, not the decimals in the question. So remember write the decimals in the question in order, not your working out decimals.

Place Value of Decimals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Complete the table. Fill blank spaces between the numbers with zeros. All questions must have a zero or whole number in the units column.

Example

4 hundreds, 3 units, 2 tenths and 7 thousandths

1. 3 units and 7 thousandths
2. 8 tens and 7 tenths
3. 7 hundreds, 8 units and 4 hundredths
4. 8 tens, 4 hundredths and 1 thousandth
5. 9 hundreds, 4 tens, 6 units, 5 tenths and 4 thousandths
6. 2 hundreds, 7 units, 3 tenths and 9 hundredths
7. 7 hundreds, 6 units and 8 thousandths
8. 3 hundreds, 9 tens and 5 tenths

	Hundreds 100's	Tens 10's	Units 1's	Decimal Point .	Tenths $\frac{1}{10}$	Hundredths $\frac{1}{100}$	Thousandths $\frac{1}{1\,000}$
Ex.	4	0	3	.	2	0	7
1							
2							
3							
4							
5							
6							
7							
8							

Give the value of the 4 in these. Express both in words and numbers

Example

5.742 = 4 hundredths $\frac{4}{100}$

9. 14.36 = _____
10. 0.034 = _____
11. 127.4 = _____
12. 15.94 = _____
13. 1.423 = _____
14. 7.0542 = _____
15. 12.471 = _____

Write these as decimals, then expand. Place only a single digit in the top (numerator) boxes.

Example

$5\frac{37}{100} = 5.37 = \boxed{5} + \frac{\boxed{3}}{10} + \frac{\boxed{7}}{100}$

16. $\frac{45}{100} = 0.\_\_ = \frac{\square}{10} + \frac{\square}{100}$

17. $\frac{572}{1\,000} = \_\_\_\_ = \frac{\square}{10} + \frac{\square}{100} + \frac{\square}{1\,000}$

18. $7\frac{17}{100} = \_\_\_\_ = \square + \frac{\square}{\square} + \frac{\square}{\square}$

19. $4\frac{703}{1\,000} = \_\_\_\_ = \square + \frac{\square}{\square} + \frac{\square}{\square}$

20. $\frac{68}{100} = \_\_\_\_ = \frac{\square}{\square} + \frac{\square}{\square}$

21. $\frac{39}{1\,000} = \_\_\_\_ = \frac{\square}{\square} + \frac{\square}{\square}$

Give the decimal places of the following

Example 25.742 3

22	850.65	23	0.4529
24	3.7055	25	56.244
26	371.9	27	24.01
28	12.408	29	100.05
30	903.2	31	363.63

Add zeros to give all the decimals the same number of decimal places then use < or > to compare them

Example 0.04 < 0.2

0.04 0.20

32. 0.7 ☐ 0.584
33. 0.72 ☐ 0.8
34. 1.25 ☐ 2.1
35. 3.56 ☐ 3.068
36. 1.963 ☐ 1.9

Rewrite decimals with the same decimal places, then arrange in descending order

37. 0.72 , 0.3 , 1.004 , 1.3

38. 0.555 , 0.5 , 5.05 , 0.55

Place Value of Decimals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Complete the table. Fill blank spaces between the numbers with zeros. All questions must have a zero or whole number in the units column.

Example

4 hundreds, 3 units, 2 tenths and 7 thousandths

1. 3 units and 7 thousandths
2. 8 tens and 7 tenths
3. 7 hundreds, 8 units and 4 hundredths
4. 8 tens, 4 hundredths and 1 thousandth
5. 9 hundreds, 4 tens, 6 units, 5 tenths and 4 thousandths
6. 2 hundreds, 7 units, 3 tenths and 9 hundredths
7. 7 hundreds, 6 units and 8 thousandths
8. 3 hundreds, 9 tens and 5 tenths

	Hundreds 100's	Tens 10's	Units 1's	Decimal Point .	Tenths $\frac{1}{10}$	Hundredths $\frac{1}{100}$	Thousandths $\frac{1}{1\,000}$
Ex.	4	0	3	.	2	0	7
1			3	.	0	0	7
2		8	0	.	7		
3	7	0	8	.	0	4	
4		8	0	.	0	4	1
5	9	4	6	.	5	0	4
6	2	0	7	.	3	0	9
7	7	0	6	.	0	0	8
8	3	9	0	.	5		

Give the value of the 4 in these. Express both in words and numbers

Example

$5.742 =$ 4 hundredths $\frac{4}{100}$

9. $14.36 =$ 4 units 4
10. $0.034 =$ 4 thousandths $\frac{4}{1\,000}$
11. $127.4 =$ 4 tenths $\frac{4}{10}$
12. $15.94 =$ 4 hundredths $\frac{4}{100}$
13. $1.423 =$ 4 tenths $\frac{4}{10}$
14. $7.0542 =$ 4 thousandths $\frac{4}{1\,000}$
15. $12.471 =$ 4 tenths $\frac{4}{10}$

Write these as decimals, then expand. Place only a single digit in the top (numerator) boxes.

Example

$5\frac{37}{100} = 5.37 = \boxed{5} + \frac{\boxed{3}}{10} + \frac{\boxed{7}}{100}$

16. $\frac{45}{100} = 0.45 = \frac{\boxed{4}}{10} + \frac{\boxed{5}}{100}$

17. $\frac{572}{1\,000} = 0.572 = \frac{\boxed{5}}{10} + \frac{\boxed{7}}{100} + \frac{\boxed{2}}{1\,000}$

18. $7\frac{17}{100} = 7.17 = \boxed{7} + \frac{\boxed{1}}{10} + \frac{\boxed{7}}{100}$

19. $4\frac{703}{1\,000} = 4.703 = \boxed{4} + \frac{\boxed{7}}{10} + \frac{\boxed{3}}{1\,000}$

20. $\frac{68}{100} = 0.68 = \frac{\boxed{6}}{10} + \frac{\boxed{8}}{100}$

21. $\frac{39}{1\,000} = 0.039 = \frac{\boxed{3}}{100} + \frac{\boxed{9}}{1\,000}$

Give the decimal places of the following

Example $25.\underline{742}$ 3

22. 850.65 2
23. 0.4529 4
24. 3.7055 4
25. 56.244 3
26. 371.9 1
27. 24.01 2
28. 12.408 3
29. 100.05 2
30. 903.2 1
31. 363.63 2

Add zeros to give all the decimals the same number of decimal places then use < or > to compare them

Example 0.04 < 0.2

0.040 0.200

32. 0.7 > 0.584

0.700 0.584

33. 0.72 < 0.8

0.72 0.80

34. 1.25 < 2.1

1.25 2.10

35. 3.56 > 3.068

3.560 3.068

36. 1.963 > 1.9

1.963 1.900

Rewrite decimals with the same decimal places, then arrange in descending order

37. 0.72 , 0.3 , 1.004 , 1.3

0.720 0.300 1.004 1.300

1.3, 1.004, 0.72, 0.3

38. 0.555 , 0.5 , 5.05 , 0.55

0.555 0.500 5.050 0.550

5.05, 0.555, 0.55, 0.5

Rounding Decimals

Rounding is used to shorten decimal answers to a level of accuracy required. Often when answering questions, you are asked to give your answer to a specific number of decimal places. This isn't done by just chopping the decimal off at the number of places required, this method is followed:

- Look at the decimal behind the decimal place asked for. For example if rounding to 2 d.p. (2 decimal places) look at the digit in the 3rd decimal place.
- If this digit is 5 or more then add 1 to the digit in front of it, this means that when increasing a 3 for example, it would become a 4. But it also means that if it is a 9 it will become a 0 and will add 1 to the digit in front of it.
- If the digit is less than 5 the digit is unchanged and the number is just 'chopped' at the required decimal place.
- If there isn't a number in the decimal place asked for, then zeros are added to the number until the decimal place has a zero in the position.

Column 1 asks firstly to round the given decimals and whole numbers to 1 d.p. To do this (an example is at the top of the column), look at the number in the 2nd decimal place position. If that number is 5 or more add 1 to the 1 d.p. number then remove all the digits behind it. If the 2 d.p. digit is less than 5 just rewrite the 1 d.p. number unchanged with the digits removed after it. The second part of column 1 asks you to round to 2 d.p. Look at the 3rd digit and use the same method, the answer will have 2 digits after the decimal point.

Column 2 asks you to round to 3 d.p. Look at he 4th decimal place digit and apply the same method. The next part of the column asks you to round to 0 d.p. This could also be asked in the form : 'round to the nearest unit' or 'round to the nearest whole number'. Look at the digit after the decimal point and apply the same method then write the whole number without a decimal point. Note that if a decimal is less than 0.5 then when it is rounded to the nearest whole number it will become 0.

Column 3 is a combination of the previous 2 columns. The first part asks you to round to the number of decimal places specified in the brackets. So instead of the column being all the same rounding, it jumps from one to the next. The second part of the column asks you to round the one number to 1, 2 and 3 d.p.

Examples of rounding
0.54862
To 1 d.p. : 0.54862 → 0.5 (as 4 < 5)
To 2 d.p. : 0.54862 → 0.55 (as 8 > 5)
To 3 d.p. : 0.54862 → 0.549 (as 6 > 5)
To nearest whole number:
0.54862 → 1 (as 5 = 5)

Example: Whole numbers
65
To 1 d.p. : 65.0
To 2 d.p. : 65.00
To 3 d.p. : 65.000

Example:
71.5
To 1 d.p. : 71.5
To 2 d.p. : 71.50
To 3 d.p. : 71.500

Rounding Decimals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Round these numbers to the nearest tenth (1 d.p.)

Example

Look at the digit to the right of the one to be rounded. If it is 5 or more round it up, if < 5 the digit is unchanged

1.1627 → 1.2

1. 0.87
2. 0.43
3. 0.90347
4. 0.05956
5. 18.374
6. 22.128
7. 67
8. 56.942
9. 129.988
10. 99.953

Round these numbers to the nearest thousandth (3 d.p.)

Example

Look at the digit to the right of the one to be rounded. If it is 5 or more round it up, if < 5 the digit is unchanged

1.1627 → 1.163

22. 2.7674
23. 0.8436
24. 8.0302
25. 6.9969
26. 6.9996
27. 0.7
28. 0.70
29. 0.707
30. 4
31. 9.9999

Round these numbers to the decimal place given in the brackets

43. 29.6751 [2]
44. 1 361.54 [1]
45. 0.4296 [0]
46. 9.1 [3]
47. 19.9971 [2]
48. 6.0606 [3]
49. 86 [2]
50. 56.0438 [1]
51. 11.4099 [0]
52. 8.8997 [3]
53. 5.9949 [2]

Round these numbers to the nearest hundredth (2 d.p.)

Example

Look at the digit to the right of the one to be rounded. If it is 5 or more round it up, if < 5 the digit is unchanged

1.1627 → 1.16

11. 0.278
12. 0.805
13. 0.4246
14. 0.9793
15. 2.2183
16. 73.2
17. 4.95829
18. 9.99811
19. 67.9942
20. 83
21. 99.9961

Round these numbers to the nearest unit (0 d.p.)

Example

Look at the digit to the right of the one to be rounded. If it is 5 or more round it up, if < 5 the digit is unchanged

1.1627 → 1

32. 4.7
33. 9.3
34. 18.78
35. 249.499
36. 7 101.835
37. 83.5004
38. 999.278
39. 999.872
40. 0.808
41. 0.080
42. 9 999.5

Round each decimal to 1, 2 and 3 decimal places

54. 0.1919 [1] _____ [2] _____ [3] _____

Rounding Decimals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Round these numbers to the nearest tenth (1 d.p.)

Example

Look at the digit to the right of the one to be rounded. If it is 5 or more round up, if < 5 the digit is unchanged

	1.1627	1.2
1	0.87	0.9
2	0.43	0.4
3	0.90347	0.9
4	0.05956	0.1
5	18.374	18.4
6	22.128	22.1
7	67	67.0
8	56.942	56.9
9	129.988	130.0
10	99.953	100.0

Round these numbers to the nearest thousandth (3 d.p.)

Example

Look at the digit to the right of the one to be rounded. If it is 5 or more round up, if < 5 the digit is unchanged

	1.1627	1.163
22	2.7674	2.767
23	0.8436	0.844
24	8.0302	8.030
25	6.9969	6.997
26	6.9996	7.000
27	0.7	0.700
28	0.70	0.700
29	0.707	0.707
30	4	4.000
31	9.9999	10.000

Round these numbers to the decimal place given in the brackets

43	29.6751	[2]	29.68
44	1 361.54	[1]	1 361.5
45	0.4296	[0]	0
46	9.1	[3]	9.100
47	19.9971	[2]	20.00
48	6.0606	[3]	6.061
49	86	[2]	86.00
50	56.0438	[1]	56.0
51	11.4099	[0]	11
52	8.8997	[3]	8.900
53	5.9949	[2]	5.99

Round these numbers to the nearest hundredth (2 d.p.)

Example

Look at the digit to the right of the one to be rounded. If it is 5 or more round up, if < 5 the digit is unchanged

	1.1627	1.16
11	0.278	0.28
12	0.805	0.81
13	0.4246	0.42
14	0.9793	0.98
15	2.2183	2.22
16	73.2	73.20
17	4.95829	4.96
18	9.99811	10.00
19	67.9942	67.99
20	83	83.00
21	99.9961	100.00

Round these numbers to the nearest unit (0 d.p.)

Example

Look at the digit to the right of the one to be rounded. If it is 5 or more round up, if < 5 the digit is unchanged

	1.1627	1
32	4.7	5
33	9.3	9
34	18.78	19
35	249.499	249
36	7 101.835	7 102
37	83.5004	84
38	999.278	999
39	999.872	1 000
40	0.808	1
41	0.080	0
42	9 999.5	10 000

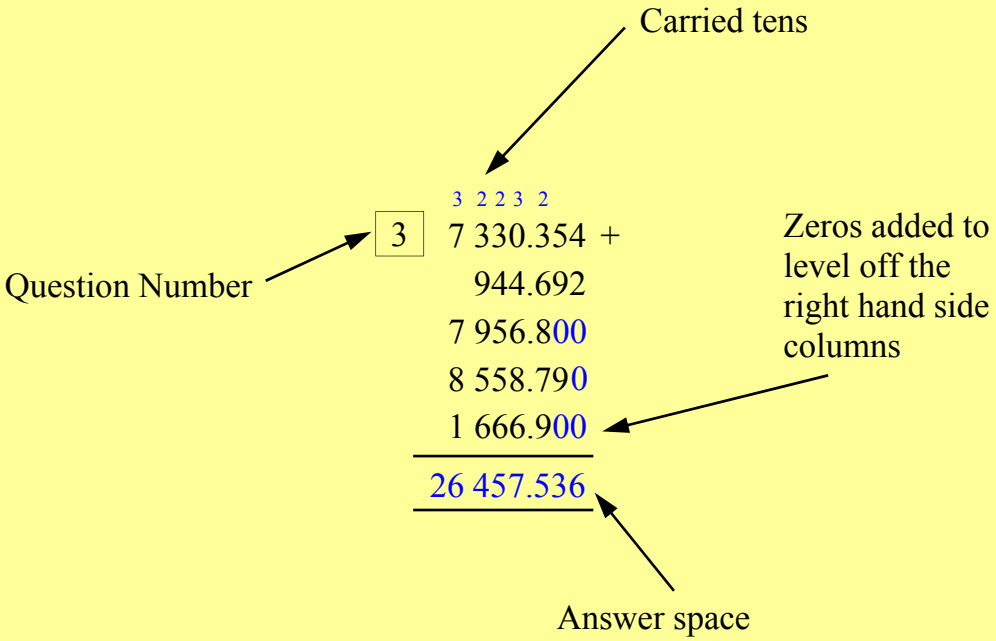
Round each decimal to 1, 2 and 3 decimal places

54	0.1919	[1]	0.2	[2]	0.19	[3]	0.192
55	3.8225	[1]	3.8	[2]	3.82	[3]	3.823
56	26.9527	[1]	27.0	[2]	26.95	[3]	26.953
57	0.3235	[1]	0.3	[2]	0.32	[3]	0.324
58	9.9994	[1]	10.0	[2]	10.00	[3]	9.999

Addition - Decimals

To perform addition move from right to left and carry tens when the total exceeds 9. The example below will show the method:

- If you want to fill the shorter decimal numbers with zeros to make the all the decimals level on the right hand side you can, if a number is a whole number then write the decimal point then the zeros.
- Total down the right hand column and if the total is less than 10 write the answer on the bottom line.
- If the number is ten or more write in the units or last digit and write the first digit (tens) above the next number to the left (carried tens).
- Add the next column including the carried figure (if any) in your calculation, repeat the process until you are finished



Addition - Decimals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Try these additions, place zeros at the ends to fill 'shorter' decimal numbers if it makes it easier.

Subtraction - Decimals

To perform subtractions move from right to left and 'borrow' when the sum of the numbers below the top digit exceeds 9. The example below outlines the method:

- If you want to fill the shorter decimal numbers with zeros to make the numbers level on the right hand side you can, if a number is a whole number then write the decimal point then the zeros. If there is a decimal point already just write in the required number of zeros.
- Subtract down the right hand column if the top digit is large enough to subtract all the digits below it. Write the answer then move to the next column.
- If the top digit isn't large enough, add the digits below it and then borrow the required number of 'tens' from the column to its left, then put the number of tens borrowed below the column from which it was borrowed.
- Then subtract the next column, including the figure that you borrowed in your calculation, repeat the process until you are finished.

Multiply and Divide by 10, 100 and 1 000

When you multiply or divide by 10, 100, 1 000, etc a rule applies which allows the calculation to be done without the usual amount of working. The rule is that when you divide by:

- 10 : move the decimal place one place to the left
- 100 : move the decimal place two places to the left
- 1 000 : move the decimal place three places to the left

The opposite applies with multiplication, when you multiply by:

- 10 : move the decimal place one place to the right
- 100 : move the decimal place two places to the right
- 1 000 : move the decimal place three places to the right

Column 1 are all multiplications, just move the decimal point to the right the same number of places as there are zeros in the number : 10 = 1 place, 100 = 2 places and 1 000 = 3 places. Examples are at the top of the column. Remember if a number doesn't have a decimal point then it is as if there is a decimal point behind the last digit, for example: think of 120 = 120**.** and 2 039 = 2 039**.** and so on.

Column 2 is all division. This time move the decimal point to the left, the same number of places as there are zeros in the number, 10 (1), 100 (2) and 1 000 (3).

Column 3 are problem-style which use the same approach as the previous 2 columns. The only difference being an additional calculation is required in most questions.

Multiply and Divide by 10, 100 and 1 000

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

When you multiply by 10, 100 or 1 000 you move the decimal point to the right

× 10 — 1 place right — 5.784 × 10 = 57.84

× 100 — 2 places right — 5.78 × 100 = 578

× 1 000 — 3 places right

1 $2.6 \times 10 =$ ____

2 $19.7 \times 10 =$ ____

3 $100 \times 100 =$ ____

4 $5.373 \times 1\,000 =$ ____

5 $933.05 \times 100 =$ ____

6 $7\,707.7 \times 10 =$ ____

7 $0.002 \times 100 =$ ____

8 $2.0202 \times 10 =$ ____

9 $2.0202 \times 100 =$ ____

10 $2.0202 \times 1\,000 =$ ____

11 $17.38 \times 10 =$ ____

12 $0.046 \times 1\,000 =$ ____

13 $90.33 \times 1\,000 =$ ____

14 $12.549 \times 100 =$ ____

26. $100\overline{)63.47}$ = 0.6347
27. $\frac{3.4}{100}$ = 0.034
28. 25 ÷ 1 000 = 0.025
29. $\frac{9.04}{1\,000}$ = 0.00904
30. $10\overline{)13.06}$ = 1.306
31. 403.02 ÷ 100 = 4.0302
32. 10.7 ÷ 1 000 = 0.0107
33. $10\overline{)6\,059.8}$ = 605.98
34. $1\,000\overline{)80.5}$ = 0.0805
35. $\frac{14.07}{100}$ = 0.1407
36. 702.6 ÷ 10 = 70.26
37. $\frac{999}{10}$ = 99.9
38. 999 ÷ 100 = 9.99
39. 999 ÷ 1 000 = 0.999

Now try these, write the question mathematically then solve

40. The airport has a departure levy of $18.30 on each person. If 1 000 people depart in an hour on average, calculate the amount (A) collected in an hour. Then give an estimate on the amount taken for a 16 h day.

A = 18.30 × 1 000

A = $18 300

Amount after 16 hours: $292 800

18 300 × 16

1

109 800

183 000

292 800

41. A small stream feeds 19.45 kL of water into a dam daily. The next day after rain it delivers 10 times this amount. Find the amount (A) for the wet day, then calculate the amount of water delivered for the 2 days.

A = 19.45 × 10

A = 194.5 kL

After 2 days the total is 213.95 kL

1 1

194.50 +

19.45

213.95

42. A tennis ball launcher fires a ball every 6 sec. Find the number of balls that are fired in a minute. Find the ball capacity of the machine if it runs out of balls after 12.5 min.

B = 60 ÷ 6

B = 10 balls

Capacity = 12.5 × 10

Capacity = 125 balls

43. A full grain silo holds 9 625 kg of grain. If it is currently filled to one hundredth of its capacity, find the mass of the grain inside.

Mass = 9 625 ÷ 100

Mass = 96.25 kg

Multiplication of Decimals

When decimals are multiplied, it is easier to take the decimal point out, that way it is just like multiplying two whole numbers. Then replace the decimal point in the answer, but where? Here's where:

- count the number of digits behind the decimal point in the first decimal
- then do the same for the second decimal
- add the two together and that is how many digits will be behind the decimal point in the answer, so put the decimal point in at the end.

In the example in the top row the first decimal has 2 decimal places, the second decimal has 1 decimal place. Add 2 and 1 and you get 3. So the answer will have 3 decimal places. Write that in the box provided below the question number. Then carry out the multiplication, get your answer, then put a decimal point between the 3rd and 4th digit (from the right).

The questions become longer as you work through. Remember to add a zero on the 2nd line and 2 zeros on the third line (if there is one).

Division of Decimals

Dividing decimals is performed in the same way as with whole numbers except that when you divide past the decimal point, place a decimal point in the quotient (answer).

Column 1 involves dividing decimals by a whole number. If the number 'won't divide' into the other number then write a zero and carry the digit to the next number (as tens) and then attempt the division again.

Column 2 involves longer questions, these involve adding zeros to enable the division to be completed. The zeros are added until you can remove the remainder. From question 18 answer the divisions using 4 decimal places. This means that you need a 5 decimal place answer which can then be rounded to the 4 d.p answer required.

Column 3 involves dividing decimals by other decimals. This column requires you to divide or multiply both numbers by either 10 or 100 before the division takes place. This is done to change the divisor (the outside number) to a single digit number, for example:

- 46.4 ÷ 0.8 ….multiply both numbers by 10 to get ...464 ÷ 8
- 29.6 ÷ 60 ….. Divide each number by 10 to get …. 2.96 ÷ 6
- 0.597 ÷ 0.04 … multiply each number by 100 to get 59.7 ÷ 4

Although you are changing the numbers you are using, because you are changing both of them in the same way the answer stays the same and doesn't need to be changed.

Division of Decimals

Example $1.56 \div 4$

$$4 \overline{)1.56} = 0.39 \quad (1\ 3)$$

1 $2.56 \div 8$

2 $9.45 \div 3$

3 $2.28 \div 6$

4 $0.572 \div 4$

5 $9.275 \div 5$

6 $45.87 \div 3$

7 $0.092 \div 4$

8 $105.6 \div 8$

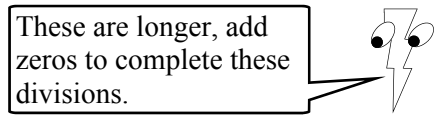
9 $4.752 \div 9$

10 $19.06 \div 2$

11 $3.584 \div 7$

12 $59.36 \div 8$

13 $862.5 \div 5$



Example $3.45 \div 8$

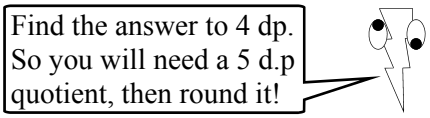
$$8 \overline{)3.45000} = 0.43125 \quad (3\ 2\ 1\ 2\ 4)$$

14 $2.63 \div 5$

15 $19.3 \div 4$

16 $15.5 \div 8$

17 $19.81 \div 2$



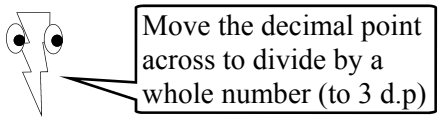
18 $6.5 \div 7$ = _____ (4 d.p.)

19 $14.8 \div 3$ = _____ (4 d.p.)

20 $7.26 \div 9$ = _____ (4 d.p.)

21 $22 \div 7$ = _____ (4 d.p.)

22 $0.41 \div 8$ = _____ (4 d.p.)



Example $52.1 \div 0.8$

$$8 \overline{)521.000} = 65.625 \quad (5\ 4\ 1\ 2\ 4)$$

$52.1 \times 10 = 521$
$0.8 \times 10 = 8$

23 $17 \div 0.4$ = _____ (3 d.p.)

24 $0.72 \div 0.5$ = _____ (3 d.p.)

25 $0.431 \div 0.03$ = _____ (3 d.p.)

26 $1.7 \div 30$ = _____ (3 d.p.)

27 $8.53 \div 0.7$ = _____ (3 d.p.)

28 $1.27 \div 0.4$ = _____ (3 d.p.)

29 $4.32 \div 90$ = _____ (3 d.p.)

30 $0.5 \div 0.06$ = _____ (3 d.p.)

31 $9.2 \div 40$ = _____ (3 d.p.)

Division of Decimals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Divide these decimals by whole numbers

Example

1.56 ÷ 4 — 4) 1.56 (1 3) = 0.39

1 2.56 ÷ 8 — 8) 2.56 (1) = 0.32

2 9.45 ÷ 3 — 3) 9.45 (1) = 3.15

3 2.28 ÷ 6 — 6) 2.28 (4) = 0.38

4 0.572 ÷ 4 — 4) 0.572 (1 1) = 0.143

5 9.275 ÷ 5 — 5) 9.275 (4 2 2) = 1.855

6 45.87 ÷ 3 — 3) 45.87 (1 2) = 15.29

7 0.092 ÷ 4 — 4) 0.092 (1) = 0.023

8 105.6 ÷ 8 — 8) 105.6 (2 1) = 13.2

9 4.752 ÷ 9 — 9) 4.752 (2 7) = 0.528

10 19.06 ÷ 2 — 2) 19.06 (1) = 9.53

11 3.584 ÷ 7 — 7) 3.584 (1) = 0.512

12 59.36 ÷ 8 — 8) 59.36 (3 1) = 7.42

13 862.5 ÷ 5 — 5) 862.5 (3 1 2) = 172.5

These are longer, add zeros to complete these divisions.

Example

3.45 ÷ 8 — 8) 3.45000 (3 2 1 2 4) = 0.43125

14 2.63 ÷ 5 — 5) 2.630 (1 3) = 0.126

15 19.3 ÷ 4 — 4) 19.3000 (3 1 2) = 4.825

16 15.5 ÷ 8 — 8) 15.5000 (7 3 6 4) = 1.9375

17 19.81 ÷ 2 — 2) 19.810 (1 1) = 9.9405

Find the answer to 4 dp. So you will need a 5 d.p quotient, then round it!

18 6.5 ÷ 7 — 7) 6.50000 (2 6 4 5) = 0.62857

= 0.6286 (4 d.p.)

19 14.8 ÷ 3 — 3) 14.80000 (2 1 1 1 1) = 4.93333

= 4.9333 (4 d.p.)

20 7.26 ÷ 9 — 9) 7.26000 (6 6 6) = 0.80666

= 0.8067 (4 d.p.)

21 22 ÷ 7 — 7) 22.00000 (1 3 2 6 4) = 3.14285

= 3.1429 (4 d.p.)

22 0.41 ÷ 8 — 8) 0.41000 (4 1 2 4) = 0.05125

= 0.0513 (4 d.p.)

Move the decimal point across to divide by a whole number (to 3 d.p)

Example

52.1 ÷ 0.8 — 8) 521.000 (5 4 1 2 4) = 65.625

{52.1 × 10 = 521
{0.8 × 10 = 8

23 17 ÷ 0.4 — 4) 170.0 (1 2) = 42.5

= 42.500 (3 d.p.)

24 0.72 ÷ 0.5 — 5) 7.20 (2 2) = 1.44

= 1.440 (3 d.p.)

25 0.431 ÷ 0.03 — 3) 43.1000 (1 1 2 2 2) = 14.3666

= 14.367 (3 d.p.)

26 1.7 ÷ 30 — 3) 0.17000 (1 2 2 2) = 0.05666

= 0.057 (3 d.p.)

27 8.53 ÷ 0.7 — 7) 85.3000 (1 1 6 4 5) = 12.1857

= 12.186 (3 d.p.)

28 1.27 ÷ 0.4 — 4) 12.700 (3 2) = 3.175

= 3.175 (3 d.p.)

29 4.32 ÷ 90 — 9) 0.432 (4 7) = 0.048

= 0.048 (3 d.p.)

30 0.5 ÷ 0.06 — 6) 50.0000 (2 2 2 2) = 8.3333

= 8.333 (3 d.p.)

31 9.2 ÷ 40 — 4) 0.92 (1) = 0.23

= 0.920 (3 d.p.)

Changing Fractions to Decimals

When you look at a fraction you can consider it as the top number divided by the bottom number. To change a fraction to a decimal you carry out the division and the answer after the division (the quotient) will be in decimal form.

Column 1 starts with changing fractions to decimals that have a denominator of either 10, 100 or 1 000. Remember that this is just like division, when you divide by these numbers move the decimal point to the left. So for division by 10, move the decimal point 1 position to the left, 100 - 2 positions to the left and 1 000 moves 3 positions left. So the answer will be the numerator (top number) with the decimal point moved. There are 9 examples at the top of the column. Remember that when you move the decimal point, zeros that had meaning on the end of whole numbers are not required when you convert them to decimals.

Column 2 gives you fractions that require division to change to decimals. First write out the division with a ÷ sign, this is done for you already in some questions. Then place the numbers in the working space, add a decimal point and zeros to the number in the division, there is room to add up to 7 zeros, you won't need that many though. Then divide. When you divide a decimal by a whole number add a decimal point in the answer when you cross over it in the division. There is an example at the top of column 2. Note that questions 29 and 30 are long division and question 31 asks you to convert a mixed number to an improper fraction then solve.

Column 3 introduces recurring (or repeating) decimals. These decimals have digits or a sequence of digits that constantly repeat themselves in the decimal. Because these go on forever you need to show that this is occurring in your answer. To do this put a dot on the number or group of numbers that are recurring, for example

- 0.76666666... would be written as $0.7\dot{6}$
- 0.7676767676…. would be written as $0.\dot{7}\dot{6}$, because both numbers are recurring
- 0.765876587658…. would be written as $0.\dot{7}65\dot{8}$ (the first and last of the recurring Numbers have dots above them.

Changing Fractions to Decimals

ALTITUDE

ALGEBRA 1

Completing Number Patterns

To complete number patterns either a "rule" is required which tells you how the number pattern is created, or, enough numbers (usually 4) are needed to determine the rule yourself. Once the rule has been found the last number is used to find the next one and so on.

In column 1 the rule is given, use the last number given and put it in the rule to get the first missing number. Then using the new number, put it in the rule and get the next missing value, and so on.

In column 2 you are asked to create the next pattern by building it with matchsticks. Then find the missing numbers to extend the pattern. Then write the rule in words as you were given in the first column.

Column 3 has number patterns, note how the numbers are changing and carry on the process for the unknown numbers in the boxes. The last few questions are more difficult and require two operations, for example multiplying by two an subtracting one.

Completing Number Patterns

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Complete the patterns by finding the missing numbers

1 Start with 2, "add" 3

→ 2, 5, 8, ☐, ☐

2 Start with 21, "subtract" 3

→ 21, 18, 15, ☐, ☐

3 Start with 5, "add" 5

→ 5, 10, ☐, 20, ☐

4 Start with 5, "multiply by" 2

→ 5, 10, ☐, 40, ☐, ☐

5 Start with 80, "divide by" 2

→ 80, 40, ☐, ☐, ☐

6 Start with 25, "subtract" 5

→ 25, 20, ☐, ☐, ☐

7 Start with 2, "multiply by" 2 then add 1

→ 2, 5, 11, ☐, ☐, ☐

8 Start with 5, "multiply by" 3 then subtract 5

→ 5, 10, ☐, 70, ☐, ☐

9 Start with 6, "multiply by" 2 then subtract 4

→ 6, 8, ☐, ☐, ☐, ☐

10 Start with 3, "multiply by" 2 then add 1

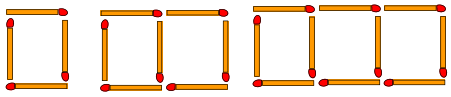
→ 3, 7, ☐, ☐, ☐, ☐

11 Start with 100, "divide by" 2 then add 2

→ 100, 52, ☐, ☐, ☐

Draw the next match-stick pattern then complete the numbers and pattern in words below it.

12

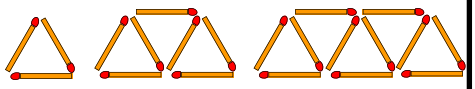


4th → pattern

4, 7, 10, ☐, ☐, ☐, ☐

Start with ☐ "add" ☐

13

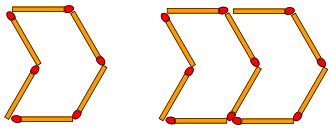


4th → pattern

3, 7, ☐, ☐, ☐, ☐

Start with ☐ ___ ☐

14

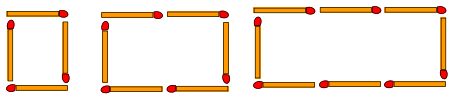


3rd → pattern

6, 10, ☐, ☐, ☐, ☐

___ ☐ ___ ☐

15



4th → pattern

☐, ☐, ☐, ☐, ☐

___ ☐ ___ ☐

Complete the patterns you will at times get answers which include decimals.

16 4, 9, 14, 19, ☐, ☐, ☐

17 20, 35, 50, 65, ☐, ☐

18 1, 2, 4, 8, ☐, ☐, ☐

19 320, 160, 80, 40, ☐, ☐

20 $\frac{1}{5}$, 1, 5, 25, ☐, ☐

21 88, 99, 110, 121, ☐, ☐

22 5, 14, 23, 32, ☐, ☐

23 87, 91, 95, 99, ☐, ☐

Writing Algebraic Expressions

An algebraic expression involves pronumerals (which are letters), like a, b, etc. Why use letters in mathematics? A letter can be used to represent different numbers, so it is a quick way to use the same 'formula' over and over.

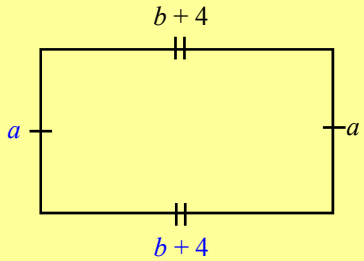
To write expressions in words there are several words that should be understood:
addition - increase, raise, sum of, plus, and add.
subtraction - decrease, reduce, subtract, minus and take away.
division - divide, over, find the quotient (answer after division).
multiplication - times, product of, multiply, times, lots of
squared - square of, multiplied by itself

In Column 1 write the algebraic expression that the sentence describes, this is sometimes not straight-forward. E.g. Subtract g^2 from the product of 9 and $m \rightarrow 9 \times m - g^2$
While g^2 is written first in the sentence, it is the last mathematical operation to be completed so it is written last in the expression.

Column 2 is the reverse of column 1, construct the sentences given the expression. Some will require order of operations to be considered so be careful.

Column 3 requires an expression for the perimeter of the shapes, write each side separated by a '+' sign, then add the numbers together to get a total but leave the letters as they are. Different letters are left with plus signs between them, you are about to learn how to add pronumerals, but for this exercise this is not required.

Example.



$P = b + 4 + a + b + 4 + a$
$= b + b + a + a + 8$ (leave your answer like this or simplify as below)
$= 2b + 2a + 8$ (you will learn this on the next sheet)

Writing Algebraic Expressions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Read the sentences and write algebraic expressions to describe them.

Example

Increase 15 by t squared

$15 + t^2$

1 The sum of g and 20

2 Decrease w by 29

3 Multiply 5 by d

4 From 15 subtract u

5 The sum of a, b and c

6 Raise 16 by r squared

7 Reduce b by 870

8 Subtract 38 from the sum of w and a

9 Reduce the quotient of 20 and q by 8

10 From the product of m and 9 subtract 6

This time write a sentence that matches the algebraic expressions below

Use words like: squared, times, increase, decrease, raise, reduce, sum of, subtract, product, plus, divide, multiply, minus and add.

11 $2 \times m$

12 $k + 5 - d$

* order of operations

13 $a + 2 \times b$*

14 $854 \div 3 \times f$

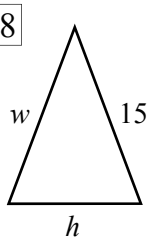
15 $9 + h \times c$

16 $a^2 + 25 - q$

17 $x^2 - 3 \times a$

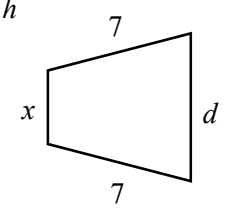
Construct an algebraic expression for the perimeter of the shapes below.

18

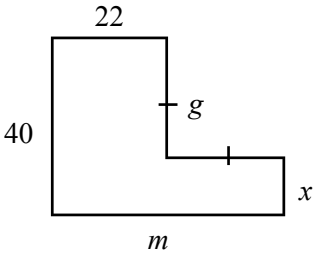


P =

19



20



These two are harder

Example

Increase 15 by t squared

$15 + t^2$

1 The sum of g and 20

$g + 20$

2 Decrease w by 29

$w - 29$

3 Multiply 5 by d

$5 \times d$

4 From 15 subtract u

$15 - u$

5 The sum of a, b and c

$a + b + c$

6 Raise 16 by r squared

$16 + r^2$

7 Reduce b by 870

$b - 870$

8 Subtract 38 from the sum of w and a

$w + a - 38$

9 Reduce the quotient of 20 and q by 8

$20 \div q - 8$

10 From the product of m and 9 subtract 6

$m \times 9 - 6$

This time write a sentence that matches the algebraic expressions below

Use words like: squared, times, increase, decrease, raise, reduce, sum of, subtract, product, plus, divide, multiply, minus and add.

11 $2 \times m$

The product of 2 and m

12 $k + 5 - d$

From the sum of k and 5

subtract d

* order of operations

13 $a + 2 \times b$*

To the product of 2 and b add a

14 $854 \div 3 \times f$

Divide 854 by 3 then multiply

the quotient by f

15 $9 + h \times c$

To the product of h and c add 9

16 $a^2 + 25 - q$

From the sum of a squared and

25, subtract q

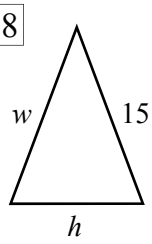
17 $x^2 - 3 \times a$

From x squared subtract the

product of 3 and a

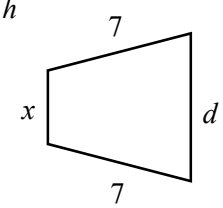
Construct an algebraic expression for the perimeter of the shapes below.

18



$P = w + h + 15$

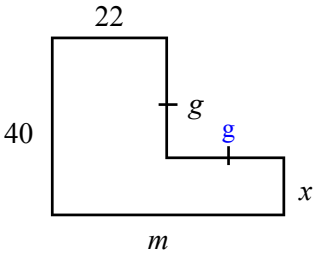
19



$P = x + d + 7 + 7$

$P = x + d + 14$

20

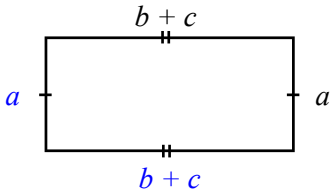


$P = 40 + 22 + g + g + x + m$

$P = 62 + 2g + x + m$

These two are harder

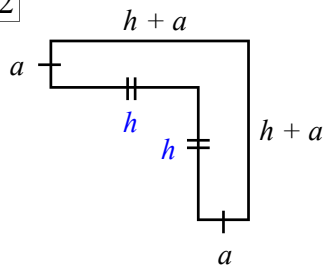
21



$P = a + b + c + a + b + c$

$P = 2a + 2b + 2c$

22



$P = a + h + a + h + a + a + h + h$

$P = 4a + 4h$

Formulae and Substitution

Substitution means to replace a pronumeral 'letter' with a number. This is just like using a formula and putting the values in. Just remember that when a number is before a letter it is as if there is a multiplication sign between them.

Eg. G = 4f, find G when f = 12 min

$G = 4f$

$= 4 \times 12$

$G = 48$ min

Note that G is written on the bottom row and includes the units, whatever they may be, in this case min (minutes).

In the 2nd column you are required to construct a formula that matches the sentence, this may be challenging. Use the underlined letters to make the formula.

Eg. Chris is 4 times older than Ian, if Ian is 9 years old calculate Chris' age.

$C = 4I$

$= 4 \times 9$

$C = 36$ years

The 3rd column requires substitution to be built up in stages, if x^2 has been found then to calculate $2x^2$ just double the answer for x^2. Note that $2x$ isn't squared. Calculate x^2 then multiply it by 2. Write your answers going down the column and the 3rd row will be some small combination of the first two rows.

Formulae and Substitution

Use the formulae below to substitute then solve

1 Find the perimeter of a square using $P = 4l$ where $l = 12$ cm.

$P = 4l$

use = signs $= 4 \times 12$ show units

$P = 48$ cm

rewrite letter

2 Find the average age of two girls using: $A = \frac{x + y}{2}$ where $x = 6$ years and $y = 16$ years.

$$A = \frac{x + y}{2}$$

$$= \frac{6 + 16}{2}$$

$A = 11$ years

3 Change minutes to seconds using $T = 60m$ where $m = 4$ min.

$T = 60m$

$= 60 \times 4$

$T = 240$ min

4 Find the area of a triangle using $A = \frac{1}{2}bh$ where $b = 16$ mm and $h = 5$ mm

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 16 \times 5$

$A = 40$ mm²

5 Now use $b = 12$ m and $h = 10$ m to find the Δ area.

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 12 \times 10$

$A = 60$ m²

Use the underlined letters to construct a formula for the following. Then substitute and solve.

6 Julian is twice as old as Ann. If Ann is 17 years old how old is Julian?

$J = 2A$

$= 2 \times 17$

$J = 34$ years

7 There are 12 pieces in one family pizza how many pieces are there in 7?

$p = 12f$

$= 12 \times 7$

$p = 84$ pieces

8 Britney bought a pair of shoes at a price of $76.85. Find her change from $100

$c = 100 - p$

$= 100 - 76.85$

$c = \$23.15$

9 Sean has half the money that he had when he left home. How much money has he now if he started with $8.70.

$n = \frac{1}{2}m$

$= \frac{1}{2} \times 8.70$

$n = \$4.35$

10 If a car has 5 wheels and a motorcycle has 2. How many wheels do 3 cars and 6 motorcycles have?

$w = 5c + 2m$

$= 5 \times 3 + 2 \times 6$

$w = 27$ wheels

Answer the top row then the 2nd row then add the two rows to help answer the 3rd row.

11

Use k =	2	3	4
k^2	4	9	16
$7k$	14	21	28
$k^2 + 7k$	18	30	44

g^2	4	16	36
$5g$	10	20	30
$2g^2 + 5g$	18	52	102

13

Use m =	4	7	10
m^2	16	49	100
$2m$	8	14	20
$m^2 + 2m - 3$	21	60	117

14

Use e =	5	10	20
e^2	25	100	400
$4e$	20	40	80
$2e^2 + 8e$	90	180	960

Substitution

This sheet doesn't feature Negative numbers. Sheet 08 in the Algebra 2 folder does.

Substitution means to replace the pronumeral (letter) with a number, then solve the question just like any other operations exercise. There is only one difference, when the letter is after a number put a × between them.

E.g. If $a = 5$ then $7a = 7 \times 5 = 35$, don't just change the a for a 5, i.e. not $7a = 75$. Another mistake is when a number is squared.

E.g. If $a = 9$ $a^2 = 9 \times 9 = 81$, it is not $a^2 = 9 \times 2 = 18$.

Column 1 asks you to use $a = 4$ in all the equations. Substitute a into each equation then solve the equation (get an answer). Remember to watch for order of operations, an example is at the top of the column.

Column 2 involves squares (^{2}) and there are two letters used, k and e. Use the same process as with the previous column but remember that a squared number is that number times itself. When there is a number before a squared term, such as $5m^2$, then only the m part is squared ($= 5 \times m^2$) not the whole line $(5m)^2$.

Column 3 involves using brackets, remember that brackets are done first. Otherwise these are the same style of question as in the previous column.

Substitution

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use $a = 4$ to find the value of the other pronumeral

Example

$q = 10a - 11$ ← question

$= 10 \times 4 - 11$ ← substitution

$q = 29$ ← solution (answer)

1 $b = a + 3$

2 $h = a + 8$

3 $m = 2a - 2$

4 $w = 6a - 5$

5 $q = 5a + 7$

6 $u = 11a - 23$

7 $k = 11a - 10$

This time use $k = 5$ and $e = 7$. Remember that $k^2 = 5^2$ or 5×5 not 5×2

Example

$d = e^2 + 5$

$= 7 \times 7 + 5$

$d = 54$

or,

$d = e^2 + 5$

$= 7^2 + 5$

$d = 54$

8 $t = k^2 + 3$

9 $g = e^2 - 5$

10 $m = k^2 - k$

11 $n = \dfrac{e^2 - 4}{9}$

$=$

12 $d = \dfrac{8k^2}{4}$

$=$

13 $b = 100 - e^2$

14 $r = 2k^2$

With brackets solve the inside of the brackets first, (order of operations). Let $m = 10$ and $f = 4$

Example

$t = 5(m + f)$

$= 5 \times (10 + 4)$

$t = 70$

15 $v = 2(m + 7)$

16 $c = 9(f + 5)$

17 $x = f(m - 3)$

18 $g = f(m - f)$

19 $n = 7(20 - m)$

20 $q = m(m - 2f)$

21 $t = 2m \div (f + 1)$

Substitution

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use $a = 4$ to find the value of the other pronumeral

Example

$q = 10a - 11$ ← question

$= 10 \times 4 - 11$ ← substitution

$q = 29$ ← solution (answer)

1 $b = a + 3$

$= 4 + 3$

$b = 7$

2 $h = a + 8$

$= 4 + 8$

$h = 12$

3 $m = 2a - 2$

$= 2 \times 4 - 2$

$m = 6$

4 $w = 6a - 5$

$= 6 \times 4 - 5$

$w = 19$

5 $q = 5a + 7$

$= 5 \times 4 + 7$

$q = 27$

6 $u = {}^{a}/_{2} + 23$

$= 4 \div 2 + 23$

$u = 25$

7 $k = 11a - 10$

$= 11 \times 4 - 10$

$k = 34$

This time use $k = 5$ and $e = 7$. Remember that $k^2 = 5^2$ or 5×5 not 5×2

Example

$d = e^2 + 5$

$= 7 \times 7 + 5$

$d = 54$

or,

$d = e^2 + 5$

$= 7^2 + 5$

$d = 54$

8 $t = k^2 + 3$

$= 5^2 + 3$

$t = 28$

9 $g = e^2 - 5$

$= 7^2 - 5$

$g = 44$

10 $m = k^2 - k$

$= 5^2 - 5$

$m = 20$

11 $n = \dfrac{e^2 - 4}{9}$

$= \dfrac{7^2 - 4}{9}$

$= \dfrac{45}{9}$

$n = 5$

12 $d = \dfrac{8k^2}{4}$

$= \dfrac{8 \times 5^2}{4}$

$= \dfrac{200}{4}$

$d = 50$

13 $b = 100 - e^2$

$= 100 - 7^2$

$b = 51$

14 $r = 2k^2$

$= 2 \times 5^2$

$r = 50$

With brackets solve the inside of the brackets first, (order of operations). Let $m = 10$ and $f = 4$

Example

$t = 5(m + f)$

$= 5 \times (10 + 4)$

$t = 70$

15 $v = 2(m + 7)$

$= 2 \times (10 + 7)$

$v = 34$

16 $c = 9(f + 5)$

$= 9 \times (4 + 5)$

$c = 81$

17 $x = f(m - 3)$

$= 4 \times (10 - 3)$

$x = 28$

18 $g = f(m - f)$

$= 4 \times (10 - 4)$

$g = 24$

19 $n = 7(20 - m)$

$= 7 \times (20 - 10)$

$n = 70$

20 $q = m(m - 2f)$

$= 10 \times (10 - 2 \times 4)$

$= 10 \times 2$

$q = 20$

21 $t = 2m \div (f + 1)$

$= 2 \times 10 \div (4 + 1)$

$= 20 \div 5$

$t = 4$

Substitution - Table of Values

Substitution is replacing a 'letter' with a number. A number before a letter means multiply the number and the substituted number together. So if the equation is $n = 2a$, *and* $a = 3$. Then, $2 \times 3 = 6$ not $2a = 23$. Similarly, when you have x^2 and $x = 5$ this means $5^2 = 5 \times 5 = 25$ not $5 \times 2 = 10$.

In column 1 an equation or 'rule' is given and you are asked to substitute the number given in the top box for the letter on the right hand side of the equation. Calculate the answer and put the value for the letter in the box below the number used. An example is at the top of the column.

Column 2 requires you to state the rule given a completed table, use this method.

- In a rule: $y = \blacktriangle x + \blacksquare$ the value $\blacksquare$ is found when $x = 0$, (the first value in the bottom row). In the example below $\blacksquare$ is 3, so that means $y = \blacktriangle x + 3$

x	0	1	2	3	4
y	3	7	11	15	19

x	0	1	2	3	4
y	3	7	11	15	19

- Look at the next value, for $x = 1$ we get $y = 7$. So $7 = \blacktriangle \times 1 + 3$. Which gives $y = 4x + 3$.

Question 13 and 14 are different, the numbers are decreasing in size, a rule similar to that used in question 4 applies in this situation.

In the 3rd column complete the table, then to plot the points go across the number in the top box and up the number in the bottom box. For the circled numbers above, for example, this would mean that you go across '0' (which means don't move) then go up 3. Then plot a point. Then plot the 2nd point, by moving across 1 and up 7, and so on. The points will be in a straight line, if they aren't you have made a mistake. Then draw a line through the points. Extend the line the full size of the graph and place arrow heads on each end.

Substitution - Table of Values

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use the rule and the value in the top row, to find the bottom row value.

Example Rule : $m = 2a + 1$

a	0	1	2	3	4
m	1	3	5	7	9

$= 2 \times 0 + 1 = 1$
$= 2 \times 1 + 1 = 3$
$= 2 \times 2 + 1 = 5$
$= 2 \times 3 + 1 = 7$
$= 2 \times 4 + 1 = 9$

1 Rule : $c = 2k$

k	0	1	2	3	4
c					

2 Rule : $m = 3t + 1$

t	0	5	10	15	20
m					

3 Rule : $d = 3e - 2$

e	2	4	6	8	10
d					

4 Rule : $w = 10 - r$

r	2	4	6	8	10
w					

5 Rule : $d = 3g - 3$

g	50	150	200	250	300
e					

6 Rule : $y = 3x - 2$

x	10	20	30	40	50
y					

7 Rule : $h = c^2$

c	0	1	2	3	4
h					

8 Rule : $b = 2x^2 + 3$

x	0	1	2	3	4
b					

This time find the rule

9 _____

c	0	1	2	3	4
h	0	2	4	6	8

10 _____

x	0	1	2	3	4
b	2	3	4	5	6

11 _____

t	0	1	2	3	4
p	0	5	10	15	20

a	0	2	4	6	8
k	20	18	16	14	12

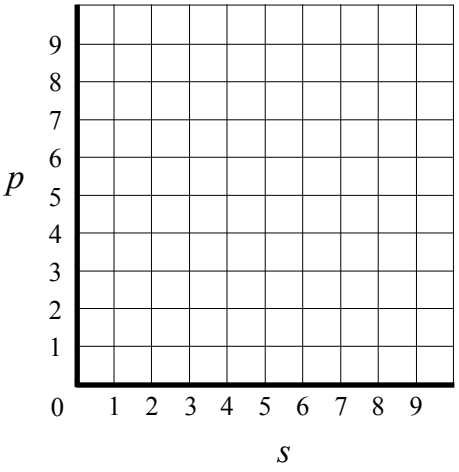
14 _____

i	0	1	2	3	4
r	10	8	6	4	2

Complete the table below then plot the points on the graph, the numbers in the top row go across and the bottom row go up. Then draw a line through them.

15 Rule : $p = 2s + 1$

s	0	1	2	3	4
p					

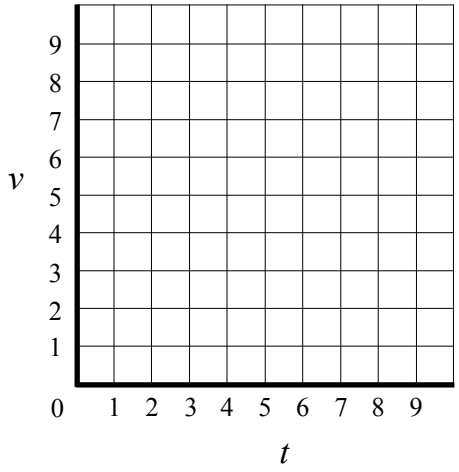


16 Graphs can be used to find values that aren't in the table. Look at the graph in Q15. and give the value of p when:

$s = 2\frac{1}{2}$ $p =$ ☐

17 Rule : $v = 8 - t$

t	0	1	2	3	4
v					



Substitution - Table of Values

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use the rule and the value in the top row, to find the bottom row value.

Example Rule : $m = 2a + 1$

a	0	1	2	3	4
m	1	3	5	7	9

$= 2 \times 0 + 1 = 1$ $= 2 \times 1 + 1 = 3$ $= 2 \times 2 + 1 = 5$ $= 2 \times 3 + 1 = 7$ $= 2 \times 4 + 1 = 9$

1 Rule : $c = 2k$

k	0	1	2	3	4
c	0	2	4	6	8

2 Rule : $m = 3t + 1$

t	0	5	10	15	20
m	1	16	31	46	61

3 Rule : $d = 3e - 2$

e	2	4	6	8	10
d	4	10	16	22	28

4 Rule : $w = 10 - r$

r	2	4	6	8	10
w	8	6	4	2	0

5 Rule : $d = 3g - 3$

g	50	150	200	250	300
e	147	447	597	747	897

6 Rule : $y = 3x - 2$

x	10	20	30	40	50
y	28	58	88	118	148

7 Rule : $h = c^2$

c	0	1	2	3	4
h	0	1	4	9	16

8 Rule : $b = 2x^2 + 3$

x	0	1	2	3	4
b	3	5	11	21	35

This time find the rule

9 Rule: $h = 2c$

c	0	1	2	3	4
h	0	2	4	6	8

10 Rule: $b = x + 2$

x	0	1	2	3	4
b	2	3	4	5	6

11 Rule: $p = 5t$

t	0	1	2	3	4
p	0	5	10	15	20

12 Rule: $h = 3c + 5$

c	0	5	10	15	20
h	5	20	35	50	65

13 Rule: $k = 20 - a$

a	0	2	4	6	8
k	20	18	16	14	12

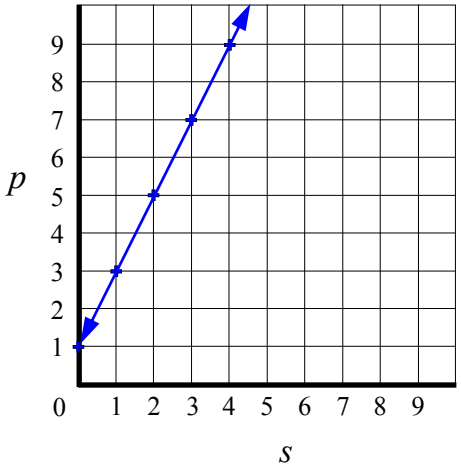
14 Rule: $r = 10 - 2i$

i	0	1	2	3	4
r	10	8	6	4	2

Complete the table below then plot the points on the graph, the numbers in the top row go across and the bottom row go up. Then draw a line through them.

15 Rule : $p = 2s + 1$

s	0	1	2	3	4
p	1	3	5	7	9

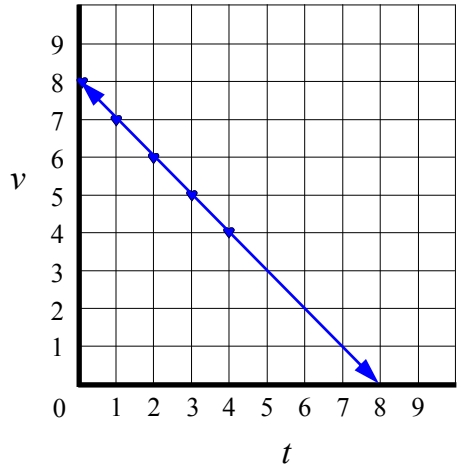


16 Graphs can be used to find values that aren't in the table. Look at the graph in Q15. and give the value of p when:

$s = 2½$ $p =$ 6

17 Rule : $v = 8 - t$

t	0	1	2	3	4
v	8	7	6	5	4



Adding and Subtracting Pronumerals

Think of algebra as being items. Standing at a street corner you may see trucks, cars and buses. If you see 3 trucks ($3t$) and 2 buses ($2b$) you can't add these together, so: $3t + 2b$ remains as $3t + 2b$. If you see 3 cars then 2 buses then 4 more cars, you have seen a total of 7 cars and 2 buses, or $3c + 2b + 4c = 7c + 2b$.

So 'like' terms (the same letter) can be added and subtracted but not different letters.

The same with numbers and terms. Numbers can be collected together and the letters can be collected together but letters can't be added/subtracted with numbers.
For example,
$3 + 4c + 4 + 5c - 2$
$= 9c + 5$

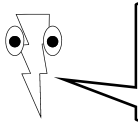
A common mistake is to write a '1' in front of a single letter, this isn't giving your answer in a fully simplified way.
For example,
$5b - 7 + 2b - 6b$
$= b - 7$ (don't write this as $1b - 7$).

Just like numbers, when the same term is subtracted from itself it will give zero.
Example,
$5f + 2 - 3f - 2f$
$= 2$ (as $5f - 5f = 0$)

Try to write the 'letters' part first when the answer is written, ie: write $5t + 6$ rather than $6 + 5t$.

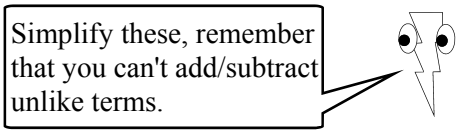
Adding and Subtracting Pronumerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE



Simplify these, remember that you don't write a 1 in front of a letter, $1m = m$

1. $t + t$
2. $k + 2k$
3. $6m - 4m$
4. $12i + 3i$
5. $2j + 5j$
6. $16e - 9e$
7. $9x + 5x + 3x$
8. $12b + 9b + 4b$
9. $6n + 2n + n$
10. $t + 6t - 2t$
11. $3e + 5e - 4e$
12. $12r - 7r + 2r$
13. $11k - 7k - 4k$
14. $24h - 9h - 14h$
15. $2c + 5c + 7c$
16. $u + 5u - 2u$
17. $6d - 3d - 2d$
18. $14q - 11q - 3q$
19. $8v - 2v - 3v$
20. $12s + 3s - 14s$



Simplify these, remember that you can't add/subtract unlike terms.

21. $a + g + a$
22. $2e + c + e$
23. $4h + 3h + 2d$
24. $10m - 3n - m$
25. $2c - 7q + 3c$
26. $9k + 3k + n$
27. $3e + 2f - f$
28. $m + p - m$
29. $4d - 2m + d$
30. $6m + 3b - 5m$
31. $2d + 3d - h$
32. $t + 5e - t$
33. $5e - 2e + q$
34. $3a - 2d - 2a$
35. $4c + 2b - b$
36. $6w + n - 6w$
37. $6n - 3n + 2d$
38. $2f + 3f + f - 2d$
39. $a + b + a + b$
40. $d + 3d + 3e$

Simplify these, remember that you can't add/subtract numbers and terms.

41. $2a + 3 + 2a$
42. $5e + 4 - 4e$
43. $10d - 3d - 6$
44. $3 + 4q + 2 - q$
45. $4y + 12 - 3y$
46. $4k + 2 + 5 - k$
47. $a + 2 + 2a - 1$
48. $2d - 5 + 4d$
49. $5 + 3e - 2 + e$
50. $t + 4 - t - 2$
51. $3v - 6 - 2v$
52. $10 + 2b - 5$

57. $2f - 10 - f$
58. $10 + k + 15$
59. $h + 3 + h + 1$
60. $y + 2y - 3 + y$

Adding and Subtracting Pronumerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Simplify these, remember that you don't write a 1 in front of a letter, $1m = m$

1	$t + t$	$= 2t$
2	$k + 2k$	$= 3k$
3	$6m - 4m$	$= 2m$
4	$12i + 3i$	$= 15i$
5	$2j + 5j$	$= 7j$
6	$16e - 9e$	$= 7e$
7	$9x + 5x + 3x$	$= 17x$
8	$12b + 9b + 4b$	$= 25b$
9	$6n + 2n + n$	$= 9n$
10	$t + 6t - 2t$	$= 5t$
11	$3e + 5e - 4e$	$= 4e$
12	$12r - 7r + 2r$	$= 7r$
13	$11k - 7k - 4k$	$= 0$
14	$24h - 9h - 14h$	$= h$
15	$2c + 5c + 7c$	$= 14c$
16	$u + 5u - 2u$	$= 4u$
17	$6d - 3d - 2d$	$= d$
18	$14q - 11q - 3q$	$= 0$
19	$8v - 2v - 3v$	$= 3v$
20	$12s + 3s - 14s$	$= s$

Simplify these, remember that you can't add/subtract unlike terms.

21	$a + g + a$	$= 2a + g$
22	$2e + c + e$	$= 3e + c$
23	$4h + 3h + 2d$	$= 7h + 2d$
24	$10m - 3n - m$	$= 9m - 3n$
25	$2c - 7q + 3c$	$= 5c - 7q$
26	$9k + 3k + n$	$= 12k + n$
27	$3e + 2f - f$	$= 3e + f$
28	$m + p - m$	$= p$
29	$4d - 2m + d$	$= 5d - 2m$
30	$6m + 3b - 5m$	$= m + 3b$
31	$2d + 3d - h$	$= 5d - h$
32	$t + 5e - t$	$= 5e$
33	$5e - 2e + q$	$= 3e + q$
34	$3a - 2d - 2a$	$= a - 2d$
35	$4c + 2b - b$	$= 4c + b$
36	$6w + n - 6w$	$= n$
37	$6n - 3n + 2d$	$= 3n + 2d$
38	$2f + 3f + f - 2d$	$= 6f - 2d$
39	$a + b + a + b$	$= 2a + 2b$
40	$d + 3d + 3e$	$= 4d + 3e$

Simplify these, remember that you can't add/subtract numbers and terms.

41	$2a + 3 + 2a$	$= 4a + 3$
42	$5e + 4 - 4e$	$= e + 4$
43	$10d - 3d - 6$	$= 7d - 6$
44	$3 + 4q + 2 - q$	$= 3q + 5$
45	$4y + 12 - 3y$	$= y + 12$
46	$4k + 2 + 5 - k$	$= 3k + 7$

59	$h + 3 + h + 1$	$= 2h + 4$
60	$y + 2y - 3 + y$	$= 4y - 3$

Further Adding and Subtracting Pronumerals

To add and subtract letters they must be the same. For example:
$5a + 2a = 7a$,
$7bc - 6bc = bc$ and
$3ab + 2ba = 5ba$ (or $5ab$).

However unlike terms can't be added together:
$4c + 3a = 4c + 3a$,
$7qm - 3q = 7qm - 3q$ and
$3ab - a - 3b = 3ab - a - 3b$.

The order of the letters doesn't matter: $4bc = 4cb$, $5xqm = 5qxm = 5mqx$ so terms can be added when the letters are the same but in a different order.

The same applies to when terms have a power, such as $3b^2$, $5d^2f$ and $2x^2y^2$. Terms with different powers can't be added or subtracted. But you can add/subtract these:
$a^2 + 3a^2 = 4a^2$ and
$5x^2y - 2yx^2 = 3x^2y$,

but not thse :
$a^2 + 2a = a^2 + 2a$,
$3e^2 - 3ed = 3e^2 - 3ed$.

Remember that $3k^2mw^2 = 3mk^2w^2 = 3w^2mk^2$, the order doesn't matter, so long as the powers are on the same letters.

The final column requires the missing sides to be found and then the sides added together to get the perimeter. Follow the example at the top of the column.

Further Adding and Subtracting Pronumerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Collect like terms and simplify.

Example

$bx + b + 5 + 2xb + 3b + 7$

$= 3xb + 4b + 12$

1 $3a + 5t + 3 - a + 6 + 4t$

2 $12d + 2a + 16 - 5d - 7 + 3a$

3 $4ux + 3xa - 3xu + 2ax$

4 $5 + 5m + 21 - 4m + 3ma$

5 $12kd - 5dk - 5dk - 8 - kd$

6 $5 + a + b + 6 + 2ab + 3b$

7 $5tu + 17 + 12ut - 12t - 12$

8 $20a - 20 - a + 5ta + 11at$

9 $30ue + 15e - 5e - u$

10 $at + ta + at + ta + a - 4t$

11 $17 + 20as - 3 - 15sa - 3as$

Collect like terms, this time using powers $(^2)$

Example

$50 + a^2 + 3a + 17 - 2a + 3a^2$

$= 4a^2 - a + 67$

12 $17 + 2m^2 - m + m^2 + 14$

13 $7h^2 + 3h - 3h^2 + 4 - 4h^2$

14 $20k^2 + 14 - 12k - 8k^2 - 7$

15 $9r^2 + 5tr + 7 - 3r^2 + 16 - 2rt$

16 $13e + 5e^2 - 8e - 2e^2 - 5 - 4e$

These are harder, note which term has the ^{2}

17 $20cw + 37 - c^2 - 18wc - 19$

18 $9fg^2 + 3f^2g + 3g^2f$

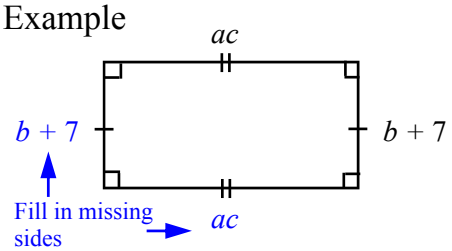
19 $10yt^2 + 3y^2t + 5yt^2$

20 $5a^2 + 3a^2t - 3a^2 - 2ta^2$

21 $y^2 + 2xy^2 + 3y^2 - y^2x^2$

Use your algebra skills to give an expression for the perimeter of the shapes below. Collect like terms.

Example



$P = ac + ac + b + 7 + b + 7$

$P = 2ac + 2b + 14$

19 $10yt^2 + 3y^2t + 5yt^2$

$= 15yt^2 + 3y^2t$

20 $5a^2 + 3a^2t - 3a^2 - 2ta^2$

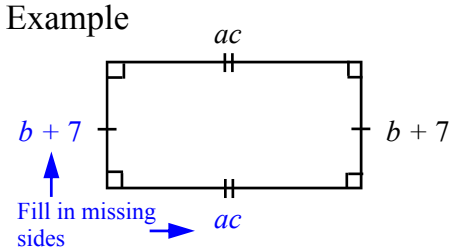
$= 2a^2 - ta^2$

21 $y^2 + 2xy^2 + 3y^2 - y^2x^2$

$= 4y^2 + 2xy^2 - y^2x^2$

Use your algebra skills to give an expression for the perimeter of the shapes below. Collect like terms.

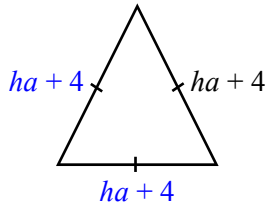
Example



$P = ac + ac + b + 7 + b + 7$

$P = 2ac + 2b + 14$

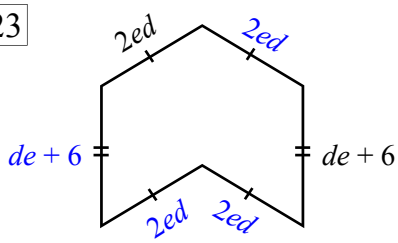
22



$P = ha + 4 + ha + 4 + ha + 4$

$P = 3ha + 12$

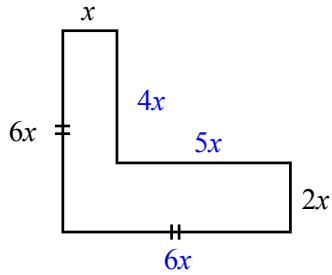
23



$P = 2ed + 2ed + 2ed + 2ed + de + 6 + de + 6$

$P = 10de + 12$

24



$P = 6x + 6x + x + 4x + 5x + 2x$

$P = 24x$

Multiplying, Dividing and Using Brackets with Pronumerals

We show multiplication between numbers and pronumerals as the number first then the letter. For example, $2 \times a = 2a$, $5 \times d = 5d$ and $4 \times a \times d = 4ad$ (or $4da$).

When several numbers and letters are mixed up, calculate the product of the numbers first, then the letters. For example, $5 \times e \times 2 \times g = 10eg$. Note that when the same letter is featured twice a squared term will result. E.g. $3 \times q \times 5 \times q = 15q^2$. A letter times itself is that letter squared. ($a \times a = a^2$, $c \times c = c^2$ etc)

When a pronumeral is divided by a number, write the letter 'over' the number.

So, $x \div 7 = \frac{x}{7}$ $\quad r \div 6 = \frac{r}{6}$ $\quad 3 \times m \div 4 = \frac{3m}{4}$

Sometimes these can be simplified. Like fractions, if both the top and bottom numbers can be divided by another number this will simplify the answer.

$12e \div 8 = \frac{\overset{3}{\cancel{12}e}}{\underset{2}{\cancel{8}}} = \frac{3e}{2}$ (divide by 4)

$12e \div 4 = \frac{\overset{3}{\cancel{12}e}}{\underset{1}{\cancel{4}}} = 3e$ (divide by 4) (you don't write a number over 1)

Remember that the largest number (HCF) that divides into both the top and the bottom numbers (not just any number) is to be found to fully simplify the answer.

Expanding, (removing brackets) is multiplication in steps. The number outside the brackets is multiplied by the first term inside the brackets and then the second term. These are added together if the sign between them is a +, subtracted if there is a negative sign - .

For example,

$5(y + 4) = 5 \times y + 5 \times 4$
$= 5y + 20$

$e(m - e) = e \times m - e \times e$
$= em - e^2$

Multiplying, Dividing and Using Brackets with Pronumerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Multiply these remember numbers first then letters. $d \times d = d^2$ not $2d$

1 $2 \times a$

2 $c \times 3$

3 $4 \times e \times 2$

4 $2 \times f \times 5$

5 $3 \times 4 \times u$

6 $8 \times h \times 2$

7 $3 \times x \times y$

8 $7 \times t \times k$

9 $g \times 2 \times g$

10 $a \times b \times c$

11 $q \times u \times q \times 7$

12 $n \times 5 \times 3 \times n$

13 $x \times 4 \times t$

14 $10 \times z \times q$

15 $h \times 3 \times b \times 4$

16 $6 \times n \times n \times b$

17 $e \times e \times t \times t$

18 $d \times a \times d \times 3$

19 $9 \times 6 \times t \times t$

20 $v \times v \times 3 \times y$

Divide these, remember that ÷ is the same as $\frac{\quad}{\quad}$ Simplify numbers when you can

Example

$9 \times m \div 3 = \frac{3}{1}\frac{\cancel{9}m}{\cancel{3}} = 3m$

21 $c \div 7$

22 $2 \times g \div 3$

23 $\frac{15 \times k}{3}$

24 $22 \times e \div 4$

25 $7 \times b \div 7$

26 $4 \times f \div 8$

27 $18 \times a \div 6$

28 $\frac{45 \times y}{9}$

29 $50d \div 10$

30 $9e \div 6$

31 $\frac{35\,y}{10}$

32 $48a \div 3$

Multiply the outside letter or number by the inside parts separately. This is called 'expanding'.

Example 1

$5\,(w + 10)$ $= 5w + 50$

Example 2

$3a\,(a - 5)$ $= 3a^2 - 15a$

33 $4\,(c + 6)$

34 $6\,(m + 3)$

19 $9 \times 6 \times t \times t$ $= 54t^2$

20 $v \times v \times 3 \times y$ $= 3v^2y$

Divide these, remember that ÷ is the same as $\frac{\ }{\ }$ Simplify numbers when you can

Example

$9 \times m \div 3 = \frac{{}^{3}\cancel{9}m}{{}_{1}\cancel{3}} = 3m$

21 $c \div 7 = \frac{c}{7}$

22 $2 \times g \div 3 = \frac{2g}{3}$

23 $\frac{{}^{5}\cancel{15} \times k}{{}_{1}\cancel{3}} = 5k$

24 $22 \times e \div 4 = \frac{{}^{11}\cancel{22}e}{{}_{2}\cancel{4}} = \frac{11e}{2}$

25 $7 \times b \div 7 = \frac{{}^{1}\cancel{7}b}{{}_{1}\cancel{7}} = b$

26 $4 \times f \div 8 = \frac{{}^{1}\cancel{4}f}{{}_{2}\cancel{8}} = \frac{f}{2}$

27 $18 \times a \div 6 = \frac{{}^{3}\cancel{18}a}{{}_{1}\cancel{6}} = 3a$

28 $\frac{{}^{5}\cancel{45} \times y}{{}_{1}\cancel{9}} = 5y$

29 $50d \div 10 = \frac{{}^{5}\cancel{50}d}{{}_{1}\cancel{10}} = 5d$

30 $9e \div 6 = \frac{{}^{3}\cancel{9}e}{{}_{2}\cancel{6}} = \frac{3e}{2}$

31 $\frac{{}^{7}\cancel{35}\,y}{{}_{2}\cancel{10}} = \frac{7y}{2}$

32 $48a \div 3 = \frac{{}^{16}\cancel{48}a}{{}_{1}\cancel{3}} = 16a$

Multiply the outside letter or number by the inside parts separately. This is called 'expanding'.

Example 1

$5(w + 10) = 5w + 50$

Example 2

$3a(a - 5) = 3a^2 - 15a$

33 $4(c + 6) = 4c + 24$

34 $6(m + 3) = 6m + 18$

35 $5(c - 8) = 5c - 40$

36 $7(3d + 2) = 21d + 14$

37 $h(h + 2) = h^2 + 2h$

38 $e(k + e) = ek + e^2$

39 $5n(n - 11) = 5n^2 - 55n$

40 $3x(x - 3) = 3x^2 - 9x$

41 $k(m + d) = km + kd$

42 $3w(a + 2) = 3wa + 6w$

43 $2q(3q - 2) = 6q^2 - 4q$

44 $8e(7e + 3) = 56e^2 + 24e$

45 $2m(e + 2m) = 2me + 4m^2$

46 $9w(w - 4) = 9w^2 - 36w$

47 $a^2(b + c) = a^2b + a^2c$

48 $x^2(d^2 + t^2) = x^2d^2 + x^2t^2$

49 $3u(2 - t^2) = 6u - 3ut^2$

Further Multiplying, Dividing and Using Brackets with Pronumerals

Column 1 is multiplication between numbers and pronumerals. Always write the number first then the letter (or letters). For example, $2 \times a = 2a$, $5 \times 3d = 15d$ and $4 \times a \times d \times 3 = 12ad$ (or $12da$).

Note that when the same letter is featured twice a squared term will result. A letter times itself is that letter squared. ($a \times a = a^2$, $c \times c = c^2$ etc) For example, $3q \times 5q = 15q^2$, $2c \times 3c = 6c^2$ and $abc \times bc = ab^2c^2$.

The 2nd column are exercises on division. Like fractions, if both the top and bottom numbers can be divided by another number this will simplify the number part of the answer. Remember that the largest number that divides into both the top and the bottom numbers (not just any number) is required to fully simplify.

$12e \div 8 = \overset{3}{\underset{2}{\frac{12e}{8}}} = \frac{3e}{2}$

(divide top and bottom by 4)

$12e \div 4 = \overset{3}{\underset{1}{\frac{12e}{4}}} = 3e$

(divide by 4)

With division of terms the following applies. A term divided by itself equals 1, so it cancels out.

$m \div m = \frac{m}{m} = 1$

$8m \div 6m = \overset{4}{\underset{3}{\frac{8m}{6m}}} = \frac{4}{3}$

$8mb \div 6m = \overset{4}{\underset{3}{\frac{8mb}{6m}}} = \frac{4b}{3}$

A squared term divided by itself equals the term. ($c^2 \div c = c$)

$d^2 \div d = \frac{dd}{d} = d$

$6d^2 \div 4d = \overset{3}{\underset{2}{\frac{6dd}{4d}}} = \frac{3d}{2}$

$8d^2b \div 6d = \overset{4}{\underset{3}{\frac{8ddb}{6d}}} = \frac{4db}{3}$

The 3rd column uses terms instead of numbers in area formulae. This is the same as multiplication (in the first column). The only difference is that triangles have a ½ in the formula. To allow for this, divide one of the numbers on one of the sides by 2 (hopefully its even). For example:

$\frac{1}{2} \times 6m \times t$ ($= 3m \times t$)

$= 3mt$ units^2

$\frac{1}{2} \times 6m \times 2t$ ($= 3m \times 2t$)

$= 6mt$ units^2

Because no units of measurement are mentioned in the question write units^2 in the answer.

16 $2abc \times 2cba$

17 $9k \times 2ek \times u$

18 $2y \times 3d \times dy$

19 $5fn \times 3 \times fe$

20 $abc \times bcd$

Divide these, remember that ÷ is the same as ___ Simplify the numbers if you can, then the terms.

Example

$8e^2 \div 2e = \frac{\overset{4}{\cancel{8}}\cancel{e}e}{\underset{1}{\cancel{2}}\cancel{e}} = 4e$

21 $3u \div 2$

22 $\frac{15x}{3}$

23 $20k \div 6$

24 $8bc \div 3b$

25 $9ch \div 3h$

26 $14ed \div 4d$

27 $4g^2 \div 2g$

28 $\frac{15b^2}{5b^2}$

29 $6ck^2 \div 2k$

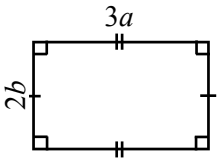
30 $16d^2 \div 6d$

31 $\frac{9ab^2}{6ab}$

32 $a^2b^2 \div ab^2$

Find the areas, here are the formulae. $A = l^2$ (square) $A = lb$ (rectangle) and $A = \frac{1}{2}bh$ (triangle).

Example 1

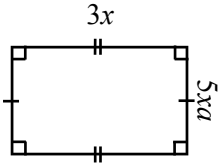


$A = lb$

$= 3a \times 2b$

$A = 6ab$ units²

Example 2

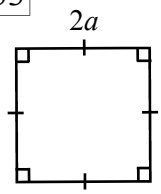


$A = lb$

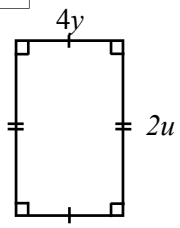
$= 3x \times 5xa$

$A = 15x^2a$ units²

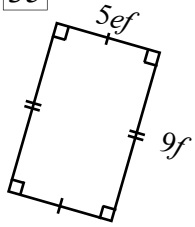
33



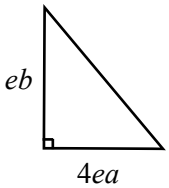
34



35

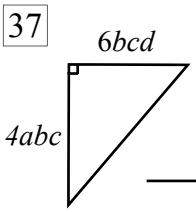


36



$A = \frac{1}{2}bh$

37



Further Multiplying, Dividing and Using Brackets with Pronumerals

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Multiply these remember numbers first then letters. These are challenging!

1 $2h \times 3u$ = $6hu$

2 $4r \times 3f$ = $12rf$

3 $10k \times 3k$ = $30k^2$

4 $4c \times 2c$ = $8c^2$

5 $7md \times 2d$ = $14md^2$

6 $3e \times 2d \times 5$ = $30ed$

7 $8y \times 2x \times 3y$ = $48xy^2$

8 $4de \times 3ed \times 2$ = $24e^2d^2$

9 $5b \times 3c \times bc$ = $15cb^2$

10 $ac \times a \times c \times b$ = a^2c^2b

11 $2t \times utx \times u$ = $2u^2t^2x$

12 $u \times 2d \times ud$ = $2u^2d^2$

13 $cn \times nc \times ab$ = abn^2c^2

14 $4v \times 2w \times 5u$ = $40vwu$

15 $abc \times abc$ = $a^2b^2c^2$

16 $2abc \times 2cba$ = $4a^2b^2c^2$

17 $9k \times 2ek \times u$ = $18k^2eu$

18 $2y \times 3d \times dy$ = $6y^2d^2$

19 $5fn \times 3 \times fe$ = $15f^2ne$

20 $abc \times bcd$ = ab^2c^2d

Divide these, remember that ÷ is the same as $\frac{\ }{\ }$ Simplify the numbers if you can, then the terms.

Example $8e^2 \div 2e = \frac{\overset{4}{\cancel{8}\cancel{e}^2}}{\underset{1}{\cancel{2}\cancel{e}}} = 4e$

21 $3u \div 2 = \frac{3u}{2}$

22 $\frac{\overset{5}{\cancel{15}x}}{\underset{1}{\cancel{3}}} = 5x$

23 $20k \div 6 = \frac{\overset{10}{\cancel{20}k}}{\underset{3}{\cancel{6}}} = \frac{10k}{3}$

24 $8bc \div 3b = \frac{8\cancel{b}c}{3\cancel{b}} = \frac{8c}{3}$

25 $9ch \div 3h = \frac{\overset{3}{\cancel{9}c}\cancel{h}}{\underset{1}{\cancel{3}}\cancel{h}} = 3c$

26 $14ed \div 4d = \frac{\overset{7}{\cancel{14}e}\cancel{d}}{\underset{2}{\cancel{4}}\cancel{d}} = \frac{7e}{2}$

27 $4g^2 \div 2g = \frac{\overset{2}{\cancel{4}g}\cancel{g}}{\underset{1}{\cancel{2}}\cancel{g}} = 2g$

28 $\frac{\overset{3}{\cancel{15}b^2}}{\underset{1}{\cancel{5}b^2}} = 3$

29 $6ck^2 \div 2k = \frac{\overset{3}{\cancel{6}}ck\cancel{k}}{\underset{1}{\cancel{2}}\cancel{k}} = 3ck$

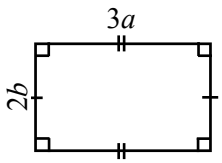
30 $16d^2 \div 6d = \frac{\overset{8}{\cancel{16}}d\cancel{d}}{\underset{3}{\cancel{6}}\cancel{d}} = \frac{8d}{3}$

31 $\frac{\overset{3}{\cancel{9}}d\cancel{b}^2}{\underset{2}{\cancel{6}}d\cancel{b}} = \frac{3b}{2}$

32 $a^2b^2 \div ab^2 = \frac{a\cancel{b}^2}{d\cancel{b}^2} = a$

Find the areas, here are the formulae. $A = l^2$ (square) $A = lb$ (rectangle) and $A = \frac{1}{2}bh$ (triangle).

Example 1

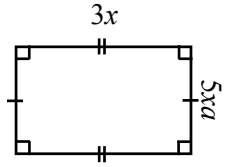


$A = lb$

$= 3a \times 2b$

$A = 6ab$ units²

Example 2

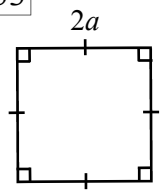


$A = lb$

$= 3x \times 5xa$

$A = 15x^2a$ units²

33

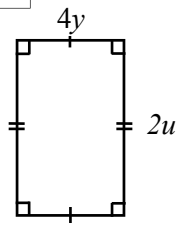


$A = l^2$

$= 2a \times 2a$

$A = 4a^2$ units²

34

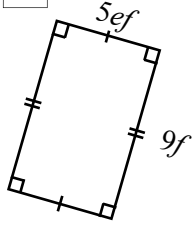


$A = lb$

$= 4y \times 2u$

$A = 8uy$ units²

35

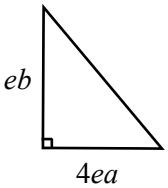


$A = lb$

$= 5ef \times 9f$

$A = 45ef^2$ units²

36

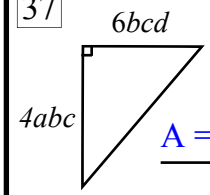


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 4ea \times eb$

$A = 2e^2ab$ units²

37



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 6bcd \times 4abc$

$A = 12b^2c^2ad$ units²

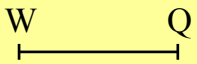
ALTITUDE

ANGLES

Naming Angles

Naming angles allows you to explain which angle or part of a shape you're dealing with.

The first column introduces intervals, lines and rays. With intervals and lines you can name them in either direction. The interval below could be WQ or QW. You are asked to give both the names in these questions.



With rays, name them in the direction of the arrow only. The ray below is called HG only, not GH.

In column 2 you are asked to name the rays and also the vertex, this is the meeting point of the two rays, the 'elbow' if you like. The vertex is named by the letter at the point alone. To show it is a vertex we put a hat on it, like an upside-down 'v'.

To name an angle we generally use 3 letters, moving from ray-to vertex-to ray. The vertex is always in the middle. To show that it is an angle you put an angle sign in front of it or write the letters placing a hat over the vertex.

$\angle ABC$ or, $\hat{A}BC$

When you name a shape (in column 3) you start at any point then go around the shape the one way. If the letters are in alphabetical order you might like to start at the earliest letter. No symbol is put before the name of a shape, though sometimes this is done with triangles. (e.g. ΔABC)

Naming Angles

♦ ∠ IHG × ∠ ABC

Classifying Angles

Classification means to group into categories. There are six classifications in all:

- acute angles are between 0° and 90°
- a right angle is exactly 90°
- obtuse angles are between 90° and 180°
- a straight angle is exactly 180°
- reflex angles are between 180° and 360°
- and a revolution is 360°

How do you remember all these? You should be able to remember the straight angle, right angle and revolution, it is the others you could mix up. Remember that as the angle increases you move through the alphabet. A (acute) is before O(Obtuse) which is before R(reflex). There is a guide at the top of the page to refer to. With the angles, the measured side is the side marked with the arc (part circle) or the right angle symbol.

When asked to name angles remember that you can use either the hat or the angle sign method, as below.

$\angle ABC$ or, $\hat{ABC}$

In column 3 the word internal is used. What does internal mean? It means the inside (interior), so the internal angles are the angles on the inside of a shape.

Classifying Angles

i) acute angles that can be made 3

ii) pieces eaten to make a right angle 4

iii) pieces eaten to make the largest obtuse angle 7

iv) reflex angles that can be made 7

Estimating and Measuring Angles

An angle is used to measure rotation, a protractor is required for this worksheet.

To answer this sheet look at each angle and estimate its size, estimate meaning a skilled guess, so it is unlikely to guess the exact answer, but within say 15° would be very good. Don't use a protractor until you have estimated all of the angles, use the guide at the top right of the sheet if you need the help.

When using a standard protractor ensure you use the correct scale (inside or outside, make sure the scale used starts at 0°) and if the angle is a reflex (greater than 180°), measure the outside of the angle then subtract the angle from 360°. If an angle is measured and it is above 90°, then it must be larger than a right angle, if it isn't you have made a mistake. Use your estimation as a guide as well, and then see how close you were.

Estimating and Measuring Angles

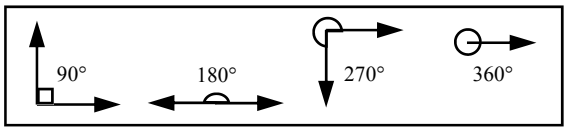
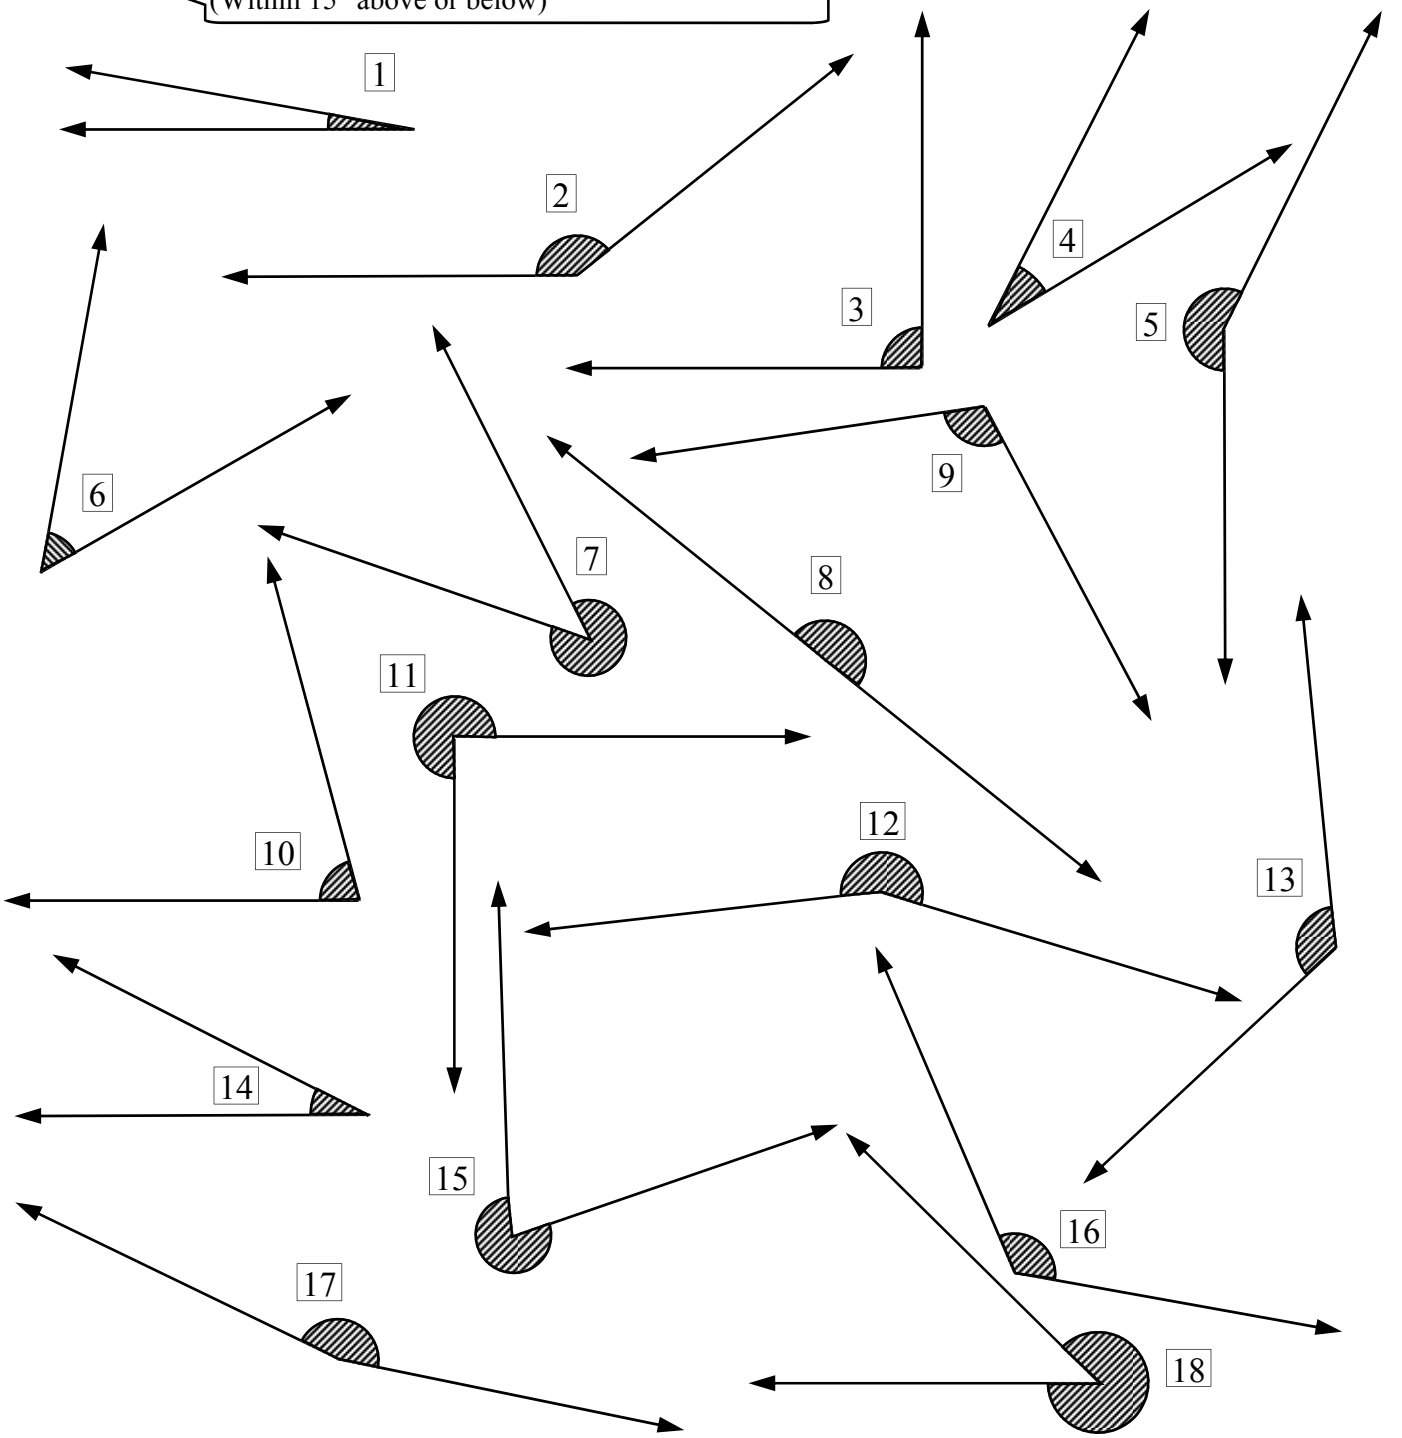
Estimate the size of all the shaded angles and place your answers in the table. Then using a protractor measure all the angles. See how well you estimated. (Within 15° above or below)





No	Estimate	Measured	No	Estimate	Measured	No	Estimate	Measured
1	5 ~ 25°	10°	7	300 ~ 330°	316°	13	115 ~ 140°	127°
2	125 ~ 155°	141°	8	180°	180°	14	20 ~ 35°	27°
3	85 ~ 95°	90°	9	95 ~ 125°	110°	15	270 ~ 300°	287°
4	20 ~ 40°	32°	10	65 ~ 85°	75°	16	110 ~ 135°	123°
5	190 ~ 220°	206°	11	265 ~ 275°	270°	17	150 ~ 170°	166°
6	40 ~ 60°	50°	12	190 ~ 220°	203°	18	300 ~ 330°	316°

Constructing Angles

The previous sheet involved measuring angles, this sheet is about the construction of angles.

The method is as follows:

- Draw a horizontal line
- Measure the given angle from the end of the drawn line, plotting a point at the angle
- Draw a line from the end of the line to the point
- Label the angle with the letters supplied in the question, remember the vertex is point on the elbow of the angle.
- Draw an arc or sector at the vertex to show the angle is the inside or outside of the angle.
- If the angle is greater than 180° then calculate (360° - the angle) the obtuse/acute angle and use that angle. Draw the sector on the other side of the angle.

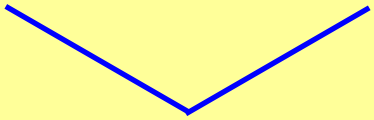
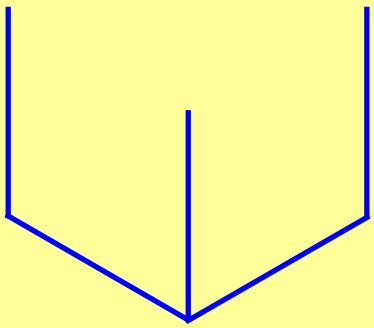
Creating an Isometric Cube

Isometric drawings are done using 30° angles. These are either drawn with a protractor or a 30°/60° set square. Make sure you don't use a 45° set square, as then you will be drawing an oblique drawing. Method:

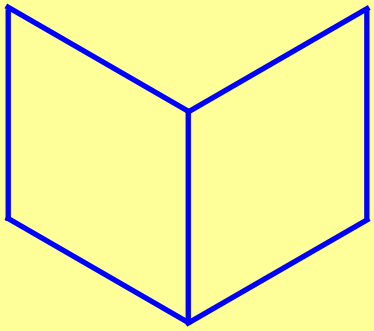
- From the point on the worksheet, or from a point on your page draw a 30° line to the left and another to the right.
- Measure off 10 cm and draw solid lines



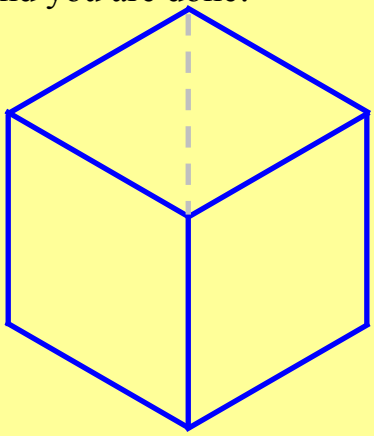
- Draw 3 vertical lines: from the start point and from ends of both lines you have just drawn. Make sure that these lines are vertical by measuring the distance from the side border of the sheet, make sure it is the same distance at the top and the bottom.



- Join the 3 ends together



- Draw a light construction line straight up the centre line, and construct the 30° angled lines from each end. Join up and you are done!



Time Out Activity - Using Angles to Create an Isometric Cube

Adjacent Angles

Adjacent means next to, in the case of angles this means that the angle shares a common ray (or arm) and vertex with the angle beside it.

In Column 1 the table requires you to add the two angles together to get a total, the sum of two adjacent angles. This continues down the column only with graphical representation, note that these angles aren't to scale, so don't use the angles as a guide. In Q.3 there are three angles but only two angles have numbers, the third is a right angle which is 90°. It is suggested that you write in the '90°', that way you won't forget it in the addition.

In the 2nd Column Q.6 asks you to name the adjacent angle. This requires you to name the two angles that touch the given angle. As the layout is circular that means each angle has an adjacent angle on each side of it, don't name one angle then the same angle with the letters reversed. Q. 7 is another table which this time gives you the total of two angles, and one of the angles. Subtract the angle from the total and you have the answer.

The same method is used for the rest of the sheet Subtract the known angles from the total to obtain the unknown angle. Except Q.10 & 12, with these use division! Q.10 gives you the hint.

Adjacent Angles

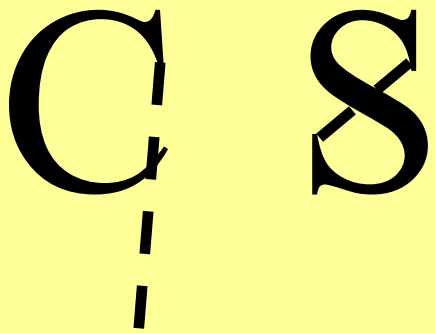
q = 255° - 90° - 90°

q = 75°

Complementary and Supplementary Angles

Complementary angles are angles that add to 90° and supplementary angles are angles that add to 180°. How do you remember which is which? C comes before S in the alphabet, as 90° comes before 180°. Or look at the construction below.

The C can be changed to a 9 (90°) and the S can be changed to an 8 to remember 180°



In Column 1 the first three questions ask you to verify that the two angles are complementary. Add the two angles together, if the sum equals 90° then they are.

For the rest of Column 1 you have to find the angle that when added to the angle given, has a total of 90°. You answer this by subtracting the given angle from 90°. The most common mistake is thinking that a right angle is 100°, or at least using it in calculations, remember 90° not 100°!

The 2nd Column has the same layout as the first but instead of the angles adding to give 90° they should total 180°, to be supplementary. The remainder of the column requires you to subtract the given angle from 180° to get the answer. When a right angle is involved write in 90°, this process should always be done as the angle may be overlooked.

The 3rd column is a mixture of the first 2 columns.

Are the following angles complementary?

1 
Circle: Yes / **No**

2 
Circle: **Yes** / No

3 
Circle: **Yes** / No

Find the unknown adjacent complementary angle

4 
$d = 90° - 32°$

$d = 58°$

5 
$t = 90° - 56°$

$t = 34°$

6 
$y = 90° - 17°$

$y = 73°$

7 
$w = 90° - 41°$

$w = 49°$

8 
$s = 90° - 25°$

$s = 65°$

9 
$h = 90° - 72°$

$h = 18°$

Are the following angles supplementary?

10 

Circle: **Yes** / No

11 
Circle: Yes / **No**

12 
Circle: Yes / **No**

Find the unknown adjacent supplementary angle

13 
$k = 180° - 46°$

$k = 134°$

14 
$x = 180° - 123°$

$x = 57°$

15 
$u = 180° - 22°$

$u = 158°$

16 
$w = 180° - 90°$

$w = 90°$

17 
$p = 180° - 136°$

$p = 44°$

18 
$c = 180° - 169°$

$c = 11°$

19 
$b = 180° - 33°$

$b = 147°$

Find the missing angle

20 
$y = 180° - 17°$

$y = 163°$

21 
$j = 180° - 141°$

$j = 39°$

22 
$m = 90° - 37°$

$m = 53°$

23 
$p = 180° - 102°$

$p = 78°$

24 
$d = 90° - 61°$

$d = 29°$

25 
$y = 90° - 9°$

$y = 81°$

26 
$n = 180° - 139°$

$n = 141°$

27 
$a = 90° - 50°$

$a = 40°$

28 
$h = 180° - 90°$

$h = 90°$

29 
$e = 180° - 152°$

$e = 28°$

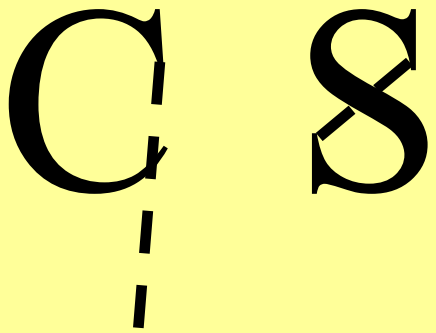
30 
$k = 90° - 43°$

$k = 47°$

Complementary Angles

Complementary angles are angles that add to 90°. Supplementary angles add to 180° (the next sheet). How do you remember which is which? C comes before S in the alphabet, as 90° comes before 180°. Or look at the construction below.

The C can be changed to a 9 (90°) and the S can be changed to an 8 to remember 180°



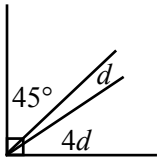
In Column 1 you are asked to find the complement, this means find the angle that when added to the angle given, has a total of 90°. You do this by subtracting the given angle from 90°. This continues down the column, subtract the angle given on the diagram from 90° to find the answer. The most common mistake is thinking that a right angle is 100°, or at least using it in calculations remember 90° not 100°!

The 2nd Column through to Q 16 in the 3rd Column is an extension of this. The same method is used only more than one angle is subtracted from 90°. Question 7 shows the method of working required.

Questions 17 and 18 require you to add the letters together, these equal 90°. Then divide by the number in front of the letter to get the value of the pronumeral. Note that the value of the pronumeral is being found, this isn't necessarily the value of the angle.

Questions 19 and 20 are more difficult questions and require an extra step. The letters are added on the left of the equals sign, and the subtraction of the angle from 90° is put on the right side. See the example below.

Example



$5d = 90° - 45°$

$5d = 45°$

$d = 9°$

Divide by 5

Complementary Angles

Find the complementary angle to those given in the table below.

1

Angle	Complement
30°	60°
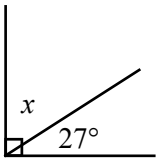
45°	45°
73°	17°
21°	69°
9°	81°
57°	33°
84°	6°

Find the complementary angle for the following

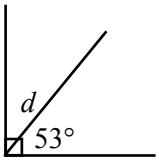
2



$x = 90° - 27°$

$x = 63°$

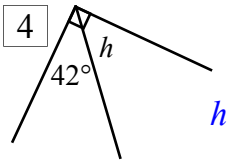
3



$d = 90° - 53°$

$d = 37°$

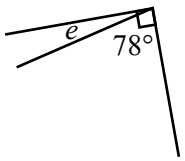
4



$h = 90° - 42°$

$h = 48°$

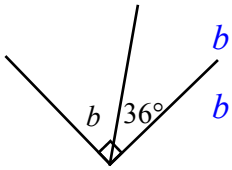
5



$e = 90° - 78°$

$e = 12°$

6

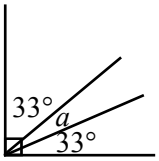


$b = 90° - 36°$

$b = 54°$

Now there are more than 2 angles. Solve these.

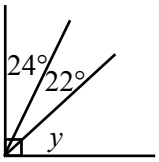
7



$a = 90° - 33° - 33°$

$a = 24°$

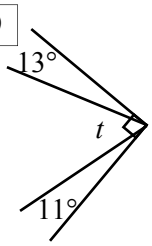
8



$y = 90° - 24° - 22°$

$y = 44°$

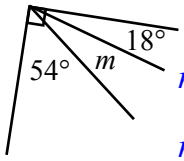
9



$t = 90° - 11° - 13°$

$t = 66°$

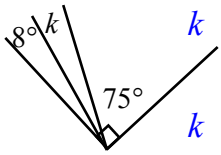
10



$m = 90° - 54° - 18°$

$m = 18°$

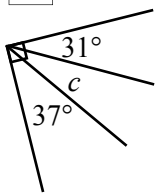
11



$k = 90° - 8° - 75°$

$k = 7°$

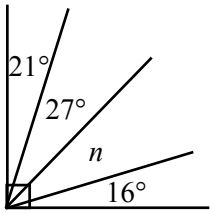
12



$c = 90° - 37° - 31°$

$c = 22°$

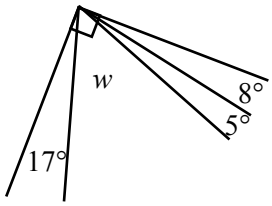
13



$n = 90° - 21° - 27° - 16°$

$n = 26°$

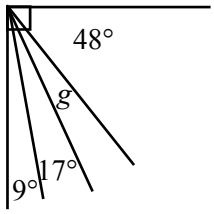
14



$w = 90° - 17° - 8° - 5°$

$w = 60°$

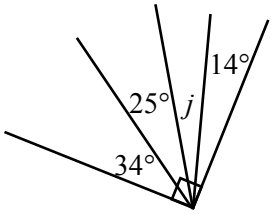
15



$g = 90° - 9° - 17° - 48°$

$g = 16°$

16

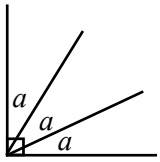


$j = 90° - 34° - 25° - 14°$

$j = 17°$

Use division to find the value of these unknowns.

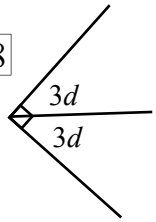
17



$3a = 90°$

$a = 30°$

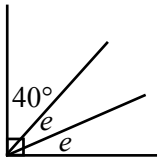
18



$6d = 90°$

$d = 15°$

19

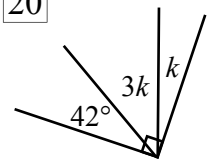


$2e = 90° - 40°$

$2e = 50°$

$e = 25°$

20



$4k = 90° - 42°$

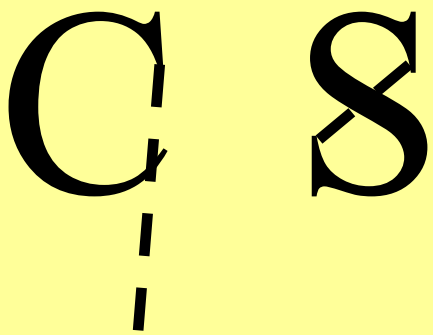
$4k = 48°$

$k = 12°$

Supplementary Angles

Supplementary angles are angles that add to 180°. How do you remember the difference between supplementary and complementary? C comes before S in the alphabet, just as 90° comes before 180°. Or look at the construction below.

The C can be changed to a 9 (90°) and the S can be changed to an 8 to remember 180°



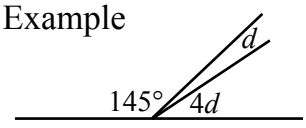
In Column 1 you are asked to find the supplement, this means find the angle that when added to the angle given, has a total of 180°. You do this by subtracting the given angle from 180°. This continues down the column, subtract the angle given on the diagram from 180° to get the answer.

The 2nd Column has a table to complete, this time both the complementary and supplementary angles are required. Subtract the angle from 180° to get the supplement and from 90° for the complement. Q 9 through 16 add more angles into the problem, but the problem is still solved the same way, by subtracting all the given angles from 180°.

Questions 17 and 19 require you to add the letters together, these equal 180°. Then divide by the number in front of the letter to get the value of the pronumeral. Note that the value of the pronumeral is being found which isn't necessarily the value of the angle (see Question 20).

Question 18 is a more difficult question and requires an extra step. The letters are added on the left of the equals sign, and the subtraction of the angle from 90° is put on the right side. See the example below.

Example



$5d = 180° - 145°$

$5d = 35°$

$d = 7°$

Divide by 5

Supplementary Angles

$2x$ = ____ $4x$ = ____

Supplementary Angles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

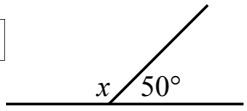
Find the supplementary angle to those given in the table below.

1

Angle	Supplement
110°	70°
45°	135°
162°	18°
16°	164°
123°	57°
27°	153°
177°	3°

Find the supplementary angle for the following

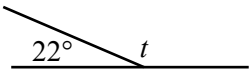
2



x = 180° - 50°

x = 130°

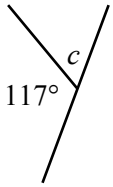
3



t = 180° - 22°

t = 158°

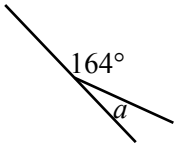
4



c = 180° - 117°

c = 63°

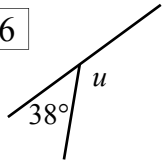
5



a = 180° - 164°

a = 16°

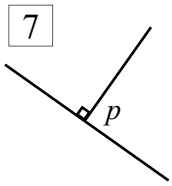
6



u = 180° - 38°

u = 142°

7



p = 180° - 90°

p = 90°

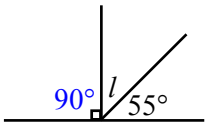
For the angles below find both the supplement and the complement.

8

Angle	Supplement	Complement
25°	155°	65°
65°	115°	25°
13°	167°	77°
79°	101°	11°
57°	123°	33°
3°	177°	87°
41°	139°	49°

Now there are more than 2 angles. Solve these.

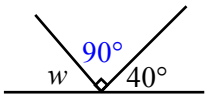
9



l = 180° - 90° - 55°

l = 35°

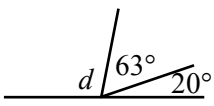
10



w = 180° - 90° - 40°

w = 50°

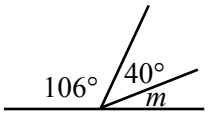
11



d = 180° - 63° - 20°

d = 97°

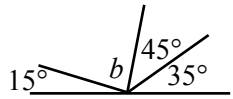
12



m = 180° - 106° - 40°

m = 34°

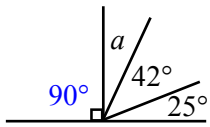
13



b = 180° - 15° - 45° - 35°

b = 85°

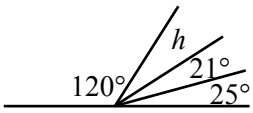
14



a = 180° - 90° - 42° - 25°

a = 23°

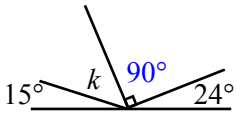
15



h = 180° - 120° - 21° - 25°

h = 14°

16

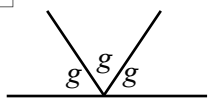


k = 180° - 15° - 90° - 24°

k = 51°

Use division to find the value of these unknowns.

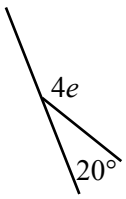
17



$3g$ = 180°

g = 60°

18

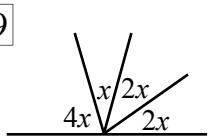


$4e$ = 180° - 20°

$4e$ = 160°

e = 40°

19



$9x$ = 180°

x = 20°

20 With the value of x found above, find the value of:

$2x$ = 40° $4x$ = 80°

Angles at a Point

Just like a circle, the angle sum at a point is 360°. To find the size of an unknown angle subtract all the given angles from 360°.

In Column 1 the unknown angle is given a letter, just write the letter then '=' and subtract all the given angles from 360°. Some angles are right angles, write '90°' in these so that you don't forget to include the right angle in your calculation.

Column 2 requires you to use your algebra skills, add the letters and then divide 360° by the number in front of the letter. Questions 13 through 15 have an additional step, use the same method to find the value of the letter, but then multiply that value by the number in front of the letter for each angle. For example if you find $x = 25°$ and the angle in the question is $3x$, then $3x = 3 \times 25° = 75°$. If the question asks 'to solve for x', then you don't need to do this, it is only when you are asked for the angle, as the angle is $3x$ you must find the size of the angle, as the size of x isn't sufficient.

Column 3 is a harder column and some students may experience difficulty with these. The steps are a combination of the earlier problems.

- add the letters together and write it then an equals, (in question 16. $e + e = 2e$)
- then subtract the given angles (remember the right angles) from 360°
- the next line write the letters sum again only evaluate 360° - the angle
- then use division to solve like earlier problems
- the last two questions are harder, they require multiplication to get the angle (like Q13-15)

Angles at a Point

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use subtraction from 360° to find the unknown angle

1

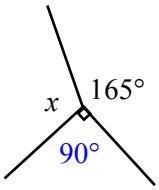
$d = 360° - 305°$

$d = 55°$

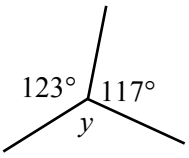
2



$x = 360° - 90° - 165°$

$x = 105°$

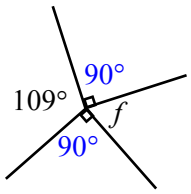
3



$y = 360° - 123° - 117°$

$y = 120°$

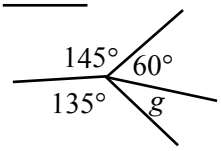
4



$f = 360° - 109° - 90° - 90°$

$f = 71°$

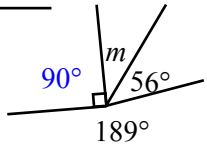
5



$g = 360° - 135° - 145° - 60°$

$g = 20°$

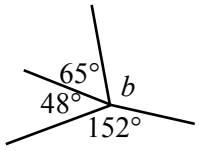
6



$m = 360° - 189° - 90° - 56°$

$m = 25°$

7

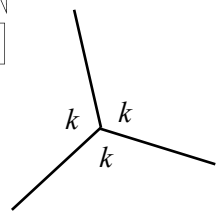


$b = 360° - 152° - 48° - 65°$

$b = 95°$

This time use division

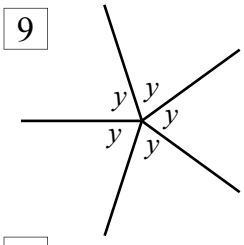
8



$3k = 360°$

$k = 120°$

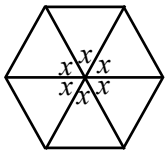
9



$5y = 360°$

$y = 72°$

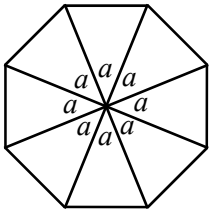
10



$6x = 360°$

$x = 60°$

11

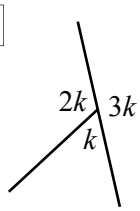


$8a = 360°$

$a = 45°$

Use the same method but this time find the value of the letter and the angles

12

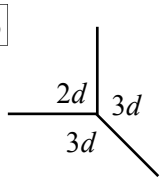


$6k = 360°$

$k = 60°$

$2k = 120°$ $3k = 180°$

13

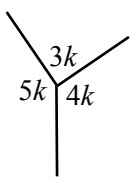


$8d = 360°$

$d = 45°$

$2d = 90°$ $3d = 135°$

14



$12k = 360°$

$k = 30°$

$3k = 90°$ $4k = 120°$

$5k = 150°$

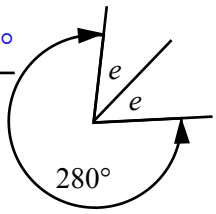
Use subtraction from 360° then division to find the unknown angles

15

$2e = 360° - 280°$

$2e = 80°$

$e = 40°$

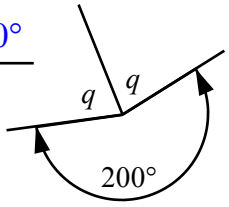


16

$2q = 360° - 200°$

$2q = 160°$

$q = 80°$

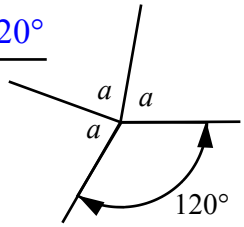


17

$3a = 360° - 120°$

$3a = 240°$

$a = 80°$

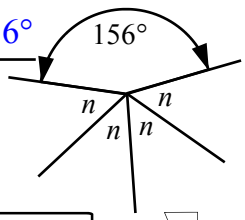


18

$4n = 360° - 156°$

$4n = 204°$

$n = 51°$



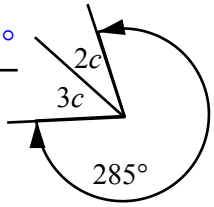
Now the angles are different

19

$5c = 360° - 285°$

$5c = 75°$

$c = 15°$



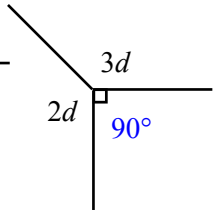
$2c = 30°$ $3c = 45°$

20

$5d = 360° - 90°$

$5d = 270°$

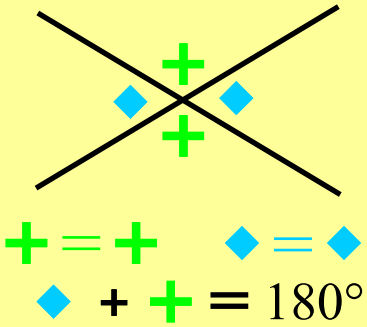
$d = 54°$



$2d = 108°$ $3d = 162°$

Vertically Opposite Angles

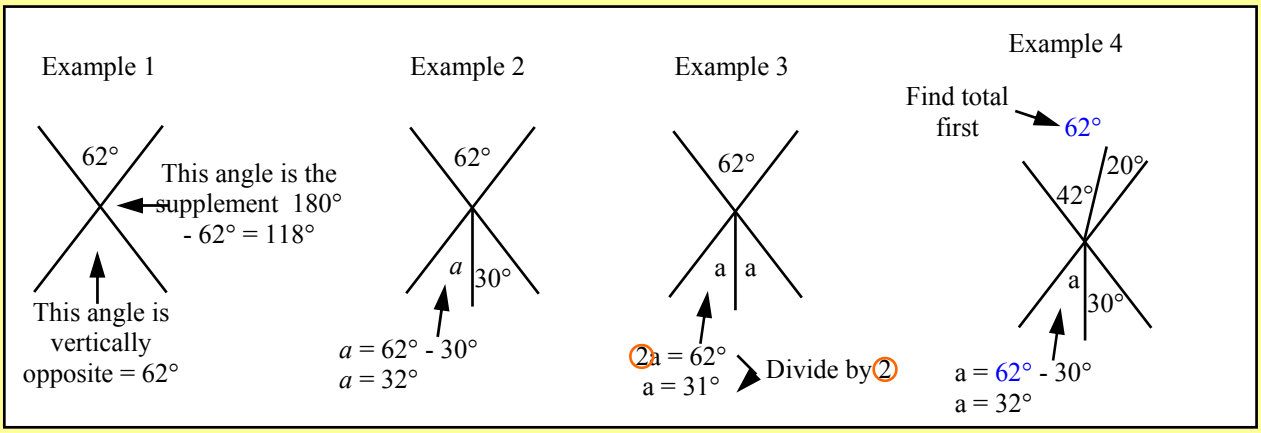
Vertically opposite angles are equal when formed by intersecting straight lines. The diagram below illustrates this. Don't let the word 'vertical' confuse you, as you can see if angles are opposite each other horizontally they are also considered vertically opposite (equal).



In Column 1 identify the vertically opposite angle, by drawing a star in the angle and then also by naming it. Write the name of the angle on the line and colour the star beside it the same colour as the one you placed on the diagram. Q 5 is more difficult as many angles are all on the one diagram so take care with this question.

Column 2 asks you to find the value of the letter, this is just identification, (the answer is in front of you) for Q. 6 through 9. But from Q 10 on…. some mathematics is required, this will always be subtraction or division look at the examples below.

With column 3 Questions 15 and 16 use the same method as the example above them, establishing two angles from identification then the 3rd by supplementary angle methods, look at the example at the top of the column. The last two questions are more difficult and require you to choose vertically opposite or supplementary methods to solve them.



Vertically Opposite Angles

5

∠ IBG → (vertically opposite) ∠ CBE

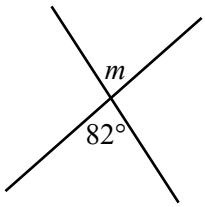
∠ HBD → ∠ ABF

∠ ABC → ∠ GBH

∠ CBD → ∠ FBG

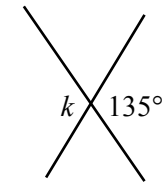
Find the value of the letters below

6



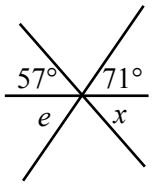
$m = 82°$

7



$k = 135°$

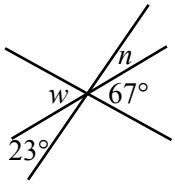
8



$e = 71°$

$x = 57°$

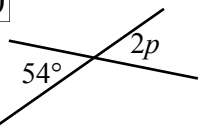
9



$n = 23°$

$w = 67°$

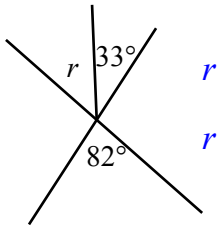
10



$2p = 54°$

$p = 27°$

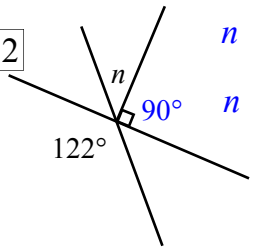
11



$r = 82° - 33°$

$r = 49°$

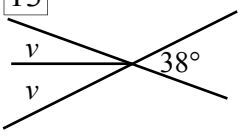
12



$n = 122° - 90°$

$n = 32°$

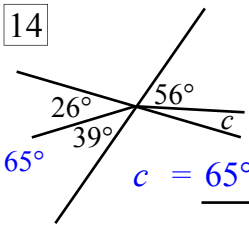
13



$2v = 38°$

$v = 19°$

14

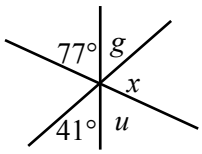


$c = 65° - 56°$

$c = 9°$

Use vertically opposite and supplementary angle properties to find the value of these letters

Example



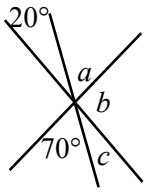
$g = 41°$

$u = 77°$

$x = 180° - 41° - 77°$

$x = 62°$

15



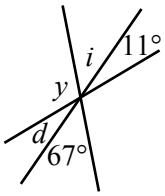
$a = 70°$

$c = 20°$

$b = 180° - 70° - 20°$

$b = 90°$

16



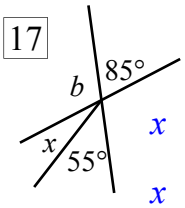
$d = 11°$

$i = 67°$

$y = 180° - 11° - 67°$

$y = 102°$

17



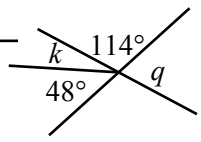
$x = 85° - 55$

$x = 30°$

$b = 180° - 55° - 30°$

$b = 95°$

18



$k = 180° - 114° - 48°$

$k = 18°$

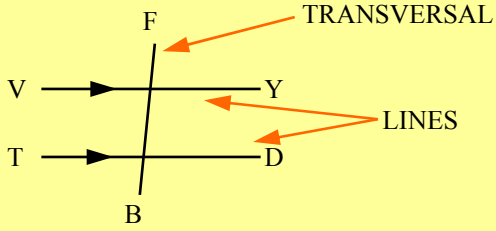
$q = 48° + 18°$

$q = 66°$

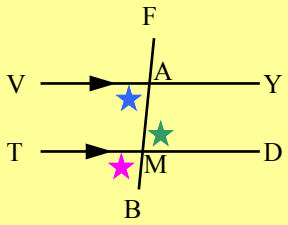
Parallel Lines and the Transversal

When parallel lines are crossed by a line the angles formed are related to each other by properties. This will require you to remember certain words and their meaning.

The first word is 'transversal' this is the name of the line that cuts across parallel lines. In column 1 you are asked to name the transversal and the parallel lines, write the 2 letters that represent the line, this can be done either way as the example below shows. The naming of angles uses the 3 point method, there is 4 possible answers for some questions as the example below shows, realise that if the answer doesn't match your answer you still may be correct, but the middle letter (vertex) must always be the same.



Lines are VY or YV and TD or DT
Transversal is either FB or BF



★ ∠VAM or ∠VAB or ∠MAV or ∠BAV

★ ∠AMD or ∠FMD or ∠DMA or ∠DMF

★ ∠TMB or ∠BMT

When lines cross, pairs of angles are made. Co-interior angles (called C angles) are the pair of angles formed on one side of the transversal inside the parallel lines, a 'c' can be formed around the angles (one is back to front). There are only two co-interior angle pairs in a standard 2-line 1 transversal problem. Remember the word interior means on the inside (of the parallel lines and the transversal).

Alternate angles (called Z angles) are also on the inside of the parallel lines but unlike co-interior angles they are on opposite sides of the transversal. A 'Z' can be made by the lines that include these angles.

Both alternate and co-interior angles are inside the two parallel lines. Corresponding angles (called F angles) require one point to be on the inside of the parallel lines and the other to be on the outside. An 'F ' or back to front ‘F’ is made by the lines that include these angles. With corresponding angles the angle is in exactly the same position on both points of intersection. Column 3 asks you to write either 'alternate', 'co-interior' or 'corresponding'. Questions 32 through 37 are more challenging but the same method is used.

Parallel Line Angle Properties

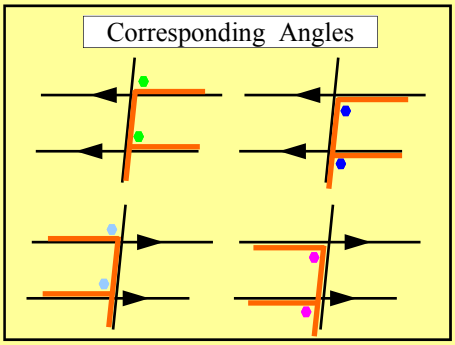
When two parallel lines are crossed by a transversal, pairs of angles are made that we can use mathematically. The previous sheet taught you alternate, co-interior and corresponding angles, now we can use their angle properties, which are:

- corresponding angles are equal if lines are parallel
- alternate angles are equal if lines are parallel
- co-interior angle sum is 180° if lines are parallel (the two angles add to 180°)

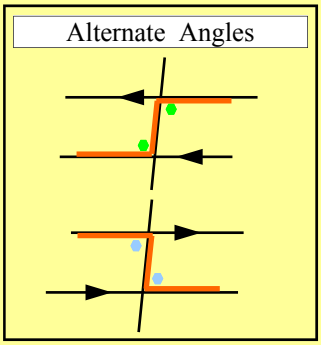
In Column 1 an angle is given and an unknown angle is required. The unknown angle will be either the alternate, corresponding or co-interior angle to the given angle. The first step is identifying which. Once identified if the angle is the alternate angle or the corresponding angle it is the same as the given angle, no working required. If the relationship is co-interior then subtract the given angle from 180° to obtain the answer.

Column 2 gives both angles, identify if the relationship between the 2 angles is either alternate or corresponding. If it is, the angles must be the same for the lines to be parallel, if the angles aren't equal then the lines aren't parallel. If the relationship between the 2 angles is co-interior then the sum of the two angles must equal 180° for the lines to be parallel. If they don't add to 180º then the lines aren't parallel. This includes if the angles are the same, the same co-interior angle means the lines aren't parallel, unless the angles are 90°. See the example at the top of the column.

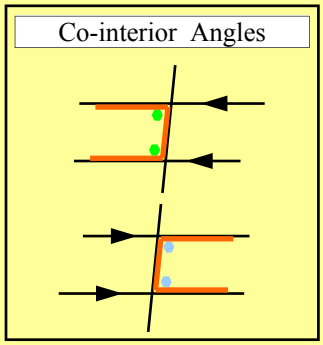
Column 3 is the same as column 1 in procedure, the only difference being that you have to divide the angle by the number in front of the letter to get your answer. The last 3 questions require a subtraction to take place before the division.



Corresponding angles are equal if the lines are parallel



Alternate angles are equal if the lines are parallel



Co-interior angles add to 180° if the lines are parallel

Parallel Lines Angle Properties

Circle: Yes / No

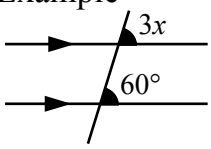
Corresponding angles equal so lines are parallel.

Find the value of x

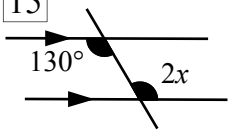
Example



$3x = 60°$

$x = 20°$

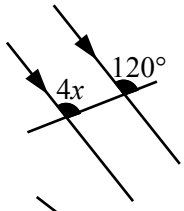
15



$2x = 130°$

$x = 65°$

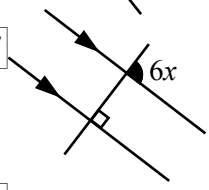
16



$4x = 120°$

$x = 30°$

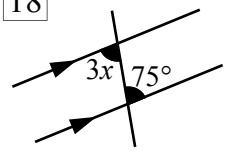
17



$6x = 90°$

$x = 15°$

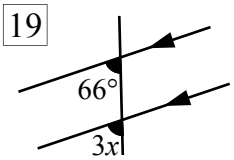
18



$3x = 75°$

$x = 25°$

19



$3x = 66°$

$x = 22°$

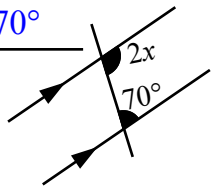
Co-interior angles require an extra step, find the value of x in these

20

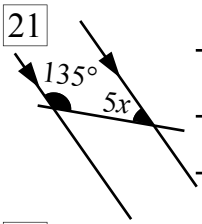
$2x = 180° - 70°$

$2x = 110°$

$x = 55°$



21



$5x = 180° - 135°$

$5x = 45°$

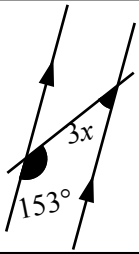
$x = 9°$

22

$3x = 180° - 153°$

$3x = 27°$

$x = 9°$



Further Parallel Lines

If two parallel lines are crossed by a transversal eight angles are formed. Given one angle, all of the other angles can be found by using these properties:

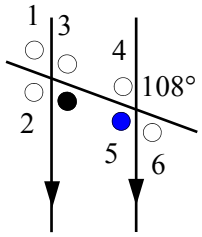
- supplementary, the angles adjacent (next to it) to the angle can be found by subtracting the given angle from 180°
- vertically opposite, the angle opposite the given angle is the same size as the angle
- then parallel line properties are used. Alternate, corresponding and co-interior can be used (it isn't necessary to use them all)

In column 1 a single angle is given, you are required to find the value of the black dotted angle in two solution 'moves'. The first step requires you to use supplementary or vertically opposite methods then for the second step use one of the parallel line properties.

The example below shows the angle given is 108°, vertically opposite was used to find 5 then co-interior to the black dotted angle. Note we could also use two other methods. Supplement to 4 then alternate to black dot or supplement to 6 and corresponding to black dot. Either way is correct. Note that the dots can be coloured, ensure that your colour choice is matched on the solution line.

Column 3 is an extension, this time the seven other angles are required. Use any method you like just make sure you give a reason, like the example below.

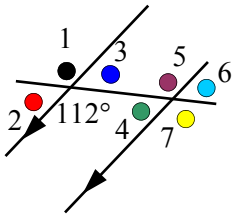
Example



● = 108° as vertically opposite

● = 72° as co-interior to ●

Example



● = 68° as supplement

● = 112° as vertically opposite

● = 68° as supplement

● = 68° as co-interior

● = 112° as alternate

● = 68° as supplement to ●

● = 112° as corresponding

Further Parallel Lines

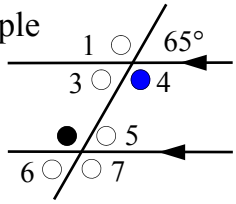
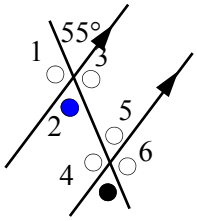
Find the vertically opposite or supplementary angle and use it to solve for the un-known angle, give a reason

Example



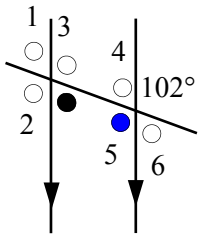
- (4) = 115° as supplement
- (4) = 115° as 4 alternate to •

1



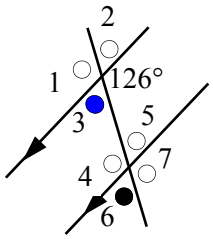
- (2)=55° as vertically opposite
- = 55° as 2 corresponds to •

2



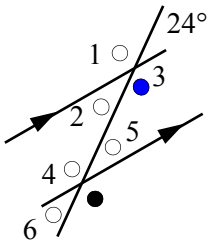
- (5)=102° as vertically opposite
- = 78° as 5 co-interior to •

3



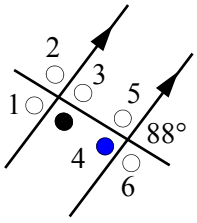
- (3) = 54° as supplement
- = 54° as corresponds to •

4



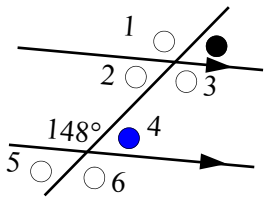
- (3) = 156° as supplement
- = 156° as corresponds to •

5



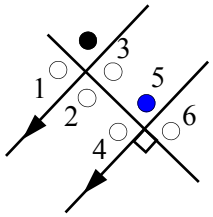
- (4)=92° as vertically opposite
- = 88° as co-interior to •

6



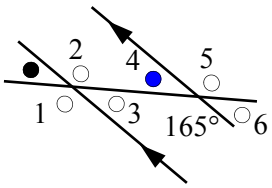
- (4) = 32° as supplement
- = 32° as corresponds to •

7



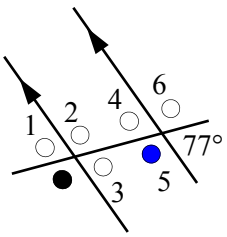
- (5)=90° as vertically opposite
- = 90° as corresponds to •

8



- (4) = 15° as supplement
- = 15° as corresponds to •

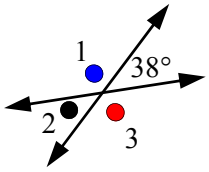
9



- (5) = 103° as supplement
- = 103° as corresponds to •

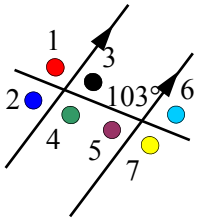
Now using the same skills find all the angles on the diagram, with reasons.

10



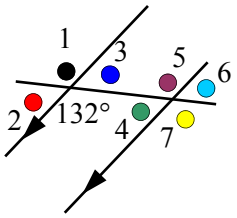
- (1)= 142° as supplement
- (2)=38° as vertically opposite
- (3)= 142° as supplement

11



- (3)= 77° as 5 co-interior
- (5)= 77° as supplement
- (4)= 103° as alternate
- (6)= 77° as supplement
- (7)= 103° as vertically opposite
- (1)= 103° as corresponding
- (2)= 77° as supplement to •

12



- (2)= 48° as supplement
- (1)= 132° as vertically opposite
- (3)= 48° as supplement
- (4)= 48° as co-interior
- (5)= 132° as alternate
- (6)= 48° as supplement to •
- (7)= 132° as corresponding

Measuring Angles in Triangles

This exercise is an introductory exercise to show that the angle sum of a triangle is 180°. Use a protractor to measure each angle in the triangles, note you should expect to experience some error in any measurement exercise, your total may be out by a degree.
Follow these steps:

- measure the angles with a protractor and then using the addition spaces in the bottom left corner add them and compare the total to 180°
- Repeat for all the triangles

Why are there errors? As the angles are not exactly a whole degree you may round them up or down, this will affect your total.

Angles in Triangles

The angle sum of a triangle is 180°. This property holds true regardless of the type of triangle. Types of triangles are:

- Equilateral - all sides equal length, all (internal) angles are 60°
- Isosceles - two sides equal length, two angles equal, note that the equal sides are opposite the equal angles
- Right angled triangle - has a right angle in the triangle with the other two angles being unequal
- Right Isosceles triangle - is a right angled triangle with the other two angles being equal (they must be 45°)
- Scalene triangle - all sides and all angles unequal, the words acute and obtuse can be used to further the description
- Acute triangle - all angles are less than 90°
- Obtuse triangle - one angle is greater than 90°, note that you can't have more than one obtuse angle in a triangle

Column 1 requires you to find the missing angle. Two angles are always given, subtract these from 180° to get the answer, (example at top of column). Once you have the 3 angles describe the type of triangle it is from the selection at the top of the sheet. Often the case is to use the word ‘obtuse’ in describing a triangle but not ‘acute’. So that if obtuse isn't used the triangle must be acute. This classification will only apply to scalene and isosceles triangles, right angled triangles and equilateral triangles can't contain an obtuse angle.

Column 3 tests your knowledge of isosceles and equilateral triangles. With equilateral triangles you know the angle is always 60°. So if the angle is $12w$ then that means $12w = 60°$ (÷ by 12) and $w = 5°$. If it was $15t$ then $15t = 60°$ (÷ by 15) and $t = 4°$. Note that in these questions you asked to find the value of the letter, this is different than finding the angle. For example if an angle is $20k$ in the corner of an equilateral triangle, $k = 3°$ but the actual angle is still 60°.

With isosceles triangles the process is the same except that instead of 60° the angle will match another angle on the diagram, question 18 is more challenging.

Angles in Triangles

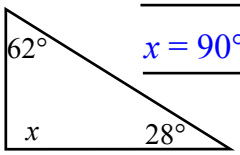
Find the missing angle, then classify (name the type of) the triangle.

Example $x = 180° - 62° - 28°$

$x = 90°$



Type: Right angled triangle

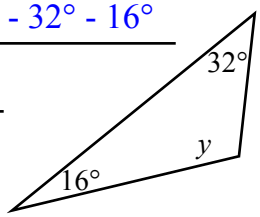
1 $y = 180° - 32° - 16°$

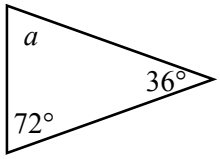
$y = 132°$



Type: Obtuse scalene triangle

2 $a = 180° - 72° - 36°$

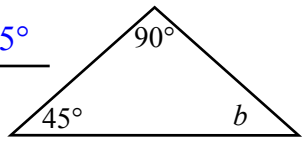
$a = 72°$



Type: Acute Isosceles Triangle

3 $b = 180° - 90° - 45°$

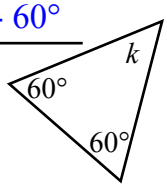
$b = 45°$



Type: Right Isosceles Triangle

4 $k = 180° - 60° - 60°$

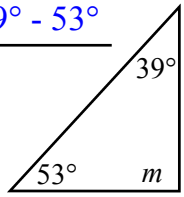
$k = 60°$



Type: Equilateral triangle

5 $m = 180° - 39° - 53°$

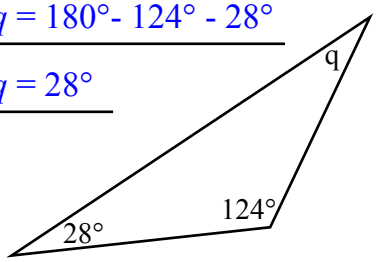
$m = 88°$



Type: Acute scalene triangle

6 $q = 180° - 124° - 28°$

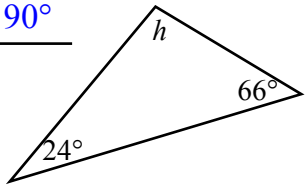
$q = 28°$



Type: Obtuse isosceles triangle

7 $h = 180° - 24° - 66°$

$h = 90°$



Type: Right angled triangle

Use the same method to solve, identify the type of triangle formed. Use '$x =$'

8 A triangle has angles 23° and 46°, find the other angle

$x = 180° - 23° - 46°$

$x = 111°$

Type: Obtuse scalene triangle

9 A triangle has angles 56° and 68°, find the other angle

$x = 180° - 56° - 68°$

$x = 56°$

Type: Acute isosceles triangle

10 Two identical angles in a triangle total 120°, find the other angle

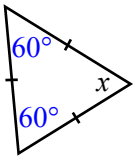
$x = 180° - 120°$

$x = 60°$

Type: Equilateral triangle

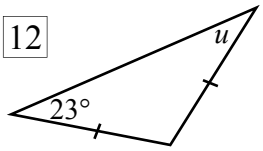
Use the side lengths to help you choose a method to find the value of the letters

11



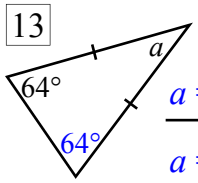
$x = 60°$

12



$u = 23°$

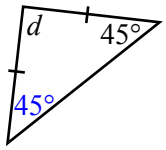
13



$a = 180° - 64° - 64°$

$a = 52°$

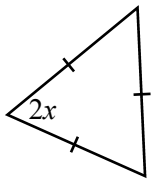
14



$d = 180° - 45° - 45°$

$d = 90°$

15



$2x = 60°$

$x = 30°$

16

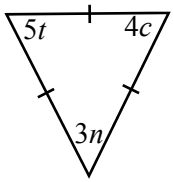
$w = 21°$

These are harder

17



$4c = 60°$

$c = 15°$

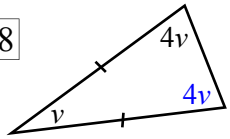
$5t = 60°$

$t = 12°$

$3n = 60°$

$n = 20°$

18



$9v = 180°$

$v = 20°$

Isosceles Triangles

Your knowledge of isosceles triangles and their properties will be tested throughout your mathematics studies, the 3 methods of finding missing angles are dealt with on this sheet. In column 1 your are given one angle and asked to find another. With a scalene triangle this is impossible because you require 2 angles to find the remaining angle, but because these are isosceles triangles you know that the angles opposite the sides with markings are equal.

Column 1 is done all the same way, place the number in the empty corner then you have your 2 angles. Then subtract the 2 angles from 180°. Look at question 1, the unlabelled angle is also 48°, so the working is s = 180° - 48° - 48° or s = 180° - 2 × 48°. The most common mistake when answering these questions is you will forget the unlabelled angle and subtract 48° from 180° instead of 48° doubled.

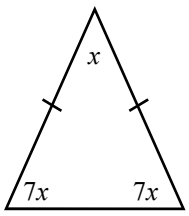
In column 2 the second type of problem is encountered, this time you are given the non-paired angle. This time 2 × (the letter) = 180° - (the given angle). An example is at the top of the column, the entire column is done using the same method. It is up to you if you write the letter in the unlabelled corner, but it is recommended.

Column 3 has written problems, 17 - 19 are the same as the previous columns, you just have to decide which method is used. The last 2 questions are harder, an example is below.

Example (questions 20 and 21)

A triangle has a pair of angles which are seven times the size of the other angle, find the size of all the angles. Let x = the smallest angle.

How this appears as a diagram:



The working required:

$7x + 7x + x = 15x$

$15x = 180°$

$\div 15$

$x = 12°$

$x = 12°$ and $7x = 84°$

Isosceles Triangles

Find the value of the pronumeral

1

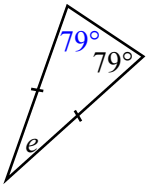
$s = 180° - 48° - 48°$

$s = 84°$

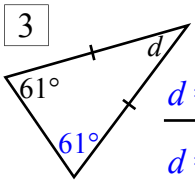
2



$e = 180° - 79° - 79°$

$e = 22°$

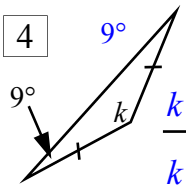
3



$d = 180° - 61° - 61°$

$d = 58°$

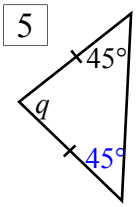
4



$k = 180° - 9° - 9°$

$k = 162°$

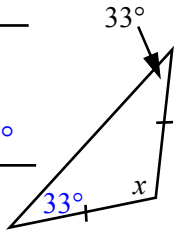
5



$q = 180° - 45° - 45°$

$q = 90°$

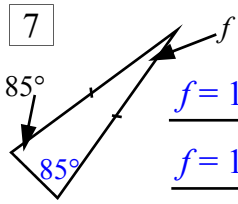
6



$x = 180° - 33° - 33°$

$x = 114°$

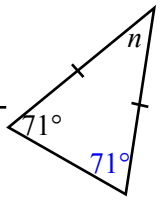
7



$f = 180° - 85° - 85°$

$f = 10°$

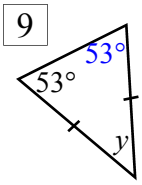
8



$n = 180° - 71° - 71°$

$n = 38°$

9

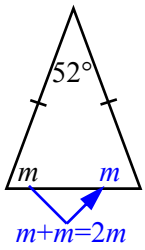


$y = 180° - 53° - 53°$

$y = 74°$

Find the value of the letter, these will take 3 lines to solve.

Example

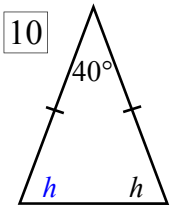


$2m = 180° - 52°$

$2m = 128°$

$m = 64°$

10

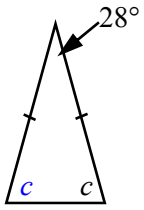


$2h = 180° - 40°$

$2h = 140°$

$h = 70°$

11

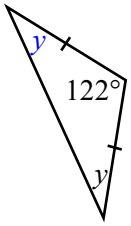


$2c = 180° - 28°$

$2c = 152°$

$c = 76°$

12

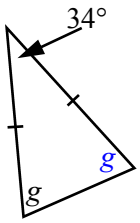


$2y = 180° - 122°$

$2y = 58°$

$y = 29°$

13

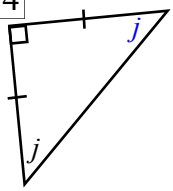


$2g = 180° - 34°$

$2g = 146°$

$g = 73°$

14

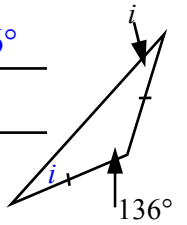


$2j = 180° - 90°$

$2j = 90°$

$j = 45°$

15

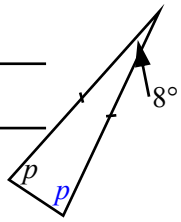


$2i = 180° - 136°$

$2i = 44°$

$i = 22°$

16



$2p = 180° - 8°$

$2p = 172°$

$p = 86°$

Solve these, you might not always need 3 lines. Use 'x=' in your working.

17 An isosceles triangle has one angle of 102°, find the size of the other angles

$2x = 180° - 102°$

$2x = 78°$

$x = 39°$

18 An isosceles triangle has a pair of angles of 17°, find the size of the other angle

$x = 180° - 17° - 17°$

$x = 146°$

19 An isosceles triangle has a pair of angles of 55°, find the size of the other angle

$x = 180° - 55° - 55°$

$x = 70°$

These are harder!

20 An isosceles triangle has a pair of angles that are twice the size of the other angle find the angles (Hint: use x and $2x$)

$5x = 180°$

$x = 36°$

$x = 36°$ $2x = 72°$

21 Repeat the above question only this time the angles are 4 times the size of the other.

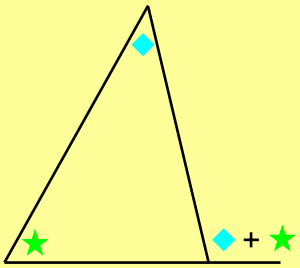
$9x = 180°$

$x = 20°$

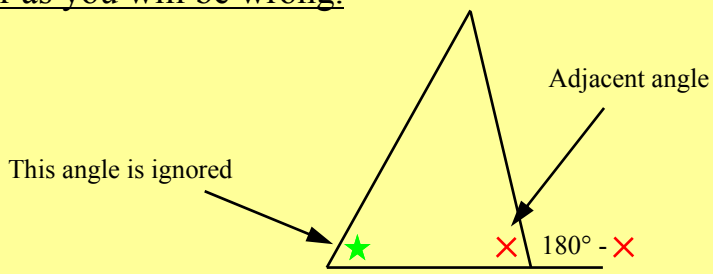
$x = 20°$ $4x = 80°$

Exterior Angles of a Triangle

There is a relationship between the exterior angle of a triangle and the 2 opposite interior angles, the sum of the 2 opposite interior angles = the exterior angle. In other words when you add the 2 opposite interior angles you get the exterior angle. The diagram below shows this graphically. It is important that you realise that the two opposite angles aren't adjacent to (don't touch) the exterior angle.



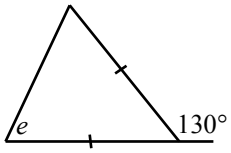
Column 1 Q.1 - 5 require you to add the two interior angles together to get the exterior angle. The adjacent angle is kept out of these questions. An example is at the top of the column. The next 3 questions show that if you have the adjacent internal angle you just take the supplement to get the external angle (subtract from 180°). So if the adjacent angle is one of the 2 angles, then just take the supplement (subtract it from 180°) of the adjacent angle. This is where the most common mistake is made, if the adjacent angle is given don't add it to the other angle to get your answer as you will be wrong.



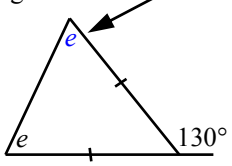
Column 2 works in reverse, you are given the exterior angle and have to calculate the missing interior angle. Do these by subtracting the given interior angle from the exterior angle, see the example at the top of the column.

The third column is challenging as it requires you to use your skills with isosceles and equilateral triangles as well as algebra. There is an example below.

Example : Find the angle



Because the triangle is isosceles the other base angle is also e



Solution:

$2e = 130°$ (opposite angle sum = exterior)

$e = 65°$

Exterior Angles of a Triangle

8

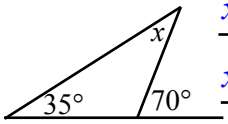
$c = 180° - 36°$

$c = 144°$

Now the exterior angle is given, use subtraction to find the unknown angle.

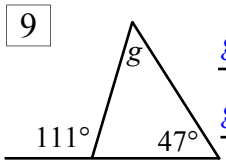
Example



$x = 70° - 35°$

$x = 35°$

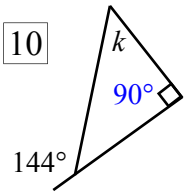
9



$g = 111° - 47°$

$g = 64°$

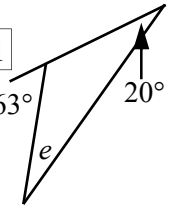
10



$k = 144° - 90°$

$k = 54°$

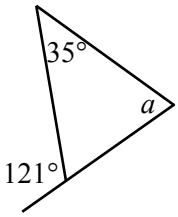
11



$e = 63° - 20°$

$e = 43°$

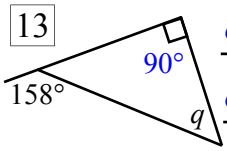
12



$a = 121° - 35°$

$a = 86°$

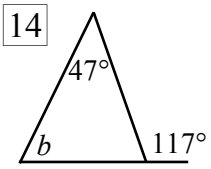
13



$q = 158° - 90°$

$q = 68°$

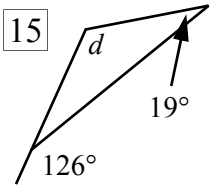
14



$b = 117° - 47°$

$b = 70°$

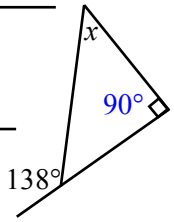
15



$d = 126° - 19°$

$d = 107°$

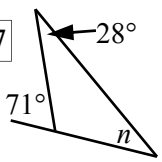
16



$x = 138° - 90°$

$x = 48°$

17

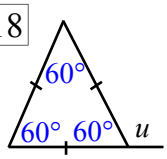


$n = 71° - 28°$

$n = 43°$

Use your knowledge of triangle properties to find the value of the angles

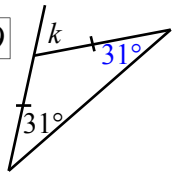
18



$u = 60° + 60°$

$u = 120°$

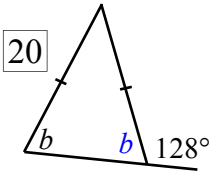
19



$k = 31° + 31°$

$k = 62°$

20



$b = 180° - 128°$

$b = 52°$

21 Hint: Find a then b then c

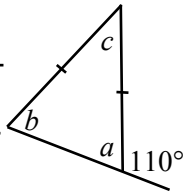
$a = 180° - 110°$

$a = 70°$

$b = 70°$ (isos)

$c = 110° - 70°$

$c = 40°$



22

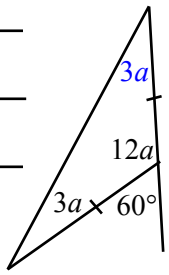
$3a + 3a = 6a$

$6a = 60°$

$a = 10°$

$3a = 30°$

$12a = 120°$



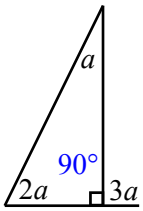
23

$3a = 180° - 90°$

$3a = 90°$

$a = 30°$

$2a = 60°$



Angles in Quadrilaterals

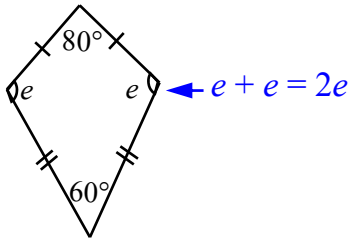
The angle sum of a quadrilateral is 360°, this means that when all the angles inside the shape are added, they total 360°. If you are given 3 angles then to find the missing angle subtract the 3 angles from 360° and what is left is the your answer.

In column 1 through to question 11 the exercises are all done the same way, you are given 3 angles (remember a right angle is 90°), subtract these from 360°. If you write in '90°' in the space next to the right angle sign you have less chance of forgetting it in your calculations. The question at the top of the 1st column shows the setting out for the exercises.

The rest of column 2 involves a small amount of algebra. The exercises are done in the same way as the first column in that the missing angles equal 360° minus the given angles. Because in the questions the 2 unknown angles are the same then you can add the letters together, i.e. $a + a = 2a$, $x + x = 2x$. An example is below. Question 20 is a similar style of question.

Column 3 is the same as the first column only one of the angles given is an exterior angle. To change the exterior angle to an interior angle subtract it from 360°. Then you have 3 interior angles which subtracted from 360° gives you the missing angle. The most common mistake is forgetting to change the exterior angle it to an interior angle in these questions.

Example: Find the value of e



Solution:

$2e = 360° - 80° - 60°$

$2e = 220°$

$e = 110°$

Find the missing angle in these quadrilaterals

1 $x = 360° - 90° - 90° - 90°$

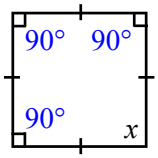
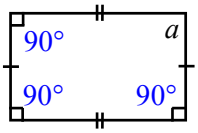
$x = 90°$



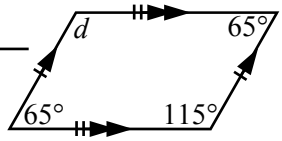
2 $a = 360° - 90° - 90° - 90°$

$a = 90°$



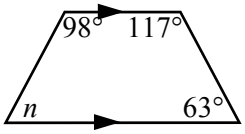
3 $d = 360° - 65° - 115° - 65°$

$d = 115°$



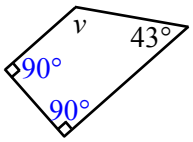
4 $n = 360° - 98° - 117° - 63°$

$n = 82°$



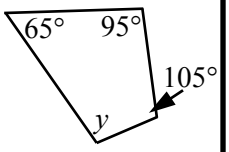
5 $v = 360° - 43° - 90° - 90°$

$v = 137°$



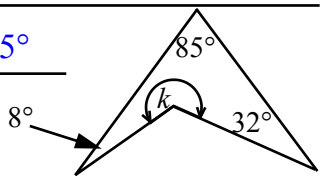
6 $y = 360° - 105° - 65° - 95°$

$y = 95°$



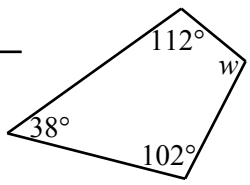
7 $k = 360° - 8° - 32° - 85°$

$k = 235°$



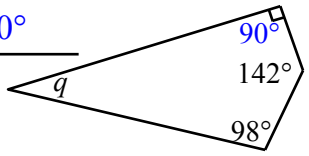
8 $w = 360° - 112° - 38° - 102°$

$w = 108°$



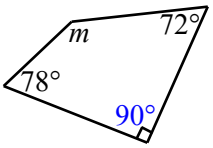
9 $q = 360° - 90° - 142° - 98°$

$q = 30°$



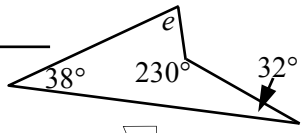
10 $m = 360° - 78° - 90° - 72°$

$m = 120°$



11 $e = 360° - 38° - 32° - 230°$

$e = 60°$

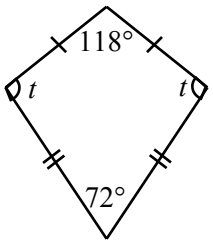


These have 2 unknown angles

12 $2t = 360° - 118° - 72°$

$2t = 170°$

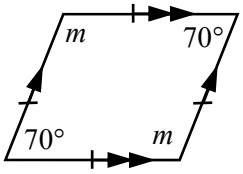
$t = 85°$



13 $2m = 360° - 70° - 70°$

$2m = 220°$

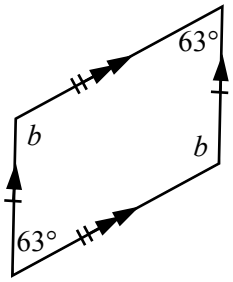
$m = 110°$



14 $2b = 360° - 63° - 63°$

$2b = 234°$

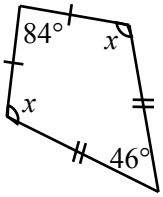
$b = 117°$



15 $2x = 360° - 84° - 46°$

$2x = 230°$

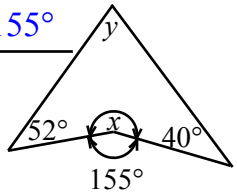
$x = 115°$



Convert the exterior angles to interior angles to find x then solve for y.

16 $x = 360° - 155°$

$x = 205°$

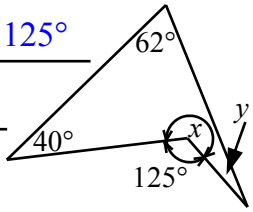


$y = 360° - 205° - 52° - 40°$

$y = 63°$

17 $x = 360° - 125°$

$x = 235°$

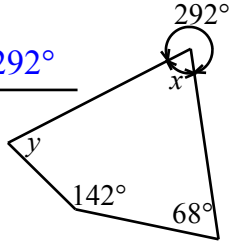


$y = 360° - 235° - 40° - 62°$

$y = 23°$

18 $x = 360° - 292°$

$x = 68°$

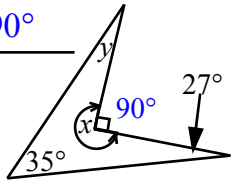


$y = 360° - 68° - 68° - 142°$

$y = 82°$

19 $x = 360° - 90°$

$x = 270°$

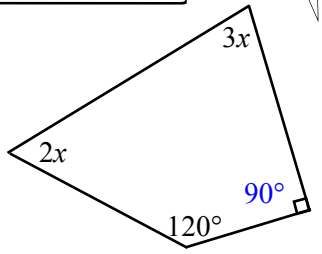


$y = 360° - 270° - 27° - 35°$

$y = 28°$

Find the 2 angles

20



$5x = 360° - 120° - 90°$

$5x = 150°$ $2x = 60°$

$x = 30°$ $3x = 90°$

INTEGERS

Directed Numbers

Directed numbers are numbers that have direction assigned, a number will have a positive value (+) in one direction and a negative value in the opposite direction. These are related to the number plane, where up and to the right are positive and down and to the left are negative. So up, North, East, a gaining of something or time after something has occurred are all positive. These can be denoted by a positive (+) sign, but this isn't necessary, just the number alone is sufficient. Down, South, West, a loss of something or time before something is to occur are all negative. These are denoted by a negative (minus) sign (-).

Column 1 uses words that imply either a positive or negative answer. Use the above as a guide if you need to and then write in the answer, note that you don't write the units, for example: $450 profit → 450, $50 loss → -50. So no km, cm, $, min or any other unit is required. A number with a minus sign when necessary is it.

Column 2 asks you to match opposites, the match is between those on the left hand side with those on the right hand side. Draw a line to connect the dots. The second part of the column asks you to make short statements using the number and topic supplied. Show units with these. Use the sign with the number to help you decide on which word to use. (Up, down, before, after etc.)

Column 3 introduces addition and subtraction. The first section asks you to imagine a change in temperature, you are given the starting temperature and then are told the size that the temperature rises or falls. You can use the thermometer diagram beside the questions as a guide. The second section gives you a 'before and after' comparison, you are asked to calculate the amount of the drop or rise in temperature that has occurred. If there is a drop use a negative sign to show that there was a fall in temperature.

Directed Numbers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use a directed number to represent the given action

Example

A gain of 300 points 300

1 Up 60 m

2 Loss of $95

3 Increase of 13%

4 Deposit of $20

5 South 400 km

6 Left 15°

7 Dismantling 61 cars

8 Bank fees of $3.80

9 Down 4 storeys

10 Fall of 23°C

11 Profit of $712

12 East 650 m

13 Lost 6 nuts

14 12 s before lift-off

15 Withdrawal of $193

16 12 knot wind assist

17 West 5 paces

18 Penalise 13 strokes

19 Found 14 bolts

20 Constructing 4 buses

21 Account interest $16

22 4 min after ignition

23 Right 85 cm

24 North 33 km

25 Rise of 56%

Match the words used in column 1 with its opposite, with a line

26

Lost •	• Penalise
North •	• Increase
Fall •	• Withdrawal
Decrease •	• Found
Bank fees •	• Profit
Up •	• South
Deposit •	• Down
Left •	• Rise
Assist •	• Interest
Loss •	• Right

Construct sentences that describe the directed numbers, given a subject for the sentence

Example -13: Time

The space shuttle will commence lift off in 13 seconds

27 -4 000: Distance

28 -220: Money

29 40: Percentage

30 -6: Temperature

Find the new temperature when the given change occurs

31 From 6°C drops 8°C

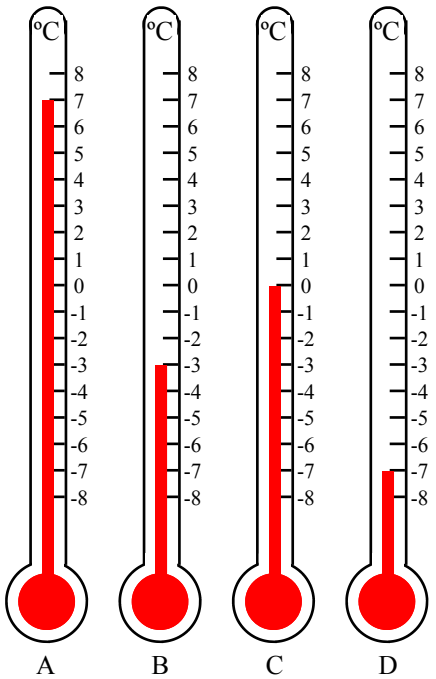
32 From 4°C drops 11°C

33 From -3°C rises 7°C

34 From -5°C rises 3°C

35 From -7°C rises 7°C

Give the temperature difference between the two thermometers, if there is a temperature drop, use '-'.



36 From A to C

Use a directed number to represent the given action

Example

A gain of 300 points — 300

1 Up 60 m — 60

2 Loss of $95 — -95

3 Increase of 13% — 13

4 Deposit of $20 — 20

5 South 400 km — -400

6 Left 15º — -15

7 Dismantling 61 cars — -61

8 Bank fees of $3.80 — -3.80

9 Down 4 storeys — -4

10 Fall of 23ºC — -23

11 Profit of $712 — 712

12 East 650 m — 650

13 Lost 6 nuts — -6

14 12 s before lift-off — -12

15 Withdrawal of $193 — -193

16 12 knot wind assist — 12

17 West 5 paces — -5

18 Penalise 13 strokes — -13

19 Found 14 bolts — 14

20 Constructing 4 buses — 4

21 Account interest $16 — 16

22 4 min after ignition — 4

23 Right 85 cm — 85

24 North 33 km — 33

25 Rise of 56% — 56

Match the words used in column 1 with its opposite, with a line

26

Lost	Penalise
North	Increase
Fall	Withdrawal
Decrease	Found
Bank fees	Profit
Up	South
Deposit	Down
Left	Rise
Assist	Interest
Loss	Right

Construct sentences that describe the directed numbers, given a subject for the sentence

Example -13: Time

The space shuttle will commence lift off in 13 seconds

27 -4 000: Distance

The ship is 4 000 km west of its destination port

28 -220: Money

A withdrawal of $220 was made from a bank account

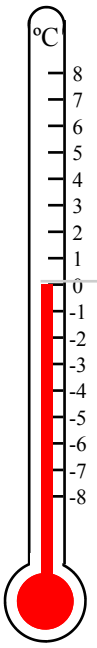
29 40: Percentage

There was a 40% increase in sales from last year

30 -6: Temperature

There was a drop in temperature of 6ºC overnight

Find the new temperature when the given change occurs



31 From 6ºC drops 8ºC — -2º C

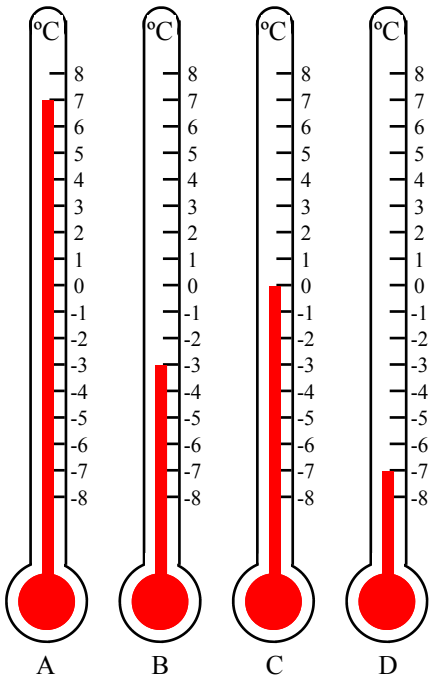
32 From 4ºC drops 11ºC — -7º C

33 From -3ºC rises 7ºC — 4º C

34 From -5ºC rises 3ºC — -2º C

35 From -7ºC rises 7ºC — 0º C

Give the temperature difference between the two thermometers, if there is a temperature drop, use '-'.



36 From A to C — -7º C

37 From B to C — 3º C

38 From C to D — -7º C

39 From D to B — 4º C

40 From A to B — -10º C

41 From D to A — 14º C

42 From B to A — 10º C

Number Line and Magnitude

This sheet deals with the size and position of negative numbers. Positive numbers are all greater than zero and increase with the size of the numbers used. Negative numbers are the opposite, they are all less than 0 and as the number part (ignoring the negative sign) increases the number decreases in size. For example, 200 > 30 but -200 < -30.

Column 1 deals with plotting points on the number line and then reading a number line. You are first asked to plot numbers, this is done by selecting the unfilled circle above the number required and filling it in. You are asked to plot odd and even numbers, an even positive number will also be even if negative. The same applies for odd numbers. The case of zero (0) is that it is neither even or odd. Questions 5 through 8 asks you to write the plotted numbers in ascending order, remember descending is down (highest to lowest), ascending is the opposite. With a number line the lowest values are to the left.

Column 2 asks you to use < and > signs to make the mathematical statement true. Remember that you point the 'arrow' at the smallest number. Then arrange the numbers in descending order in the next section of the column.

Column 3 asks you to circle the largest number and put a square around the smallest number. The last section of the column deals again with inequalities (the use of < and >). Instead of drawing the sign, a sign has been included, if the sign is correct (if it 'points' to the smallest number) then write 'true', if it doesn't, write 'false'.

Number Line and Magnitude

53	0	>	3	False

Addition of Integers

Unlike positive numbers (1, 2, 3 …) which when added always give a larger number, the addition of negative numbers (-1, -2, -3….) results in smaller numbers. Negative numbers can challenge students so don't feel frustrated if you don't take to them straight away, it may mean counting to yourself out loud or using your fingers to assist you.

In Column 1 both positive and negative numbers are involved in additions with positive numbers. Questions 1 to 9 and questions 10 to 18 are in 2 groups. These questions give answers that form a number pattern, the pattern can be used to check your answer as you move through the question groups. Note also there is a number line at the top of the page to assist you. Remember that when you subtract you move to the left and addition moves to the right.

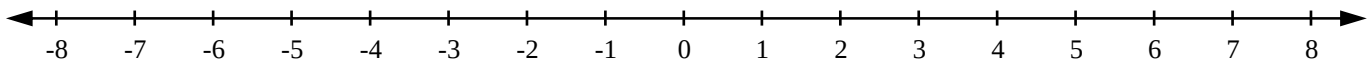
Questions 21 to 29 mostly won't fit on the number line so you have to understand the concept of negative numbers for these questions. All the questions start with a negative number and have a positive number added to them. Answer these questions by solving them and then circling the answer.

Column 2 involves the addition of both positive and negative numbers with negative numbers. Don’t get confused by the two signs (+ and -) next to each other. When a plus and minus sign are together the result is a minus sign. So + and - = - (or - and + = -). It is even more easy if you remember unlike signs together = minus. As this rule will be built upon in the next sheets. So really, while we are adding the numbers, the result is a subtraction, I hear you ask 'then why show the + sign?', the answer is that when you substitute negative numbers into positive equations the two signs will occur. This column has the same layout, two groups of questions which have a pattern. Use the pattern or the number line to assist you.

Column 3 involves 3 numbers, that means that you answer the questions in 2 stages. Look at the first 2 numbers, complete the sum, strike them out and write the total above them. There is an example at the top of the column.

Addition of Integers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE



Look at the pattern formed by your answers and the number line to assist you

1 3 + 2 = ____	2 2 + 2 = ____	3 1 + 2 = ____
4 0 + 2 = ____	5 -1 + 2 = ____	6 -2 + 2 = ____
7 -3 + 2 = ____	8 -4 + 2 = ____	9 -5 + 2 = ____
10 -5 + 0 = ____	11 -5 + 1 = ____	12 -5 + 2 = ____
13 -5 + 3 = ____	14 -5 + 4 = ____	15 -5 + 5 = ____
16 -5 + 6 = ____	17 -5 + 7 = ____	18 -5 + 8 = ____

Circle the correct answer

19	-5 + 4 =	-9	9	-1
20	-4 + 3 =	-1	7	-7
21	-10 + 8 =	2	-2	-18
22	-15 + 3 =	-12	12	-18
23	-30 + 25 =	-55	-5	5
24	-14 + 14 =	0	28	-28
25	-5 + 10 =	-15	15	5
26	-7 + 3 =	-4	4	10
27	-20 + 60 =	-40	-80	40
28	-15 + 27 =	-42	-12	12
29	-11 + 4 =	-7	-15	7

When you add a negative number it is like subtracting a positive number

30 5 + 1 = ____	31 5 + 0 = ____	32 5 + -1 = ____
33 5 + -2 = ____	34 5 + -3 = ____	35 5 + -4 = ____
36 5 + -5 = ____	37 5 + -6 = ____	38 5 + -7 = ____
39 4 + -7 = ____	40 3 + -7 = ____	41 2 + -7 = ____
42 1 + -7 = ____	43 0 + -7 = ____	44 -1 + -7 = ____
45 -2 + -7 = ____		46 -3 + -7 = ____

Circle the correct answer

47	-6 + -6 =	0	12	-12
48	3 + -5 =	-8	-2	8
49	-5 + -7 =	2	-12	-2
50	8 + -5 =	3	-3	13
51	10 + -12 =	-2	-22	2
52	-4 + -10 =	6	-6	-14
53	-15 + -8 =	-23	-7	7
54	14 + -12 =	-2	2	26
55	20 + -50 =	30	-70	-30
56	-5 + -25=	20	-20	-30
57	12 + -12 =	0	-24	24

Now find the answer for these

Example

$\cancel{4} + -\cancel{10}^{-6} + 6 =$ 0

58 10 + -5 + 3 = ____

59 8 + 10 + -6 = ____

60 -3 + 9 + -2 = ____

61 -8 + -3 + 6 = ____

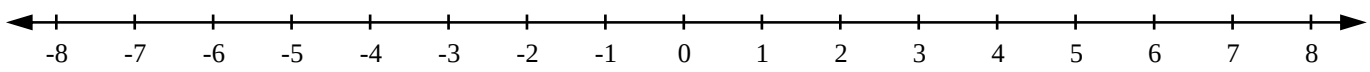
Addition of Integers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE



Look at the pattern formed by your answers and the number line to assist you

1 3 + 2 = 5	2 2 + 2 = 4	3 1 + 2 = 3
4 0 + 2 = 2	5 -1 + 2 = 1	6 -2 + 2 = 0
7 -3 + 2 = -1	8 -4 + 2 = -2	9 -5 + 2 = -3
10 -5 + 0 = -5	11 -5 + 1 = -4	12 -5 + 2 = -3
13 -5 + 3 = -2	14 -5 + 4 = -1	15 -5 + 5 = 0
16 -5 + 6 = 1	17 -5 + 7 = 2	18 -5 + 8 = 3

Circle the correct answer

19	-5 + 4 =	-9 9 **-1**
20	-4 + 3 =	**-1** 7 -7
21	-10 + 8 =	2 **-2** -18
22	-15 + 3 =	**-12** 12 -18
23	-30 + 25 =	-55 **-5** 5
24	-14 + 14 =	**0** 28 -28
25	-5 + 10 =	-15 15 **5**
26	-7 + 3 =	**-4** 4 10
27	-20 + 60 =	-40 -80 **40**
28	-15 + 27 =	-42 -12 **12**
29	-11 + 4 =	**-7** -15 7

When you add a negative number it is like subtracting a positive number

30 5 + 1 = 6	31 5 + 0 = 5	32 5 + -1 = 4
33 5 + -2 = 3	34 5 + -3 = 2	35 5 + -4 = 1
36 5 + -5 = 0	37 5 + -6 = -1	38 5 + -7 = -2
39 4 + -7 = -3	40 3 + -7 = -4	41 2 + -7 = -5
42 1 + -7 = -6	43 0 + -7 = -7	44 -1 + -7 = -8
45 -2 + -7 = -9		46 -3 + -7 = -10

Circle the correct answer

47	-6 + -6 =	0 12 **-12**
48	3 + -5 =	-8 **-2** 8
49	-5 + -7 =	2 **-12** -2
50	8 + -5 =	**3** -3 13
51	10 + -12 =	**-2** -22 2
52	-4 + -10 =	6 -6 **-14**
53	-15 + -8 =	**-23** -7 7
54	14 + -12 =	-2 **2** 26
55	20 + -50 =	30 -70 **-30**
56	-5 + -25=	20 -20 **-30**
57	12 + -12 =	**0** -24 24

Now find the answer for these

Example

$4 + -^{-6}10 + 6 =$ 0

58	$10 + -^{5}5 + 3 =$	8
59	$8 + 10 + -^{18}6 =$	12
60	$-3 + 9 + -^{6}2 =$	4
61	$-8 + -^{-11}3 + 6 =$	5
62	$11 + -^{6}5 + -8 =$	-2
63	$8 + -^{-4}12 + 4 =$	0
64	$-6 + 5 + -^{-1}9 =$	-10
65	$12 + 8 + -^{20}15 =$	5
66	$-15 + 3 + -^{-12}10 =$	-2
67	$-9 + -9 + -^{-18}20 =$	2
68	$8 + -15 + -^{-7}6 =$	-13
69	$-10 + -10 + -^{-20}50 =$	30
70	$-30 + 5 + -^{-25}17 =$	-8
71	$9 + -15 + -^{-6}8 =$	2
72	$7 + 12 + -^{19}20 =$	-1
73	$13 + -20 + -^{-7}10 =$	3
74	$18 + -20 + -^{-2}2 =$	-4
75	$-25 + 35 + -^{10}10 =$	0

Subtraction of Integers

Unlike positive numbers which when subtracted always give a smaller number, the subtraction of two negative numbers results in larger number. That is because when two '-' signs are together the result is a '+'.

In column 1 both positive and negative numbers are involved in subtractions with positive numbers. Questions 1 to 9 and questions 10 to 18 are in 2 groups. Note that sometimes numbers have a '+' in front of them and sometimes they don't, but both mean the same thing. E.g. -10 - 2 = -10 - +2 = -12. As you learnt on the previous sheet unlike signs equals a minus, so the minus and the plus next to each other equals a minus. These questions give answers that form a number pattern, this pattern can be used to check your answer as you move through the question groups. Note also there is a number line at the top of the page to assist you.

Questions 21 to 29 mostly won't fit on the number line so you have to understand the concept of negative numbers for these questions. All the questions subtract a positive number. This means they will decrease, circle the correct answer.

Column 2 involves the subtraction of both positive and negative numbers with negative numbers. Don't be confused by the two minus signs (- -) next to each other. When a minus and another minus sign are together the result is a plus '+' sign. So - and - = +. And as you know a + and + = +. It is even more easy if you remember like signs = plus. This column has the same layout, two groups of questions which have a pattern. Use the pattern or the number line to assist you. Then for the lower part of the column circle the correct answer.

Column 3 involves 3 numbers, that means that you answer the questions in 2 stages. Look at the first 2 numbers, complete the sum strike them as you move through. There is an example at the top of the column.

75	-~~6~~ - 1~~1~~ (-17) - - 17 =	0

Subtraction/Addition and Using Brackets with Integers

This sheet mixes subtraction and addition together and introduces the use of brackets with integers.

Remember negative numbers are on the left hand side of the number line and as you should know as you move to the left the 'value' of the numbers decrease. So instead of 0 being the smallest number it now lies in the middle of positive and negative numbers. So:

- 0 > (greater than) all negative numbers e.g. 0 > -1, 0 > -8, 0 > -1 008
- The larger the value of the number part of the negative number the smaller it is, e.g. -8 < (less than) -3, -204 < -176 and -82 > -106
- All positive numbers are greater than negative numbers

Column 1 asks you to place a <, > or = sign in the boxes. The first two involve 2 numbers on each side. Find the answer for each side and write it in the box below it, then 'point the arrow' at the smallest number. From then on there are 3 numbers on each side. Look at each side separately, add/subtract the first two numbers, strike them out and total them. Repeat for the other side and write in the <, > or = signs. An example is to the left, below.

Column 2 introduces brackets with negative numbers. When a number is in brackets on its own then treat the brackets as if they aren't there. For example -(-10) = - -10 = 10 and -(15) = -15. When there are two or more numbers within brackets evaluate the inside of the brackets first to get a single number, then the above applies again, remove the brackets and solve. For example
-(10 - 13) = -(-3) = 3, -(5 - -11) = -(16) = -16 and -(-6 -7) = -(-13) = 13.

Column 3 is an extension on this with 4 numbers involved so total as you move across. Brackets are also introduced. Again it isn't obvious why we need brackets for single numbers, it will become clear when powers and substitution are introduced. The last 5 questions involve two numbers in brackets, remember with brackets you solve the inside of the brackets first, then the tricky part, how does the sign in front of the brackets affect the number inside? An example is to the right, below.

$= 7 + 3$ $= 10$

Multiplication of Integers

As with addition and subtraction, multiplication has rules concerning negative numbers also. These are:

- a positive × a positive = a positive, this you already know (+ × + = +)
- a negative number × a negative = a positive (- × - = +)

So this means that when like signs are multiplied you get a positive answer, and:

- a negative × a positive = a negative (- × + = -)
- a positive × a negative = a negative (+ × - = -)

So this means that when unlike signs are multiplied you get a negative answer.

In column 1 you are asked to multiply 2 numbers together, one is a negative number, the other a positive, this means the answer will always be negative.

In column 2 down to question 44 you are asked to multiply 2 negative numbers. This means the answer will always be positive. The rest of the 2nd column is a mixture, some are like signs others are unlike. The method is to look at the question and determine the sign, talk it out in your head '….a minus times a minus is a plus' or '…..a minus times a plus is a minus'. Then write the sign and then go back and multiply the numbers as if the signs aren't there.

In column 3 the first 5 questions are to test you know the sign. As above you talk it through mentally, for -5 × -2 × 4 × -3 you would say this: 'a minus times a minus is a plus...a plus times a plus is a plus ... a plus times a minus is a minus. So the sign is negative, circle it. You can use the same method for the next set of questions to get the sign first, then multiply the numbers ignoring the signs. Using the same example above, 5 × 2 is 10, × 4 is 40 and × 3 is 120. So you have -120! There is an example at the top of the column.

Multiplication of Integers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Try these, use the rules: - × + = - and + × - = -

1 -2 × 3 =

2 4 × -2 =

3 -3 × 4 =

4 5 × -3 =

5 5 × -7 =

6 -5 × (+10) =

7 8 × -4 =

8 -3 × 7 =

9 -2 × (+8) =

10 -5 × 5 =

11 3 × -25 =

12 9 × -5 =

13 -6 × (+4) =

14 5 × -11 =

15 13 × -10 =

16 -12 × 2 =

17 15 × (-4) =

18 6 × -9 =

19 -8 × 3 =

20 -7 × +20 =

21 -3 × 12 =

22 7 × -6 =

23 9 × (-11) =

24 -16 × 2 =

25 -35 × +3 =

26 12 × -7 =

27 -8 × 21 =

28 -4 × 13 =

29 -7 × +8 =

30 34 × (-3) =

Try these, use the rule: - × - = +

31 -2 × -2 =

32 -4 × -5 =

33 -10 × (-3) =

34 -7 × -3 =

35 -6 × -21 =

36 -8 × -4 =

37 (-5) × -9 =

38 -11 × -8 =

39 -4 × (-13) =

40 -22 × -5 =

41 - 1.7 × -2 =

42 $-3\frac{1}{2}$ × -2 =

43 -14 × -5 =

44 -3 × -15 =

These are mixed up

45 -30 × 6 =

46 -2 × -16 =

47 -9 × -4 =

48 11 × -7 =

49 -10 × -23 =

50 -60 × 4 =

51 -15 × -5 =

52 5 × -12 =

53 8 × -4 =

54 -3 × -11 =

55 -8 × -7 =

56 -5 × 50 =

57 -2 × -45 =

58 7 × -21 =

Circle the sign that the answer would have, don't try to solve them

Example

- × + = - × - = +

-5 × 2 × -3 - or (+)

59 -2 × -2 × 3 - or +

60 4 × -2 × 5 - or +

61 -2 × -4 × -4 - or +

62 -5 × -7 × -2 × -1 - or +

63 -(-7) × 4 × -2 - or +

With these, find the sign of the answer first, then multiply for the answer.

Example + × - = -, then - × + = - and then - × - = +. So positive

$\cancel{5}^{1} \times -\cancel{2}^{10} \times \cancel{3}^{30} \times -2$ = 60

64 5 × -4 × -4 =

65 -2 × -6 × -5 =

66 8 × 3 × -2 =

67 -2 × 5 × -2 × -3 =

68 5 × 3 × -1 × 1 =

69 20 × -2 × -2 × 5 =

70 -3 × -4 × -2 × -2 =

71 10 × -2 × -1 × 2 =

72 -4 × -2 × -4 × 2 =

73 2 × -2 × 2 × -2 =

74 -1 × -1 × -1 × -1 =

75 4 × -2 × -5 × 0 =

Multiplication of Integers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Try these, use the rules: - × + = - and + × - = -

1	-2 × 3 = -6	2	4 × -2 = -8
3	-3 × 4 = -12	4	5 × -3 = -15
5	5 × -7 = -35	6	-5 × (+10) = -50
7	8 × -4 = -32	8	-3 × 7 = -21
9	-2 × (+8) = -16	10	-5 × 5 = -25
11	3 × -25 = -75	12	9 × -5 = -45
13	-6 × (+4) = -24	14	5 × -11 = -55
15	13 × -10 = -130	16	-12 × 2 = -24
17	15 × (-4) = -60	18	6 × -9 = -54
19	-8 × 3 = -24	20	-7 × +20 = -140
21	-3 × 12 = -36	22	7 × -6 = -42
23	9 × (-11) = -99	24	-16 × 2 = -32
25	-35 × +3 = -105	26	12 × -7 = -84
27	-8 × 21 = -168	28	-4 × 13 = -52
29	-7 × +8 = -56	30	34 × (-3) = -102

Try these, use the rule: - × - = +

31	-2 × -2 = 4	32	-4 × -5 = 20
33	-10 × (-3) = 30	34	-7 × -3 = 21
35	-6 × -21 = 126	36	-8 × -4 = 32
37	(-5) × -9 = 45	38	-11 × -8 = 88
39	-4 × (-13) = 52	40	-22 × -5 = 110
41	- 1.7 × -2 = 3.4	42	$-3\frac{1}{2}$ × -2 = 7
43	-14 × -5 = 70	44	-3 × -15 = 45

These are mixed up

45	-30 × 6 = -180	46	-2 × -16 = 32
47	-9 × -4 = 36	48	11 × -7 = -77
49	-10 × -23 = 230	50	-60 × 4 = -240
51	-15 × -5 = 75	52	5 × -12 = -60
53	8 × -4 = -32	54	-3 × -11 = 33
55	-8 × -7 = 56	56	-5 × 50 = -250
57	-2 × -45 = 90	58	7 × -21 = -147

Circle the sign that the answer would have, don't try to solve them

Example

- × + = ⊖ ▶ ⊖ × - = +

-5 × 2 × -3 - or ⊕

59 -2 × -2 × 3 - or ⊕

60 4 × -2 × 5 ⊖ or +

61 -2 × -4 × -4 ⊖ or +

62 -5 × -7 × -2 × -1 - or ⊕

63 -(-7) × 4 × -2 ⊖ or +

With these, find the sign of the answer first, then multiply for the answer.

Example + × - = -, then - × + = - and then - × - = +. So positive

5 × -2 × 3 × -2 = 60 (10, 30)

64 5 × -4 × -4 = 80 (20)

65 -2 × -6 × -5 = -60 (12)

66 8 × 3 × -2 = -48 (24)

67 -2 × 5 × -2 × -3 = -60 (10, 20)

68 5 × 3 × -1 × 1 = -15 (15, 15)

69 20 × -2 × -2 × 5 = 400 (40, 80)

70 -3 × -4 × -2 × -2 = 48 (12, 24)

71 10 × -2 × -1 × 2 = 40 (20, 20)

72 -4 × -2 × -4 × 2 = -64 (8, 32)

73 2 × -2 × 2 × -2 = 16 (4, 8)

74 -1 × -1 × -1 × -1 = 1 (1, 1)

75 4 × -2 × -5 × 0 = 0 (8, 40)

Division of Integers

As with addition, subtraction and multiplication, division has rules concerning negative numbers also. The good news is that it is just the same as the other rules, that is:

- a positive ÷ a positive = a positive, this you already know (+ ÷ + = +)
- a negative number ÷ a negative = a positive (- ÷ - = +)

So this means that when like signs are divided you get a positive answer, and:

- a negative ÷ a positive = a negative (- ÷ + = -)
- a positive ÷ a negative = a negative (+ ÷ - = -)

So this means that when unlike signs are divided you get a negative answer.

In column 1 you are asked to divide 2 numbers, one is a negative number, the other a positive, this means the answer will always be negative. So don't let the signs confuse you, write the negative sign then divide the two numbers, ignoring the signs, to complete the answer.

In Column 2 down to question 40 you are asked to divide two negative numbers. This means the answer will always be positive, so divide the two numbers together ignoring the signs. The rest of the 2nd column is a mixture, some are like signs others are unlike. The method is to look at the question and determine the sign, talk it out in your head '….a minus divided by a minus is a plus' or '…..a minus divided by a plus is a minus'. Then write the sign. Then divide the numbers as if the signs aren't there.

In Column 3 the first 5 questions are to test you know the sign. As above you talk it through mentally, for -40 ÷ -2 ÷ 5 ÷ -2 you would say this: 'a minus divided by a minus is a plus...a plus divided by a plus is a plus ... a plus divided by a minus is a minus. So the sign is negative, so circle it. Use the same method with the rest of the column, find the sign first by talking it through, write it in, then staying with the example above, ignore the signs e.g. 40 ÷ 2 is 20, ÷ 5 is 4 and ÷ 2 is 2. So you have -2! There is an example at the top of the column.

39 $-8 \overline{)-504}$ = 63 (2)

40 -27 ÷ -3 = 9

Try these they are mixed up.

41 -56 ÷ 7 = -8

42 18 ÷ -3 = -6

43 -40 ÷ -5 = 8

44 55 ÷ -11 = -5

45 $4 \overline{)-344}$ = -86 (2)

46 -66 ÷ -3 = 22

47 $\frac{38}{-2}$ = -19

48 80 ÷ -5 = -16

49 -20 ÷ -2 = 10

50 $-6 \overline{)-258}$ = 43 (1)

51 $\frac{120}{-4}$ = -30

52 -100 ÷ -4 = 25

Circle the sign that the answer would have, don't try to solve them

Example

- ÷ + = ▶ ÷ - = +

-12 ÷ 6 ÷ -3 - or (+)

53 -30 ÷ -5 ÷ -2 (-) or +

54 -24 ÷ 2 ÷ -4 - or (+)

55 -18 ÷ -6 ÷ -3 (-) or +

56 -60 ÷ 5 ÷ -3 ÷ -2 (-) or +

57 -9 ÷ -3 ÷ -3 ÷ -1 - or (+)

Find the sign for the answer first, then divide for the number.

Example

40 ÷ -2 ÷ 5 ÷ 4 = -1 (20, 4)

58 -45 ÷ -3 ÷ -5 = -3 (15)

59 -60 ÷ -15 ÷ -2 = -2 (4)

60 -100 ÷ -5 ÷ -2 ÷ -5 = 2 (20, 10)

61 -200 ÷ 5 ÷ -4 ÷ 2 = 5 (40, 10)

62 70 ÷ 2 ÷ -7 ÷ -1 = 5 (35, 5)

63 90 ÷ -2 ÷ -5 ÷ -3 = -3 (45, 9)

64 -150 ÷ -3 ÷ -5 ÷ -2 = 5 (50, 10)

65 300 ÷ 5 ÷ -12 ÷ 5 = -1 (60, 5)

66 -24 ÷ -2 ÷ -3 ÷ -2 = 2 (12, 4)

67 500 ÷ -5 ÷ 10 ÷ -5 = 2 (100, 10)

68 -80 ÷ -4 ÷ -5 ÷ -2 = 2 (20, 4)

Mixed Operations and Brackets with Integers

This sheet involves integers in exercises with the four operations. This means that order of operations rules will have to be considered when solving these problems. Questions using brackets are also involved, remember brackets are done first before any other operation.

Column 1 involves integers and +, -, × and ÷. Remember order of operations require that the × and ÷ part of the exercise be done before the + and - part. An example is at the top of the column.

Column 2 has division questions with the numerator and denominator containing operations. Calculate the top row and the bottom row separately first. Then perform the division. The questions involve order of operations from Q.20 so an extra line is supplied for these to perform the order of operation part first. An example is below.

$$\frac{11 \times -6 + 3}{90 \div 10 \div -3} = \frac{-66 + 3}{9 \div -3}$$

$$= \frac{-63}{-3} = 21$$

Column 3 involves using brackets. The method for these is:

- 1st working line: evaluate the brackets and rewrite the first line with the brackets removed
- 2nd working line : perform the order of operations part of the question
- Solve

$$100 + 3 \times (9 - 15)$$

$$= 100 + 3 \times -6$$

$$= 100 - 18$$

$$= 82$$

Mixed Operations and Brackets with Integers

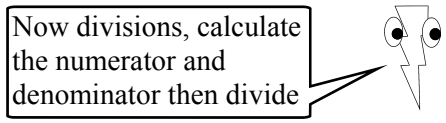
9 $100 \div -20 + 5$

10 $7 + 13 \times -5$

11 $19 + 25 \times -3$

12 $11 \times -5 - 10$



Example

$$\frac{-2\cancel{1} - \overset{-18}{\cancel{-3}}}{-\cancel{2} \times -\cancel{3}} = \frac{-18}{6} = -3$$

13 $\dfrac{-50 - -2}{20 - 8} = \_\_\_ = \_\_\_$ (6)

14 $\dfrac{44 \div -2}{-5 - -6} = \_\_\_ = \_\_\_$

15 $\dfrac{8 \times -7}{-9 - 5} = \_\_\_ = \_\_\_$

16 $\dfrac{-18 - -3}{10 - 13} = \_\_\_ = \_\_\_$

17 $\dfrac{-100 + 25}{15 - -10} = \_\_\_ = \_\_\_$

18 $\dfrac{-40 - 32}{-4 \times -2} = \_\_\_ = \_\_\_$

19 $\dfrac{-84 \div -4}{-6 - 5} = \_\_\_ = \_\_\_$

20 $\dfrac{17 - 3 \times -5}{20 \div -2 - 6} = \_\_\_$

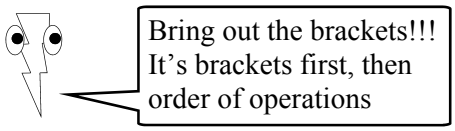
$= \_\_\_ = \_\_\_$

21 $\dfrac{-7 + 6 \times -3}{-50 + 9 \times 5} = \_\_\_$

$= \_\_\_ = \_\_\_$

22 $\dfrac{80 \div -4 + 6}{30 + 8 \times -2} = \_\_\_$

$= \_\_\_ = \_\_\_$



Example

$-(\cancel{1}\overset{6}{\cancel{3}} - 7) \times (-\cancel{2} - \overset{-7}{\cancel{5}})$

$= -6 \times -7$

$= 42$

23 $-3 + (-5\ -7) \times 4$

24 $15 - 7 \times (-3 + 8)$

25 $(1 - 7) \times 4 - 9$

26 $(-11 - 9) - 3 \times -2$

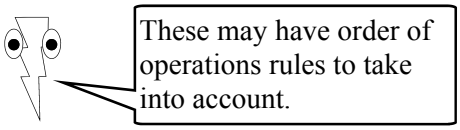
27 $(12 - 30) \div (27 \div -3)$

28 $(-65 + 40) \times (-3\ -8)$

Mixed Operations and Brackets with Integers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

These may have order of operations rules to take into account.



Example

$15 - \cancel{3} \times \cancel{-4}^{\boxed{-12}}$

$= 15 - -12$

$= 27$

1

$-9 - 17 \times 2$

$= -9 - 34$

$= -43$

2

$24 \div -3 \times -4$

$= -8 \times -4$

$= 32$

3

$-55 + 15 \div 5$

$= -55 + 3$

$= -52$

4

$5 \times -10 \div 2$

$= -50 \div 2$

$= -25$

5

$16 \div -4 \times -2$

$= -4 \times -2$

$= 8$

6

$7 - -3 \times -4$

$= 7 - 12$

$= -5$

7

$8 + -9 \times 2$

$= 8 + -18$

$= -10$

8

$-60 \div -15 \times 4$

$= 4 \times 4$

$= 16$

9

$100 \div -20 + 5$

$= -5 + 5$

$= 0$

10

$7 + 12 \times -5$

$= 7 + -60$

$= -53$

11

$19 + 25 \times -3$

$= 19 + -75$

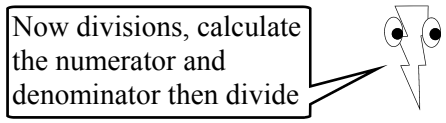
$= -56$

12

$11 \times -5 - 10$

$= -55 - 10$

$= -65$



Now divisions, calculate the numerator and denominator then divide

Example

$$\frac{-2\cancel{1} - -\cancel{3}^{\boxed{-18}}}{-\cancel{2} \times -\cancel{3}_{\boxed{6}}} = \frac{-18}{6} = -3$$

13 $\dfrac{-50 - -2}{20 - 8} = \dfrac{-48}{12} = -4$

14 $\dfrac{44 \div -2}{-5 - -6} = \dfrac{-22}{1} = -22$

15 $\dfrac{8 \times -7}{-9 - 5} = \dfrac{-56}{-14} = 4$

16 $\dfrac{-18 - -3}{10 - 13} = \dfrac{-15}{-3} = 5$

17 $\dfrac{-100 + 25}{15 - -10} = \dfrac{-75}{25} = -3$

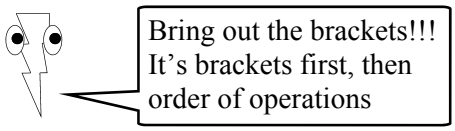
18 $\dfrac{-40 - 32}{-4 \times -2} = \dfrac{-72}{8} = -9$

19 $\dfrac{-88 \div -4}{-6 - 5} = \dfrac{22}{-11} = -2$

20 $\dfrac{17 - 3 \times -5}{20 \div -2 - 6} = \dfrac{17 - -15}{-10 - 6} = \dfrac{32}{-16} = -2$

21 $\dfrac{-7 + 6 \times -3}{-50 + 9 \times 5} = \dfrac{-7 + -18}{-50 + 45} = \dfrac{-25}{-5} = 5$

22 $\dfrac{80 \div -4 + 6}{30 + 8 \times -2} = \dfrac{-20 + 6}{30 + -16} = \dfrac{-14}{14} = -1$



Bring out the brackets!!! It's brackets first, then order of operations

Example

$-(\cancel{13} - \cancel{7}^{\boxed{6}}) \times (-\cancel{2} - \cancel{5}^{\boxed{-7}})$

$= -6 \times -7$

$= 42$

23 $-3 + (-5 - 7) \times 4$

$= -3 + -12 \times 4$

$= -3 - 48$

$= -51$

24 $15 - 7 \times (-3 + 8)$

$= 15 - 7 \times 5$

$= 15 - 35$

$= -20$

25 $(1 - 7) \times 4 - 9$

$= -6 \times 4 - 9$

$= -24 - 9$

$= -33$

26 $(-11 - 9) - 3 \times -2$

$= -20 - -6$

$= -14$

27 $(12 - 30) \div (27 \div -3)$

$= -18 \div -9$

$= 2$

28 $(-65 + 40) \times (-3 - 8)$

$= -25 \times -11$

$= 275$

Powers and Integers

When a negative number is raised to a power the answer is either positive or negative. When the power is even the answer will be positive and when the power is an odd number the answer will be negative. So as a negative number is multiplied by itself, over and over, the answer will alternate (change) between positive and negative.

Column 1 asks you to express the number raised to a power in expanded form. This means no powers and separated by × signs. Write the number in the brackets then a × sign, then the number again and so on, until there are the same amount of numbers as the power. Then solve, find the sign first, then multiply the numbers without signs. Questions 6 to 11 attempt to show you how the answer changes with the power. The last two questions require a single word response.

Column 2 starts with you identifying the rule regarding odd and even powers and negative numbers. If the power is an odd number then the answer will be negative. If the power is even the answer will be positive. Column 2 then returns to expanding and finding the solution. The difference is that the numbers are larger and they require using the multiplication working spaces provided. 'Build up' two numbers from the expansion by replacing 2 or 3 numbers with one larger number, then use the working space. An example of this is above Q 22. When you multiply the two numbers don't include the signs as you should know the sign of the answer from the power in the question being odd or even. These questions continue to the end of the sheet.

Powers and Integers

Absolute Value

An absolute value of a number is the positive value of that number. Absolute value is shown by 'bars' | | , these are straight lines not brackets. These bars mean that you want a positive answer for the number (or operation) inside the bars. For example:

- |5| = 5 → absolute value has no effect on numbers that are already positive
- |-10| = 10 → remove the negative sign and 10 is the absolute value of -10.

Column 1 starts with 10 questions on numbers inside 'bars'. If the number is a positive number then you just rewrite the same number without the bars. If the number is a negative number, write the number without the minus sign. The rest of the column requires you to perform a calculation and then find the absolute value. These questions involve two lines of working. In the first line write the bars and inside them the answer to the operation. Then the third line write the answer. The answer will be the same as the previous line, but no bars, and if there is a minus sign, it is removed.

Column 2 introduces a negative sign outside of the bars. As the sign is outside of the bars it is not affected by them so: -|10| = -10 and -|-10| = -10. So if there is a negative sign before the bars the answer must be negative. The first 10 questions test you understand this, then the next 10 ask you to apply this to some operations. There are two examples, before question 29, showing you how to answer the questions.

Column 3 involves order of operations in the questions. Complete the order of operations step first, then use the next 3 lines to solve the question, use the example at the top of the column as a guide.

Absolute Value

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the absolute value of these numbers

Examples

i) $|-12| =$ 12 ii) $|25| =$ 25

1 $|30| =$ ___ 2 $|65| =$ ___

3 $|-73| =$ ___ 4 $|-1.6| =$ ___

5 $|-19| =$ ___ 6 $|141| =$ ___

7 $|-83| =$ ___ 8 $|39| =$ ___

9 $|0| =$ ___ 10 $|-1| =$ ___

Now find the absolute value of these operations

Examples

i) $|43 - -16|$

$= |59|$

$= 59$

ii) $|18 - 30|$

$= |-12|$

$= 12$

11 $|15 - 25|$

12 $|67 - 14|$

13 $|18 - -6|$

14 $|17 - 200|$

15 $|5 \times -8|$

16 $|-4 \times -12|$

17 $|-27 + 9|$

18 $|-5 - -3|$

The - sign outside the brackets is not affected

Examples

i) $-|17| =$ -17 ii) $-|-76| =$ -76

19 $-|8| =$ ___ 20 $-|-61| =$ ___

21 $|-5.9| =$ ___ 22 $-|81| =$ ___

23 $-|-11| =$ ___ 24 $|-35| =$ ___

25 $-|-20| =$ ___ 26 $-|47| =$ ___

27 $-|-5| =$ ___ 28 $|-94| =$ ___

Now try these operations

Examples

i) $|-11| - |-4|$

$= 11 - 4$

$= 7$

ii) $-|13| - |-9|$

$= -13 - 9$

$= -22$

29 $|29| - |-39|$

30 $|12| + |-26|$

31 $-|-2| \times |-7|$

32 $-|-8| \div |-4|$

33 $-|-3| + |-3|$

34 $|-20| - |17|$

35 $|58| - |-12|$

36 $|-41| + |-9|$

37 $-|-11| \times |9|$

38 $-|-60| - |20|$

These may require order of operations rules to be considered. Solve these.

Example

$|12 + 5 \times 3| - |-5 + 7|$ (15)

$= |27| - |2|$

$= 27 - 2$

$= 25$

39 $|15 + 9 \div 3| - |26 - 50|$

40 $-|30 \div 3 \times 2| \times |-9 + 5|$

41 $-|-12 \div 6| \times |5 - 4 \times 7|$

42 $|16 \div 8 - 4| - |-3 + 7 \times 6|$

43 $-|6 - 4 \times 9| \div |12 - 2 \times 3|$

Absolute Value

18 $|-5 - -3|$

$= |-2|$

$= 2$

The - sign outside the brackets is not affected

Examples

i) $-|17| = -17$ ii) $-|-76| = -76$

19 $-|8| = -8$ 20 $-|-61| = -61$

21 $|-5.9| = 5.9$ 22 $-|81| = -81$

23 $-|-11| = -11$ 24 $|-35| = 35$

25 $-|-20| = -20$ 26 $-|47| = -47$

27 $-|-5| = -5$ 28 $|-94| = 94$

Now try these operations

Examples

i) $|-11| - |-4|$

$= 11 - 4$

$= 7$

ii) $-|13| - |-9|$

$= -13 - 9$

$= -22$

29 $|29| - |-39|$

$= 29 - 39$

$= -10$

30 $|12| + |-26|$

$= 12 + 26$

$= 38$

31 $-|-2| \times |-7|$

$= -2 \times 7$

$= -14$

32 $-|-8| \div |-4|$

$= -8 \div 4$

$= -2$

33 $-|-3| + |-3|$

$= -3 + 3$

$= 0$

34 $|-20| - |17|$

$= 20 - 17$

$= 3$

35 $|58| - |-12|$

$= 58 - 12$

$= 46$

36 $|-41| + |-9|$

$= 41 + 9$

$= 50$

37 $-|-11| \times |9|$

$= -11 \times 9$

$= -99$

38 $-|-60| - |20|$

$= -60 - 20$

$= -80$

These may require order of operations rules to be considered. Solve these.

Example

$|12 + 5 \times 3| - |-5 + 7|$ (15)

$= |27| - |2|$

$= 27 - 2$

$= 25$

39 $|15 + 9 \div 3| - |26 - 50|$ (3)

$= |18| - |-24|$

$= 18 - 24$

$= -6$

40 $-|30 \div 3 \times 2| \times |-9 + 5|$ (10)

$= -|20| \times |-4|$

$= -20 \times 4$

$= -80$

41 $-|-12 \div 6| \times |5 - 4 \times 7|$ (28)

$= -|-2| \times |-23|$

$= -2 \times 23$

$= -46$

42 $|16 \div 8 - 4| - |-3 + 7 \times 6|$ (2) (42)

$= |-2| - |39|$

$= 2 - 39$

$= -37$

43 $-|6 - 4 \times 9| \div |12 - 2 \times 3|$ (36) (6)

$= -|-30| \div |6|$

$= -30 \div 6$

$= -5$

ALGEBRA 2

Solving One Step Equations
Addition and Subtraction

One Step equations are equations you solve in one line of working. They will involve a letter (pronumeral) with two numbers, you have to solve the equation for the value of the letter.

In column 1 you are given one step equations that you can solve with no working, talk them through if it helps you. Here is an example:

$d + 20 = 30$ …. So something plus 20 equals 30
Try $d = 10$ …. 10 plus 20 equals 30, so $d = 10$

Another way to do these is to think of the equation as scales, as each side is equal you have to maintain balance by finding what number would keep the scales balanced.

Column 2 is the same as column 1 except you are asked to now show working. The goal is to get the letter by itself. One of the examples at the top of the 2nd column is $b + 15 = 85$. To get the letter by itself you have to remove the + 15, how do you remove + 15? You subtract 15. So you minus 15 from the left hand side, and because it's like a set of scales, you must do the same thing on the other side of the equals sign. So you subtract 15 from $b + 15$ and you get b on its own. You subtract 15 from 85 and you get 70. The other example is $a - 9 = 27$. You have to get a by itself, to get rid of the - 9 you have to add 9. So you add 9 to each side and you get $a = 36$.

So the questions are the same as the first column but you are showing you are following a procedure by showing your working out. You may be wondering why you have to do this when often you can see the answer without working. You have to practice the process so that when you encounter more complicated problems in the future, that you can't just see the answer for, you know the correct method to use.

Column 3 is the same as column 2 except the letter is on the right hand side of the equals sign. Solve it in the same way and you get the number equal to the letter. Then rewrite your answer so that the letter is first. Again there are examples at the top of the column.

Solving One Step Equations - Addition/Subtraction

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Look at these equations and give the value for the pronumeral

1 $k + 8 = 10$ $k =$

2 $b + 3 = 15$

3 $d + 4 = 9$

4 $x + 20 = 60$

5 $t - 10 = 5$

6 $m - 8 = 20$

7 $h + 9 = 30$

8 $l - 20 = 70$

9 $w - 15 = 104$

10 $s + 12 = 13$

11 $u - 9 = 9$

12 $q + 7 = 23$

13 $n - 100 = 40$

14 $y + 22 = 30$

15 $a + 16 = 50$

16 $e - 7 = 6$

17 $z - 11 = 5$

18 $c - 10 = 94$

19 $j + 3 = 101$

20 $v + 35 = 100$

21 $t - 4 = 24$

22 $m - 17 = 4$

23 $x + 11 = 100$

Now solve these equations showing working

Examples

$b + 15 = 85$
(-15) (-15)
$b = 70$

$a - 9 = 27$
(+9) (+9)
$a = 36$

24 $c + 15 = 22$

25 $y + 11 = 28$

26 $x - 9 = 34$

27 $t - 7 = 18$

28 $q - 20 = 17$

29 $b + 10 = 11$

30 $n + 26 = 26$

31 $d - 20 = 77$

32 $t - 14 = 33$

33 $a - 11 = 59$

34 $15 + g = 33$

35 $w - 9 = 8$

36 $x - 12 = 38$

37 $18 + c = 27$

38 $e + 7 = 103$

39 $i - 56 = 11$

40 $37 + h = 80$

41 $k - 8 = 109$

42 $d - 90 = 1$

43 $u - 15 = 63$

The letter is on the right and so these need an extra line. Find the value of the letter.

Examples

$16 = 5 + c$
(-5) (-5)
$11 = c$
$c = 11$

Then reverse the equation

$35 = e - 7$
(+7) (+7)
$42 = e$
$e = 42$

44 $20 = f - 11$

45 $19 = m + 4$

46 $83 = r + 16$

47 $12 = n - 36$

48 $64 = 19 + k$

49 $11 = m - 17$

50 $87 = u - 51$

51 $100 = a - 9$

52 $33 = 18 + s$

53 $56 = d - 24$

54 $75 = p + 55$

55 $86 = 37 + x$

56 $11 = j - 11$

57 $62 = 16 + t$

15	$a + 16 = 50$	$a = 34$
16	$e - 7 = 6$	$e = 13$
17	$z - 11 = 5$	$z = 16$
18	$c - 10 = 94$	$c = 104$
19	$j + 3 = 101$	$j = 88$
20	$v + 35 = 100$	$v = 65$
21	$t - 4 = 24$	$t = 28$
22	$m - 17 = 4$	$m = 21$
23	$x + 11 = 100$	$x = 89$

Now solve these equations showing working

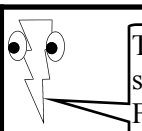
Examples

$b + 15 = 85$
(-15) (-15)
$b = 70$

$a - 9 = 27$
(+9) (+9)
$a = 36$

24	$c + 15 = 22$ - 15 - 15 $c = 7$	25 $y + 11 = 28$ - 11 - 11 $y = 17$
26	$x - 9 = 34$ + 9 + 9 $x = 43$	27 $t - 7 = 18$ + 7 + 7 $t = 25$
28	$q - 20 = 17$ + 20 + 20 $q = 37$	29 $b + 10 = 11$ - 10 - 10 b = 1
30	$n + 26 = 26$ - 26 - 26 $n = 0$	31 $d - 20 = 77$ + 20 + 20 $d = 97$
32	$t - 14 = 33$ + 14 +14 $t = 47$	33 $a - 11 = 59$ + 11 + 11 $a = 70$
34	$15 + g = 33$ - 15 - 15 $g = 18$	35 $w - 9 = 8$ + 9 + 9 $w = 17$
36	$x - 12 = 38$ + 12 + 12 $x = 50$	37 $18 + c = 27$ - 18 - 18 $c = 9$
38	$e + 7 = 103$ - 7 - 7 $e = 96$	39 $i - 56 = 11$ + 56 + 56 $i = 67$
40	$37 + h = 80$ - 37 - 37 $h = 43$	41 $k - 8 = 109$ + 8 + 8 $k = 117$
42	$d - 90 = 1$ + 90 + 90 $d = 91$	43 $u - 15 = 63$ + 15 + 15 $u = 78$

The letter is on the right and so these need an extra line. Find the value of the letter.



Examples

$16 = 5 + c$
(-5) (-5)
$11 = c$
$c = 11$

Then reverse the equation

$35 = e - 7$
(+7) (+7)
$42 = e$
$e = 42$

44	$20 = f - 11$ + 11 + 11 $31 = f$ $f = 31$	45 $19 = m + 4$ - 4 - 4 $15 = m$ $m = 15$
46	$83 = r + 16$ - 16 - 16 $67 = r$ $r = 67$	47 $12 = n - 36$ + 36 + 36 $48 = n$ $n = 48$
48	$64 = 19 + k$ - 19 - 19 $55 = k$ $k = 55$	49 $11 = m - 17$ + 17 + 17 $28 = m$ $m = 28$
50	$87 = u - 51$ + 51 + 51 $138 = u$ $u = 138$	51 $100 = a - 9$ + 9 + 9 $109 = a$ $a = 109$
52	$33 = 18 + s$ - 18 - 18 $15 = s$ $s = 15$	53 $56 = d - 24$ + 24 + 24 $80 = d$ $d = 80$
54	$75 = p + 55$ - 55 - 55 $20 = p$ $p = 20$	55 $86 = 37 + x$ - 37 - 37 $49 = x$ $x = 49$
56	$11 = j - 11$ + 11 + 11 $22 = j$ $j = 22$	57 $62 = 16 + t$ - 16 - 16 $46 = t$ $t = 46$

Further One Step Equations
Adding and Subtracting Negative Numbers

This sheet involves one step equations that involve integers (positive and negative numbers). This sheet may challenge some students. Before you attempt this sheet you should have completed the previous one step equation sheet and the folder "Integers".

Column 1 begins with 10 questions, you are asked to write in the number that satisfies the equation (makes both sides equal). This is a quick refresher on using negative numbers. The next 11 questions are much the same, except the box has been replaced by a pronumeral (letter). If you have trouble with these questions pick a number and replace the letter with it and see if it works. If it doesn't, use another number that you think is a better choice and so on. Make sure you write the letter, an '=' sign and the answer. Not the answer alone.

The second column follows the same method used with the previous one step equation sheet. See the example at the top of the column. The second part of the column has the letter on the right hand side of the equation, solve in the same way then use the additional line to reverse the answer so that the letter is on the left hand side. This is the same method used in the third column on the previous sheet.

Column 3 is different in that the sign in front of the letter is a minus sign. When you solve this equation you will have a negative sign in front of the letter. Remove it by multiplying each side by -1, this will change the signs on both sides. There are a pair of examples at the top of the column.

Just a reminder:

$+ - \;\; = - + \;\; = -$

(a plus sign before or after a minus sign is the same as a minus sign alone)

$- - = +$

(a minus sign together with another minus sign is the same as a plus sign alone)

Further One Step Equations - Add/Sub Negative Numbers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the solution to these and put the number in the box

1 $3 - \square = -1$

2 $8 + \square = 5$

3 $-6 + \square = 11$

4 $-5 + \square = -1$

5 $\square - 8 = -6$

6 $\square + 3 = -10$

7 $\square + -7 = 4$

8 $\square - 8 = -8$

9 $\square + 5 = 7$

10 $\square + -3 = -1$

Now try these without working, test numbers to help you if necessary.

11 $g + 6 = 4$ $g =$

12 $n - 5 = -3$

13 $j - 2 = -10$

14 $v + 4 = -7$

15 $m + 6 = -2$

16 $y + 8 = -8$

17 $d + 10 = -7$

18 $q + 2 = 0$

19 $a - 7 = -2$

20 $e + -5 = 10$

21 $s - 7 = -7$

Now solve these equations showing working

Examples

$6 + z = -5$

(-6) (-6)

$z = -11$

$t - 9 = -4$

(+9) (+9)

$t = 5$

22 $m + 7 = 3$

23 $b - 4 = -6$

24 $n + 11 = -5$

25 $a - 3 = -2$

26 $q + 6 = -1$

27 $9 + r = -5$

28 $t - 4 = -3$

29 $c - -5 = -5$

30 $w - -2 = 0$

31 $n - 7 = -3$

Get the letter on its own then rewrite the equation so that the letter is on the left.

32 $15 = -7 + d$

33 $-3 = y - 3$

Then reverse the equation

34 $-20 = x + 9$

35 $-3 = 10 + u$

36 $5 = -3 + b$

37 $-1 = k + 6$

Solve these then change the sign on both sides of the equation so that it's positive

Examples

$7 - j = -6$

(-7) (-7)

$-j = -13$

$j = 13$

$-h - 4 = 10$

(+4) (+4)

$-h = 14$

$h = -14$

Multiply throughout by -1

38 $8 - m = -11$

39 $-v - 6 = 5$

40 $-t - 6 = 0$

41 $-7 - a = -3$

42 $5 - e = -2$

43 $-x - 11 = 2$

44 $14 - p = 40$

45 $-d - -9 = 12$

46 $-k - 8 = -15$

47 $-t - -6 = 4$

48 $14 - u = 20$

49 $-5 - c = 2$

50 $8 - a = -15$

51 $-80 - f = 35$

Further One Step Equations - Add/Sub Negative Numbers

Find the solution to these and put the number in the box

1 $3 - \boxed{4} = -1$

2 $8 + \boxed{-3} = 5$

3 $-6 + \boxed{17} = 11$

4 $-5 + \boxed{4} = -1$

5 $\boxed{2} - 8 = -6$

6 $\boxed{-13} + 3 = -10$

7 $\boxed{11} + -7 = 4$

8 $\boxed{0} - 8 = -8$

9 $\boxed{2} + 5 = 7$

10 $\boxed{2} + -3 = -1$

Now try these without working, test numbers to help you if necessary.

11 $g + 6 = 4$ — $g = -2$

12 $n - 5 = -3$ — $n = 2$

13 $j - 2 = -10$ — $j = -8$

14 $v + 4 = -7$ — $v = -11$

15 $m + 6 = -2$ — $m = -8$

16 $y + 8 = -8$ — $y = -16$

17 $d + 10 = -7$ — $d = -17$

18 $q + 2 = 0$ — $q = -2$

19 $a - 7 = -2$ — $a = 5$

20 $e + -5 = 10$ — $e = 15$

21 $s - 7 = -7$ — $s = 0$

Now solve these equations showing working

Examples

$6 + z = -5$
(-6) (-6)
$z = -11$

$t - 9 = -4$
(+9) (+9)
$t = 5$

22 $m + 7 = 3$
- 7 - 7
$m = -4$

23 $b - 4 = -6$
+ 4 + 4
$b = -2$

24 $n + 11 = -5$
- 11 - 11
$n = -16$

25 $a - 3 = -2$
+ 3 + 3
$a = 1$

26 $q + 6 = -1$
- 6 - 6
$q = -7$

27 $9 + r = -5$
- 9 - 9
$r = -14$

28 $t - 4 = -3$
+ 4 + 4
$t = 1$

29 $c - -5 = -5$
- 5 - 5
$c = -10$

30 $w - -2 = 0$
- 2 - 2
$w = -2$

31 $n - 7 = -3$
+ 7 + 7
$n = 4$

Get the letter on its own then rewrite the equation so that the letter is on the left.

32 $15 = -7 + d$
+ 7 +7
$22 = d$
$d = 22$

33 $-3 = y - 3$
+ 3 + 3
$0 = y$
$y = 0$

Then reverse the equation

34 $-20 = x + 9$
- 9 - 9
$-29 = x$
$x = -29$

35 $-3 = 10 + u$
- 10 - 10
$-13 = u$
$u = -13$

36 $5 = -3 + b$
+ 3 + 3
$8 = b$
$b = 8$

37 $-1 = k + 6$
- 6 - 6
$-7 = k$
$k = -7$

Solve these then change the sign on both sides of the equation so that it's positive

Examples

$7 - j = -6$
(-7) (-7)
$-j = -13$
$j = 13$

$-h - 4 = 10$
(+4) (+4)
$-h = 14$
$h = -14$

Multiply throughout by -1

38 $8 - m = -11$
- 8 - 8
$-m = -19$
$m = 19$

39 $-v - 6 = 5$
+ 6 + 6
$-v = 11$
$v = -11$

40 $-t - 6 = 0$
+ 6 + 6
$-t = 6$
$t = -6$

41 $-7 - a = -3$
+ 7 + 7
$-a = 4$
$a = -4$

42 $5 - e = -2$
- 5 - 5
$-e = -7$
$e = 7$

43 $-x - 11 = 2$
+ 11 + 11
$-x = 13$
$x = -13$

44 $14 - p = 40$
- 14 - 14
$-p = 26$
$p = -26$

45 $-d - -9 = 12$
- 9 - 9
$-d = 3$
$d = -3$

46 $-k - 8 = -15$
+ 8 + 8
$-k = -7$
$k = 7$

47 $-t - -6 = 4$
- 6 - 6
$-t = -2$
$t = 2$

48 $14 - u = 20$
- 14 - 14
$-u = 6$
$u = -6$

49 $-5 - c = 2$
+ 5 + 5
$-c = 7$
$c = -7$

50 $8 - a = -15$
- 8 - 8
$-a = -23$
$a = 23$

51 $-80 - f = 35$
+ 80 + 80
$-f = 115$
$f = -115$

Solving One Step Equations - Multiplication

This sheet deals with one step equations that involve multiplication. The sheet starts with a column of questions that you should be able to answer by inspection without showing your working out. From column 2 onwards you are expected to show working, even if you can still solve the problems mentally.

Column 1 involves simple one step equations in that the answers are all cardinal numbers. One way to solve these is to talk them through, for example:

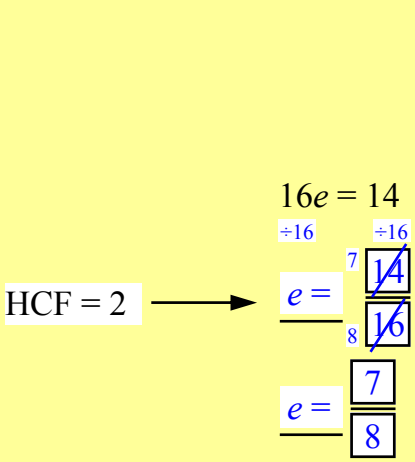
$8m = 24$ …. say 8 times something equals 24
Try $m = 3$ …. say 8 times 3 is 24 so write $m = 3$

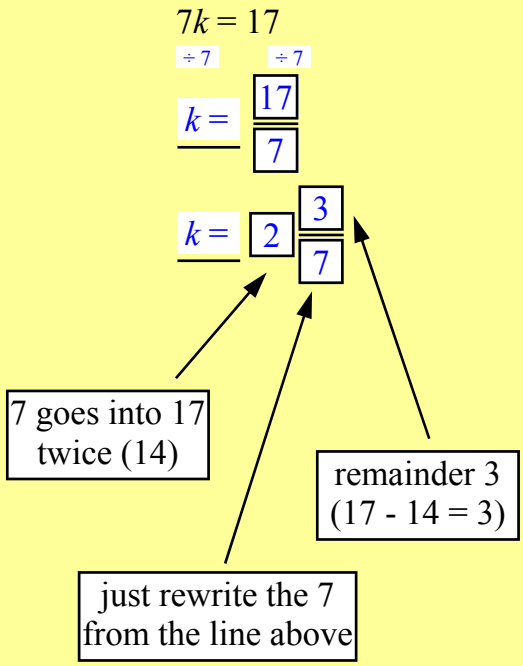
Column 2 asks you to show working and also includes fractions. These fractions won't simplify until Q 34. Follow the examples at the top of the column by dividing the number on the right hand side by the number on the left hand side (in front of the letter). Show your working as the example shows.

From Q 34 it's fractions only, this time they simplify. So use the same method to get the first line, then find the HCF (Highest Common Factor) or the largest number that goes into the top and bottom numbers and divide through.

The third column changes with the last 6 questions. These involve answers that are mixed numerals (number + fraction). Use the same method to get to the first line by dividing through. You will have an improper fraction (the numerator or top number is larger than the denominator). Then convert to mixed numerals….do you remember how? Ask yourself:

- how many times does the bottom number go into the top number, write this in the whole number box at the front
- then write the remainder (amount left over) in the top box.
- the bottom box has the same number as the bottom box in the line above.





Solving One Step Equations - Multiplication

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Look at these equations and give the value for the pronumeral

1 $4d = 8$ $d =$

2 $6h = 12$

3 $5x = 45$

4 $9g = 36$

5 $10n = 120$

6 $7e = 42$

7 $8y = 56$

8 $5t = 55$

9 $11a = 44$

10 $9q = 18$

11 $3z = 39$

12 $2w = 30$

13 $5r = 15$

14 $15p = 45$

15 $4b = 28$

16 $6c = 36$

17 $2k = 48$

18 $9y = 90$

19 $30u = 180$

20 $15x = 60$

21 $2v = 34$

22 $7j = 84$

23 $5t = 0$

Solve these equations only this time show your working out.

Examples

$6p = 54$ (÷6) (÷6) $p = 9$

$5d = 3$ (÷5) (÷5) $d = \frac{3}{5}$

24 $3e = 36$

25 $9u = 4$

26 $8a = 40$

27 $2w = 54$

23	$5t = 0$	$t = 0$

Solve these equations only this time show your working out.

Examples

$6p = 54$ (÷6 ÷6) $p = 9$

$5d = 3$ (÷5 ÷5) $d = \frac{3}{5}$

24 $3e = 36$ (÷3 ÷3) $e = 12$

25 $9u = 4$ (÷9 ÷9) $u = \frac{4}{9}$

26 $8a = 40$ (÷8 ÷8) $a = 5$

27 $2w = 54$ (÷2 ÷2) $w = 27$

28 $11q = 9$ (÷11 ÷11) $q = \frac{9}{11}$

29 $17t = 7$ (÷17 ÷17) $t = \frac{7}{17}$

30 $12c = 60$ (÷12 ÷12) $c = 5$

31 $15x = 13$ (÷15 ÷15) $x = \frac{13}{15}$

32 $20m = 9$ (÷20 ÷20) $m = \frac{9}{20}$

33 $7r = 42$ (÷7 ÷7) $r = 6$

These will have fraction answers that can be simplified

34 $6j = 3$ (÷6 ÷6) $j = \frac{\cancel{3}^{1}}{\cancel{6}_{2}}$ $j = \frac{1}{2}$

35 $8d = 6$ (÷8 ÷8) $d = \frac{\cancel{6}^{3}}{\cancel{8}_{4}}$ $d = \frac{3}{4}$

36 $15k = 9$ (÷15 ÷15) $k = \frac{\cancel{9}^{3}}{\cancel{15}_{5}}$ $k = \frac{3}{5}$

37 $20e = 12$ (÷20) $e = \frac{\cancel{12}^{3}}{\cancel{20}_{5}}$ $e = \frac{3}{5}$

38 $40a = 25$ (÷40 ÷40) $a = \frac{\cancel{25}^{5}}{\cancel{40}_{8}}$ $a = \frac{5}{8}$

39 $12v = 10$ (÷12 ÷12) $v = \frac{\cancel{10}^{5}}{\cancel{12}_{6}}$ $v = \frac{5}{6}$

40 $24f = 6$ (÷24 ÷24) $f = \frac{\cancel{6}^{1}}{\cancel{24}_{4}}$ $f = \frac{1}{4}$

41 $20s = 16$ (÷20 ÷20) $s = \frac{\cancel{16}^{4}}{\cancel{20}_{5}}$ $s = \frac{4}{5}$

42 $30h = 12$ (÷30 ÷30) $h = \frac{\cancel{12}^{2}}{\cancel{30}_{5}}$ $h = \frac{2}{5}$

43 $35x = 28$ (÷35 ÷35) $x = \frac{\cancel{28}^{4}}{\cancel{35}_{5}}$ $x = \frac{4}{5}$

These can be changed from improper fractions to mixed numerals

44 $4t = 9$ (÷4 ÷4) $t = \frac{9}{4}$ $t = 2\frac{1}{4}$

45 $3c = 11$ (÷3 ÷3) $c = \frac{11}{3}$ $c = 3\frac{2}{3}$

46 $8n = 35$ (÷8 ÷8) $n = \frac{35}{8}$ $n = 4\frac{3}{8}$

47 $14d = 33$ (÷14 ÷14) $d = \frac{33}{14}$ $d = 2\frac{5}{14}$

48 $11z = 50$ (÷11 ÷11) $z = \frac{50}{11}$ $z = 4\frac{6}{11}$

49 $4k = 33$ (÷4 ÷4) $k = \frac{33}{4}$ $k = 8\frac{1}{4}$

Further One Step Equations - Multiplication

This sheet involves the use of negative numbers in one step equations. To answer this sheet you should have first completed the 'Integers' folder or already have learnt about negative numbers. The methods used in this sheet are identical to the previous sheet except that the rules for operations with negative numbers are included.

Column 1 begins with revision of operations with negative numbers, you are asked to write in the answer (with the sign) in the box provided. Remember that:

- negative × (or ÷) negative = positive
- negative × (or ÷) positive = negative
- positive × (or ÷) negative = negative

The second part of column 1 is the same as above except the box is replaced by a letter and you have to specify the value of the letter. Talk it through to yourself if it makes it easier. So if you had:

$8b = -40$: say→ eight times something gives me -40. I know 8 times 5 gives me 40, so eight times -5 must give me -40.

so $b = -5$.

Note that you can test numbers to see if they work and modify your number until you get your answer also.

Column 2 uses division by the number (including the sign) that is in front of the letter. Look at the examples at the top of the column. The questions have the letter on the right hand side in the second part of the column. Use the same method then reverse your answer, as shown in the example at the base of this sheet.

Column 3 is the same as the third column on the previous sheet. Simplify the fraction on the first line by dividing through by the HCF. From Q 44 the answers are to be expressed as mixed numerals. Have a look at the examples below.

$-35 = -7x$

÷ -7 ÷ -7

$5 = x$

$x = 5$

$-32u = 56$

÷ -32 ÷ -32

$u = \frac{56}{-32}$ (7, -4)

$u = \frac{-7}{4}$

$-5w = -19$

÷ -5 ÷ -5

$w = \frac{-19}{-5}$

$w = 3\frac{4}{5}$

7 $2 \times \square = -2$

8 $-5 \times \square = -50$

9 $4 \times \square = -36$

10 $1 \times \square = -1$

Now try these without working, test numbers to help you if necessary.

11 $6r = -24$ $r =$ _____

12 $-9e = 72$ _____

13 $-5q = -25$ _____

14 $2y = -4$ _____

15 $-8v = 32$ _____

16 $-3j = -33$ _____

17 $7k = -28$ _____

18 $-5c = 0$ _____

19 $-4n = -60$ _____

20 $13g = -52$ _____

21 $4p = -4$ _____

Solve these equations, only this time show your working out.

Examples

$6x = -54$

$\div 6$ $\div 6$

$x = -9$

$-3h = -33$

$\div -3$ $\div -3$

$h = 11$

22 $12q = -24$ _____

23 $-7t = -70$ _____

24 $15d = -45$ _____

25 $-4a = 36$ _____

26 $-10h = 50$ _____

27 $-b = 80$ _____

28 $3c = -39$ _____

29 $-8m = -48$ _____

30 $15i = -90$ _____

31 $-2y = 54$ _____

32 $-5e = -75$ _____

33 $4s = -100$ _____

Solve these then reverse the answer so that the letter is on the left.

34 $38 = -2x$ _____

35 $-28 = -4r$ _____

36 $-56 = 7w$ _____

37 $75 = -3f$ _____

The fraction answers will need to be simplified. From Q 44 mixed numeral answers are required.

38 $-20e = -8$

39 $16v = -12$

40 $-45t = 20$

41 $30h = -24$

42 $-6g = -3$

43 $60p = -48$

44 $-3a = -8$

45 $-4w = 11$

46 $5n = -12$

47 $-7b = 24$

48 $-12c = -17$

49 $-3x = 5$

Further One Step Equations - Multiplication

$c = 1\frac{5}{12}$

49 $-3x = 5$

$\div -3 \quad \div -3$

$x = \frac{5}{-3}$

$x = -1\frac{2}{3}$

Solving One Step Equations - Division

These one step equations have the letter being divided by a number (or decimal). As with addition, subtraction and multiplication you will use the opposite operation to solve these exercises. The opposite sign to ÷ is ×, so you will use multiplication to solve these questions.

Column 1 starts with questions that you should be able to complete mentally. Talk it through to yourself, for example if you have $^{t}/_{6} = 4$:
$^{t}/_{6} = 4$ ….. say something divided by 6 equals 4
t = 24 ….. say 24 divided by 6 is equal to 4, so $t = 24$

Column 2 then uses multiplication to solve the problems. Look at the number that the letter is being divided by and multiply both sides by it. Examples are at the top of the column.

Column 3 uses the same solving method except decimals are involved. Follow the examples at the top of the column then see if you can answer the first 4 questions mentally. From then on when you multiply, use the multiplication working space to get your answer. Write your answer and remember to write the letter then '=' before your answer.

Solving One Step Equations - Division

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the value for the letter that will make these equations true.

1 $\frac{d}{2} = 5$ — $d = 10$

2 $\frac{t}{6} = 3$ — $t = 18$

3 $\frac{b}{4} = 3$ — $b = 12$

4 $\frac{c}{5} = 3$ — $c = 15$

5 $\frac{f}{6} = 4$ — $f = 24$

6 $\frac{n}{10} = 4$ — $n = 40$

7 $\frac{p}{7} = 3$ — $p = 21$

8 $\frac{q}{6} = 8$ — $q = 48$

9 $\frac{k}{5} = 10$ — $k = 50$

10 $\frac{j}{2} = 9$ — $j = 18$

11 $\frac{v}{3} = 8$ — $v = 24$

12 $\frac{m}{12} = 3$ — $m = 36$

13 $\frac{y}{8} = 4$ — $y = 32$

14 $\frac{h}{7} = 6$ — $h = 42$

15 $\frac{r}{2} = 17$ — $r = 34$

16 $\frac{u}{20} = 8$ — $u = 160$

Now solve these equations showing working

Examples

$\frac{d}{7} = 8$ (×7 ×7) $d = 56$

$\frac{v}{11} = 5$ (×11 ×11) $v = 55$

17 $\frac{x}{9} = 6$ (×9 ×9) $x = 54$

18 $\frac{h}{15} = 3$ (×15 ×15) $h = 45$

19 $\frac{q}{12} = 10$ (×12 ×12) $q = 120$

20 $\frac{c}{7} = 9$ (×7 ×7) $c = 63$

21 $\frac{k}{5} = 15$ (×5 ×5) $k = 75$

22 $\frac{w}{20} = 4$ (×20 ×20) $w = 80$

23 $\frac{n}{6} = 21$ (×6 ×6) $n = 126$

24 $\frac{b}{10} = 17$ (×10 ×10) $b = 170$

25 $\frac{m}{53} = 2$ (×53 ×53) $m = 106$

26 $\frac{d}{4} = 25$ (×4 ×4) $d = 100$

27 $\frac{y}{31} = 3$ (×31 ×31) $y = 93$

28 $\frac{a}{5} = 40$ (×5 ×5) $a = 200$

29 $\frac{p}{4} = 12$ (×4 ×4) $p = 48$

30 $\frac{e}{10} = 13$ (×10 ×10) $e = 130$

31 $\frac{f}{9} = 8$ (×9 ×9) $f = 72$

32 $\frac{h}{6} = 30$ (×6 ×6) $h = 180$

This time the questions involve decimals. Try to answer without a calculator, spaces are provided.

Examples

$\frac{k}{4} = 3.2$ (×4 ×4) $k = 12.8$

$\frac{n}{2.1} = 5$ (×2.1 ×2.1) $v = 10.5$

33 $\frac{a}{2} = 3.4$ (×2 ×2) $a = 6.8$

34 $\frac{e}{4.3} = 3$ (×4.3 ×4.3) $e = 12.9$

35 $\frac{h}{7.1} = 6$ (×7.1 ×7.1) $h = 42.6$

36 $\frac{t}{3} = 5.2$ (×3 ×3) $t = 15.6$

37 $\frac{n}{2.9} = 7$ (×2.9 ×2.9) $n = 20.3$

2.9×7 (6) $= 20.3$

38 $\frac{q}{4.7} = 5$ (×4.7 ×4.7) $q = 23.5$

4.7×5 (3) $= 23.5$

39 $\frac{t}{3} = 9.6$ (×3 ×3) $t = 28.8$

9.6×3 (1) $= 28.8$

40 $\frac{b}{0.8} = 4$ (×0.8 ×0.8) $b = 3.2$

0.8×4 (3) $= 3.2$

41 $\frac{k}{5} = 7.4$ (×5 ×5) $k = 37$

7.4×5 (2) $= 37.0$

Further One Step Division Equations and Solutions to Equations

This sheet involves using negative numbers, you should have covered 'Integers' before you attempt this sheet.

Column 1 carries on from the previous sheet only this time negative numbers are involved. Examples are at the top of the column, the method is the same as the previous sheet.

Column 2 uses substitution, (when the letter is replaced by a number). These questions aren't to find the value for the letter that makes the equation true. A value is already given and you are asked to test to see whether it is a solution. This is done by replacing the letter with the value given in each question, simplifying the left hand side of the equation (L.H.S.) and checking if it equals the right hand side (R.H.S.) of the equation.

If the same number is on both sides of the = sign then the value 'satisfies' the equation (it is a solution). If the numbers aren't the same on either side of the = sign then you write ≠ (not equal to) and say that it isn't a solution. As in the example at the top of column 2.

Column 3 follows on from column 2 except that brackets are introduced. You have to evaluate the brackets before you multiply by the outside number.

Test for $b = 6$

$2(b - 9) = -6$

$2 \times (6 - 9) = -6$ (-3)

$-6 = -6$

LHS = RHS so 6 satisfies the equation.

Further One Step Division Equations and Solutions to Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the value of the letter that make these true.

Examples

$\frac{j}{6} = -12$ (× 6, × 6)

$j = -72$

$\frac{n}{-8} = -5$ (× -8, × -8)

$n = 40$

1 $\frac{a}{5} = -6$

2 $\frac{t}{-7} = 9$

3 $\frac{h}{-3} = -15$

4 $\frac{y}{5} = -12$

5 $\frac{t}{7} = -1$

6 $\frac{m}{-6} = -3$

7 $\frac{u}{9} = -5$

8 $\frac{b}{16} = -2$

9 $\frac{d}{-3} = -11$

10 $\frac{g}{-5} = 60$

11 $\frac{f}{20} = -12$

12 $\frac{q}{-7} = -8$

13 $\frac{m}{17} = -3$

14 $\frac{e}{15} = -5$

15 $\frac{x}{19} = -2$

16 $\frac{k}{-2} = -1$

Substitute the value for the letter to see if it is a solution for the equation

Example

$g + 17 = 40$ Try $g = 33$

$33 + 17 = 40$ LHS ≠ RHS so 33

$50 \neq 40$ is not a solution

17 Test for $n = 31$

$n - 12 = 19$

18 Test for $t = 16$

$t + 37 = 63$

19 Test for $m = 7$

$3m = 23$

20 Test for $u = -4$

$8u = 32$

21 Test for $c = -6$

$19 - c = 25$

22 Test for $q = 9$

$-5 - q = 14$

23 Test for $a = -3$

$-6a = 18$

24 Test for $k = -8$

$k^2 = 64$

25 Test for $g = 5$

$7(g + 3) = 56$

26 Test for $d = 12$

$5(9 - d) = -2$

27 Test for $x = -27$

$\frac{x}{-3} = -9$

28 Test for $e = -9$

$2(3 - e) = 24$

29 Test for $v = 3$

$5(v - 8) = -30$

Further One Step Division Equations and Solutions to Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Find the value of the letter that make these true.

Examples

$\frac{j}{6} = -12$ (× 6 / × 6)

$j = -72$

$\frac{n}{-8} = -5$ (× -8 / × -8)

$n = 40$

1 $\frac{a}{5} = -6$ (× 5 / × 5)

$a = -30$

2 $\frac{t}{-7} = 9$ (× -7 / × -7)

$t = -63$

3 $\frac{h}{-3} = -15$ (× -3 / × -3)

$h = 75$

4 $\frac{y}{5} = -12$ (× 5 / × 5)

$y = -60$

5 $\frac{t}{7} = -1$ (× 7 / × 7)

$t = -7$

6 $\frac{m}{-6} = -3$ (× -6 / × -6)

$m = 18$

7 $\frac{u}{9} = -5$ (× 9 / × 9)

$u = -45$

8 $\frac{b}{16} = -2$ (× 16 / × 16)

$b = -32$

9 $\frac{d}{-3} = -11$ (× -3 / × -3)

$d = 33$

10 $\frac{g}{-5} = 60$ (× -5 / × -5)

$g = -300$

11 $\frac{f}{20} = -12$ (× 20 / × 20)

$f = -240$

12 $\frac{q}{-7} = -8$ (× -7 / × -7)

$q = 56$

13 $\frac{m}{17} = -3$ (× 17 / × 17)

$m = -51$

14 $\frac{e}{15} = -5$ (× 15 / × 15)

$e = -75$

15 $\frac{x}{19} = -2$ (× 19 / × 19)

$x = -38$

16 $\frac{k}{-2} = -1$ (× -2 / × -2)

$k = 2$

Substitute the value for the letter to see if it is a solution for the equation

Example

$g + 17 = 40$ Try $g = 33$

$33 + 17 = 40$ LHS ≠ RHS so 33

$50 \neq 40$ is not a solution

17 Test for $n = 31$

$n - 12 = 19$ LHS = RHS so 31

$31 - 12 = 19$ is a solution

$19 = 19$

18 Test for $t = 16$

$t + 37 = 63$ LHS ≠ RHS so 16

$16 + 37 = 63$ is not a solution

$53 \neq 63$

19 Test for $m = 7$

$3m = 23$ LHS ≠ RHS so 7 is

$3 \times 7 = 23$ not a solution

$21 \neq 23$

20 Test for $u = -4$

$8u = 32$ LHS ≠ RHS so

$8 \times -4 = 32$ -4 is not a

$-32 \neq 32$ solution

21 Test for $c = -6$

$19 - c = 25$ LHS = RHS so

$19 - -6 = 25$ -6 is a solution

$25 = 25$

22 Test for $q = 9$

$-5 - q = 14$ LHS ≠ RHS so 9

$-5 - 9 = 14$ is not a solution

$-14 \neq 14$

23 Test for $a = -3$

$-6a = 18$ LHS = RHS so

$-6 \times -3 = 18$ -3 is a solution

$18 = 18$

24 Test for $k = -8$

$k^2 = 64$ LHS = RHS so

$(-8)^2 = 64$ -8 is a solution

$64 = 64$

25 Test for $g = 5$

$7(g + 3) = 56$ LHS = RHS so

$7 \times (5 + 3) = 56$ (8) 5 is a solution

$56 = 56$

26 Test for $d = 12$

$5(9 - d) = -2$ LHS ≠ RHS so

$5 \times (9 - 12) =$ (-3) 12 is not a

$-15 \neq -2$ solution

27 Test for $x = -27$

$\frac{x}{-3} = -9$ LHS ≠ RHS so

-9 is not a

$\frac{-27}{-3} = -9$ solution

$9 \neq 9$

28 Test for $e = -9$

$2(3 - e) = 24$ LHS = RHS so

$2 \times (3 - -9) =$ (12) -9 is a solution

$24 = 24$

29 Test for $v = 3$

$5(v - 8) = -30$ LHS ≠ RHS so 3

$5 \times (3 - 8) = -30$ (-5) is not a solution

$-25 \neq -30$

Powers and Expansion

This sheet has some questions written sideways. To read these questions click on the "View" menu, select the rotate option then "counter clockwise".

When you use powers with pronumerals (letters) it is important that you understand what the power means. Unlike numbers raised to a power, you can't use a calculator to get an answer with letters.

Column 1 gives you expanded expressions (expressions don't have an =, equations have an =) that you are asked to simplify. Expanded form is when the expression is broken up so that there are no powers, with each piece being separated by an × sign. The way you answer these is:

- Multiply all the numbers together and write the number part of the answer
- Count the number of same letters then write the letter and the number straight after it, small and raised, e.g. a^2. If there is only 1 letter then you don't need to write a number.
- Are there other letters in the question? If there are, count the number of those letters and repeat the process.

Column 2 asks you to expand the expressions. Use the opposite method. Write the number then an '=' sign. Then the letters separated by × signs, the number of letters being the power, no power means one letter.

Column 3 is a brief introduction to multiplying with powers. The column starts with asking you to expand out the multiplication, then simplify. It's the same as the previous work. You may notice a rule that applies to multiplying indices. This rule is that you add the powers when you multiply. This is dealt with by the second part of the column, there are examples in the column. Just remember when a letter is by itself, it is as if there is a 1 as its power. So $m = m^1$.

Powers and Expansion

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Simplify these expressions by removing the × signs and rewriting using powers

Example $4 \times j \times v \times 6 \times j \times j = 24vj^3$

1 $y \times y \times y \times y$ =

2 $m \times m \times m \times m \times m$ =

3 $a \times a$ =

4 $h \times h \times h$ =

5 $6 \times t \times t \times t$ =

6 $u \times u \times 4 \times u \times u$ =

7 $2 \times b \times b \times 3 \times b \times b$ =

8 $a \times x \times x$ =

9 $n \times n \times c \times c \times c$ =

10 $8 \times i \times i \times h \times i \times i$ =

11 $d \times a \times d \times d \times a \times a$ =

12 $e \times e \times 3 \times q \times e \times e \times 7 \times q$ =

13 $c \times c \times 5 \times c \times b \times c \times c \times 4$ =

14 $6 \times g \times b \times b \times g \times g \times b \times 9$ =

15 $8 \times c \times b \times a \times c \times b \times c \times 5$ =

16 $s \times t \times s \times t \times v \times 4 \times s \times s$ =

17 $y \times y \times 3 \times a \times 2 \times x \times a \times 4$ =

Now the opposite, expand these removing powers and inserting × signs

Example $6am^2 = 6 \times a \times m \times m$

18 $7b^2$ =

19 $10k^4$ =

20 $2t^3$ =

21 $5qx^3$ =

22 d^2c^4 =

23 $4r^3b^4$ =

24 $57ud^3$ =

25 $8y^4s^3$ =

26 $3r^2d^2$ =

27 ab^2c^3 =

28 $6mr^3t$ =

29 y^2ib^3 =

30 $12x^2y^2$ =

31 $10d^3aw$ =

32 $3m^2qk^3$ =

33 dv^4h^2 =

34 $2s^2rx^3$ =

35 $38q^2vb^2$ =

36 $9k^3g^2e$ =

37 $2cgpq^2$ =

38 x^2atf^3 =

Expand these and then rewrite them as simplified indices

Example $h^2 \times h^2 = h \times h \times h \times h = h^4$ ($h^2 = h \times h$)

39 $a^2 \times a^3$

= =

40 $b^4 \times b^2$

= =

41 $n^3 \times n$

= =

42 $3c^2 \times c^2$

= =

43 $3y^3 \times 4y$

= =

Sum the powers to find the answer to these

Examples $h^7 \times h^9 = h^{16}$ ($7 + 9 = 16$) $k \times k^6 = k^7$ ($k = k^1$, $1 + 6 = 7$)

$5x^5 \times 4x^7 = 20x^{12}$

43 $u^3 \times u^8$ =

44 $t^9 \times t^{11}$ =

45 $c^5 \times c^{17}$ =

46 $3x^{14} \times x^{17}$ =

47 $5d^3 \times 7d$ =

48 $2s^5 \times 4s^5$ =

49 $7q^6 \times 9q^3$ =

50 $5w^4 \times 2w \times 3w^2$ =

51 $4e^4 \times 3e^5 \times e^2$ =

Powers and Expansion

28 $6mr^3t = 6 \times m \times r \times r \times r \times t$

29 $y^2ib^3 = y \times y \times i \times b \times b \times b$

30 $12x^2y^2 = 12 \times x \times x \times y \times y$

31 $10d^3aw = 10 \times d \times d \times d \times a \times w$

32 $3m^2qk^3 = 3 \times m \times m \times q \times k \times k \times k$

33 $dv^4h^2 = d \times v \times v \times v \times v \times h \times h$

34 $2s^2rx^3 = 2 \times s \times s \times r \times x \times x \times x$

35 $38q^2vb^2 = 38 \times q \times q \times v \times b \times b$

36 $9k^3g^2e = 9 \times k \times k \times k \times g \times g \times e$

37 $2cgpq^2 = 2 \times c \times g \times p \times q \times q$

38 $x^2atf^3 = x \times x \times a \times t \times f \times f \times f$

Expand these and then rewrite them as simplified indices

Example $h^2 \times h^2 = h \times h \times h \times h = h^4$ ($h^2 = h \times h$, $h^2 = h \times h$)

39 $a^2 \times a^3 = a \times a \times a \times a \times a = a^5$

40 $b^4 \times b^2 = b \times b \times b \times b \times b \times b = b^6$

41 $n^3 \times n = n \times n \times n \times n = n^4$

42 $3c^2 \times c^2 = 3 \times c \times c \times c \times c = 3c^4$

43 $3y^3 \times 4y = 3 \times y \times y \times y \times 4 \times y = 12y^4$

Sum the powers to find the answer to these

Examples $h^7 \times h^9 = h^{16}$ ($7 + 9 = 16$), $k \times k^6 = k^7$ ($k = k^1$, $1 + 6 = 7$)

$5x^5 \times 4x^7 = 20x^{12}$

44 $u^3 \times u^8 = u^{11}$

45 $t^9 \times t^{11} = t^{20}$

46 $c^5 \times c^{17} = c^{22}$

47 $3x^{14} \times x^{17} = 3x^{31}$

48 $5d^3 \times 7d = 35d^4$

49 $2s^5 \times 4s^5 = 8s^{10}$

50 $7q^6 \times 9q^3 = 63q^9$

51 $5w^4 \times 2w \times 3w^2 = 30w^7$

52 $4e^4 \times 3e^5 \times e^2 = 12e^{11}$

Substitution

Substitute means to replace with. In mathematics you are often asked to replace a letter with a number and find the answer. There are two important things to remember, the first is when there is no sign between letters then it is as if there is a × between them.
For example wr is $w \times r$, so if $w = 4$ and $r = 2$ then $wr = 4 \times 2 = 8$ not 42.

The second point is powers, so if $w = 4$ then : $w^2 = w \times w = 4 \times 4 = 16$ (or $4^2 = 16$),
not $w^2 = 4 \times 2 = 8$. A frequent mistake.

Column 1 starts with questions that ask you to find the values of two pronumerals. Substitute in the numbers on the second line (after an equals sign), then on the third line write the letter = and your answer. Question 1 has the format shown for you to start you off. From question 4 you may encounter questions that order of operations rules apply. Remember × and ÷ before + and -, be careful.

Column 2 is the same as column 1 except you may find the numbers a little more challenging.

Find the values of a and b
given $y = 12$ and $x = 7$

a)	b)
$a = y + 3x$	$b = 2y - x$
$= 12 + 3 \times 7$ 21	$= 2 \times 12 - 7$ 24
$a = 33$	$b = 17$

Column 3 tests your knowledge of negative numbers, remember:

- a negative number × or ÷ a negative number gives a positive number
- a positive number × or ÷ a negative number gives a negative number
- a negative number × or ÷ a positive number gives a negative number
- + then a - = - (+ - = -)
- - then a + = - (- + = -)
- - then a - = + (- - = +)

Substitution

Substitute the values for the letters and find the answer

1 Find the value of k and r when $x = 7$ and $m = 6$

a) $k = xm$

$= \quad \times$

$k =$

b) $r = x + m$

$= \quad +$

$r =$

2 Evaluate for h and e when $a = 5$ and $t = 3$

a) $h = at$

b) $e = 2a + t$

3 Solve for b and v given $w = 7$ and $c = 2$

a) $b = w^2$

b) $v = 3cw$

4 Find the values of g and d given $n = 12$ and $q = 5$

a) $g = n + 8q$

b) $d = n - 2q$

5 Solve for c, v and y given $t = 6$ and $e = 3$

a) $c = te^2$

b) $v = t + 5e$

c) $y = c + 2v$

6 Solve for q, v and b given $e = 6$ and $x = 3$

a) $q = 2xe$

b) $v = q - 2e$

c) $b = q + v - x$

7 Find the values of r, c and t given $u = 10$ and $a = 4$

a) $r = 3u - a$

b) $c = a^2 - u$

c) $t = 2r - 3c$

8 Solve for x, y and z given $a = 6$ and $b = 2$

a) $x = ab^2$

b) $y = 2x - 18$

c) $z = (y - x)^2$

9 Find the values of d and p given $c = 24$ and $v = 3$

a) $d = c + 3v$

b) $p = 2d - c$

These questions use negative numbers

10 Evaluate for h and n when $t = -5$ and $c = 3$

a) $h = c + t$

b) $n = 3t$

11 Find the values of s and k given $x = -8$ and $d = -4$

a) $s = x - d$

b) $k = d^2$

12 Find the values of n and b given $r = -10$ and $e = 6$

a) $n = r - 2e$

b) $b = 3r + e$

13 Solve for a and b given $u = -4$ and $y = -7$

a) $a = 2u^2$

b) $b = a + y$

14 Find the values of a and k given $p = -3$ and $q = 9$

a) $a = \frac{2q}{p}$

b) $k = \frac{pq}{p^2}$

Substitution

Substitute the values for the letters and find the answer

1 Find the value of k and r when $x = 7$ and $m = 6$

a) $k = xm$

$= 7 \times 6$

$k = 42$

b) $r = x + m$

$= 7 + 6$

$r = 13$

2 Evaluate for h and e when $a = 5$ and $t = 3$

a) $h = at$

$= 5 \times 3$

$h = 15$

b) $e = 2a + t$

$= \cancel{2} \times \cancel{5}^{10} + 3$

$e = 13$

3 Solve for b and v given $w = 7$ and $c = 2$

a) $b = w^2$

$= 7 \times 7$

$b = 49$

b) $v = 3cw$

$= \cancel{3} \times \cancel{2}^{6} \times 7$

$v = 42$

4 Find the values of g and d given $n = 12$ and $q = 5$

a) $g = n + 8q$

$= 12 + \cancel{8} \times \cancel{5}^{40}$

$g = 52$

b) $d = n - 2q$

$= 12 - \cancel{2} \times \cancel{5}^{10}$

$d = 2$

5 Solve for c, v and y given $t = 6$ and $e = 3$

a) $c = te^2$

$= \cancel{6} \times \cancel{3}^{18} \times 3$

$c = 54$

b) $v = t + 5e$

$= 6 + \cancel{5} \times \cancel{3}^{15}$

$v = 21$

c) $y = c + 2v$

$= 54 + \cancel{2} \times \cancel{21}^{42}$

$y = 96$

6 Solve for q, v and b given $e = 6$ and $x = 3$

a) $q = 2xe$

$= \cancel{2} \times \cancel{3}^{6} \times 6$

$q = 36$

b) $v = q - 2e$

$= 36 - \cancel{2} \times \cancel{6}^{12}$

$v = 24$

c) $b = q + v - x$

$= 36 + 24 - \cancel{3}^{21}$

$b = 57$

7 Find the values of r, c and t given $u = 10$ and $a = 4$

a) $r = 3u - a$

$= \cancel{3} \times 10^{30} - 4$

$r = 26$

b) $c = a^2 - u$

$= \cancel{4} \times \cancel{4}^{16} - 10$

$c = 6$

c) $t = 2r - 3c$

$= \cancel{2} \times 26^{52} - \cancel{3} \times \cancel{6}^{18}$

$t = 34$

8 Solve for x, y and z given $a = 6$ and $b = 2$

a) $x = ab^2$

$= \cancel{6} \times \cancel{2}^{12} \times 2$

$x = 24$

b) $y = 2x - 18$

$= \cancel{2} \times 24^{48} - 18$

$y = 30$

c) $z = (y - x)^2$

$= (\cancel{30} - 24)^{2\ 6}$

$z = 36$

9 Find the values of d and p given $c = 24$ and $v = 3$

a) $d = c + 3v$

$= 24 + \cancel{3} \times \cancel{3}^{9}$

$d = 33$

b) $p = 2d - c$

$= \cancel{2} \times \cancel{33}^{66} - 24$

$p = 42$

These questions use negative numbers

10 Evaluate for h and n when $t = -5$ and $c = 3$

a) $h = c + t$

$= 3 + -5$

$h = -2$

b) $n = 3t$

$= 3 \times (-5)$

$n = -15$

11 Find the values of s and k given $x = -8$ and $d = -4$

a) $s = x - d$

$= -8 - -4$

$s = -4$

b) $k = d^2$

$= (-4)^2$

$k = 16$

12 Find the values of n and b given $r = -10$ and $e = 6$

a) $n = r - 2e$

$= -10 - \cancel{2} \times \cancel{6}^{12}$

$n = -22$

b) $b = 3r + e$

$= \cancel{3} \times -\cancel{10}^{-30} + 6$

$b = -24$

13 Solve for a and b given $u = -4$ and $y = -7$

a) $a = 2u^2$

$= 2 \times (-\cancel{4})^{2\ 16}$

$a = 32$

b) $b = a + y$

$= 32 + -7$

$b = 25$

14 Find the values of a and k given $p = -3$ and $q = 9$

a) $a = \dfrac{2q}{p}$

$= \dfrac{\cancel{2} \times \cancel{9}^{18}}{-3}$

$a = -6$

b) $k = \dfrac{pq}{p^2}$

$= \dfrac{-\cancel{3} \times \cancel{9}^{-27}}{(-\cancel{3})^{2\ 9}}$

$k = -3$

Bisecting an Interval

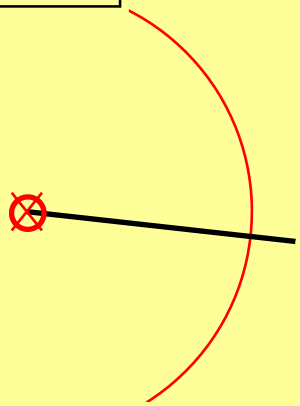
Bisecting something is cutting it into two equal pieces. This sheet deals with bisecting intervals. An interval is a straight line but instead of going on forever it has specific length. The intervals on this sheet have markers at their ends for you to position instruments more effectively.

Column 1 starts with asking you to bisect these five intervals with a ruler. Measure the length of the interval, write your answer in the space, give the answer in mm. Divide this number by 2 and write that answer in the 'half length' space. Mark off half-way with a small stroke.

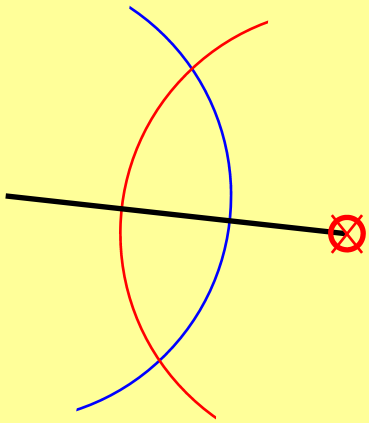
Questions 6 through 10 involve the same 60 mm interval, the questions ask you to break the interval up into a specific number of parts. Divide 60 by the number of parts required in the question and that is the measured gap required between 'marks'.

Columns 2 and 3 are the same, it is asking you to bisect the given intervals using a compass. Below is the process outlined step-by-step.

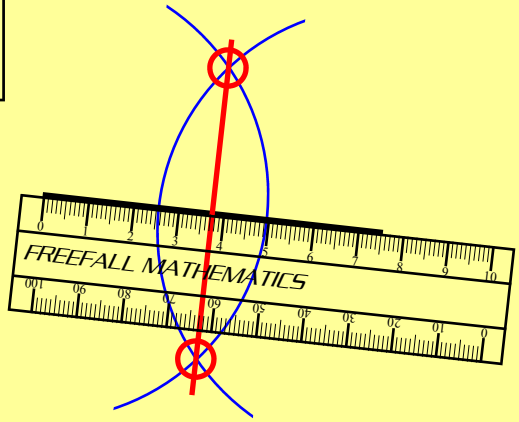
1 Draw an arc from one end of the interval (red circle). Open the compass more than half the interval's length.



2 Repeat for the other end of the interval. Keep the compass set at the same distance.



3 Draw a line through the two intersection points (red circles). Use a ruler to measure the lengths as a check.



Bisecting an Interval

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Using your ruler, measure then bisect these intervals

1 Interval length : _____

Half length : _____

2 Interval length : _____

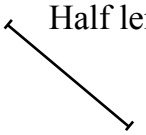
Half length : _____

3 Interval length : _____

Half length : _____

4 Interval length : _____

Half length : _____



5 Interval length : _____

Half length : _____

Divide the 60 mm intervals into 3, 4, 5, 6 and 10 parts

6 3 parts, interval = _____ mm

7 4 parts, interval = _____ mm

8 5 parts, interval = _____ mm

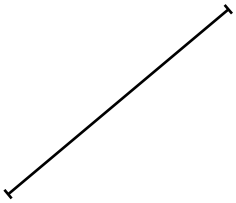
9 6 parts, interval = _____ mm

10 10 parts, interval = _____ mm

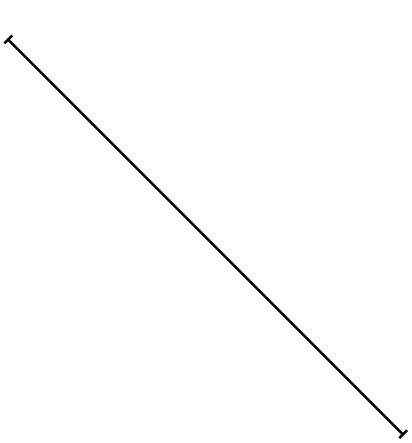
Use a compass to bisect these intervals. Give the measurement from one end to the midpoint (cm)

11 Half length : _____

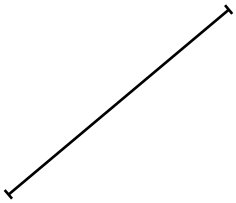
12 Half length : _____



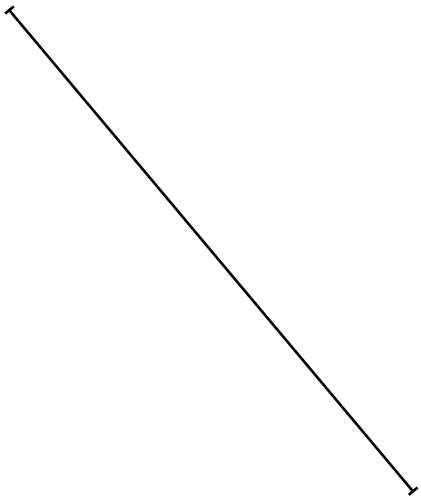
13 Half length : _____



14 Half length : _____



15 Half length : _____



16 Half length : _____

Bisecting an Interval

Using your ruler, measure then bisect these intervals

1 Interval length : 60 mm

Half length : 30 mm

2 Interval length : 48 mm

Half length : 24 mm

3 Interval length : 36 mm

Half length : 18 mm

4 Interval length : 21 mm

Half length : 10.5 mm

5 Interval length : 42 mm

Half length : 21 mm

Divide the 60 mm intervals into 3, 4, 5, 6 and 10 parts

6 3 parts, interval = 20 mm

7 4 parts, interval = 15 mm

8 5 parts, interval = 12 mm

9 6 parts, interval = 10 mm

10 10 parts, interval = 6 mm

Use a compass to bisect these intervals. Give the measurement from one end to the midpoint (cm)

11 Half length : 2.8 cm

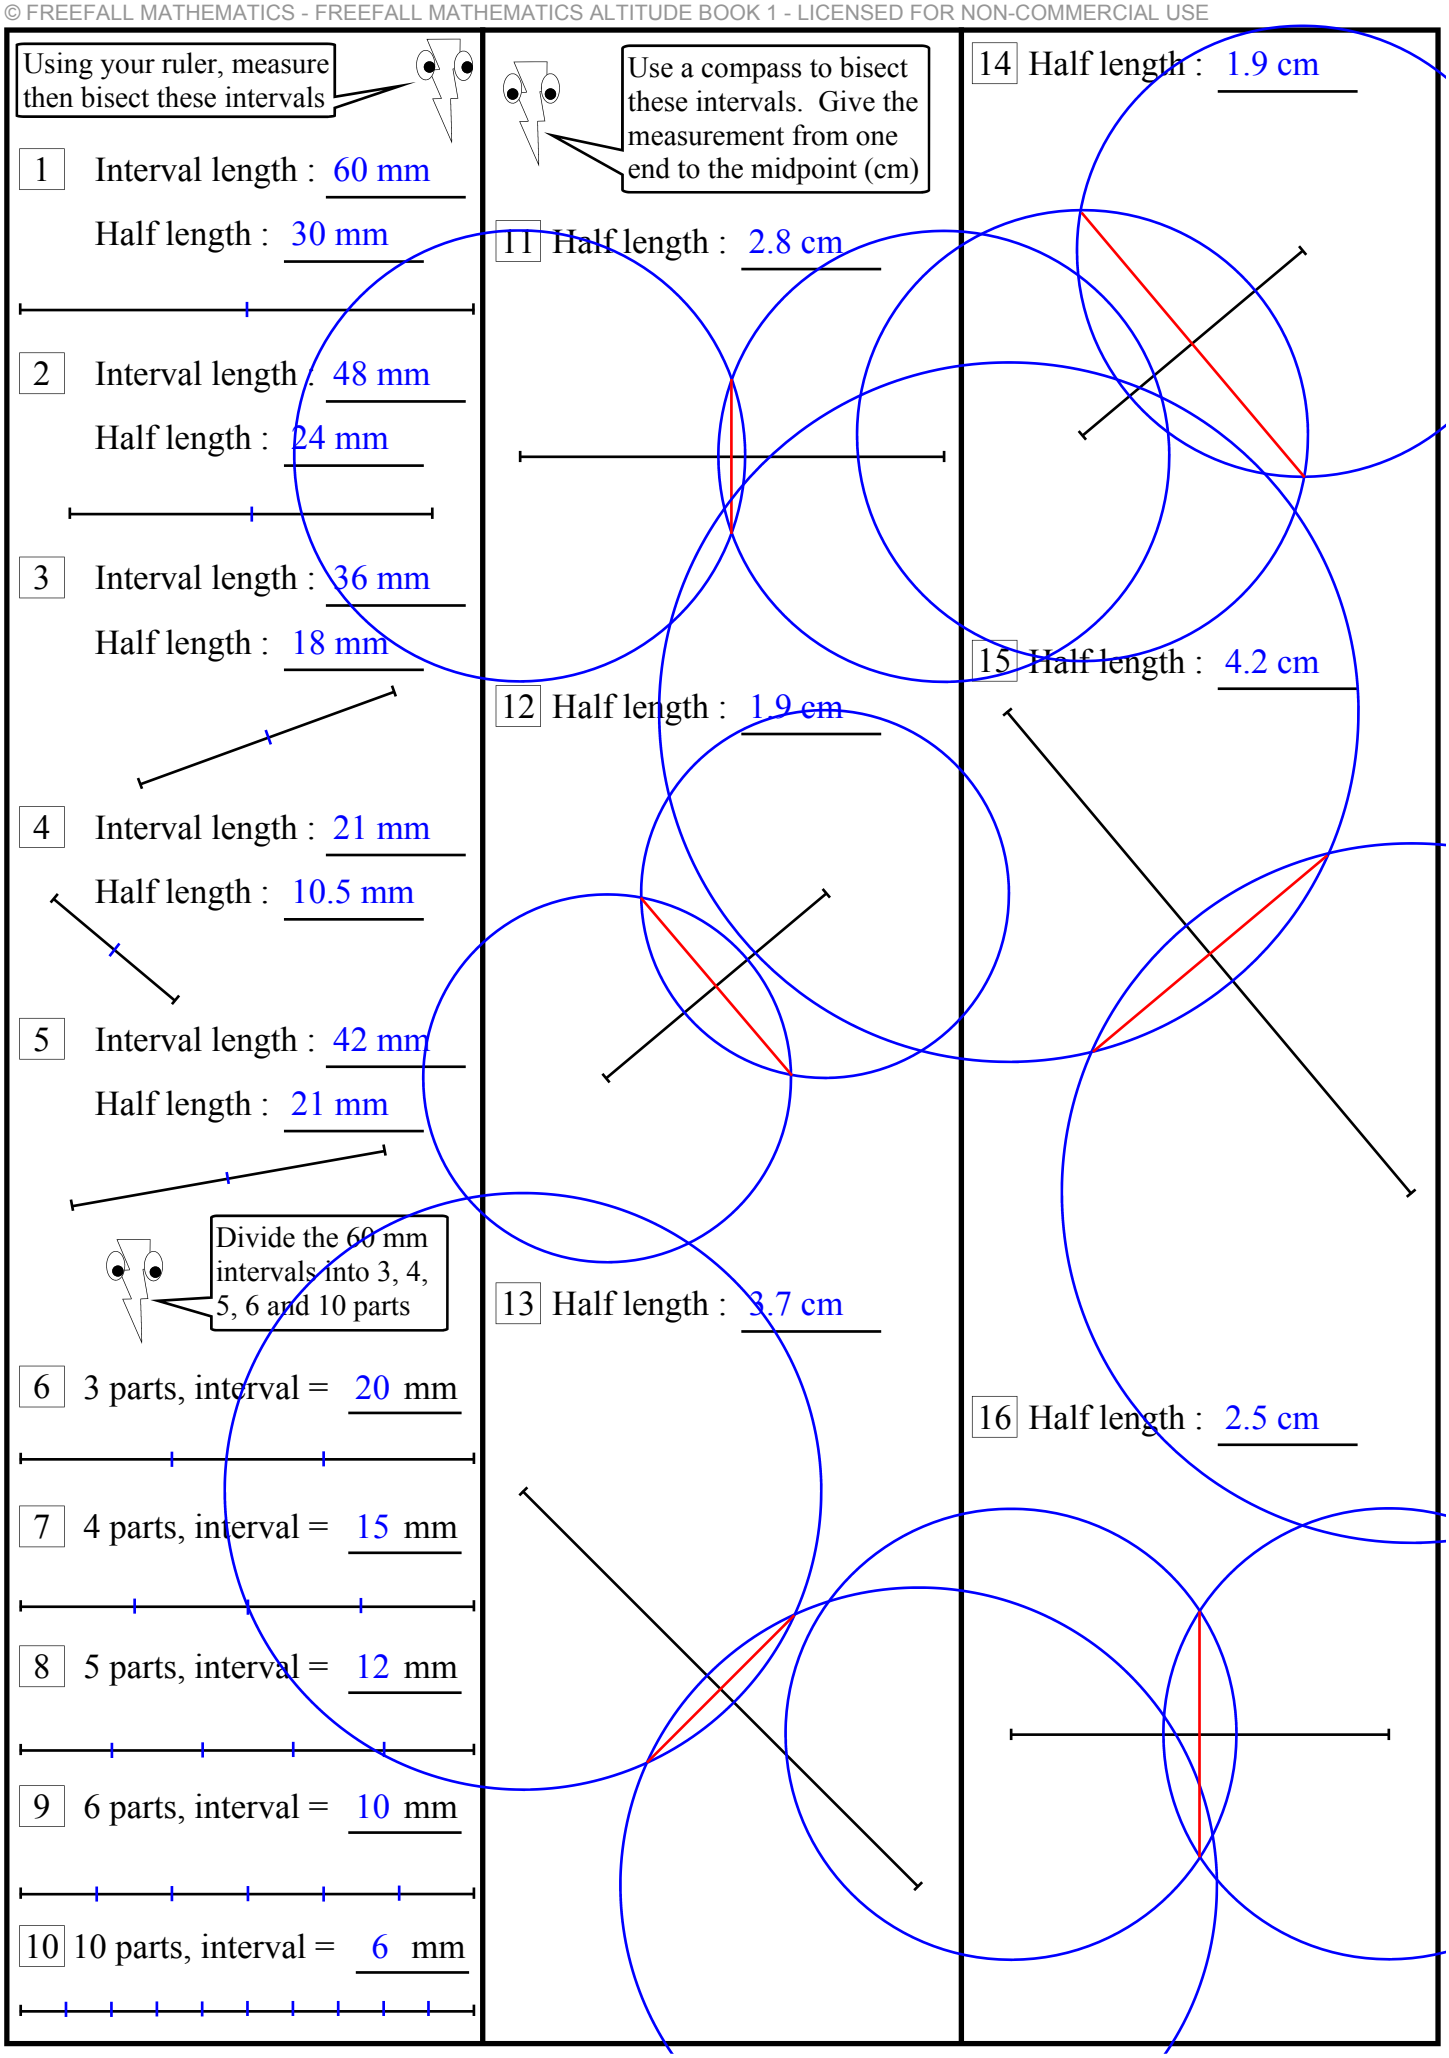
12 Half length : 1.9 cm

13 Half length : 3.7 cm

14 Half length : 1.9 cm

15 Half length : 4.2 cm

16 Half length : 2.5 cm

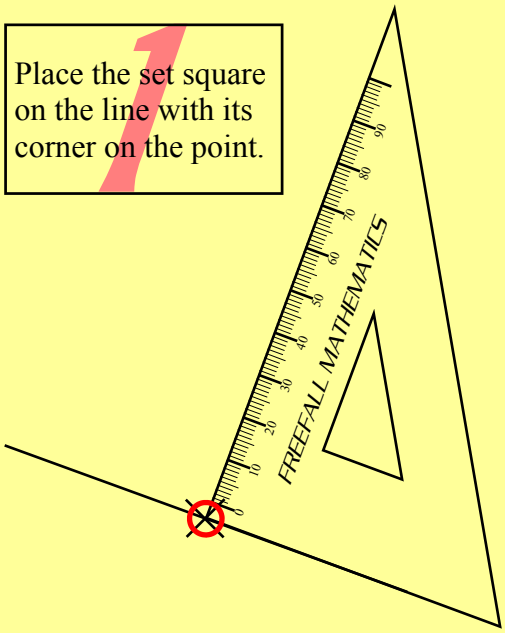


Perpendicular and Parallel Lines

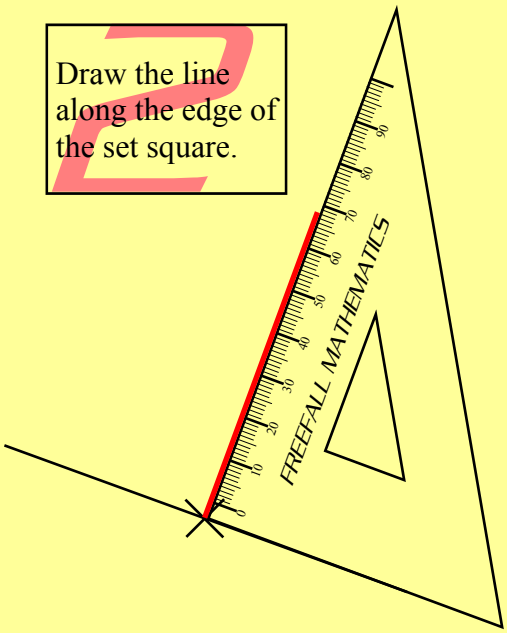
Perpendicular lines are lines that are at right angles to each other, so the angles formed when the lines intersect are 90º. Parallel lines are lines that are the same distance apart throughout their length and so they never intersect (touch each other). This sheet requires the use of a compass and a set square to create parallel and perpendicular lines.

Column 1 - Perpendicular from a point on a line - Set Square

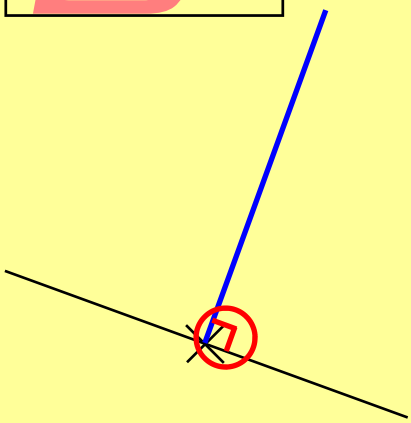
1 Place the set square on the line with its corner on the point.



2 Draw the line along the edge of the set square.

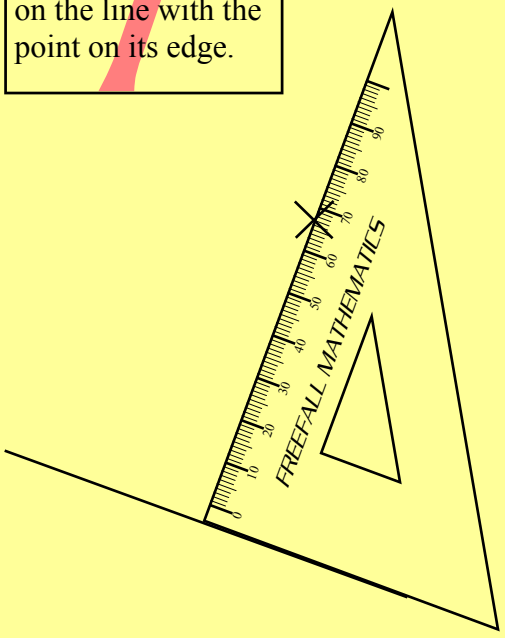


3 Place right angle markings to show it is a perpendicular.

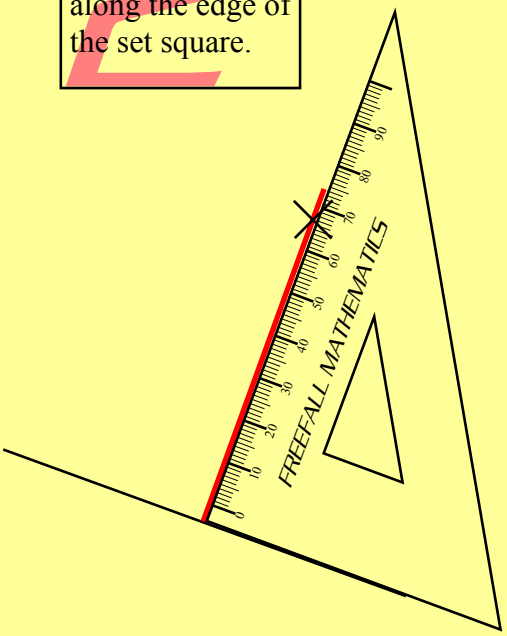


Column 1 - Perpendicular from a point away from a line - Set Square

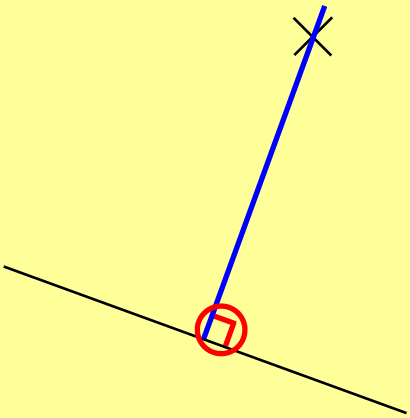
1 Place the set square on the line with the point on its edge.



2 Draw the line along the edge of the set square.

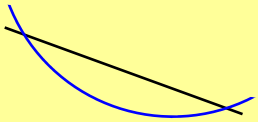


3 Place right angle markings to show it is a perpendicular.

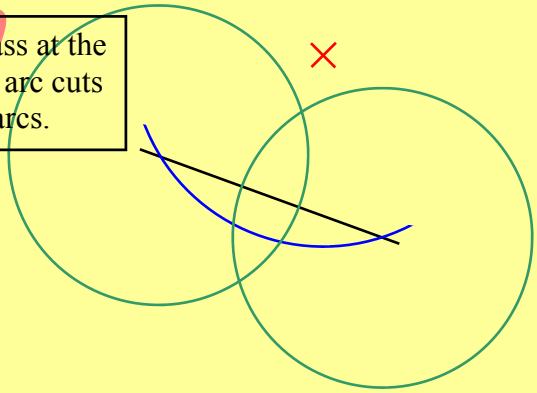


Column 2 - Perpendicular from a point away from on a line - Compass

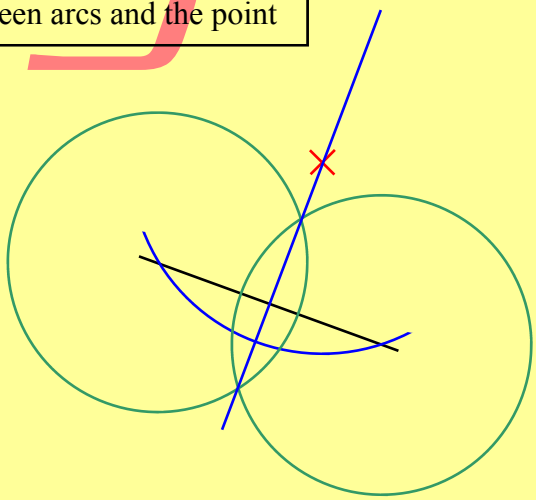
1 Position the compass in the point and draw an arc that cuts the interval in two places



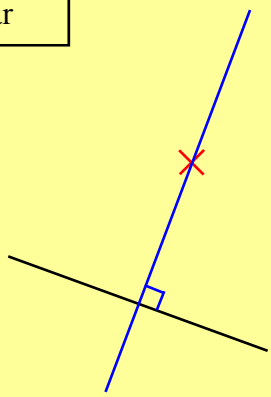
2 Then place the compass at the points where the blue arc cuts the interval, create 2 arcs.



3 Draw a line through the intersection points of the green arcs and the point



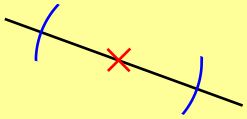
4 Place right angle markings to show it is a perpendicular



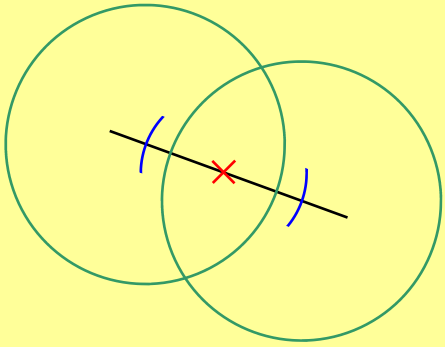
5 Green arcs and blue arcs don't have to be the same size

Column 2 - Perpendicular from a point away from on a line - Compass

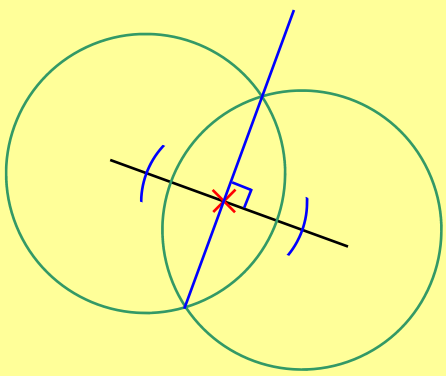
1 Position the compass at the point and draw an arc cutting the interval each side of the point (blue).



2 Position the compass where the blue arcs cut the interval and draw 2 arcs as shown, (green circles).



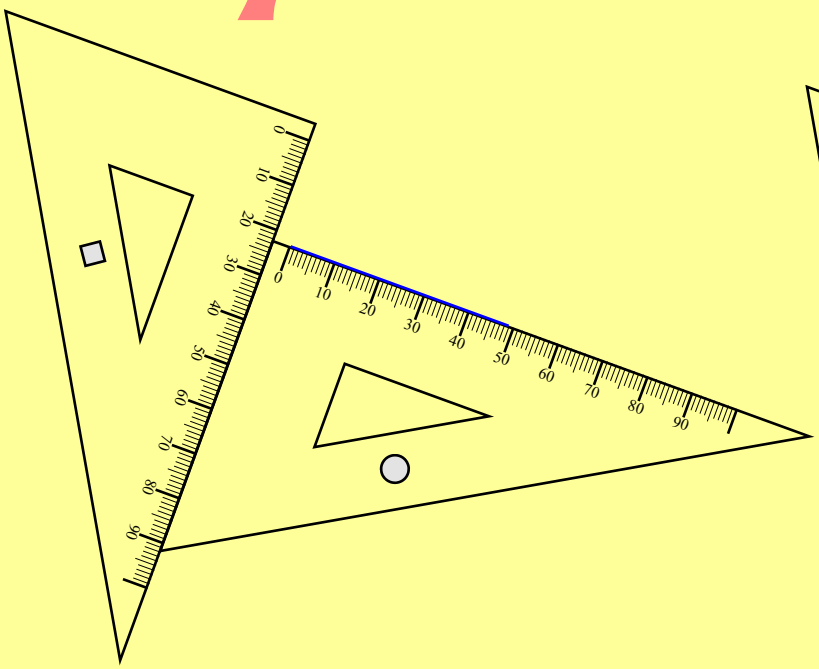
3 Draw a line through the two intersection points and the original point. Add a right angle symbol to complete.



Column 3 - Drawing a Parallel line - Set Square

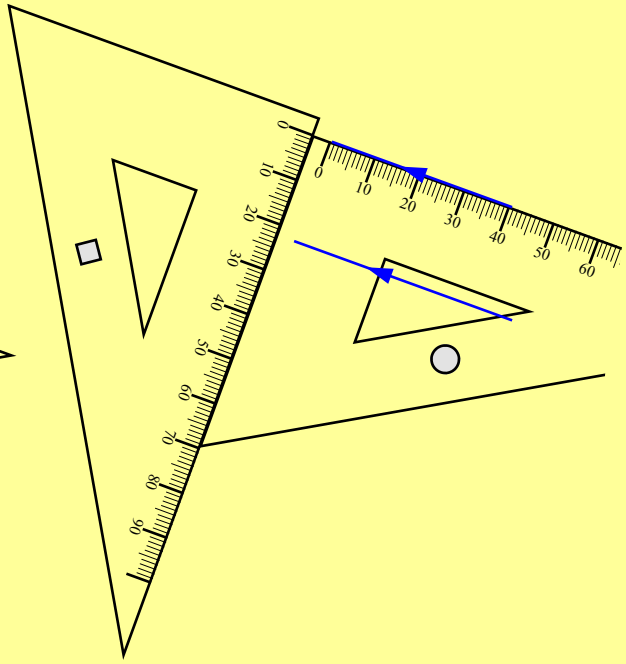
1

Position the set square marked with a circle on the line. Place another set square (square) or ruler on its edge, slide it to the required length (2.2 cm).



2

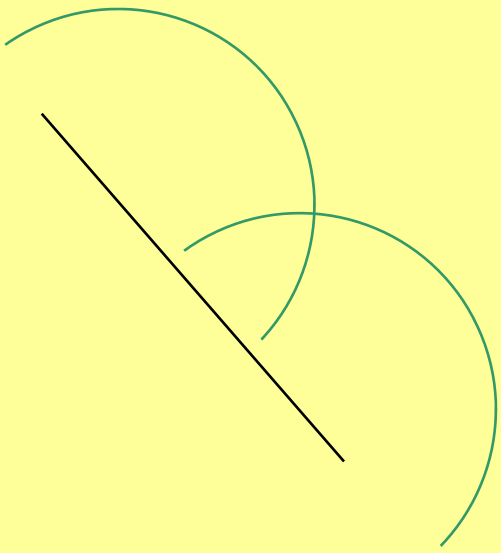
Slide the set square (circle) up to the zero then draw your line. To show the lines are parallel draw an arrow-head on each line.



Column 3 - Drawing a Parallel line - Compass

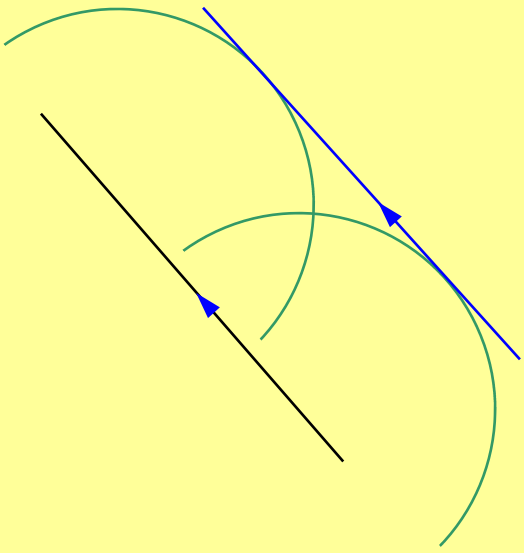
1

Open your compass the required distance and draw two arcs from any position on the interval.



2

Draw a line across the edges of the circles. Place arrow heads on the lines to show they are parallel.



Perpendicular and Parallel Lines

Geometry - Spider's Web

This sheet is a line drawing exercise which will make a spider's web. Join the numbers that add up to 8, in branches that face each other, 1 and 7, 2 and 6 and so on. If you prefer to have no numbers on your worksheet, the second worksheet has the numbers removed.

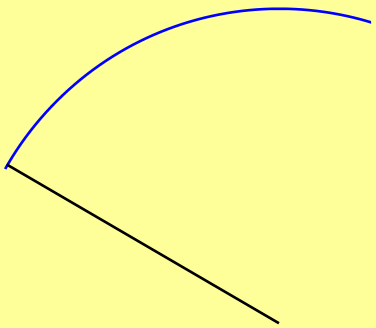
Equilateral and Scalene Triangles

Equilateral triangles are triangles with all sides equal and all interior angles equal (all 60º). This sheet is about constructing equilateral triangles with a compass (and a ruler). This is best described in steps, follow the steps outlined below.

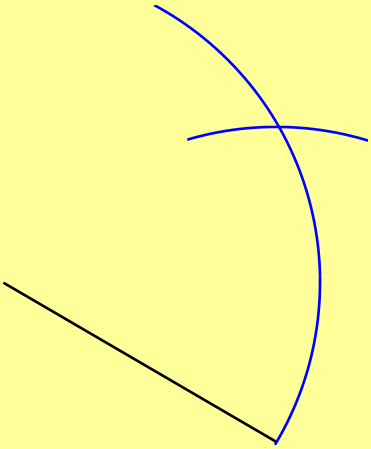
Scalene triangles have no equal sides. Follow the steps on the next page for constructing these triangles. Note that when a scalene triangle has an interior angle that is 90°, it isn't a scalene triangle it is a right (angled) triangle.

Column 1 - Constructing Equilateral Triangles - Compass

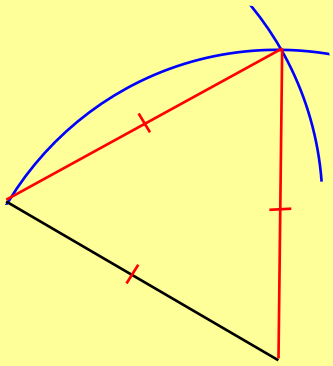
1 Position the compass at the end of the interval and open it to the interval length and draw an arc.



2 Repeat for the other end of the interval to create a point of intersection.

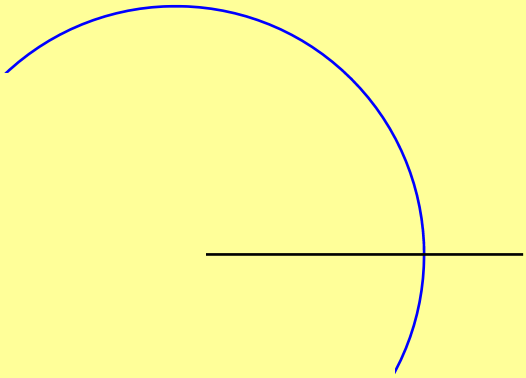


3 Draw a line from the end of the interval to the intersection point and then repeat for the other end of the interval. Mark the sides to show sides are all equal.

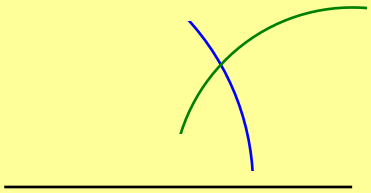


Column 2 - For the second part of the column rule a line first then repeat the above steps.

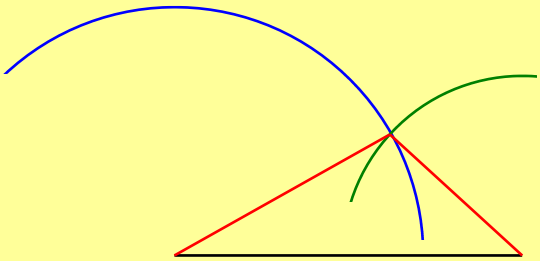
Column 2 - Constructing Scalene Triangles - Compass



1 Position the compass at the end of the interval and open it to the given length and draw an arc.



2 Repeat for the other end of the interval to create a point of intersection.



3 Draw a line from the end of the interval to the intersection point and then repeat for the other end of the interval.

Column 2 - For the second part of the column rule a line first then repeat the above steps. Rule the longest line first, then use your compass to create the other two lines.

Equilateral and Scalene Triangles

16 3.8 cm, 2.9 cm and 4.1 cm

Creating Isosceles and Side-Angle-Side Triangles

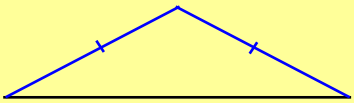
Column 1 - Constructing Isosceles Triangles - Compass

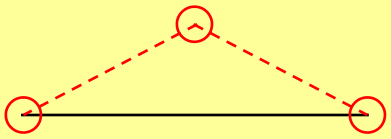
1 Open your compass to the given length then position the compass at the end of the line and draw an arc.

2 Repeat for the other end of the line to create a point of intersection. Note that the second line may not be the same length as the first.

3 Using a ruler, draw lines from the intersection point to the ends of the line.

4 Label the two sides of equal length with dashes.





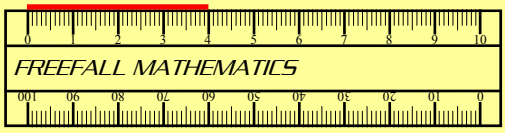
Questions 7 & 8 - Rule a line first then repeat the above steps. Rule the longest line first, then use your compass to construct the other two lines.

Creating Isosceles and Side-Angle-Side Triangles

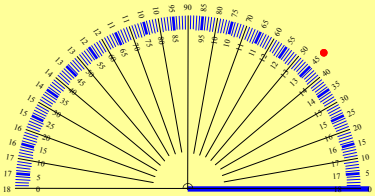
Column 2 - Constructing Triangles - Protractor & Ruler

Example:
4 cm, 3 cm
& 45° angle

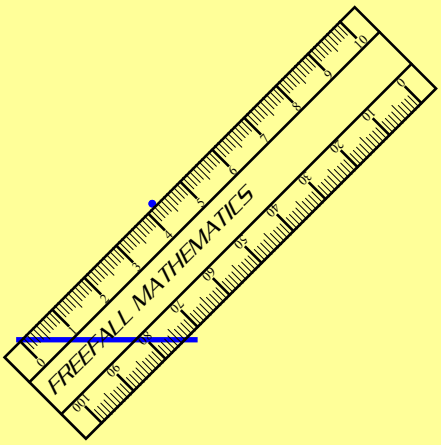
1 Draw the line of longest line first, the 4 cm line in our example.



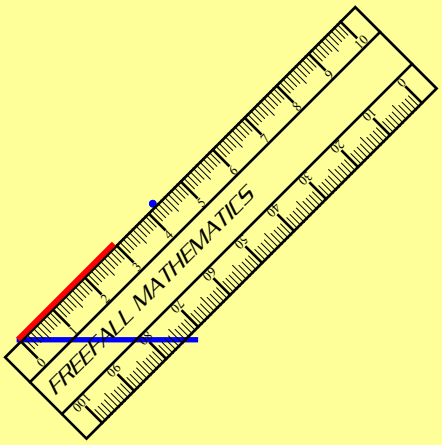
2 Place a protractor at the end of the line and plot a point at the given angle. In our example it is 45º.



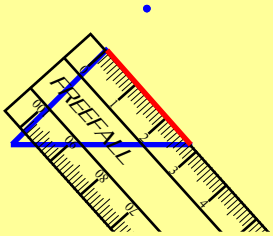
3 Remove the protractor and place a ruler with the zero at the end of the line and the point on the ruler's edge.



4 Rule the other line given in the question. It doesn't have to pass through the point.



5 Complete the final side by using a ruler between the two points



Making Isosceles and Side Angle Side Triangles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Make an isosceles triangle, one side is already drawn for you. Use the two other measurements to complete it.

12 7.1 cm, 6.3 cm, 38º

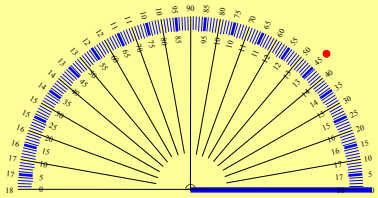
Angle-Angle-Side Triangles and Properties

A triangle can be constructed when you are given two angles and a side. This sheet requires a protractor and a ruler. The steps are below:

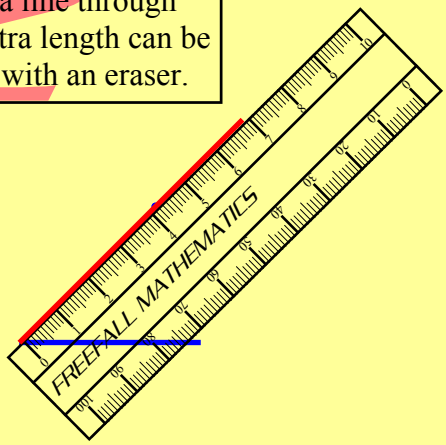
Column 1 - Constructing AAS Triangles - Protractor & Ruler

Example: 45º and 60º Base Angles

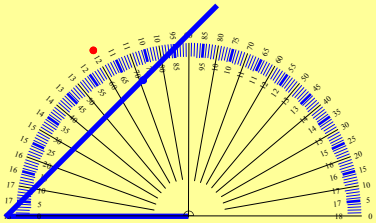
1 Using your protractor place it at one end of the line and measure the first angle. Plot a dot at the first angle.



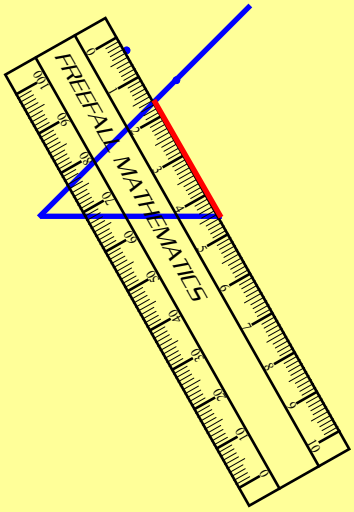
2 Place a ruler at the end of the line and draw a line through the dot, the extra length can be removed later with an eraser.



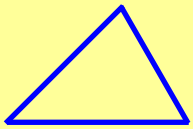
3 Repeat for the other end of the line.



4 Use a ruler to draw the final side. Stop when the line intersects the other side.



5 Erase the extended side length. All done!



Column 2 - Q.8 - Q.11.

Use the same method as above after first ruling the line.

The second part of the sheet aims to outline the relationship between the largest angle of a triangle and the triangle's longest side. Name the longest side and largest angle and in Q.15 explain how the angle and side are always located on a triangle.

Angle-Angle-Side Triangles and Properties

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use a protractor and a ruler to create triangles with base internal angles as given below

1 40º & 50º

2 23º & 55º

3 70º & 80º

4 52º & 47º

5 15º & 38º

6 117º & 29º

7 60º & 60º

This time draw the given side then use the same method. Be careful where you choose to place the line.

8 2.5 cm, 30º, 40º

9 3.7 cm, 22º, 47º

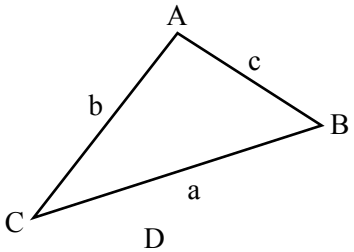
10 4.4 cm, 53º, 35º

11 1.7 cm, 75º, 75º

Name the largest angle and the largest side in these triangles

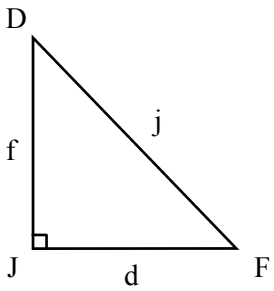
12 Side : ____

Angle : ∠ _____



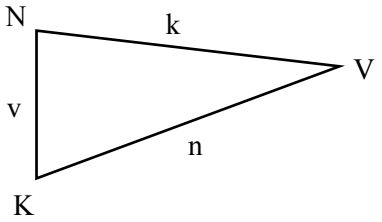
13 Side : ____

Angle : ∠ _____



14 Side : ____

Angle : ∠ _____



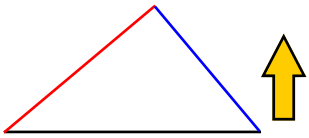
15 What is the relationship between the largest angle and the longest side? _____

Angle-Angle-Side Triangles and Properties

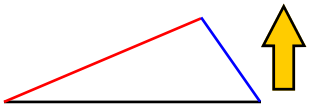
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use a protractor and a ruler to create triangles with base internal angles as given below

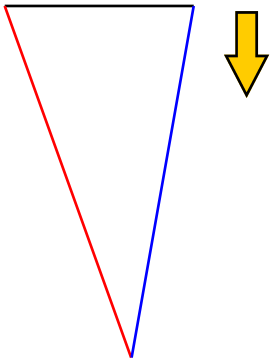
1 40º & 50º



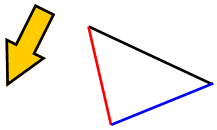
2 23º & 55º



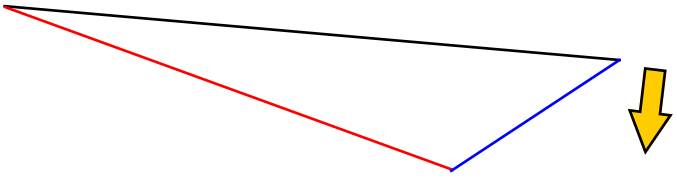
3 70º & 80º



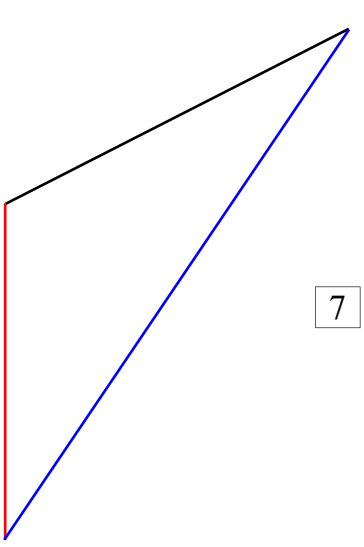
4 52º & 47º



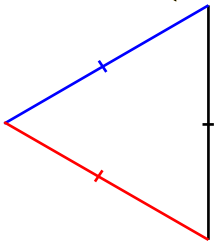
5 15º & 38º



6 117º & 29º



7 60º & 60º



This time draw the given side then use the same method. Be careful where you choose to place the line.

8 2.5 cm, 30º, 40º

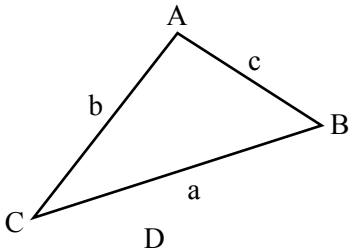
Name the largest angle and the largest side in these triangles

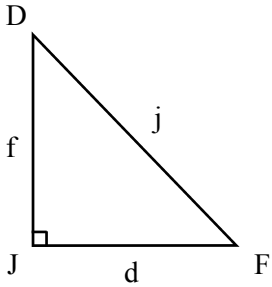
12 Side : a

Angle : ∠ BAC



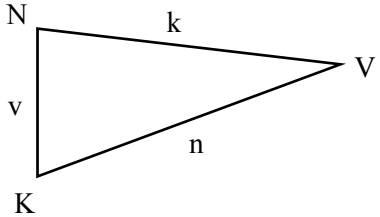
13 Side : j

Angle : ∠ DJF



14 Side : n

Angle : ∠ VNK



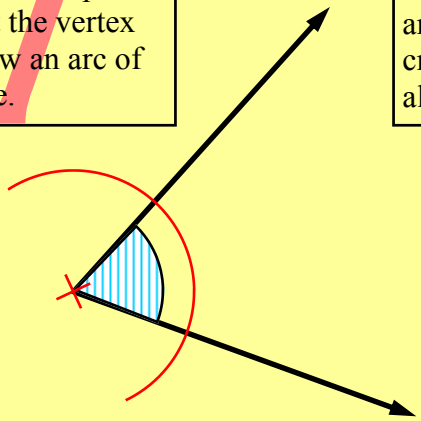
15 What is the relationship between the largest angle and the longest side? They are always opposite each other.

Bisecting Angles and Making 45° Angles

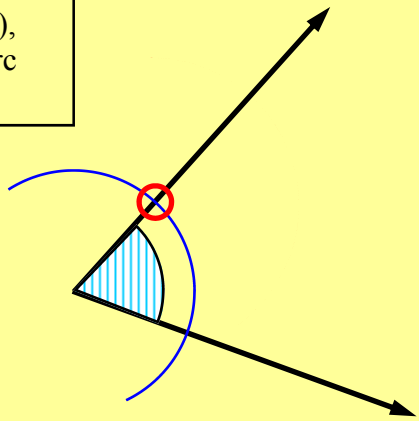
This sheet is about bisecting an angle, this means cutting the angle in half. The second part of the sheet is about creating 45° angles using a compass and a ruler. When you make a 45° angle you are also making a 135° angle, it's the angle's supplement, it will be the adjacent obtuse angle beside the 45° angle.

Column 1 - Bisecting Angles - Protractor & Ruler

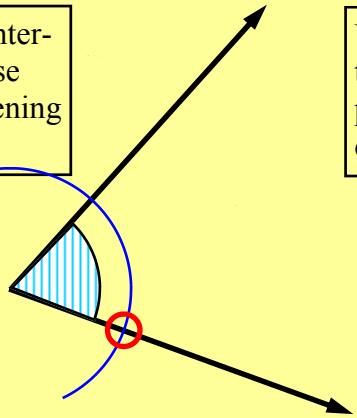
1 Place the compass point at the vertex and draw an arc of any size.



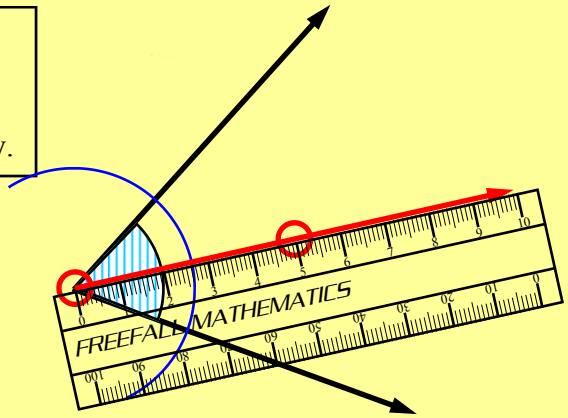
2 Using the intersection of the arc and the ray (red circle), create another arc. This arc also can be of any size.



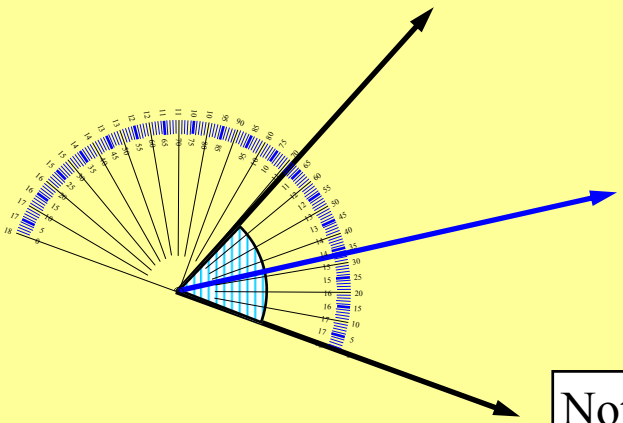
3 Repeat for the other intersection point (red). Use the same compass opening as the previous arc.



4 Using the vertex and the arc intersection point (red circles), draw the bisecting ray.



5 Use a protractor to measure the size of the bisection and original angle to check that your method is correct.



Note Q.4 is a reflex angle so a working space is provided.

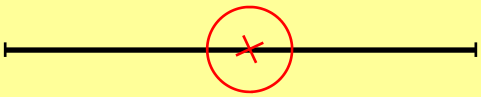
Bisecting Angles and Making 45° Angles

A 45º angle can be constructed by first making a 90º angle and bisecting it. So a right angle is created, then the same process from the previous column is repeated.

Column 2 - Constructing 45º Angles - Compass & Ruler

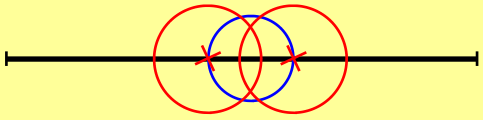
1

Using a compass draw a circle near the centre of the interval.



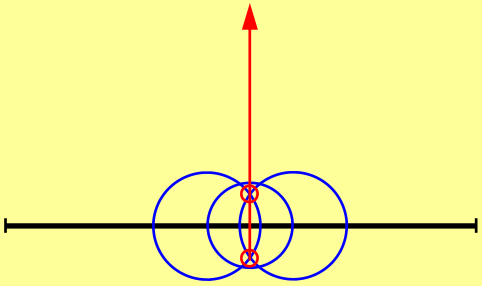
2

Using the intersection points, create two more circles (or arcs).



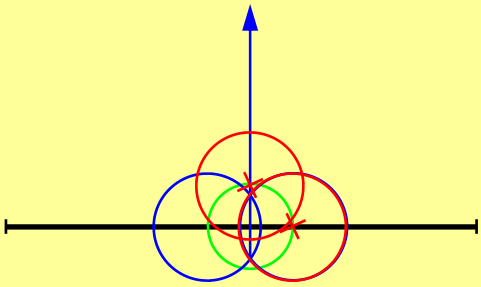
3

Use the intersection points created by the two circles (red), draw a perpendicular line. This is a 90º angle.



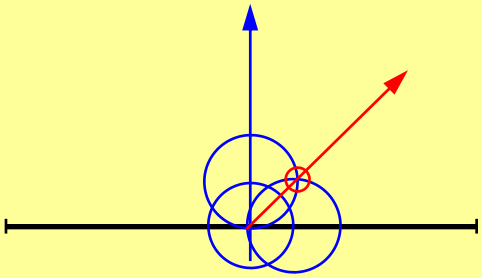
4

The first circle (green) intersects the perpendicular and the interval. Using these point create two arcs or circles (red circles).



5

Draw a line through the vertex and intersection point (red circle) and its done!



6

Check your work with a protractor.

Constructing 60° and 30° Angles

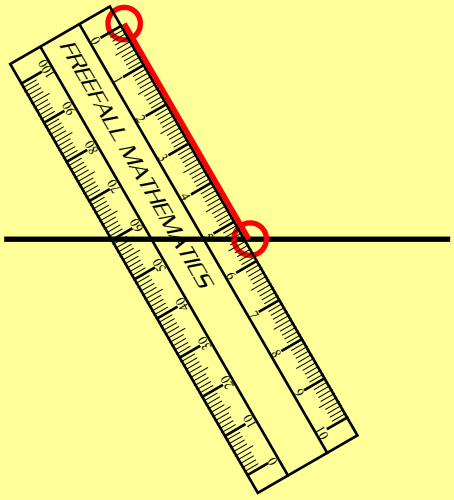
This sheet is about constructing a 60° angle and a 30° angle (a bisected 60° angle), to complete this sheet you require a compass and a ruler. One important thing to remember is that if you make a 60° angle you are also making a 120° angle, it's the supplementary angle. It will be the adjacent obtuse angle beside the 60° angle. Likewise when you make a 30° angle the adjacent obtuse angle will be 150°.

Column 1 - Constructing 60º & 120º Angles - Compass & Ruler

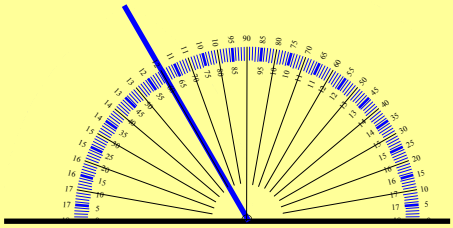
1 Place the compass at the end of the interval, open to any size and draw an arc.

2 Using the intersection of the arc and the interval (red circle), keep the compass at the same opening and draw another arc.

3 Use a ruler to connect the two intersection points (red circles).



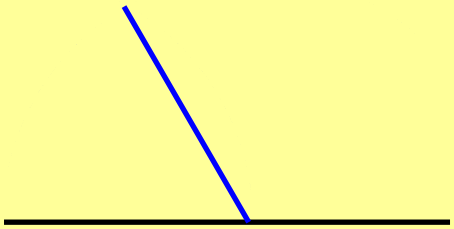
4 Check your work with a protractor.



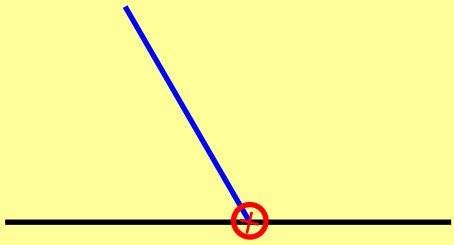
Constructing 60° and 30° Angles

Column 2 - Constructing 30º & 150º Angles - Compass & Ruler

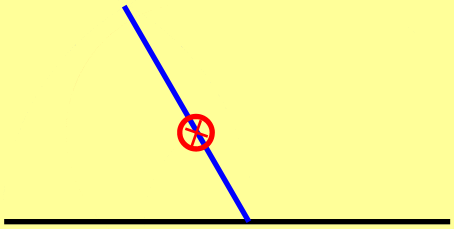
1 Create a 60º angle as outlined on the previous page. A 30º angle is made by bisecting a 60º angle.



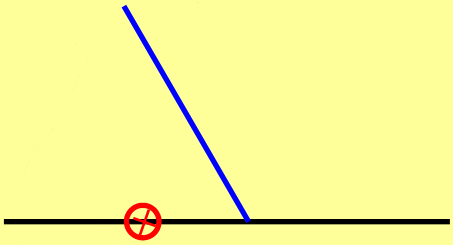
2 Draw an arc from the vertex of the angle (red circle) of any length.



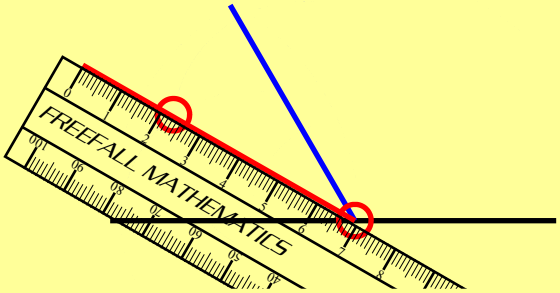
3 Draw an arc from one intersection point (red circle).



4 Then repeat for the other intersection point (red circle). Keep the compass at the same opening.



5 Use a ruler to connect the intersection point and the vertex (red circles). All done!



6 Using a protractor, check your work.

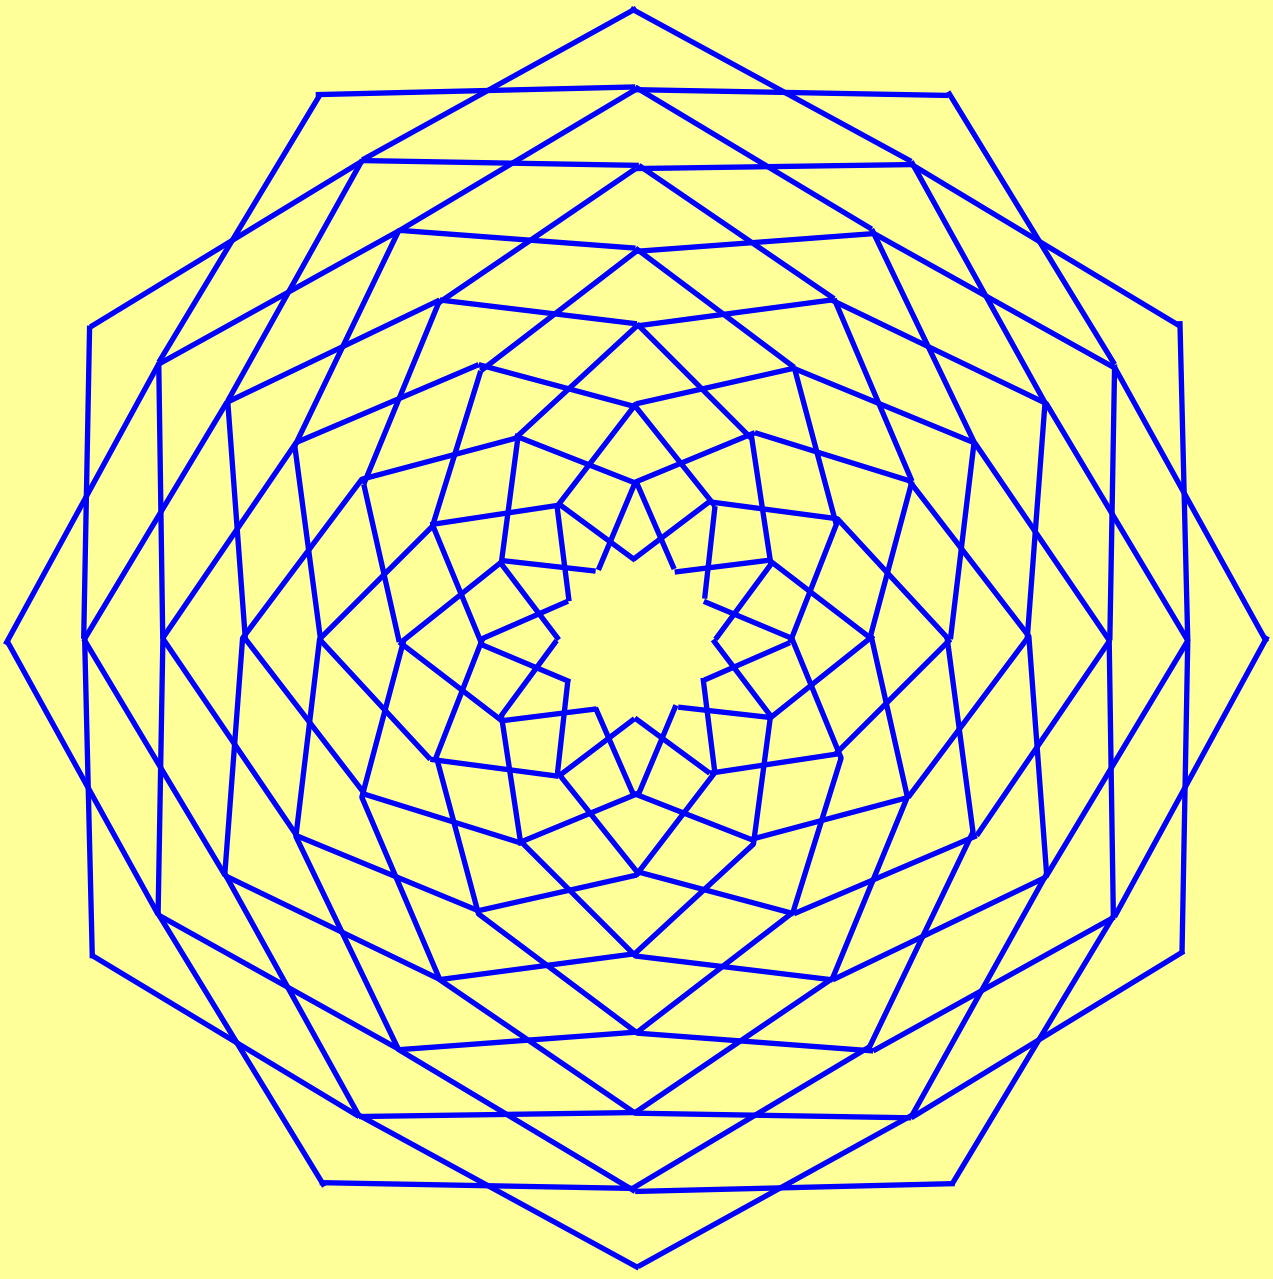
Flower Design

This is a simple design that creates a flower-like effect. Draw lines starting at the smallest circle then moving to the next circle and one position clockwise. Complete all the way to the outside circle then repeat starting from the next position on the inside circle, and so on.

After you have a full revolution you repeat the process only you move anti-clockwise instead. There are two worksheets, the first has one completed clockwise step and a completed anti-clockwise step. The second sheet is completely blank if you don't need the help.

A image of the completed flower is below.



Flower Design

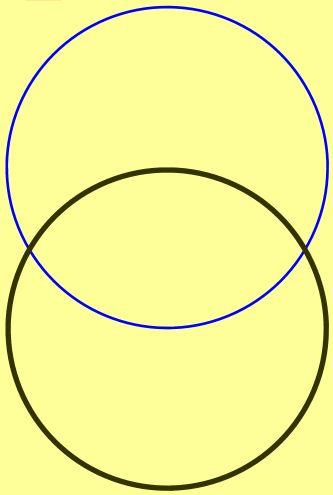
Making a Hexagon

This sheet involves constructing a hexagon using a compass and ruler, if printing this sheet use the dot in the middle of the circle to open your compass to the required radius or use a ruler and open your compass to 7 cm.

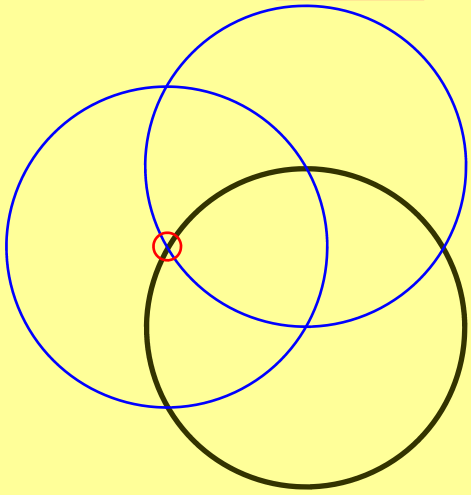
1

Position your compass at any position on the circumference and draw a circle.



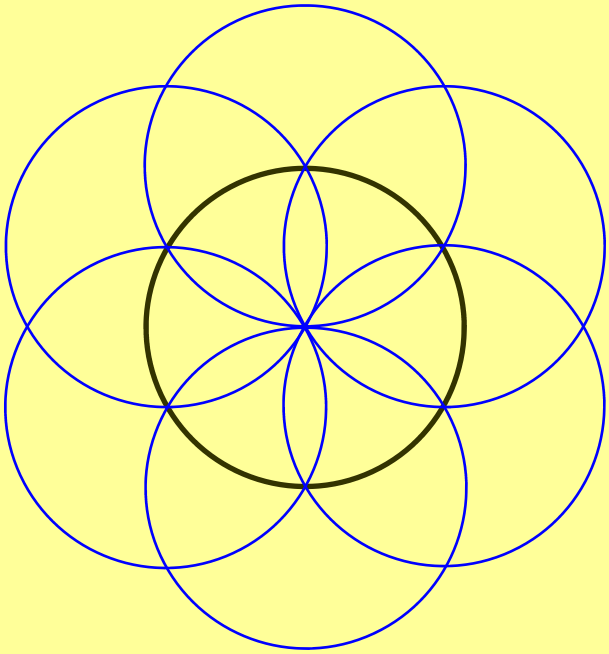
2

Place the compass at one of the points where the blue circle intersects the first circle and create another circle.



3

Repeat until six circles are completed



4

Join all intersection points to complete a hexagon (yellow).

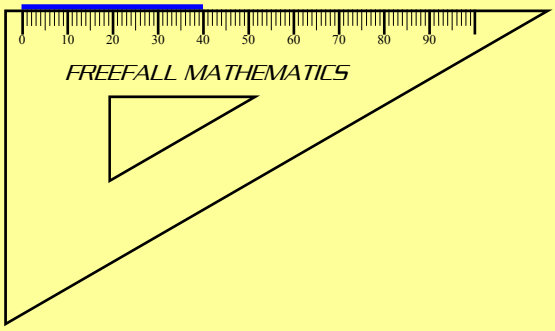
Drawing Quadrilaterals

This sheet involves the construction of four different plane (2-D) shapes. These are squares, rectangles, rhombi (plural of rhombus) and parallelograms.

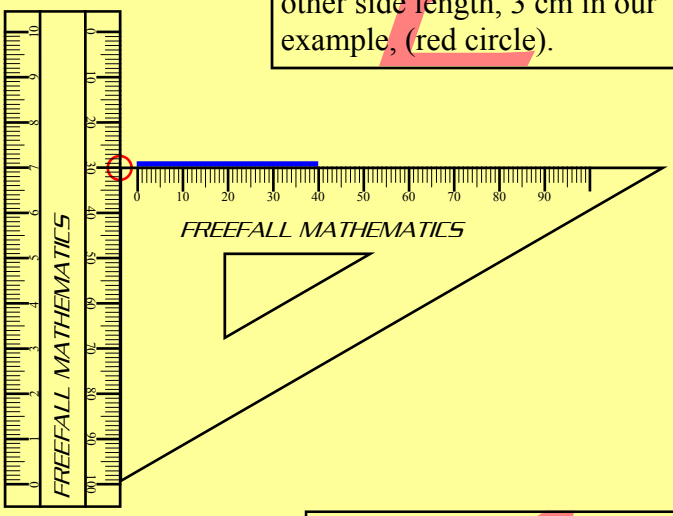
Column 1 - Constructing Squares & Rectangles - Set Square & Ruler

Example:
4 cm × 3 cm
Rectangle

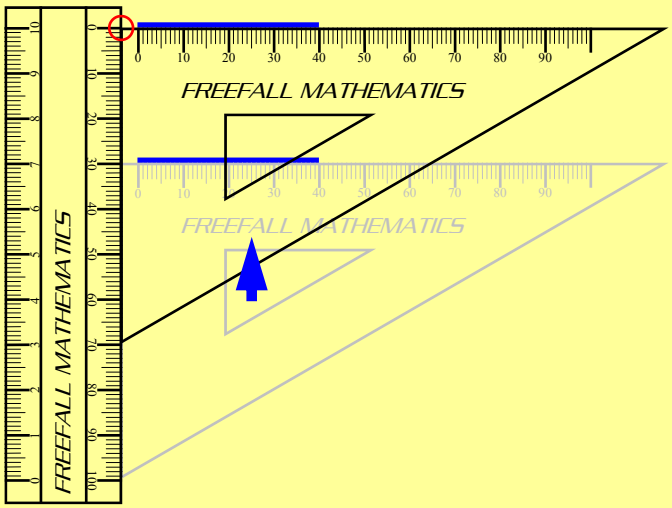
1 Using your set square draw a line the required length. In our example, 4 cm in length.



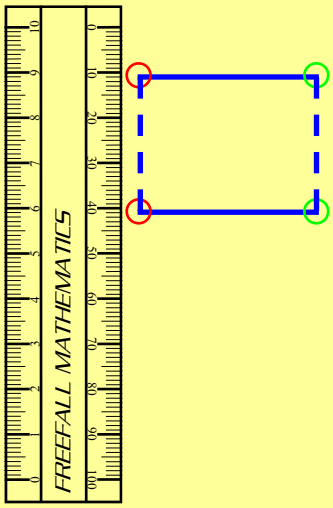
2 Place a ruler on the set square's edge so that the corner is at the other side length, 3 cm in our example, (red circle).

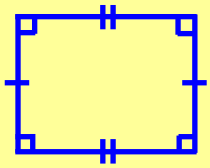


3 Slide the set square along the ruler edge until its corner is at zero, (red circle). Then draw the same length line as previously drawn, 4 cm in our example



4 Use a ruler to draw the remaining two sides. In our example they are 3 cm.





5 Place right angle markings in each corner and mark the opposite equal sides with dashes. All done!

Drawing Quadrilaterals

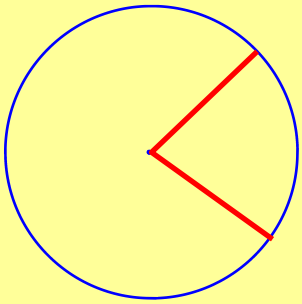
Column 2 - Constructing a Rhombus - Compass & Ruler

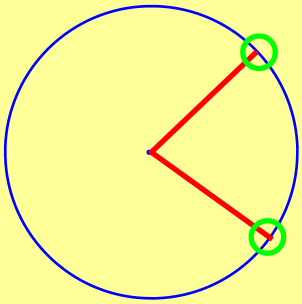
Example:
4 cm Rhombus

1 Draw a point where you wish to start.

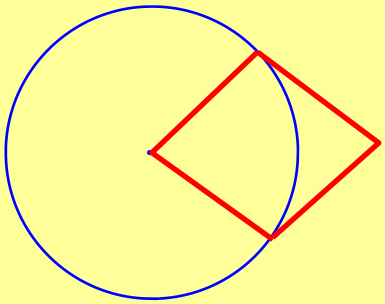
2 Open your compass to the side length (4 cm in our example) and draw a circle. Then draw 2 lines from the centre to the circumference, at any angle you like.

3 Using the compass open at the same length, draw 2 arcs from the intersection points shown below in green.

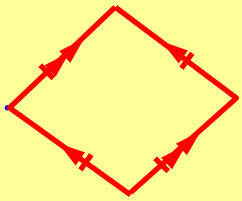




4 Use your ruler to complete the rhombus.



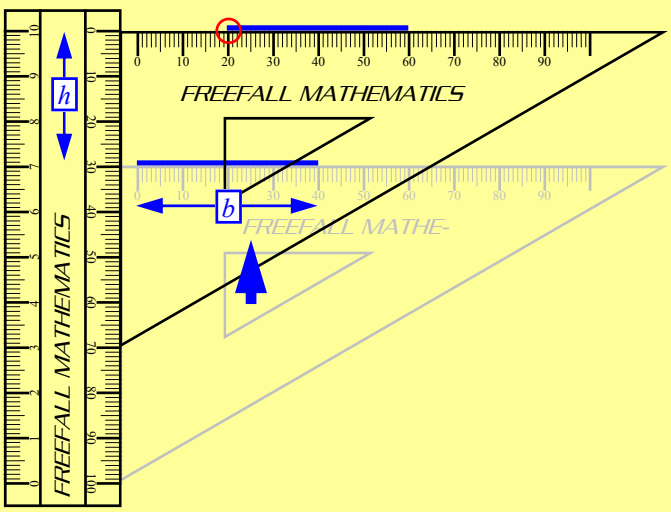
5 Show the parallel sides with arrows. Label all the equal sides with dashes.

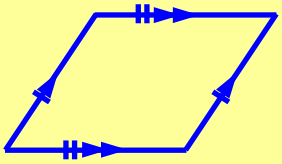


Column 2 - Constructing a Parallelogram - Set Square & Ruler

1 Start by using the same method as with the construction of a square or rectangle. When drawing the second line, instead of starting from zero start from another number, in the example below 2 cm was chosen.

2 Complete the sides and place arrows on parallel sides. You should also put dashes on the sides to show that they are the same length, that way a rhombus isn't confused with a parallelogram.





Drawing Quadrilaterals

16 $h = 1.8$ cm, $b = 3.2$ cm

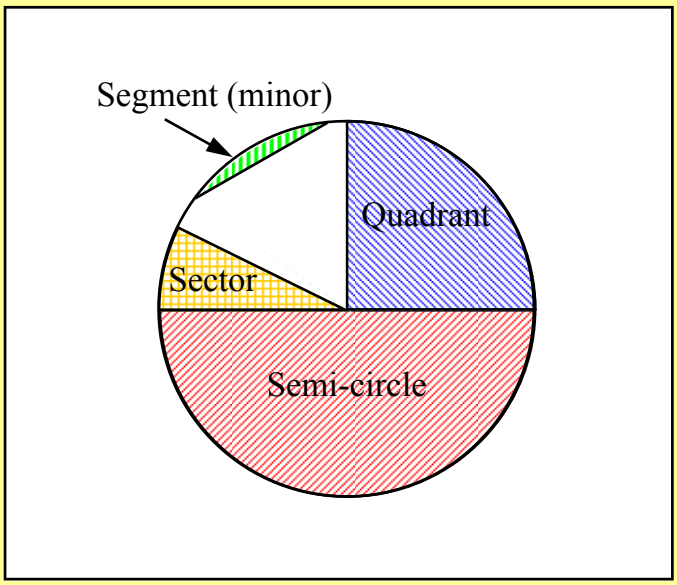
The Circle

This sheet deals with naming parts of a circle, these are areas of circles created by particular lines and also the lines themselves.

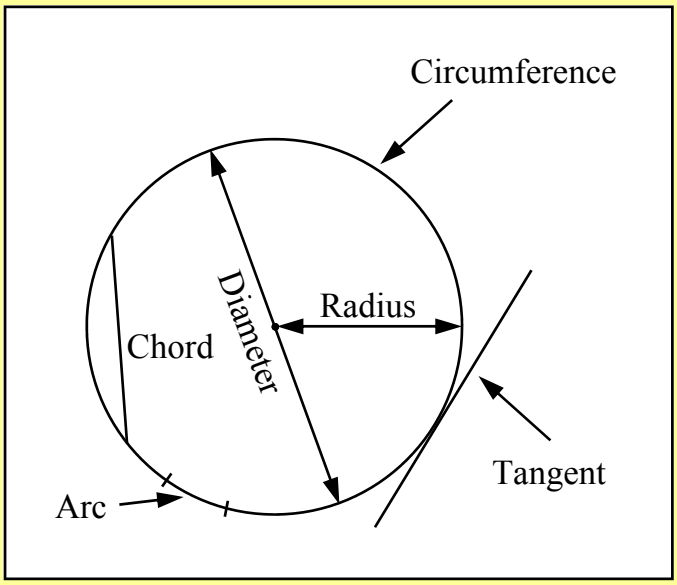
The sheet has 2 columns with diagrams at the top of each. In the spaces provided, name the parts of the circle that are being pointed to.

The questions below the diagrams all refer to the parts that have just been named, so look at the diagrams below if you need help. A word you may not be familiar with is radii - this is the plural of radius (so 1 radius, 2 radii). Also segments may be named minor segments when they are smaller than a semi-circle and major segments when they are larger than a semi-circle. Though for this sheet the word 'segment' alone is adequate, ask your teacher if minor/major is also required.

Column 1 - Circle Areas



Column 2 - Circle Lengths



The Circle

ALTITUDE

GRAPHS & TABLES

Picture Graphs

Picture graphs are similar to bar graphs, the data is displayed by pictures or symbols of an item. Graphs usually have an axis to read off the value, Picture graphs don't require this scale as each picture of an item represents a specified number of items. Picture graphs are as accurate as their scale allows, but they are used mainly for quick reference rather than an exact display of data.

Column 1 of this sheet has the graphs drawn for you, you are asked to read the graph and answer the questions. Note the 'key' or 'scale', this tells you the value of each symbol. To increase accuracy, portions of a symbol can be used.

The computer in the first column is either: fully drawn, ¾ drawn, ½ drawn or ¼ drawn. If a fully drawn computer represents 20 computers then part drawn computers equal that fraction of 20.

Graph 2 is a representation of a Café's sales of fresh juices. This time each symbol represents 200 glasses of juice. Note that again the same fractions ¼, ½ and ¾ are used. Questions 6 and 7 are about rounding. While 2 symbols may represent 400 glasses, those same 2 symbols could also represent 390 glasses. Some students will have difficulty with this concept.

Column 2 asks you to construct graphs from data in the tables. The data can be constructed exactly by adding whole and part pieces of a symbol, you don't need to worry about rounding.

Remember that fractions of a picture are always on the end (right hand side) and there can only be one in each line. Don't use several fractions of a symbol, the purpose of a picture graph is that they are easy and quick to read, not confusing!

Picture Graphs

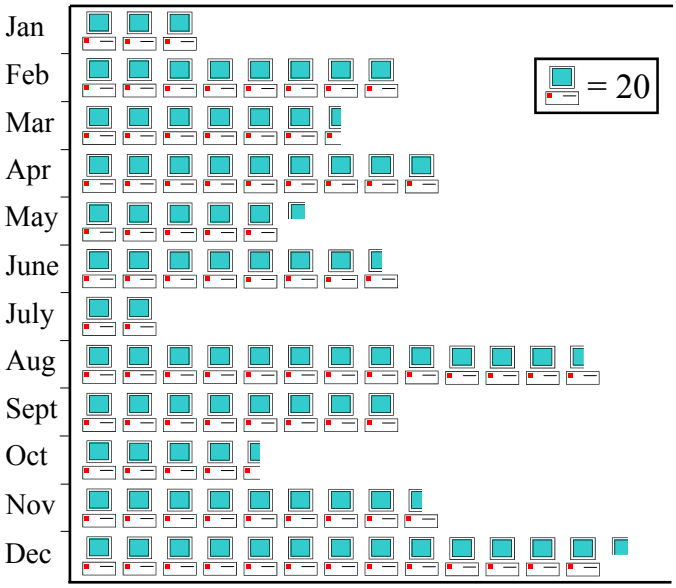
Study the graphs then answer the questions

Graph 1 : Computer Sales in 2002



1 Give the values represented by these symbols:

= ___ = ___ = ___ = ___

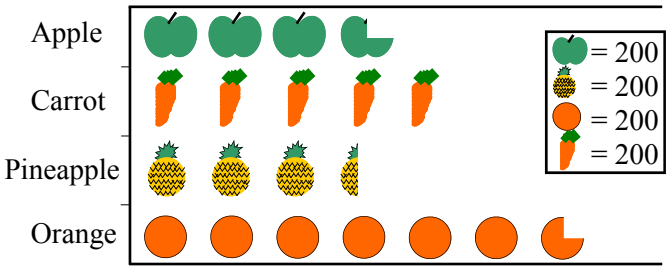
2 Name the months with the same sales figures and give the number of sales _____

3 Give the lowest sales month & sales _____

4 Give the highest sales month & sales figure, give a reason why this month could have the most sales.

_____

Graph 2 : Average Monthly Juice Sales (glass)



5 Name and give sales figures for the:

a) least popular juice _____

b) most popular juice _____

6 Actual sales figures for carrot juice could range from 975 - 1 024 glasses. Briefly explain why.

_____

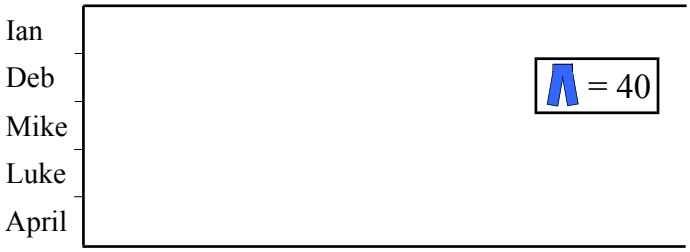
7 Give the largest and smallest possible sales figures for pineapple juice _____

Now place the details in the table on the graph

Table 1 : Jeans Shop Sales Assistant Figures

Name	Ian	Deb	Mike	Luke	April
Sales	240	80	140	170	150

Graph 3 : Jeans Shop Sales Assistant Figures



8 Give the values represented by these symbols:

= ___ = ___ = ___ = ___

Table 2 : Students Using Bus Transport

School Name	Student Numbers

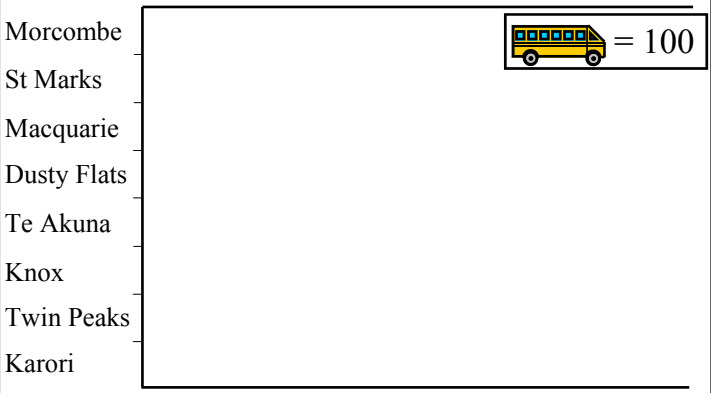
Graph 4 : Students Using Bus Transport



9 Give the values represented by these symbols:

= 25 = 50 = 75 = 125

Column Graphs

Column graphs show data with columns which are read off a vertical scale, with the horizontal axis giving the meaning of the column. This sheet has two columns, the first being reading graphs and the second being constructing graphs (from reading a table).

Column 1 starts with a column graph on the fundraising activity of a charity. It outlines the different methods of fundraising along its horizontal axis and their financial success on the vertical axis. This graph can be read to the nearest $5 000.

The second graph is about the conversion of a chicken battery farm to a free range farm. This time there are two columns for each category. The free range egg figure and the battery laid figure. Note also that the columns are rectangular prisms, these give the graph a different appearance, but be careful when reading the columns. Read the columns off the top edge that is 'closer' to you, not the edge at the back of the column. In other words, use the front face of the prism for measurement.

Column 2 starts with a question about dice. When you roll 2 dice you have 36 different combinations of the two faces of each die. The first table is just like a 6 by 6 addition table, just add the two numbers. Then count how many of each number there are for the next table. Note both tables have been started for you. Then graph the result. Note that the first column is already done for you.

Question 6 involves a survey of traffic, it requires you to read the data straight from the table and place it on the graph.

Note the use of the word frequency, frequency means the number of times something occurs.

Column Graphs

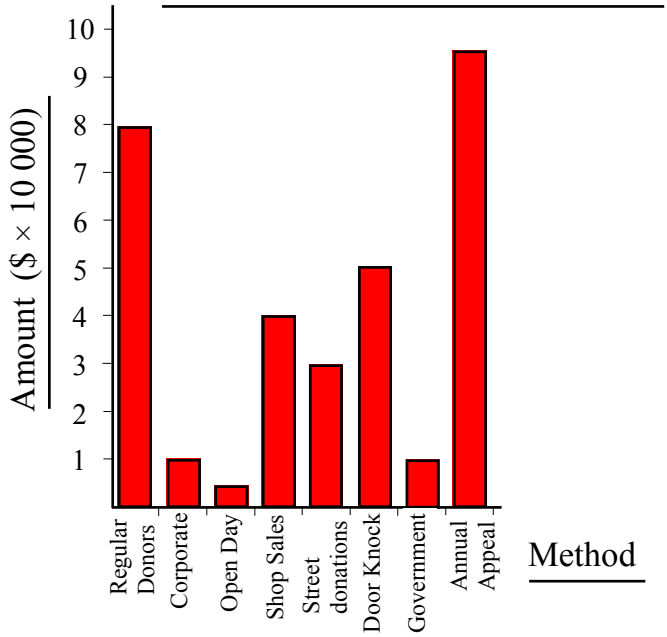
Study the column graphs below then answer the questions

Graph 1 : Fundraising by a Charity



1 Give amount raised by: *a*) Door Knock _____

b) Regular Donors _____ *c*) Shop Sales _____

2 Which method of fundraising:

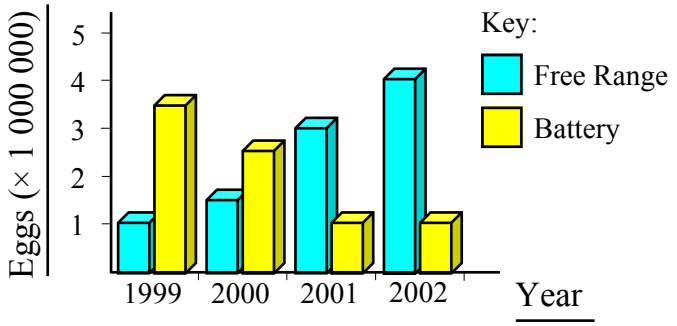
a) is the third most successful _____

b) matches Government donations _____

c) more than triples the street donations _____

d) made $5 000 _____

Graph 2 : Ingall's Hen Farm Egg Production



3 Give the total number of eggs for: *a*) 1999 _____

b) 2000 _____ *c*) 2001 _____

4 Give the year that free range production was:

a) 1 000 000 eggs less then battery laid eggs _____

b) increased and battery laid was unchanged _____

c) three times more than battery laid eggs _____

d) increased by 1 500 000 eggs _____

Complete the tables for the totals possible for 2 dice, then graph them.

5

Graph 4 : Vehicle Survey

Bar Graphs

Bar graphs display data in the same way as column graphs except the graph is on its side. These graphs all have:

- A title which describes the purpose of the graph
- Axes headings, these describe the scale on each axis
- Scales, these let you to read or construct the bars with reasonably accuracy

Column 1 asks you to extract information from constructed graphs. Both graphs have columns that are either exactly on the number or half way between two numbers on the horizontal scale. The first graph deals with Blue Whale population, Questions 1 and 2 ask you to read figures off the graph, question 3 asks you to write the years that correspond to the change in population.

The second graph refers to the way a student may spend their day. This graph uses ½ hours so write either 0.5 h or ½ h.

The second column asks you to create bar graphs. Write the title, axes headings and complete the scale which has been started for you. Then construct the bars.

Bar Graphs

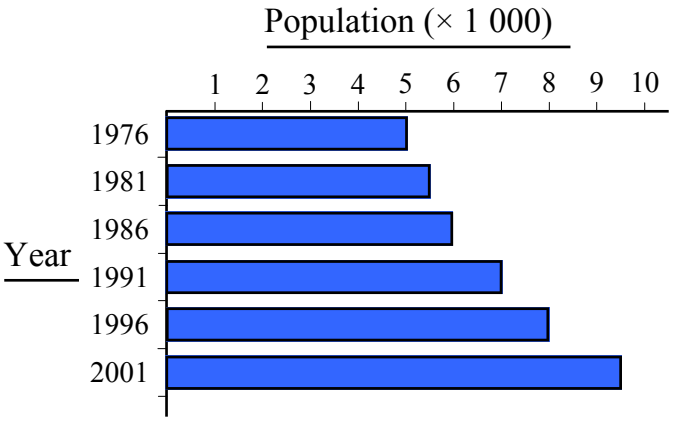
Answer these questions on the use of bar graphs

Graph 1 : Blue Whale Population Estimation



1 Give the estimated number of blue whales in:

a) 1976 _____ *b*) 1986 _____ *c*) 1996 _____

2 Give the increase in whale numbers between

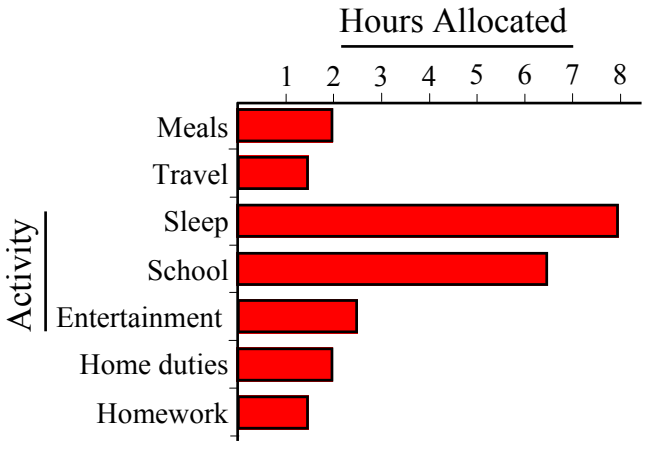
a) 1976 - 1991 _____ *b*) 1981 - 2001 _____

3 Between which years is there a population increase of:

a) 500 _____ *b*) 1 500 _____

c) 3 000 _____ *d*) 4 000 _____

Graph 2 : Analysis of a School Day



4 Give the number of hours spent: *a*) Sleeping ____

b) Eating ____ *c*) At school ____ *d*) Travelling ____

5 Give the difference in time spent on these activities:

a) Entertainment and.. Homework ____ Eating ____

b) Time at School and.. Travel ____ Sleeping ____

c) Home duties and.. School time ____ Travel ____

6 How many hours could the above student be at home each weekday _____

Now put this data on the bar graph below

7 Table 1 : Least Painful Home Duty

Home Duty	Student Approval
Mowing Grass	15%
Washing Dishes	10%
Tidy Bedroom	5%
Washing Car	25%
Meal Preparation	45%

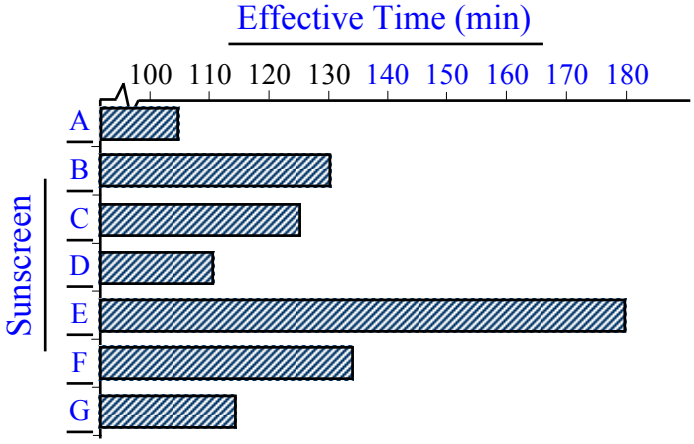
Graph 4 : Timing Sunscreen Protection



Line Graphs

Line graphs show data as a continuous line, this allows for estimations to be made between data. For example if population data is assembled every 5 years by using a line graph you can estimate the population in between those years. You should realise that there are limitations to this, as the population won't change in a straight line, it could rapidly rise and fall between actual readings. Another common use of line graphs is to relate two values against each other. This relationship may be a straight line and so values at any point on the line will be correct.

Column 1 starts with a town's population being graphed. Note the scale on the vertical axis is × 10 000, so 1 = 10 000, 1.4 = 14 000 and so on. You would use a ruler to accurately read off the graph. The second graph involves converting currency, between NZ$ and A$ (or NZD and AUD).

Column 2 questions 5, 6 and 7 refer to the column 1 graph, only you are asked to find one value from the graph and then using your number skills, find other conversions without using the graph. Remember when you multiply by 10 you move the decimal point one place to the right, 100 = 2 places and so on. For division move the decimal point to the left.

Graph 3 compares US$ with both Australian and New Zealand currencies. To convert US$ to A$ use a ruler horizontally (flat) then where the ruler intersects the black line, read off the amount on the bottom scale. To convert to from US$ to NZ$ use the same method but use the red line. Note that you could use this graph to convert between A$ and NZ$, you would go up to the red or black line, then across to other line, then down.

Line Graphs

c) A$0.40 = US$ 0.21 *d*) A$400.40 = US$ 210.21

Composite Graphs

Composite graphs stack different pieces of information together to form the total column (or bar). This method of displaying data allows access to the total as well as the basic parts to form the total.

Column 1 starts with a composite column graph showing a family's phone call history for the past 6 months. The calls are categorised as local calls, national calls, international calls and calls to mobile phones. All columns are rounded to the nearest $10 so that they are easier to read. Note that each part starts where the other stops, so to obtain a value for a specific part read off the amount at its base and subtract that from the amount at its top.

Another way of showing composite graphs is with just a single bar (or column) which is divided up into parts. These are usually to scale so that a ruler can be used to get information. Time lines are commonly in this format. Our graph is a time line about the construction of a hamburger in a fast food outlet. Use a ruler to measure each part and the total of the bar, note that 1 cm = 4 s (seconds). Q 5 shows employees being faster than standard time in certain aspects of burger building, replace the standard time with the new time and then give the reduced total time for the complete build. Q 6 refers to an employee who prefers a better quality of finish and is slower in certain phases of the build.

Column 2 asks you to construct a composite column graph comparing 5 different dentists in the procedure of putting a filling in a tooth. Position columns on top of the first part (the needle injection) which is in place for each column and build them up.

The same method is use for the composite bar graph, note that 1 cm = 10 animals (or 1 mm = 1 animal). You can colour the key the same colour as the blocks and you can write the names on as well.

Composite Graphs

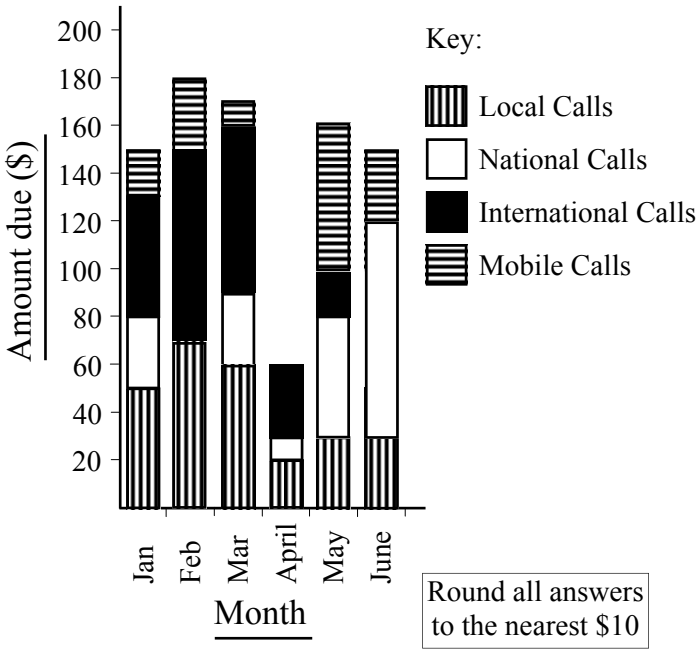
Cats Rabbits

Composite Graphs

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Study the composite graphs then answer the questions

Graph 1 : Forsythe Family Monthly Phone Bill



Round all answers to the nearest $10

1 Give the total amount due in:

a) Jan $150 *b*) Feb $180 *c*) May $160

2 Which month had the lowest number of calls to:

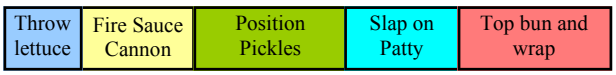
a) Mobile phones April *b*) Local Numbers April

3 Give the amount spent on international calls in:

a) Jan $50 *b*) Feb $80

c) March $70 *d*) April $30

Graph 2 : Standard Times for Building a Burger



1 cm = 4 seconds

4 Give the time taken to:

a) 'Apply' lettuce 4 s *b*) Build burger 32 s

5 If some actions can be done faster, calculate total time

a) Jackie can sauce burgers in 3 s, new total time: 29 s

b) Oscar can place pickles in 2 s, new total time: 26 s

c) Jason cannons the sauce in 5 s: new total time: 31 s

d) Marie slaps on a patty in 4 s, new total time: 30 s

6 Ryan treats burgers as art, find his total time when he takes 16 s to position the pickles and 12 s to apply sauce, all other times are unchanged 46 s

Construct a composite column graph for these dentists

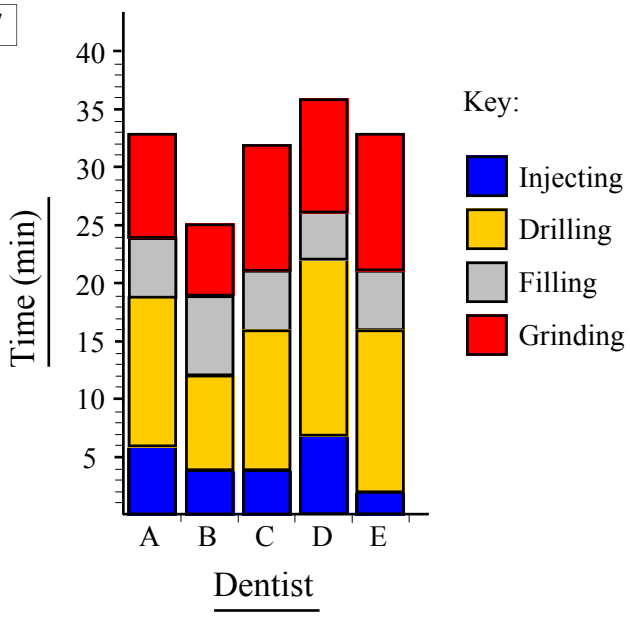
Table 1 : Time Comparison for Filling a Tooth

Action	Dentist A	Dentist B	Dentist C	Dentist D	Dentist E
Injecting	6	4	4	7	2
Drilling	13	8	12	15	14
Filling	5	7	5	4	5
Grinding	9	6	11	10	12

All times above are in min

Graph 3 : Time Comparison for Filling a Tooth

7



Construct a composite bar graph for the details in the table below

Table 2 : Treated Animals for Day

Animal	Dogs	Cats	Birds	Rabbits	Other
Number	16	25	9	7	23

8 Graph 4 : Treated Animals for Day

1 cm = 10 animals

Key:

Dogs Birds Other

Cats Rabbits

Sector Graphs

You may know of them as Pie Graphs, Circle Graphs or Sector Graphs, they are all the same, just different names. Sector graphs display data as portions of a circle, so they are most commonly used with percentages or portions of a whole. At this stage we will deal only with percentages, all of which will have values that are multiples of 5%.

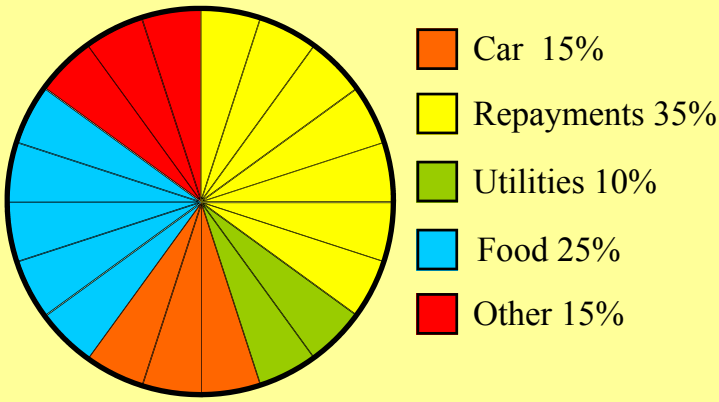
As a circle covers 360º in a revolution, with percentages that means 100% is 360º. So 10% is 36º and so 5% is 18º. Column 1 asks you to give the sector angle for all the multiples of 5%. To do this add 18º to the previous angle and that's your answer. You should be able to check you addition at 50% because it will equal ½ of 360º, which is 180º.

Graph 1 is a sector graph describing travel to school, you are asked to find the percentages of each. You need a protractor to do this, the percentages are multiples of 5 and so your angle will match a percentage given in Q.1. Note that the lines inside the circle may have to be extended to allow you to read them properly, (depending on your protractor type). The second worksheet is supplied for students without protractors, markings are on the graph at every 5º.

Graphs 3 and 4 are the reverse, creating sectors this time. Before you start you may like to change all the percentages to angles, remember use the values in Q.1. Once you have finished each sector remember to label it.

Graphs 5 and 6 are sector graphs that you can colour. They don't need labels as the square in front of the category is coloured the same colour as the sector. It is usually referred to as a 'key'. Look at the example below, it shows a completed sector graph.

Example : Household Expenditure



Colour the sectors, each sector is 5%, all percentages given are in multiples of 5%.

Colour the square, which is the key, the same colour as its respective sector.

Sector Graphs

FREEFALL MATHEMATICS

ALTITUDE

NUMBER PLANE

Grid Reference - The Hidden Friend

A grid reference system is used to pinpoint locations on a map or diagram. This sheet uses grid referencing to plot diagrams of 2 hidden friends. Grid referencing gives a letter then a number, the letter being along the horizontal axis (the top and bottom) and the number being on the vertical axis, which are the two sides.

Some maps may use a zero, these maps start at 1. To plot the points move across to the letter required then up the column to the number, then colour the square. Then plot the next grid position, after the points are plotted your friends should be revealed.

The co-ordinates are all in the same colour except where you are told to change colour, but if you want to make a multi-coloured one go ahead! You should strike out each grid reference as you plot them incase you need to remember where you are up to.

Using a Street Map

A street map uses grid co-ordinates to specify the location of streets and points of interest. The reference system generally uses letters across its horizontal axis (top and bottom) and numbers on its vertical axis (sides). To give a co-ordinate you move across first, then up, so the letter first then the number.

For example D7 would be the green area. Note that some areas could be given more than one co-ordinate, due to its size it could cross into another reference area. If you are attempting this sheet on paper use a ruler or just the eye.

Column 1 asks for the co-ordinates for the black symbols on the map. Look at the map key (sometimes called a 'legend') so that you know what you are looking for. Then using the grid read off the locations.

Column 2 asks you to place buildings and points of interest on the map. So show that artistic talent!

Column 3 asks you to place post boxes, traffic lights and phone boxes in given locations.

You can print either a map with a grid over it or a map with no grid.

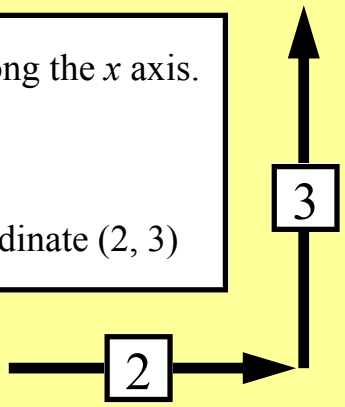
Plotting Points - Positive Quadrant

This sheet involves the plotting of Cartesian co-ordinates. When plotting points on a number plane you are given 2 numbers, referred to as an ordered pair. The first number tells you how much you move across and the second number tells you how much you move up or down. This sheet only moves across to the right and up, negative numbers (not on this sheet) move to the left and down.

Move across first along the *x* axis.

Then move up.

Eg. To plot the co-ordinate (2, 3)



Note that the plane consists of an *x*-axis (horizontal or across) and a *y*-axis which is vertical (up and down). The plural of axis is axes (pronounced ak-seas). The co-ordinate (0, 0) is commonly referred to as the 'origin', the place where measurement starts from. Teachers often ask for the co-ordinates of the origin.

The first column asks you to locate the points and write in their co-ordinates. This is done by opening a bracket writing the *x* co-ordinate, writing a comma, then the *y* co-ordinate and close bracket. You should always place the co-ordinates in brackets.

The second column asks you to plot points. Once the group of points are plotted draw a line between points (in alphabetical order) to form a shape. Then write in the name of the shape plotted in the space provided.

Plotting Points - Positive Quadrant

Shape formed: Right (Angled) Triangle
Two or three word description

Drawing Animals - Positive Quadrant

This sheet uses your skills in plotting points from the previous sheet. The series of points makes a pair of animals when lines are joined between the points. The way you attempt this exercise is, for the first animal:

- Plot one point at a time and then draw a line between it and the previous point. Don't try to plot all the points and then draw the lines afterwards as the drawing is too complicated.
- When you reach stop, restart at the new position and start again, DON'T JOIN THE POINTS BETWEEN WHERE YOU STOPPED AND WHERE YOU RESTARTED.

For the next animal follow the same process except use 2 different colours.

Move across first along the *x* axis.

Then move up.

Eg. To plot the co-ordinate (2, 3)

Plotting Points - 4 Quadrants

This sheet involves the plotting of Cartesian co-ordinates. When plotting points on a number plane you are given two numbers. The first number tells you how much you move across and the second number tells you how much you move up or down. As the numbers are in order, across first, up/down second, these numbers can be referred to as 'ordered pairs', as their order is important. Positive numbers move across to the right if the first number, negative numbers move to the left if the first number. Positive numbers move up if the second number, negative numbers move down if the second number.

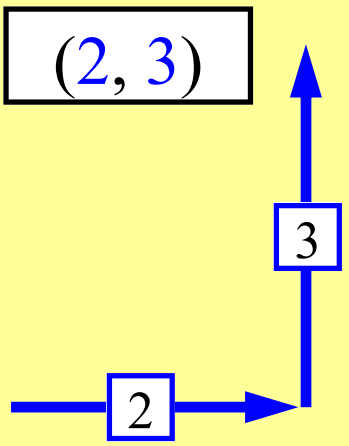
The first column asks you to locate the points and write in their co-ordinates. This is done by opening a bracket writing the *x* co-ordinate, a comma, then the *y* co-ordinate and close bracket. Always place co-ordinates in brackets.

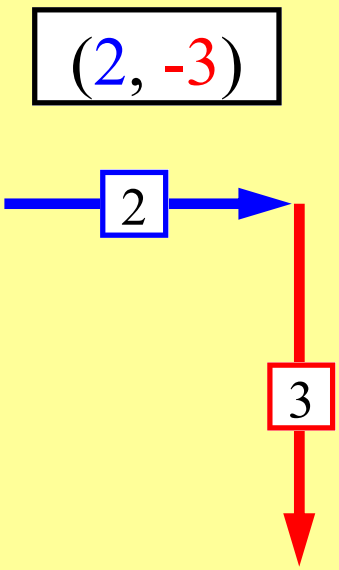
The second column asks you to plot points. Draw filled in circles at the given location and label them with the letter supplied in each question.

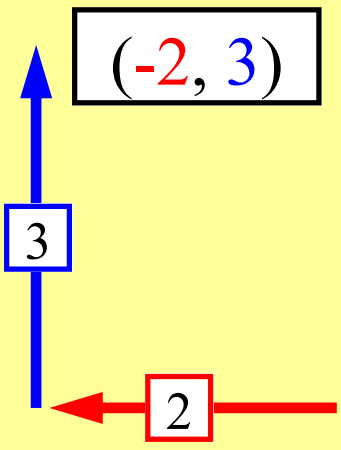
Once you plot the point record down which quadrant it is in. Quadrants start with the 1st Quadrant (top right) and then moving anti-clockwise, are called II (2nd), III (3rd) and IV (4th). If the point is on the axis then record it by filling in the oval around the word 'Axis'.

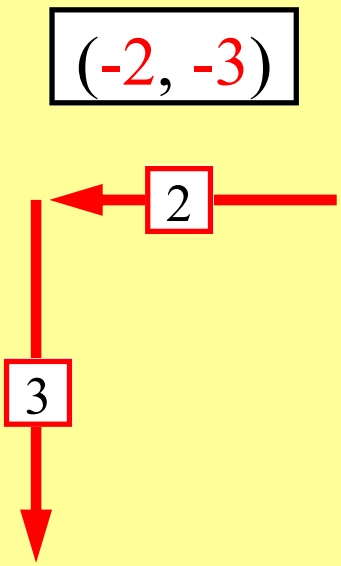
Move across first along the *x* axis.
Negative to the left, Positive to the right.

Then move up or down in the *y* direction.
Negative is down, Positive is up.









Plotting Points - 4 Quadrants

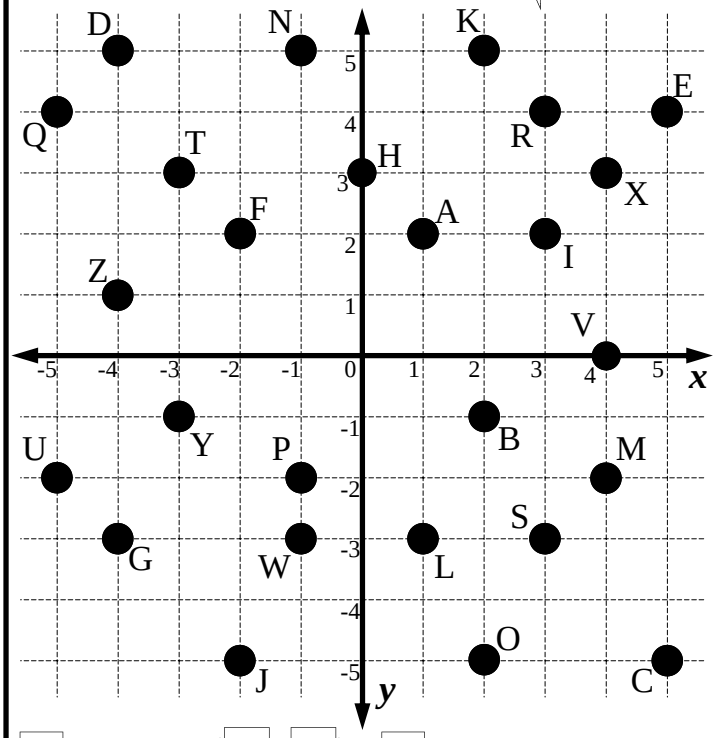
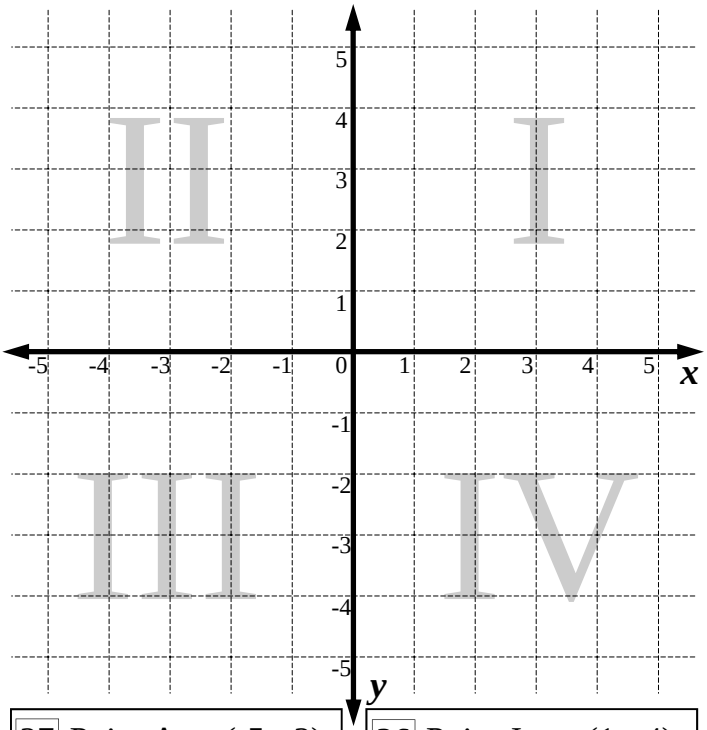
Give the co-ordinates for the points on the number plane below.



1 Point A (,)
2 Point B
3 Point C
4 Point D
5 Point E
6 Point F
7 Point G
8 Point H
9 Point I
10 Point J
11 Point K
12 Point L
13 Point M
14 Point N
15 Point O
16 Point P
17 Point Q
18 Point R
19 Point S
20 Point T
21 Point U
22 Point V
23 Point W
24 Point X
25 Point Y
26 Point Z

Plot the following points on the number plane below, label each point and give the quadrant that the point lies in.



27 Point A (-5, -2) Quadrant I II III IV Axis
28 Point B (2, 4) Quadrant I II III IV Axis
29 Point C (4, 0) Quadrant I II III IV Axis
30 Point D (3, -3) Quadrant I II III IV Axis
31 Point E (-3, 5) Quadrant I II III IV Axis
32 Point F (0, 0) Quadrant I II III IV Axis
33 Point G (5, -5) Quadrant I II III IV Axis
34 Point H (-2, 4) Quadrant I II III IV Axis
35 Point I (1, 2) Quadrant I II III IV Axis
36 Point J (1, -4) Quadrant I II III IV Axis
37 Point K (-3, -4) Quadrant I II III IV Axis
38 Point L (-1, 0) Quadrant I II III IV Axis
39 Point M (-4, 2) Quadrant I II III IV Axis
40 Point N (3, -5) Quadrant I II III IV Axis
41 Point O (0, -3) Quadrant I II III IV Axis
42 Point P (-5, -5) Quadrant I II III IV Axis
43 Point R (-2, 1) Quadrant I II III IV Axis
44 Point S (2, -2) Quadrant I II III IV Axis

Plotting Points - 4 Quadrants

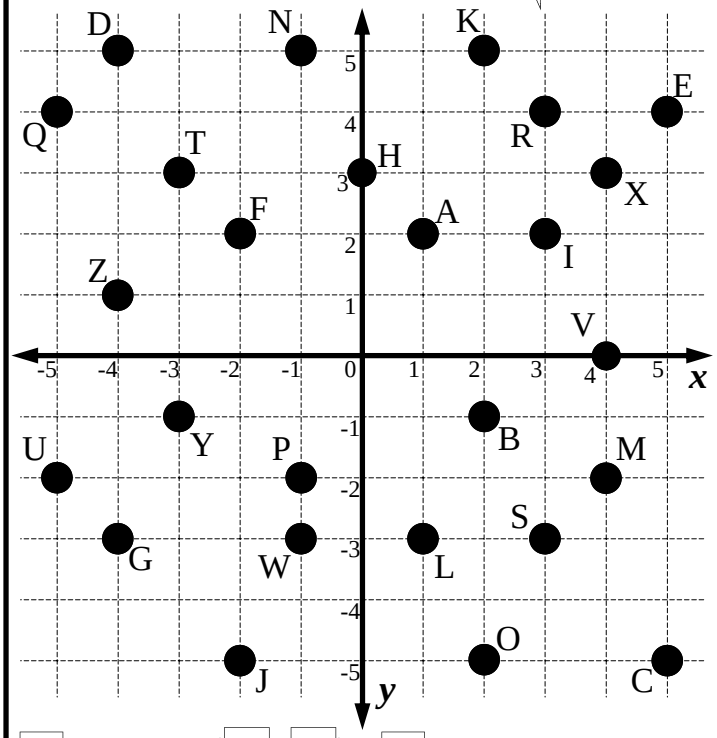
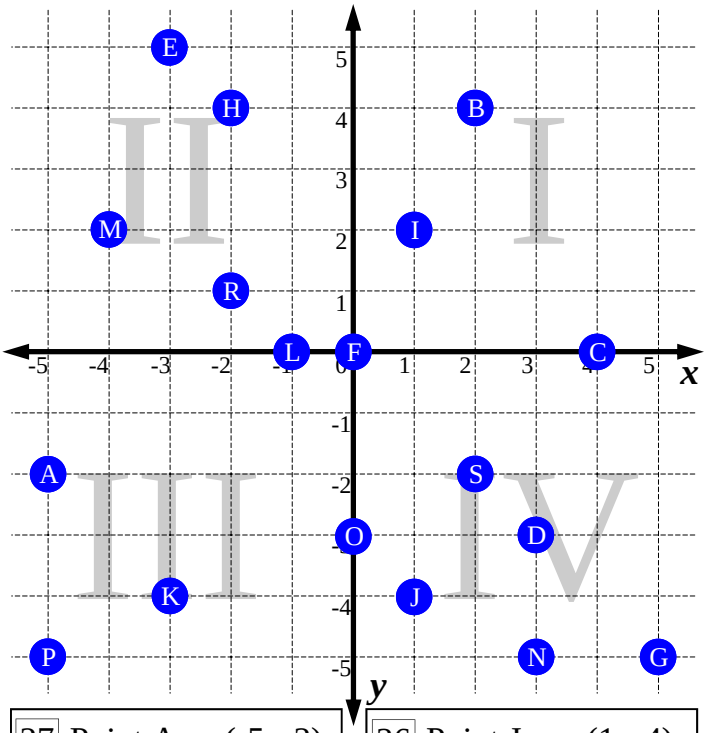
Give the co-ordinates for the points on the number plane below.



1	Point A	(1, 2)	14	Point N	(-1, 5)
2	Point B	(2, -1)	15	Point O	(2, -5)
3	Point C	(5, -5)	16	Point P	(-1, -2)
4	Point D	(-4, 5)	17	Point Q	(-5, 4)
5	Point E	(5, 4)	18	Point R	(3, 4)
6	Point F	(-2, 2)	19	Point S	(3, -3)
7	Point G	(-4, -3)	20	Point T	(-3, 3)
8	Point H	(0, 3)	21	Point U	(-5, -2)
9	Point I	(3, 2)	22	Point V	(4, 0)
10	Point J	(-2, -5)	23	Point W	(-1, -3)
11	Point K	(2, 5)	24	Point X	(4, 3)
12	Point L	(1, -3)	25	Point Y	(-3, -1)
13	Point M	(4, -2)	26	Point Z	(-4, 1)

Plot the following points on the number plane below, label each point and give the quadrant that the point lies in.



27 Point A (-5, -2) Quadrant I II **III** IV Axis

28 Point B (2, 4) Quadrant **I** II III IV Axis

29 Point C (4, 0) Quadrant I II III IV **Axis**

30 Point D (3, -3) Quadrant I II **III** IV Axis

31 Point E (-3, 5) Quadrant **II** III IV Axis

32 Point F (0, 0) Quadrant I II III IV **Axis**

33 Point G (5, -5) Quadrant I II **III** IV Axis

34 Point H (-2, 4) Quadrant **II** III IV Axis

35 Point I (1, 2) Quadrant **I** II III IV Axis

36 Point J (1, -4) Quadrant I II III **IV** Axis

37 Point K (-3, -4) Quadrant I II **III** IV Axis

38 Point L (-1, 0) Quadrant I II III IV **Axis**

39 Point M (-4, 2) Quadrant **II** III IV Axis

40 Point N (3, -5) Quadrant I II III **IV** Axis

41 Point O (0, -3) Quadrant I II III IV **Axis**

42 Point P (-5, -5) Quadrant I II **III** IV Axis

43 Point R (-2, 1) Quadrant **II** III IV Axis

44 Point S (2, -2) Quadrant I II III **IV** Axis

Drawing Animals - All Quadrants

This sheet uses your skills in plotting points from the previous sheet. The series of points makes a pair of animals when lines are joined between the points. The way you attempt this exercise is, for the first animal:

- Plot one point at a time and then draw a line between it and the previous point. Don't try to plot all the points and then draw the lines afterwards as the drawing is too complicated.
- When you reach stop, restart at the new position and start again, DON'T JOIN THE POINTS BETWEEN WHERE YOU STOPPED AND WHERE YOU RESTARTED.

Move across first along the *x* axis.
Negative to the left, Positive to the right.

Then move up or down in the *y* direction.
Negative is down, Positive is up.

Warship Rules

This game uses your grid reference skills to play a game. This game is called ‘Warship’ and it involves marine military vessels.

The game:

- The bottom grid is for placing one of each of the 5 craft supplied either horizontally or vertically. For a shorter game don't use the 'zodiac'.
- Your opponent does the same on their separate grid sheet and then you decide who has first shot.
- You pick a co-ordinate and call it out, letter first then number, (like… B3) if it hits you opponent's craft they say 'Hit', if it misses they say 'Miss'. On the top grid you then place a cross in the square if it hits or a dot in the square if its a miss. The dot ensures you don’t call the same co-ordinate again.
- Your opponent then has a shot, if their co-ordinates hit part of a craft then you call 'Hit' and place a cross on the bottom grid, if they miss you don’t have to record their shot.
- Note that your next try will be above/below or to the left/right of the hit if you hit your opponent, until you sink the craft. Your opponent must call out 'Sunk' if the craft is destroyed (a cross over each square that the craft is in). If you didn't hit a craft in your previous try then guess another 'random' location, away from the point called earlier.
- Shots are alternated until one player loses all his or her fleet. You may like to cross out your sunken opponents craft as a reminder of the craft still remaining.
- Note: Sometimes you score a hit and then get 4 more hits but your opponent doesn't call 'sunk'. If they have placed two craft in a line this is possible don't jump to the conclusion that they have made a mistake.
- If you lose a zodiac early you are unlucky and may lose the game because of it, so think carefully about its placement. Also if the zodiac is hit while your opponent is hitting a craft next to your zodiac then you must say that it is the zodiac that was sunk.
- Another way to speed up the game is to give a player another turn if a hit is made including after the craft is sunk.

Don't cheat by changing the location of your craft during play as your opponent will quickly tire of playing you and it spoils the fun for both of you. You would also be surprised at how long one particular craft can be unsuccessfully hunted.

Latitude and Longitude

Similar to the number plane, when you give locations on the globe you do so by using 2 co-ordinates. Latitude lines are the horizontal or flat 'lines' (remember lat is flat). Longitude lines are the vertical lines (remember they aren't flat!).

Note that there are no negative numbers, instead direction is used, the equator is when the latitude is 0°. Then moving up (northerly), latitudes increase and are denoted by an N for north. Moving down (southwards) they are denoted by an S. Longitudes are measured from the 0° 'prime meridian' which matches GMT, Greenwich Meridian Time. Then when you move left (West) you denote the movement with a W, moving right (East) you use an E.

When you give these locations unlike a number plane you give the latitude first, you probably remember the compass points by saying 'North South East West' well this applies to the co-ordinates also, give the North or South co-ordinate first then the East or West co-ordinate. You also use a degree sign, separate the co-ordinates with a comma and put them in brackets.

If you look at the point N at the top left of the globe you would give its position as:
(50°N, 120°W).

While the sheet differs from column to column the use of co-ordinates is all that is being dealt with on this sheet. The first column asks you to give the co-ordinates for the given point, open a bracket and write in the latitude, then a comma, then the longitude and close the brackets. Note that 0° latitude or longitude doesn't require a letter, just write it as 0°.

Column 2 is the reverse, given a co-ordinate find the point. Write in the letter.

Column 3 takes this one step further. A word (which will be a city) will be formed by using the co-ordinates to find each letter in order, write the letter as you locate the points. If the city is unrecognisable then you need to go back and check your points. Note that the letters are in order they aren't jumbled.

The most common mistake made apart from giving the co-ordinates reversed is with the longitude. Most people get the North or South right but some mix up their east with their west.

Latitude and Longitude

ALTITUDE

PERCENTAGES

Fractions to Percentages

Often a result of a test or survey is expressed as a fraction. Fractions can be difficult to compare and often these are converted to percentages, allowing easier comparison of the result. A fraction is converted to a percentage by multiplying it by 100. This is more easily achieved if the fraction already has a denominator of 100, so finding the equivalent fraction with a denominator of 100 is the first step:

$$\frac{7}{25} \overset{\times 4}{=} \frac{\boxed{28}}{100} = \underline{28\ \%}$$ Why is it 28%?…. Because $\frac{28}{\cancel{100}} \times \cancel{100} = 28\%$

In the example above $^{7}/_{25}$ is changed to $^{28}/_{100}$ by looking at the denominators. Ask yourself what you would multiply 25 by to get 100?… 4! If you multiply the bottom by 4 you have to multiply the top by 4 …. $7 \times 4 = 28$. Then if you multiply $^{28}/_{100}$ by 100, you are left with 28%.

Note that this method only works for factors of 100, denominators of 2, 4, 5, 10, 20, 25, 50. It can also work for multiples of 100, this time by dividing, as long as the numerator also allows the division.

Column 1 starts with writing the shaded fraction of a shape as a fraction with a denominator of 100 (don't simplify), and then as a percentage. Count the painted squares, this is the numerator of the fraction. The same number is also the percentage.

Column 2 is an extension of this. A fraction is given and you are asked to make an equivalent fraction with a denominator of 100. Look at the denominator (bottom number) and find the number you need to multiply it by to get 100. You can write this number above/below the equals sign if you like (see the example, top of column). Then multiply the numerator (top number) by the same number. This will give you the percentage. Note questions 12 and 13 require division.

You may think that 100% is all that you can give. With things like 'effort', 'determination' or 'support', this is the case. With mathematics it is possible you can find 300% of a number, it's 3 times the number.

Column 3 involves converting mixed numbers to percentages. If $1 = {}^{100}/_{100}$, $2 = {}^{200}/_{100}$, $3 = {}^{300}/_{100}$ etc, this means that 1 = 100%, 2 = 200% and 3 = 300%. So with this column first split the whole number from the fraction and write each separately as a fraction over 100, then add them together and change to a percentage. An example is at the top of the column.

Fractions to Percentages

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Write the shaded part of the (hundredths) grid as a fraction 'over a hundred', and then as a percentage.

1 
$= \frac{\square}{100}$

$= \_\_\_\_ \%$

2 
$= \frac{\square}{100}$

$= \_\_\_\_ \%$

3 
$= \frac{\square}{100}$

$= \_\_\_\_ \%$

4 
$= \frac{\square}{100}$

$= \_\_\_\_ \%$

5 
$= \frac{\square}{100}$

$= \_\_\_\_ \%$

Rewrite the fraction changing the denominator to 100. Then write as a %.

Example

$\frac{3}{20} \overset{\times 5}{=} \frac{\boxed{15}}{100} = 15\ \%$ $\times 5$

6 $\frac{4}{5} = \frac{\square}{100} = \_\_\_\_ \%$

7 $\frac{6}{10} = \frac{\square}{100} = \_\_\_\_ \%$

8 $\frac{7}{20} = \frac{\square}{100} = \_\_\_\_ \%$

9 $\frac{17}{50} = \frac{\square}{100} = \_\_\_\_ \%$

10 $\frac{3}{4} = \frac{\square}{100} = \_\_\_\_ \%$

11 $\frac{7}{4} = \frac{\square}{100} = \_\_\_\_ \%$

12 $\frac{12}{200} = \frac{\square}{100} = \_\_\_\_ \%$

13 $\frac{350}{500} = \frac{\square}{100} = \_\_\_\_ \%$

14 David is $^{3}/_{10}$ of the way home, write as a percentage

$\frac{3}{10} = \frac{\square}{100} = \_\_\_\_ \%$

15 Ellen scored $^{17}/_{20}$ in a test, write this as a percentage.

$\frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_ \%$

16 Ken forgets his lunch 1 day in 5, write as a percentage

$\frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_ \%$

Change these mixed numbers to fractions with 100 as the denominator, then simplify them.

Example

$2\ \frac{1}{4} = \frac{\boxed{200}}{100} + \frac{\boxed{25}}{100} = \frac{\boxed{225}}{100}$

$= 225\ \%$

17 $4\ \frac{7}{10} = \frac{\square}{100} + \frac{\square}{100} = \frac{\square}{100}$

$= \_\_\_\_ \%$

18 $5\ \frac{1}{2} = \frac{\square}{100} + \frac{\square}{100} = \frac{\square}{100}$

$= \_\_\_\_ \%$

19 $7\ \frac{9}{20} = \frac{\square}{100} + \frac{\square}{100} = \frac{\square}{100}$

$= \_\_\_\_ \%$

20 $1\ \frac{34}{200} = \frac{\square}{100} + \frac{\square}{100} = \frac{\square}{100}$

$= \_\_\_\_ \%$

21 $9\ \frac{15}{500} = \frac{\square}{100} + \frac{\square}{100} = \frac{\square}{100}$

$= \_\_\_\_ \%$

22 $6\ \frac{8}{25} = \frac{\square}{100} + \frac{\square}{100} = \frac{\square}{100}$

$= \_\_\_\_ \%$

23 $4\ \frac{2}{50} = \frac{\square}{100} + \frac{\square}{100} = \frac{\square}{100}$

$= \_\_\_\_ \%$

Write the shaded part of the (hundredths) grid as a fraction 'over a hundred', and then as a percentage.

1 
$= \frac{10}{100}$

$= 10\ \%$

2 
$= \frac{25}{100}$

$= 25\ \%$

3 
$= \frac{78}{100}$

$= 78\ \%$

4 
$= \frac{30}{100}$

$= 30\ \%$

5 
$= \frac{55}{100}$

$= 55\ \%$

Rewrite the fraction changing the denominator to 100. Then write as a %.

Example

$\frac{3}{20} \overset{\times 5}{=} \frac{15}{100} = 15\ \%$

6 $\frac{4}{5} \overset{\times 20}{=} \frac{80}{100} = 80\ \%$

7 $\frac{6}{10} \overset{\times 10}{=} \frac{60}{100} = 60\ \%$

8 $\frac{7}{20} \overset{\times 5}{=} \frac{35}{100} = 35\ \%$

9 $\frac{17}{50} \overset{\times 2}{=} \frac{34}{100} = 34\ \%$

10 $\frac{3}{4} \overset{\times 25}{=} \frac{75}{100} = 75\ \%$

11 $\frac{7}{4} \overset{\times 25}{=} \frac{175}{100} = 175\ \%$

12 $\frac{\overset{6}{\cancel{12}}}{\underset{100}{\cancel{200}}} = \frac{6}{100} = 6\ \%$

13 $\frac{\overset{70}{\cancel{350}}}{\underset{100}{\cancel{500}}} = \frac{70}{100} = 70\ \%$

14 David is $^3/_{10}$ of the way home, write as a percentage

$\frac{3}{10} \overset{\times 10}{=} \frac{30}{100} = 30\ \%$

15 Ellen scored $^{17}/_{20}$ in a test, write this as a percentage.

$\frac{17}{20} \overset{\times 5}{=} \frac{85}{100} = 85\ \%$

16 Ken forgets his lunch 1 day in 5, write as a percentage

$\frac{1}{5} \overset{\times 20}{=} \frac{20}{100} = 20\ \%$

Change these mixed numbers to fractions with 100 as the denominator, then simplify them.

$2\frac{1}{4} = \frac{200}{100} + \frac{25}{100} = \frac{225}{100}$

$= 225\ \%$

17 $4\frac{7}{10} = \frac{400}{100} + \frac{70}{100} = \frac{470}{100}$

$= 470\ \%$

18 $5\frac{1}{2} = \frac{500}{100} + \frac{50}{100} = \frac{550}{100}$

$= 550\ \%$

19 $7\frac{9}{20} = \frac{700}{100} + \frac{45}{100} = \frac{745}{100}$

$= 745\ \%$

20 $1\frac{34}{200} = \frac{100}{100} + \frac{17}{100} = \frac{117}{100}$

$= 117\ \%$

21 $9\frac{10}{500} = \frac{900}{100} + \frac{2}{100} = \frac{902}{100}$

$= 902\ \%$

22 $6\frac{8}{25} = \frac{600}{100} + \frac{32}{100} = \frac{632}{100}$

$= 632\ \%$

23 $4\frac{2}{5} = \frac{400}{100} + \frac{40}{100} = \frac{440}{100}$

$= 440\ \%$

Percentages to Fractions

To use percentages in calculations the percentage will usually be converted to a decimal or a fraction. This sheet deals with converting percentages to fractions.

Column 1 asks you to write the percentages in simplified form. Start by rewriting the percentage as a fraction over 100. Then fully simplify, this is done by finding the largest number that goes into both numbers, their HCF, then dividing through by that number. An example is at the top of the first column, use the same method throughout the column.

Column 2 is in problem form, start with the same method (except question 16) by writing the percentage as a fraction with 100 as its denominator. Then find the equivalent fraction changing the denominator to the number given in the question. In question 16 you have to find the percentage first, though you may see a quicker way.

Column 3 is much the same as column 1 with the difference being that the percentages are greater than 100% and so the fraction will have a value greater than 1. Start with the same first step, writing the number over 100. Then look for the HCF. Divide through and write the answer as an improper fraction. The answer could be left this way if the question just asked for a fraction, but the question asks for mixed numerals. So convert the improper fraction to a mixed numeral. Look at the mixed numeral when you have finished and make sure it can't be further simplified.

Percentages to Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Change these percentages to fractions with 100 as the denominator, then simplify them fully.

Example (÷ 5)

$55\ \% = \frac{55}{100} = \frac{11}{20}$

1 $30\ \% = \frac{\square}{100} = \frac{\square}{\square}$

2 $20\ \% = \frac{\square}{100} = \frac{\square}{\square}$

3 $60\ \% = \frac{\square}{100} = \frac{\square}{\square}$

4 $12\ \% = \frac{\square}{100} = \frac{\square}{\square}$

5 $34\ \% = \frac{\square}{100} = \frac{\square}{\square}$

6 $44\ \% = \frac{\square}{100} = \frac{\square}{\square}$

7 $15\ \% = \frac{\square}{100} = \frac{\square}{\square}$

8 $85\ \% = \frac{\square}{100} = \frac{\square}{\square}$

9 $64\ \% = \frac{\square}{100} = \frac{\square}{\square}$

10 Ryan drank 35% of his drink, express as a fraction

$\_\_\_\ \% = \frac{\square}{100} = \frac{\square}{\square}$

11 Write a 16% levy on water rates as a fraction

$\_\_\_\ \% = \frac{\square}{100} = \frac{\square}{\square}$

Use equivalent fractions to solve these

12 Michael achieved 68% in a test. If the test was out of 50, what was his mark?

$68\ \% = \frac{\square}{100} = \frac{\square}{50}$

13 Carla achieved 80% in a test which had a maximum mark of 20, find her mark.

$80\ \% = \frac{\square}{100} = \frac{\square}{\square}$

14 A new apartment building has 300 apartments, 40% have been sold, how many apartments is this?

$\_\_\_\ \% = \frac{\square}{\square} = \frac{\square}{\square}$

15 How many apartments are still available?

16 Jane scored 12 out of 20 in her previous test. If the next test is out of 50 what must she score for the same %?

$\frac{12}{20} = \frac{\square}{\square} = \_\_\_\ \%$

$\_\_\_\ \% = \frac{\square}{\square} = \frac{\square}{\square}$

17 Ian falls out of bed in his sleep 8% of nights. How many times would he fall out of bed in a 25 night period?

$\_\_\_\ \% = \frac{\square}{\square} = \frac{\square}{\square}$

These percentages are larger than 100%. Express them as mixed numerals.

Example (÷ 50) improper

$150\ \% = \frac{150}{100} = \frac{3}{2}$

Rewrite as a mixed numeral $= 1\frac{1}{2}$

18 $120\ \% = \frac{\square}{100} = \frac{\square}{\square} = \square\frac{\square}{\square}$

19 $250\ \% = \frac{\square}{100} = \frac{\square}{\square} = \square\frac{\square}{\square}$

20 $110\ \% = \frac{\square}{100} = \frac{\square}{\square} = \square\frac{\square}{\square}$

21 $180\ \% = \frac{\square}{100} = \frac{\square}{\square} = \square\frac{\square}{\square}$

22 $125\ \% = \frac{\square}{100} = \frac{\square}{\square} = \square\frac{\square}{\square}$

23 $105\ \% = \frac{\square}{100} = \frac{\square}{\square} = \square\frac{\square}{\square}$

Percentages to Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Change these percentages to fractions with 100 as the denominator, then simplify them fully.

Example (÷ 5)

$55\ \% = \frac{55}{100} = \frac{11}{20}$

1 $30\ \% = \frac{30}{100} = \frac{3}{10}$

2 $20\ \% = \frac{20}{100} = \frac{1}{5}$

3 $60\ \% = \frac{60}{100} = \frac{3}{5}$

4 $12\ \% = \frac{12}{100} = \frac{3}{25}$

5 $34\ \% = \frac{34}{100} = \frac{17}{50}$

6 $44\ \% = \frac{44}{100} = \frac{11}{25}$

7 $15\ \% = \frac{15}{100} = \frac{3}{20}$

8 $85\ \% = \frac{85}{100} = \frac{17}{20}$

9 $64\ \% = \frac{64}{100} = \frac{16}{25}$

10 Ryan drank 35% of his drink, express as a fraction

$35\ \% = \frac{35}{100} = \frac{7}{20}$

11 Write a 16% levy on water rates as a fraction

$16\ \% = \frac{16}{100} = \frac{4}{25}$

Use equivalent fractions to solve these

12 Michael achieved 68% in a test. If the test was out of 50, what was his mark?

$68\ \% = \frac{68}{100} = \frac{34}{50}$

13 Carla achieved 80% in a test which had a maximum mark of 20, find her mark.

$80\ \% = \frac{80}{100} = \frac{16}{20}$

14 A new apartment building has 300 apartments, 40% have been sold, how many apartments is this?

$40\ \% = \frac{40}{100} = \frac{120}{300}$

15 How many apartments are still available?

180 apartments

16 Jane scored 12 out of 20 in her previous test. If the next test is out of 50 what must she score for the same %?

$\frac{12}{20} \overset{\times 5}{=} \frac{60}{100} = 60\ \%$

$60\ \% = \frac{60}{100} = \frac{30}{50}$

17 Ian falls out of bed in his sleep 8% of nights. How many times would he fall out of bed in a 25 night period?

$8\ \% = \frac{8}{100} = \frac{2}{25}$

These percentages are larger than 100%. Express them as mixed numerals.

Example (÷ 50) improper

$150\ \% = \frac{150}{100} = \frac{3}{2}$

Rewrite as a mixed numeral $= 1\frac{1}{2}$

18 $120\ \% = \frac{120}{100} = \frac{6}{5} = 1\frac{1}{5}$

19 $250\ \% = \frac{250}{100} = \frac{5}{2} = 2\frac{1}{2}$

20 $110\ \% = \frac{110}{100} = \frac{11}{10} = 1\frac{1}{10}$

21 $180\ \% = \frac{180}{100} = \frac{9}{5} = 1\frac{4}{5}$

22 $125\ \% = \frac{125}{100} = \frac{5}{4} = 1\frac{1}{4}$

23 $105\ \% = \frac{105}{100} = \frac{21}{20} = 1\frac{1}{20}$

Decimals and Percentages

When percentages are used in calculations such as with bank loans and government taxes, they are often converted to decimals. This is done, as with fractions, by dividing by 100. With decimals this step is replaced with moving the decimal point 2 places to the left (dividing by 100). If converting a decimal to a percentage then you multiply by 100, move the decimal point 2 places to the right.

Column 1 has 100 square grid and you are asked to express the shaded area as a decimal and percentage, then repeat for the unshaded part. To express the shaded part as a decimal count the squares and write the number behind 0._ _. For example 53 squares would be 0.53, don't write in a zero when it isn't required, for example 30 squares is 0.3 rather than 0.30. The percentage shaded is the number of shaded squares with the % sign after it. For example 10 squares = 10%. Once you have answered the shaded part then complete the unshaded portion. You can count the white squares, but it would be easier and faster to subtract the number of blue squares from 100. If you want to be really fast then count the smallest number of squares (unshaded or shaded) and answer it first. Your teacher may ask you what the sum (addition) of the two decimals equals and what the sum of the two percentages equals, you should know that this is 1 (decimals) and 100% (percentages).

Column 2 involves changing decimals to percentages, answer by multiplying by 100, so move the decimal point 2 places right. If there isn't a decimal point it's because the number is a whole number, so you assume it's behind the last digit. That means you add 2 zeros to the end. There is an example at the top of the column.

Column 3 is the reverse, converting percentages to decimals. This time move the decimal point 2 places to the left, as you are dividing by 100. Again there is an example at the top. Possibly the most asked question and the one that tricks the most students is to write 0.5% (or ½%) as a decimal, this question is there (Q.45), see how you go.

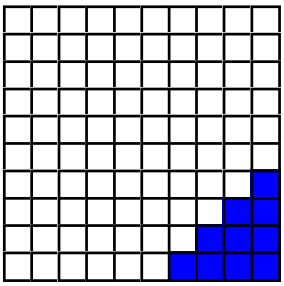
Decimals and Percentages

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Write the both the shaded and unshaded part of the hundredths grid as a decimal and a percentage.

Decimal: write the number of squares behind decimal point ie, 23 sq = 0.23
Percentage: write the number of squares in front of the % sign. (23%)

1



Shaded:

Further Fractions to Percentages

Changing fractions to percentages with denominators that are factors of 100 has been covered, but what of the fractions with denominators that aren't factors of 100, this sheet deals with these.

Column 1 deals with the first step in changing a fraction to a percentage, you should look at the fraction and see if you can express it with a denominator of 100. All the fractions in this column can be, and the process is:

- Look at the fraction and change it to have a denominator that is a factor of 100 (2, 4, 5, 10, 20, 25, 50)
- Rewrite the equivalent fraction with the new denominator
- Then write the equivalent fraction with a denominator of 100
- The percentage is the numerator (top number).

An example is at the top of the column. Note that these fractions have been carefully selected, this process only works sometimes, but it is an important method to learn.

Column 2 outlines the method for all other fractions. Using division, change to a decimal, then to a percentage by moving the decimal point 2 places to the right. The method is identical to converting fractions to decimals with the decimal point shifting being the only difference. The answers are to be percentages to 1 d.p. so that means you require a 4 d.p. answer. Why 4? Because the 4th decimal digit is needed for rounding, if the 4th decimal digit is 5 or above then you round up. In the example at the top of the column the 4th d.p. digit is a 0 so there is no rounding.

Column 3 has long division problems, again the percentage is required to be to 1 d.p. so you need a 4 d.p. answer then round up or down as required. An example is shown, in the example the answer is rounded up due to the 4th d.p. digit being a 5.

Further Fractions to Percentages

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Use you knowledge of the factors of 100 to write these fractions as decimals

Example

$\frac{9}{15} = \frac{3}{5} \overset{\times 20}{=} \frac{60}{100} \overset{\times 100}{=} 60\ \%$ (÷ 3)

1 $\frac{6}{8} = \frac{\square}{4} = \frac{\square}{100} = \_\_\_\_\ \%$

2 $\frac{3}{12} = \frac{\square}{4} = \frac{\square}{100} = \_\_\_\_\ \%$

3 $\frac{32}{40} = \frac{\square}{20} = \frac{\square}{100} = \_\_\_\_\ \%$

4 $\frac{12}{16} = \frac{\square}{4} = \frac{\square}{100} = \_\_\_\_\ \%$

5 $\frac{36}{80} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

6 $\frac{24}{120} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

7 $\frac{39}{60} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

8 $\frac{18}{24} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

9 $\frac{33}{110} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

10 $\frac{24}{30} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

11 $\frac{66}{150} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

12 $\frac{30}{75} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

13 $\frac{27}{45} = \frac{\square}{\square} = \frac{\square}{100} = \_\_\_\_\ \%$

Convert these fractions to decimals, then to percentages (to 1 d.p.)

Example

$\frac{5}{8} = 8\overline{)5.0000}$ (add zeros) $= 0.6250$ (change to decimal)

$= 62.5\%$ (multiply by 100 move • 2 places)

14 $\frac{3}{8} = 8\overline{)3}$

$= \_\_\_\_$

15 $\frac{4}{9} = 9\overline{)4}$

$= \_\_\_\_$

16 $\frac{5}{6} = 6\overline{)5}$

$= \_\_\_\_$

17 $\frac{2}{7} = 7\overline{)2}$

$= \_\_\_\_$

18 $\frac{1}{3} = 3\overline{)1}$

$= \_\_\_\_$

19 $\frac{7}{8} = 8\overline{)7}$

$= \_\_\_\_$

20 $\frac{1}{9} = 9\overline{)1}$

$= \_\_\_\_$

21 $\frac{5}{9} = 9\overline{)5}$

$= \_\_\_\_$

22 $\frac{1}{6} = 6\overline{)1}$

$= \_\_\_\_$

These fractions to percentages will require long division (1 d.p.)

Example

$\frac{5}{16} = 31.3\%$

$16\overline{)5.0000} = 0.3125$

48
20
16
40
32
80
80
0

23 $\frac{2}{15} = \_\_\_\_$

$15\overline{)2}$

24 $\frac{4}{17} = \_\_\_\_$

$17\overline{)4}$

25 $\frac{9}{11} = \_\_\_\_$

$11\overline{)9}$

$17\overline{)4.0000} = 0.2352$

34, 60, 51, 90, 85, 50, 34, 16

25 $\frac{9}{11} = 81.8\%$

$11\overline{)9.0000} = 0.8181$

88, 20, 11, 90, 88, 20, 11, 9

Fractions - Decimals - Percentages

This is a combination of converting between percentages, fractions and decimals. It is assumed that earlier sheets have been completed before this sheet is attempted.

Column 1 asks you to:

- Convert a decimal to a %. To answer these multiply by 100 or move the decimal point 2 places to the right.
- Converting a % to a decimal is the opposite, divide by 100 this time so move the decimal point 2 places to the left.
- Converting fractions to percentages requires multiplying by 100. This will involve 2 steps. First rewrite the fraction (form an equivalent fraction) with a denominator of 100. The % will be the numerator (top number) of the fraction. Rewrite it with a % sign.
- Converting a % to a fraction is the reverse. Write the % over 100 (dividing by 100) then simplify the fraction. Expect improper fraction answers at times.

Column 2 is the same as Column 1 except it is in table form and is jumbled. You are given either a decimal, percentage or fraction and you have to find the other two. An example is at the top of the column.

Fractions - Decimals - Percentages

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Express these decimals as percentages, multiply by 100, so move the decimal point 2 places right.

1 0.34 ____ 2 1.24 ____

3 0.05 ____ 4 0.4 ____

5 7.09 ____ 6 0.091 ____

7 0.002 ____ 8 2 ____

9 0.708 ____ 10 20.06 ____

Now the reverse, change these percentages to decimals. Move • 2 places to the left.

11 86% ____ 12 17% ____

13 9% ____ 14 44.6% ____

15 110% ____ 16 0.5% ____

17 30.02% ____ 18 400.5% ____

19 300% ____ 20 80.3% ____

Express these fractions as percentages, change denominator to 100, numerator = %

21 $\frac{7}{10} = \frac{\square}{100}$ ____ 22 $\frac{1}{4} = \frac{\square}{100}$ ____

23 $\frac{3}{5} = \frac{\square}{100}$ ____ 24 $\frac{9}{20} = \frac{\square}{100}$ ____

25 $\frac{150}{200} = \frac{\square}{100}$ ____ 26 $\frac{18}{25} = \frac{\square}{100}$ ____

27 $\frac{110}{500} = \frac{\square}{100}$ ____ 28 $\frac{11}{5} = \frac{\square}{100}$ ____

Now change these percentages to fractions

29 60% $\frac{\square}{100} = \frac{\square}{\square}$ 30 15% $\frac{\square}{100} = \frac{\square}{\square}$

31 350% $\frac{\square}{100} = \frac{\square}{\square}$ 32 32% $\frac{\square}{100} = \frac{\square}{\square}$

33 ½% $\frac{\square}{100} = \frac{\square}{\square}$ 34 120% $\frac{\square}{100} = \frac{\square}{\square}$

35 104% $\frac{\square}{100} = \frac{\square}{\square}$ 36 42% $\frac{\square}{100} = \frac{\square}{\square}$

Complete the table below filling all the missing spaces, so that the fraction, decimal and percentage are equivalent.

Example

32 % → 0.32 → $\frac{32}{100} = \frac{8}{25}$

	FRACTION	DECIMAL	PERCENTAGE
37	$\frac{\square}{100} = \frac{\square}{\square}$	____	10 %
38	$\frac{\square}{100} = \frac{\square}{\square}$	0.5	%
39	$\frac{\square}{100} = \frac{\square}{\square}$	0.8	%

46	$\frac{18}{25} = \frac{72}{100}$	0.72	72 %
47	$\frac{250}{100} = 2\frac{1}{2}$	2.5	250 %
48	$\frac{8}{100} = \frac{2}{25}$	0.08	8 %
49	$\frac{65}{100} = \frac{13}{20}$	0.65	65 %

Calculating Percentages - Calculator

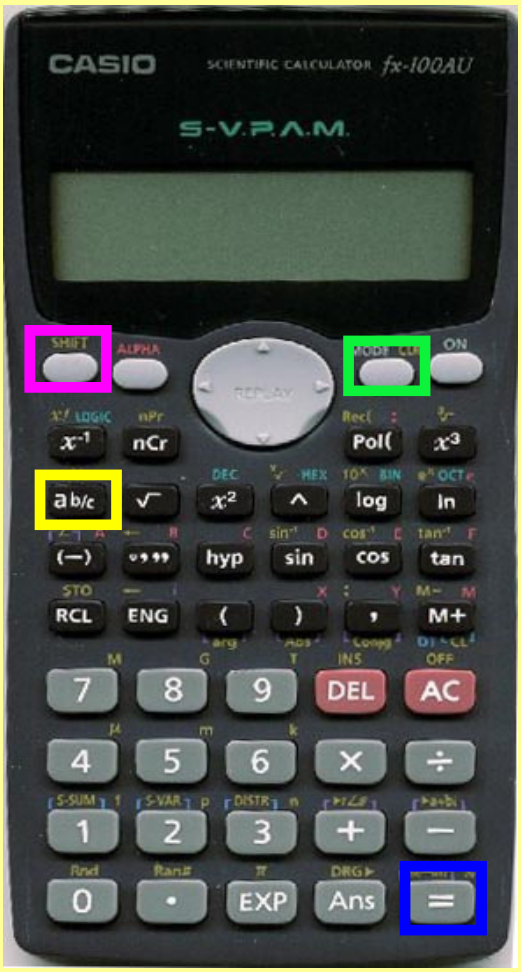
The method of calculating a percentage from a decimal or fraction is to multiply the decimal or fraction by 100. To change a percentage to a decimal or fraction you divide by 100.

A picture of a calculator is shown with below with keys highlighted. The methods used for each column are also listed on the foillowing pages. Where there is a alternative method it is shown, so you can select the method that makes the most sense to you.

Column 1 asks you to convert fractions to percentages to 2 decimal places, then to a specified number of decimal places (in brackets). Fix your calculator to the correct d.p. then multiply the fractions by 100 for the answer. Note that if writing a whole number, such as 45%, when asked to give to 2 d.p. then the answer is 45.00%. Even though the decimal portion adds nothing to the answer, it fulfils the question. If the question said 'show to 2 d.p. where appropriate (or necessary)' then you wouldn't have to show the decimal part.

Column 2 asks you to convert the decimals to percentages. Again multiply the question by 100.

Column 3 deals with changing percentages back to fractions or decimals. In this case divide by 100.



Column 2

Example of calculating a decimal percentage from a decimal

Convert 0.206 to a percentage

Using × 100

0 . 2 0 6 × 1 0 0 =

if you get 20.6 for the question above you are correct

Column 1

Example of calculating a decimal percentage from a fraction

Convert $^{7}/_{8}$ to a percentage

Using % key (not recommended)

7 ÷ 8 Shift %

Using × 100

7 ÷ 8 × 1 0 0 =

Using fraction key

7 $a^b/_c$ 8 × 1 0 0 = $a^b/_c$

if you get 87.5 (no fix) for the question above you are correct

Example of calculating a fraction percentage from a fraction

Convert $^{7}/_{8}$ to a percentage

Using fraction key

7 $a^b/_c$ 8 × 1 0 0 =

Using × 100

7 ÷ 8 × 1 0 0 = $a^b/_c$

if you get 87 ½ for the question above you are correct
note that this style of question isn't on the sheet

Example of calculating a decimal percentage from a mixed numeral

Convert $2\ ^{7}/_{8}$ to a percentage

Using fraction key

2 $a^b/_c$ 7 $a^b/_c$ 8 × 1 0 0 = $a^b/_c$

Using × 100

2 + 7 ÷ 8 = × 1 0 0 =

if you get 287.5 for the question above you are correct

Column 3

Example of converting a decimal percentage to a decimal

Convert 56.32% to a decimal

Using ÷ 100

5 6 . 3 2 ÷ 1 0 0 =

if you get 0.5632 (no fix) for the question above you are correct

Example of converting a fraction percentage to a decimal

Convert 56 ¼% to a decimal

Using the fraction key

5 6 $a^b/_c$ 1 $a^b/_c$ 4 ÷ 1 0 0 = $a^b/_c$

if you get 0.5625 (no fix) for the question above you are correct

Example of converting a decimal percentage to a fraction

Convert 56.25% to a fraction

Using the fraction key Note that the featured calculator can convert decimals to fractions, this may not be a feature on your calculator

5 6 . 2 5 ÷ 1 0 0 = $a^b/_c$

If your calculator has a fraction key but can't convert decimals to fractions then use this method (note you need some mental skills)

5 6 $a^b/_c$ 2 5 $a^b/_c$ 1 0 0 ÷ 1 0 0 =

if you get $^9/_{16}$ for the question above you are correct

Example of converting a fraction percentage to a fraction

Convert 56 ¼% to a fraction

Using the fraction key

5 6 $a^b/_c$ 1 $a^b/_c$ 4 ÷ 1 0 0 =

if you get $^9/_{16}$ for the question above you are correct

ALTITUDE

VOLUME, CAPACITY & MASS

Centicube Volumes

Volume is a measure of the amount of space an object occupies. The units used in measuring volume are cubic units: mm^3, cm^3 and m^3. The solids on this sheet are all constructed from centicubes (each 1 cm^3). This allows the volume to be found by counting the cubes with the volume being the total number of cubes (in cm^3).

The first 2 columns ask you to count the cubes, you have to accept that the cubes that you can't see, due to cubes being in front, are still there. A cube must be on top of another cube to be above the first layer. When you write the volume you must include the units (cm^3).

Column 3 introduces the Volume formula : $V = Ah$. This applies to any shape with a uniform cross-section, (this means the blue area is the same throughout the height of the shape). Count the number of squares that make up the blue area (A) and multiply this by the number of red squares that make up the height (h), this will give you the volume in cm^3.

Don't let the word 'height' confuse you. You may feel that height must go up and down but the word height is used to describe the direction of the uniform cross-section. When you think about it if you turn the page sideways it will be up and down, so the answer will be the same.

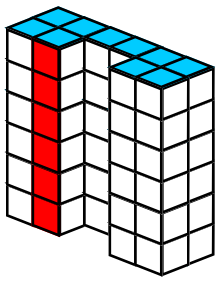
25 A = 10 cm^2 h = 6 cm

V = Ah = 60 cm^3



Volume, Area and Height

When a solid has a uniform cross section (same shape throughout the height of the solid) then the formula $V = Ah$ can be used to obtain the volume of the solid. The area will be given in square units (mm^2, cm^2, m^2) and the height of the solid will be given in mm, cm and m. Multiply the two together to get your answer. The answers will be in cubic units mm^3, cm^3, m^3.

The entire sheet uses the same method, this is : writing the equation ($V = Ah$), substituting the values (A and h), with an '=' sign before them and a '×' sign between them, then the answer with the cubic units after it.

Volume of Rectangular Prisms

Rectangular prisms are the most common form of packaging, from shipping containers to match boxes they are everywhere. To calculate their volume you multiply the 3 sides together, in any order. Because we have $V = Ah$ as the standard equation for volume with the 'area' part being a rectangle we can replace the A with $l \times b$. So we have $V = l \times b \times h$, or $V = lbh$.

This sheet uses the same method for the entire sheet. Using 3 lines of working:

- Write the equation $V = lbh$
- Substitute in the values (order isn't important), separated by × signs
- Strike out 2 numbers that you can multiply together mentally and write the total above the two numbers
- Use the working space to multiply the non-stroked number with the number above
- Write this answer in the 3rd line with 'V =' at the start and the cubic units at the end (either mm^3, cm^3 or m^3)

An example is at the top of the 1st column.

Example

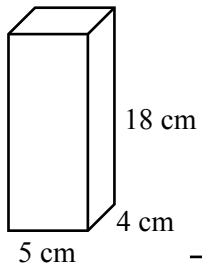
V = *lbh*

$= \cancel{8} \times \cancel{6}^{48} \times 4$

V = 192 cm^3

$\overset{3}{48} \times 4 = 192$

1



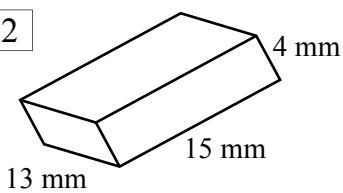
V = *lbh*

$= \cancel{5} \times \cancel{4}^{20} \times 18$

V = 360 cm^3

$\overset{1}{18} \times 20 = 360$

2



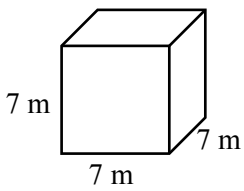
V = *lbh*

$= 13 \times \cancel{4} \times \cancel{15}^{60}$

V = 780 mm^3

$\overset{1}{13} \times 60 = 780$

3



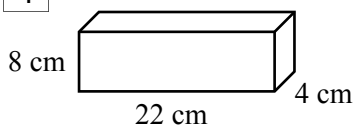
V = *lbh*

$= 7 \times \cancel{7} \times \cancel{7}^{49}$

V = 343 m^3

$\overset{6}{49} \times 7 = 343$

4



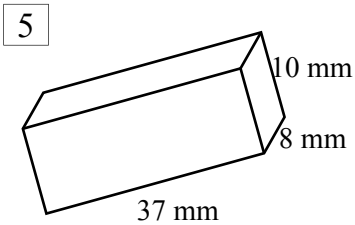
V = *lbh*

$= \cancel{8} \times \cancel{4}^{32} \times 22$

V = 704 cm^3

$32 \times 22 = \overset{1}{64}$, 640, 704

5



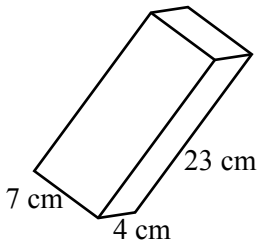
V = *lbh*

$= 37 \times \cancel{8} \times \cancel{10}^{80}$

V = 2960 mm^3

$\overset{5}{37} \times 80 = 2\,960$

6



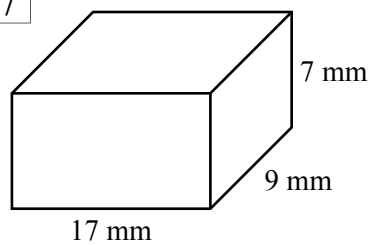
V = *lbh*

$= \cancel{7} \times \cancel{4}^{28} \times 23$

V = 644 cm^3

$28 \times 23 = \overset{1}{84}$, 560, 644

7



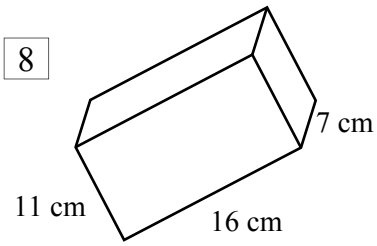
V = *lbh*

$= 17 \times \cancel{9} \times \cancel{7}^{63}$

V = 1 071 mm^3

$63 \times 17 = 441$, 630, $1\,071$

8



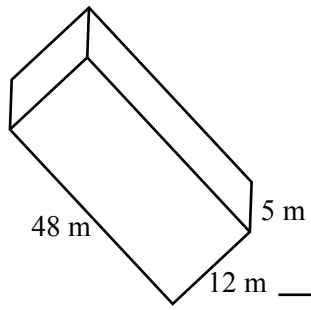
V = *lbh*

$= 16 \times \cancel{7} \times \cancel{11}^{77}$

V = 1 232 cm^3

$77 \times 16 = \overset{1}{462}$, 770, $1\,232$

9



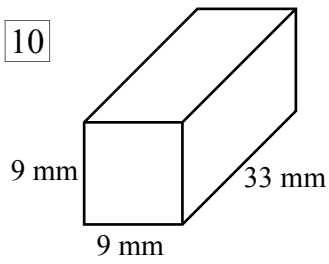
V = *lbh*

$= 48 \times \cancel{5} \times \cancel{12}^{60}$

V = 2 880 m^3

$\overset{4}{48} \times 60 = 2\,880$

10



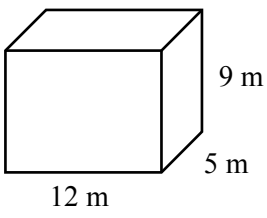
V = *lbh*

$= \cancel{9} \times \cancel{9}^{81} \times 33$

V = 2 673 mm^3

$81 \times 33 = 243$, $2\,430$, $2\,673$

11



V = *lbh*

$= 12 \times \cancel{5} \times \cancel{9}^{45}$

V = 540 m^3

$45 \times 12 = \overset{1}{90}$, 450, 540

Further Volumes of Prisms

The method of the sheet is to first calculate the area of the face (uniform cross section area) then multiply it by the height of the shape. Note that because this sheet deals with triangular prisms you must not confuse the h used in $A = \frac{1}{2}bh$ with the h used in $V = Ah$.

There are six lines of working as the example in column 1 shows. Calculate the area of the triangular face, then using the working space multiply the area with the shape's height to get its volume. Write 3 lines of working for the volume. Don't forget you will have square units (mm^2, cm^2, m^2) for the area and cubic units (mm^3, cm^3, m^3) for the volume.

The 3rd column involves composite shapes. You have to add the 2 areas to get the total area. So find the sum of the two areas (add them) and multiply by the height to get the volume.

There is an example at the top of column 1.

Converting between Volume and Capacity

When you calculate the volume within a solid it's measured in cubic units such as mm^3, cm^3, or m^3. These units are used usually to define empty space such as storage space, shipping containers or packaging, usually when they are to be filled with solid material. Capacity is measured in millilitres (mL), litres (L), kilolitres (kL) and Megalitres (ML). Each unit is 1 000 times larger than the unit before it. While capacity is usually associated with liquids it is also used with air. For example the space inside a car will have its capacity measured in litres.

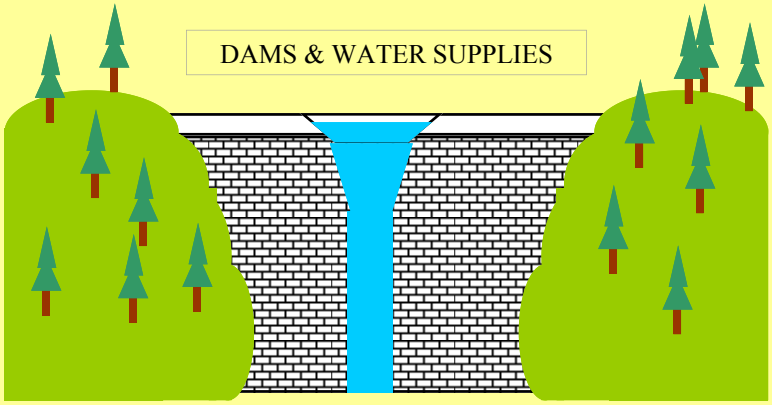
Column 1 starts with comparing mL and cm^3. They are the same, so a measurement in mL, say 5.72 mL is the same in cm^3, 5.72 cm^3. So rewrite the number and change to the other unit. From question 7 you are asked to convert cm^3 to L. As 1 cm^3 is 1 mL, and there are 1 000 mL in a L, then 1 cm^3 must be $^1/_{1000}$ of a L. So divide by 1 000 or move the decimal point 3 places to the left to get your answer. Remember that litres is written with an upper case L.

A common object where both capacity and volume are used is with car motors. The size of the engine could be given in c.c. (cubic centimetres) which is an accepted way of writing cm^3, or litres (L). For example a 1 800 c.c. engine could also be described as a 1.8 L engine.

Column 2 starts with the reverse converting from L to cm^3. This time you multiply by 1 000 or move the decimal point 3 places to the right. The last 6 questions involve the conversion between kL and m^3. Just as with mL and cm^3, they are identical so 1 kilolitre (1 000 L) = 1 cubic metre (m^3). Just rewrite the number and change the unit.

Column 3 asks you first to convert from m^3 to L. Remember that $1m^3$ = 1 kL which is 1 000 L. So multiply by 1 000 or move the decimal point 3 places to the right. The next section of the column reverses the process, converting L to m^3. Reverse the process by dividing by 1 000 or moving the decimal place 3 places to the left.

This sheet doesn't deal with Megalitres (ML) as they are rarely used. But there are times when their use is essential when dealing with large capacities, can you think of where ML would be used?



Converting between Volume and Capacity

Change the units from mL to cm^3 or the reverse

Example

73 mL = 73 cm^3

1. 350 mL = _____
2. 105 mL = _____
3. 56.3 cm^3 = _____
4. 850 mL = _____
5. 2.43 cm^3 = _____
6. 600 cm^3 = _____

Convert these volumes in cm^3 (c.c.) to litres

850 cm^3 = 0.85 L (3 places left)

7. 1 000 cm^3 = _____
8. 800 cm^3 = _____
9. 450 cm^3 = _____
10. 2 100 cm^3 = _____
11. 1 700 cm^3 = _____
12. 750 cm^3 = _____
13. 1 250 cm^3 = _____
14. 5 000 cm^3 = _____
15. 85 cm^3 = _____
16. 4 302 cm^3 = _____
17. 120.4 cm^3 = _____
18. 333 cm^3 = _____
19. 2 006 cm^3 = _____
20. 500 cm^3 = _____
21. 25.1 cm^3 = _____
22. 1 007 cm^3 = _____
23. 10 cm^3 = _____

Now reverse, change these from L to cm^3

4.3 L = 4 300 cm^3 (3 places right)

24. 2 L = _____
25. 0.5 L = _____
26. 3.1 L = _____
27. 0.2 L = _____
28. 3.5 L = _____
29. 1.75 L = _____
30. 0.04 L = _____
31. 4.03 L = _____
32. 0.05 L = _____
33. 0.01 L = _____
34. 0.2063 L = _____
35. 2.02 L = _____
36. 0.25 L = _____
37. 4.06 L = _____
38. 0.96 L = _____
39. 3.007 L = _____
40. 4.55 L = _____

Change the units from kL to m^3 or the reverse

Example

2.9 m^3 = 2.9 kL

41. 7 m^3 = _____
42. 3.84 kL = _____
43. 43 kL = _____
44. 0.3 m^3 = _____
45. 204 m^3 = _____
46. 7.06 kL = _____

Change these volumes from m^3 to litres.

2.53 m^3 = 2 530 L (3 places right)

47. 7.2 m^3 = _____
48. 0.5 m^3 = _____
49. 3.7 m^3 = _____
50. 0.25 m^3 = _____
51. 16.403 m^3 = _____
52. 0.02 m^3 = _____
53. 5.62 m^3 = _____
54. 1.01 m^3 = _____
55. 7.9035 m^3 = _____
56. 18.006 m^3 = _____
57. 105.12 m^3 = _____

Now change these from litres to cubic metres

2 650 L = 2.65 m^3 (3 places left)

58. 2 000 L = _____
59. 1 700 L = _____
60. 800 L = _____
61. 3 075 L = _____
62. 175 L = _____
63. 422 L = _____
64. 9.06 L = _____
65. 45.6 L = _____
66. 115 L = _____
67. 2 L = _____
68. 500.5 L = _____
69. 3 000.6 L = _____

Converting between Volume and Capacity

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Change the units from mL to cm^3 or the reverse

Example

73 mL = 73 cm^3

1. 350 mL = 350 cm^3
2. 105 mL = 105 cm^3
3. 56.3 cm^3 = 56.3 mL
4. 850 mL = 850 cm^3
5. 2.43 cm^3 = 2.43 mL
6. 600 cm^3 = 600 mL

Convert these volumes in cm^3 (c.c.) to litres

850 cm^3 = 0.85 L (3 places left)

7. 1 000 cm^3 = 1 L
8. 800 cm^3 = 0.8 L
9. 450 cm^3 = 0.45 L
10. 2 100 cm^3 = 2.1 L
11. 1 700 cm^3 = 1.7 L
12. 750 cm^3 = 0.75 L
13. 1 250 cm^3 = 1.25 L
14. 5 000 cm^3 = 5 L
15. 85 cm^3 = 0.085 L
16. 4 302 cm^3 = 4.302 L
17. 120.4 cm^3 = 0.1204 L
18. 333 cm^3 = 0.333 L
19. 2 006 cm^3 = 2.006 L
20. 500 cm^3 = 0.5 L
21. 25.1 cm^3 = 0.0251 L
22. 1 007 cm^3 = 1.007 L
23. 10 cm^3 = 0.01 L

Now reverse, change these from L to cm^3

4.3 L = 4 300 cm^3 (3 places right)

24. 2 L = 2 000 cm^3
25. 0.5 L = 500 cm^3
26. 3.1 L = 3 100 cm^3
27. 0.2 L = 200 cm^3
28. 3.5 L = 3 500 cm^3
29. 1.75 L = 1 750 cm^3
30. 0.04 L = 40 cm^3
31. 4.03 L = 4 030 cm^3
32. 0.05 L = 50 cm^3
33. 0.01 L = 10 cm^3
34. 0.2063 L = 206.3 cm^3
35. 2.02 L = 2 020 cm^3
36. 0.25 L = 250 cm^3
37. 4.06 L = 4 060 cm^3
38. 0.96 L = 960 cm^3
39. 3.007 L = 3 007 cm^3
40. 4.55 L = 4 550 cm^3

Change the units from kL to m^3 or the reverse

Example

2.9 m^3 = 2.9 kL

41. 7 m^3 = 7 kL
42. 3.84 kL = 3.84 m^3
43. 43 kL = 43 m^3
44. 0.3 m^3 = 0.3 kL
45. 204 m^3 = 204 kL
46. 7.06 kL = 7.06 m^3

Change these volumes from m^3 to litres.

2.53 m^3 = 2 530 L (3 places right)

47. 7.2 m^3 = 7 200 L
48. 0.5 m^3 = 500 L
49. 3.7 m^3 = 3 700 L
50. 0.25 m^3 = 250 L
51. 16.403 m^3 = 16 403 L
52. 0.02 m^3 = 20 L
53. 5.62 m^3 = 5 620 L
54. 1.01 m^3 = 1 010 L
55. 7.9035 m^3 = 7 903.5 L
56. 18.006 m^3 = 18 006 L
57. 105.12 m^3 = 105 120 L

Now change these from litres to cubic metres

2 650 L = 2.65 m^3 (3 places left)

58. 2 000 L = 2 m^3
59. 1 700 L = 1.7 m^3
60. 800 L = 0.8 m^3
61. 3 075 L = 3.075 m^3
62. 175 L = 0.175 m^3
63. 422 L = 0.422 m^3
64. 9.06 L = 9 060 m^3
65. 45.6 L = 0.0456 m^3
66. 115 L = 0.115 m^3
67. 2 L = 0.002 m^3
68. 500.5 L = 0.5005 m^3
69. 3 000.6 L = 3.0006 m^3

Units of Capacity

Capacity is another way of expressing volume. Rather than using length measurements, capacity is expressed using measurements normally associated with liquids. Usually mL, L and kL. This sheet deals with the changing of units between these three. As with length, (mm, m and km), capacity units are × 1 000 apart (cm is the exception with length). So you multiply by 1 000, or as hopefully you know, you move the decimal point 3 places to the right (multiplying) and to the left (dividing).

Column 1 deals with changing from a smaller unit to a larger unit. With these you divide by 1 000. So move the decimal point 3 places to the left with these, remember to write the new unit after your answer, it will be the unit inside the brackets. Watch that you don't have unnecessary zeros in your answers when decimal points are involved.

Column 2 is the reverse, this time moving to a smaller unit so you have more of them, so you are multiplying by 1 000. Move the decimal point 3 places to the right to make the number larger. Again remember to write the new units after the number.

Column 3 asks you to find the volume of the prisms, the answer will be in cubic units, either cm^3 or m^3. Convert these to either mL (if cm^3) or kL (if m^3), rewrite the number and change the units. Then rewrite the answer in litres (L), using your skills from the previous 2 columns. Capacity is volume, so you still write 'V =' in your answer.

Note that L is the symbol for litres, it is a capital letter, this may seem unusual but many metric units use capital letters, an example being ‘N’ (Newtons, a measure of force) or ‘W’ (Watt, a measure of electrical power).

Units of Capacity

9	505 L	[kL] =	0.505 L
10	50 L	[kL] =	0.05 kL
11	10 mL	[L] =	0.01 L
12	35 mL	[L] =	0.035 L
13	1 017 L	[kL] =	1.017 kL
14	110 mL	[L] =	0.11 L
15	4 070 L	[kL] =	4.07 L
16	1 400 mL	[L] =	1.4 L
17	60 mL	[L] =	0.06 L
18	15 L	[kL] =	0.015 kL
19	410 mL	[L] =	0.41 L
20	5 030 L	[kL] =	5.03 kL
21	303 L	[kL] =	0.303 kL
22	1 L	[kL] =	0.001 kL

Convert the measurements to the smaller units shown in the brackets

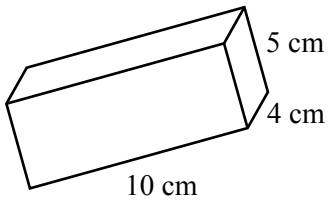
kL → L × 1 000 → 3 places right

L → mL × 1 000 → 3 places right

23	1 L	[mL] =	1 000 mL
24	6 L	[mL] =	6 000 mL
25	4.5 kL	[L] =	4 500 mL
26	1.25 L	[mL] =	1 250 mL
27	0.75 L	[mL] =	750 mL
28	0.8 kL	[L] =	800 L
29	3.2 L	[mL] =	3 200 mL
30	0.01 kL	[L] =	10 L
31	1.12 kL	[L] =	1 120 L
32	3.05 kL	[L] =	3 050 L
33	0.079 L	[mL] =	79 mL
34	5.03 L	[mL] =	5 030 mL
35	0.871 kL	[L] =	871 L
36	5.64 kL	[L] =	5 640 L
37	0.0025 L	[mL] =	2.5 mL
38	2.004 kL	[L] =	2 004
39	0.07 L	[mL] =	70 mL
40	0.003 kL	[L] =	3 L
41	0.0005 kL	[L] =	0.5 L
42	1.9 L	[mL] =	1 900 mL
43	0.0087 kL	[L] =	8.7 L
44	0.053 L	[mL] =	53 mL

Calculate the volume in either cm^3 or m^3, write the answer as mL or kL, then rewrite converting to litres

45



$V = l \times b \times h$

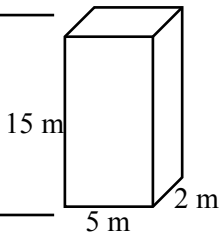
$= 10 \times 5 \times 4$

V = 200 cm^3

V = 200 mL

V = 0.2 L

46



$V = l \times b \times h$

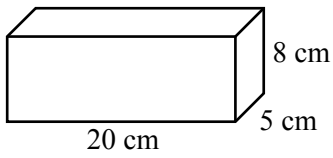
$= 5 \times 15 \times 2$

$V = 150\ m^3$

V = 150 kL

V = 150 000 L

47



$V = l \times b \times h$

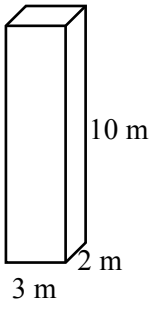
$= 20 \times 8 \times 5$

$V = 800\ cm^3$

V = 800 mL

V = 0.8 L

48



$V = l \times b \times h$

$= 3 \times 10 \times 2$

$V = 60\ m^3$

V = 60 kL

V = 60 000 L

Mass

Mass is a measure of weight, so why is it called mass? The difference is that mass is constant, if you weigh 53 kg at sea level you won't actually weigh 53 kg on top of Mt Everest. This is due to gravity being weaker when you are further from the centre of the planet, so as you move up, you technically weigh less! But your mass is still 53 kg, it stays unchanged from gravitational or outside effects. This is exaggerated when space or moon travel are involved as each planet/moon has a different gravitational pull. So the technical word is mass but unless you are going to Mars or Mt Everest the word weight is usually more commonly used.

Column 1 deals with changing from one unit to a larger unit. In all circumstances the difference is a factor of 1 000, and when you move to a larger unit you divide. But when you divide by 1 000 it is easier to move the decimal point 3 places (count the zeros) to the left. Examples are at the top of the column, don't forget to write the units (mg, g, kg, t). If in your answer you have a zero on the end of the number and it is behind the decimal point, it shouldn't be there, decimal answers should always be in their shortest form.

43.70 kg = 43.7 kg

Don't write the mass with an unnecessary zero, always write decimals in their most simplest form.

Column 2 is the reverse, you are moving to a smaller unit and so you multiply by 1 000. This means you move the decimal point 3 places to the right. Examples are there as well as the 'arrowed' guide, again don't forget the units.

Column 3 is in problem form and asks you to then express (state or give) the answer in two different units. The last two questions ask for the unit weight. The unit weight is the weight of 1 item, so you will have to divide the total mass by the number of items to get the unit weight.

Mass

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Express these masses in the units given in the brackets. All are ÷ 1 000.

50 mg = 0.05 g (3 places left)

950 g = 0.95 kg (3 places left)

4 250 kg = 4.25 t (3 places left)

1 2 000 kg [t] = _____

2 3 600 g [kg] = _____

3 900 g [kg] = _____

4 150 mg [g] = _____

5 305.7 kg [t] = _____

6 100 mg [g] = _____

7 1 750 mg [g] = _____

8 80.2 g [kg] = _____

9 220 kg [t] = _____

10 3 510 kg [t] = _____

11 5 300 mg [g] = _____

12 95 g [kg] = _____

13 750 g [kg] = _____

14 11 mg [g] = _____

15 8 070 kg [t] = _____

16 610 kg [t] = _____

17 8 g [kg] = _____

18 400 mg [g] = _____

19 16 300 kg [t] = _____

20 7 070 mg [g] = _____

21 30 090g [kg] = _____

22 101.3 g [kg] = _____

Now the reverse, multiply by 1 000 to change to the units in the brackets

3.7 t = 3 700 kg (3 places right)

0.52 kg = 520 g (3 places right)

1.06 g = 1 060 mg (3 places right)

23 1.2 kg [g] = _____

24 4.3 g [mg] = _____

25 3.85 t [kg] = _____

26 0.7 kg [g] = _____

27 5.02 t [kg] = _____

28 11 kg [g] = _____

29 0.05 g [mg] = _____

30 1.01 g [mg] = _____

31 10.01 kg [g] = _____

32 0.04 kg [g] = _____

33 13.14 t [kg] = _____

34 0.35 t [kg] = _____

35 9.04 g [mg] = _____

36 46 kg [g] = _____

37 0.01 g [mg] = _____

38 6.702 t [kg] = _____

39 0.65 g [mg] = _____

40 7.15 kg [g] = _____

41 6.06 t [kg] = _____

42 0.05 kg [g] = _____

43 0.2 g [mg] = _____

44 3.71 g [mg] = _____

Calculate the combined mass of these, then convert to kilograms.

45 7 cans of salmon, each 450g

g: _____ ×

kg: _____ _____

46 3 cartons of milk, each one having a mass of 830 g.

g: _____ ×

kg: _____ _____

47 A dozen oranges each having an average mass of 270g

g: _____ ×

kg: _____ _____

Now find the average unit weight for the following

48 Eight tablets with a total mass of 36.48 g

g: _____

mg: _____)_____

49 Four cars with a total mass of 4.3 t.

t: _____

kg: _____)_____

Mass

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Express these masses in the units given in the brackets. All are ÷ 1 000.

50 mg = 0.05 g (3 places left)

950 g = 0.95 kg (3 places left)

4 250 kg = 4.25 t (3 places left)

1	2 000 kg	[t] =	2 t
2	3 600 g	[kg] =	3.6 kg
3	900 g	[kg] =	0.9 kg
4	150 mg	[g] =	0.15 g
5	305.7 kg	[t] =	0.3057 t
6	100 mg	[g] =	0.1 g
7	1 750 mg	[g] =	1.75 g
8	80.2 g	[kg] =	0.0802 kg
9	220 kg	[t] =	0.22 kg
10	3 510 kg	[t] =	3.51 t
11	5 300 mg	[g] =	5.3 g
12	95 g	[kg] =	0.095 kg
13	750 g	[kg] =	0.75 kg
14	11 mg	[g] =	0.011 g
15	8 070 kg	[t] =	8.07 t
16	610 kg	[t] =	0.61 t
17	8 g	[kg] =	0.008 kg
18	400 mg	[g] =	0.4 g
19	16 300 kg	[t] =	16.3 t
20	7 070 mg	[g] =	7.07 g
21	30 090g	[kg] =	30.09 kg
22	101.3 g	[kg] =	0.1013 kg

Now the reverse, multiply by 1 000 to change to the units in the brackets

3.7 t = 3 700 kg (3 places right)

0.52 kg = 520 g (3 places right)

1.06 g = 1 060 mg (3 places right)

23	1.2 kg	[g] =	1 200 g
24	4.3 g	[mg] =	4 300 mg
25	3.85 t	[kg] =	3 850 kg
26	0.7 kg	[g] =	700 g
27	5.02 t	[kg] =	5 020 kg
28	11 kg	[g] =	11 000 g
29	0.05 g	[mg] =	50 mg
30	1.01 g	[mg] =	1 010 mg
31	10.01 kg	[g] =	10 010 g
32	0.04 kg	[g] =	40 g
33	13.14 t	[kg] =	13 140 kg
34	0.35 t	[kg] =	350 kg
35	9.04 g	[mg] =	9 040 mg
36	46 kg	[g] =	46 000 g
37	0.01 g	[mg] =	10 mg
38	6.702 t	[kg] =	6 702 kg
39	0.65 g	[mg] =	650 mg
40	7.15 kg	[g] =	7 150 g
41	6.06 t	[kg] =	6 060 kg
42	0.05 kg	[g] =	50 g
43	0.2 g	[mg] =	200 mg
44	3.71 g	[mg] =	3 710 mg

Calculate the combined mass of these, then convert to kilograms.

45 7 cans of salmon, each 450g

g: 3 150 g

kg: 3.15 kg

$$\begin{array}{r} {\scriptstyle 3}\,450 \\ \times\ 7 \\ \hline 3\,150 \end{array}$$

46 3 cartons of milk, each one having a mass of 830 g.

g: 2 490 g

kg: 2.49 kg

$$\begin{array}{r} 830 \\ \times\ 3 \\ \hline 2\,490 \end{array}$$

47 A dozen oranges each having an average mass of 270g

g: 3 240 g

kg: 3.24 kg

$$\begin{array}{r} {\scriptstyle 1}\,270 \\ \times\ 12 \\ \hline {\scriptstyle 1}\,540 \\ 2\,700 \\ \hline 3\,240 \end{array}$$

Now find the average unit weight for the following

48 Eight tablets with a total mass of 36.44 g

g: 4.56 g

mg: 4 560 mg

$$8\overline{)\,36.48} = 4.56$$

49 Four cars with a total mass of 4.3 t.

t: 1.075 t

kg: 1 075 kg

$$4\overline{)\,4.300} = 1.075$$

Net and Gross Mass

When you buy a product from a shop you want to know how much product you are getting, so that you can compare. For example frozen corn kernels will be in a plastic bag while unfrozen corn kernels will be in a can, the can may weigh more than the bag, but is that because of the can or is there more corn inside? Instead of products having their total weight on them they have their Net weight, this is the weight of the actual product inside the can or bag.

So Net weight is the weight of the contents. The total weight, product + container is called the Gross weight. Gross weight is rarely on the item but you have to calculate it if you are sending an item by mail or paying for its transport. Gross weight is also important in industry which sets a maximum weight that a person can lift, the packaging must be factored into calculations. Remember the environment when you buy an item, try to buy one that minimises the use of packaging.

These three equations are involved with this worksheet:

- Net weight = Gross weight - Container weight
- Gross weight = Net weight + Container weight
- Container weight = Gross weight - Net weight

Column 1 asks you to calculate the gross weight, add the packaging weight to the net weight to get the answer. You should be able to complete the table mentally, watch the units asked for in the answer. Problem style questions then follow, use the working spaces provided then give your answer in the units asked for.

Column 2 asks you to calculate the net weight. This is found by subtracting the packaging weight from the gross weight. This column is in the same format as the previous column, you should be able to do these mentally, then the problems have working spaces provided.

Column 3 asks you to calculate the weight of the packaging, subtract the net weight from the gross weight to answer these. The last question has a table that gives two values in each row, you have to use your skills with these to calculate the third value. Do you add or do you subtract…?

The weight given on a product is the net weight. This is the weight of the tuna inside the can without the can's weight. You only want to know this weight so… 'the net is what you get.'

Net and Gross Mass

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Calculate the gross weight of the items below in the given units

1 Net + Container = Gross

Net	Container	Gross
150 g	30 g	g
225 g	70 g	g
480 g	90 g	g
1 kg	50 g	g
20 kg	750 g	kg
13.2 kg	1050 g	kg

2 A cable car weighing 1.4 t has 8 people board it with an average weight of 77 kg.

i) Calculate the combined weight of the passengers

×

kg: _____

_____

_____

ii) Calculate the current gross mass of the cable car in kg and t

+

kg: _____ _____

t: _____ _____

3 A jar of vitamin pills contains 35 pills at 7 g each. If the jar itself weighs 83 g find the gross weight.

× +

_____ _____

_____ _____

_____

What's in the net is what you get.. calculate the net mass of these

4 Gross - Container = Net

Gross	Container	Net
305 g	60 g	g
495 g	25 g	g
120 g	35 g	g
75 kg	17 kg	kg
1 750 kg	300 kg	t
8.7 t	250 kg	t

5 Tegan has caught a rare finger-swallowing tiger slug. If the bug catcher weighs 469 g and with the slug weighs 718 g, find the mass of the slug.

-

_____ _____

_____ _____

6 A variety pack of cereals has 8 different selections. If the net mass of the pack is 600g find the mass of each selection.

_____)

_____

7 A man on scales weighing 86 kg lifts his daughter up and the new reading is 133 kg. Find the weight of his daughter.

-

_____ _____

_____ _____

8 A rain gauge jar weighs 57 g, after rain it weighs 67 g. The mL of water inside is…

1 ⬭ 10 ⬭ 100 ⬭ 1 000 ⬭

Now calculate the weight of the containers.

9 Gross - Net = Container

Gross	Net	Container
45 g	18 g	g
300 g	225 g	g
705 g	620 g	g
8.3 kg	7.6 kg	g
850 kg	65 kg	t
19.2 t	1.6 t	t

10 Harry's glasses weigh 248g, in their case the weight is 437g. Find the weight of the case.

-

_____ _____

_____ _____

11 Han weighs 75 kg, when he is encased in carbonite he tips the scales at 722 kg. Find the weight of the carbonite.

-

_____ _____

_____ _____

Fill in the blanks… may the gross be with you!

12

Net	Packaging	Gross
200 g	55 g	
	17 g	80 g
20.3 kg		21.9 kg
0.83 t	150 kg	
5.7 t	80 kg	
	97 kg	1.3 t

Net and Gross Mass

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 1 - LICENSED FOR NON-COMMERCIAL USE

Calculate the gross weight of the items below in the given units

1 Net + Container = Gross

Net	Container	Gross
150 g	30 g	180 g
225 g	70 g	295 g
480 g	90 g	570 g
1 kg	50 g	1 050 g
20 kg	750 g	20.75 kg
13.2 kg	1050 g	14.25 kg

2. A cable car weighing 1.4 t has 8 people inside with an average weight of 77 kg.

i) Calculate the combined weight of the passengers

kg: 616 kg

$^{5}77 \times 8 = 616$

ii) Calculate the current gross mass of the cable car in kg and t

kg: 2 016 kg

t: 2.016 t

$^{1}1\,400 + 616 = 2\,016$

3. A jar of vitamin pills contains 35 pills at 7 g each. If the jar itself weighs 83 g find the gross weight.

$^{3}35 \times 7 = 245$

$^{1}245 + 83 = 328$

Gross weight is 328 g

What's in the net is what you get.. calculate the net mass of these

4 Gross - Container = Net

Gross	Container	Net
305 g	60 g	245 g
495 g	25 g	470 g
120 g	35 g	85 g
75 kg	17 kg	58 kg
1 750 kg	300 kg	1.45 t
8.7 t	250 kg	8.45 t

5 Tegan has caught a rare finger-swallowing tiger slug. If the bug catcher weighs 469 g and with the slug weighs 718 g, find the mass of the slug.

Start running its 249 g!!!!

$^{1\,1}718 - 469 = 249$

6 A variety pack of cereals has 8 different selections. If the net mass of the pack is 600g find the mass of each selection.

Each pack weighs 75 g

$8\overline{)600} = 75$

7 A man on scales weighing 86 kg lifts his daughter up and the new reading is 133 kg. Find the weight of his daughter.

She weighs 47 kg.

$^{1\,1}133 - 86 = 47$

8 A rain gauge jar weighs 57 g, after rain it weighs 67 g. The mL of water inside is…

1 ○ 10 ● 100 ○ 1 000 ○

Now calculate the weight of the containers.

9 Gross - Net = Container

Gross	Net	Container
45 g	18 g	27 g
300 g	225 g	75 g
705 g	620 g	85 g
8.3 kg	7.6 kg	700 g
850 kg	65 kg	0.785 t
19.2 t	1.6 t	17.6 t

10 Harry's glasses weigh 248g, in their case the weight is 437g. Find the weight of the case.

The spectacles case weighs 189 g

$^{1\,1}437 - 248 = 189$

11 Han weighs 75 kg, when he is encased in carbonite he tips the scales at 722 kg. Find the weight of the carbonite.

Its 647 kg! Lucky it hovers.

$^{1\,1}722 - 75 = 647$

Fill in the blanks… may the gross be with you!

12

Net	Packaging	Gross
200 g	55 g	255 g
63 g	17 g	80 g
20.3 kg	1.6 kg	21.9 kg
0.83 t	150 kg	980 kg
5.7 t	80 kg	5.78 t
1.203 t	97 kg	1.3 t

ALTITUDE

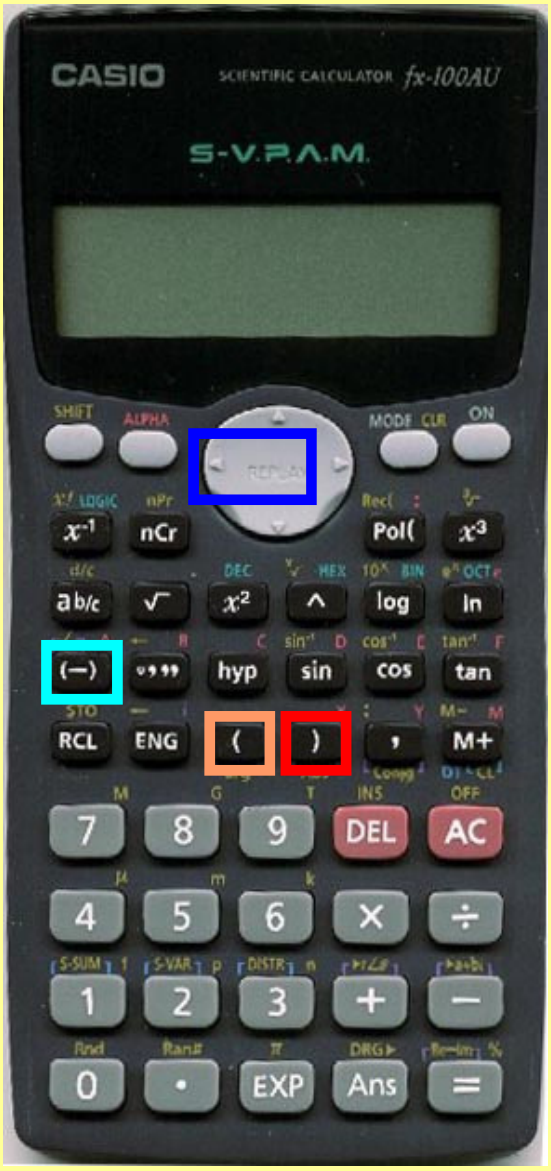
CALCULATOR

Replay, Negatives & Brackets - Calculator Applications

This sheet deals with understanding some features of your calculator. Calculator design is always changing, so the button style may be different to the layout below, but an alternative button will exist of\n your calculator.

Column 1 deals with use of the replay key, as referred to on Casio calculators. The "Back Button" is just the same. It is important, especially when using "Guess and Check" methods that you can alter numbers in a long calculation without having to retype the Entire calculation again. So this column gets you to use the replay button to save time.



Note that some replay functions write over the number while some insert the number, so you may have to use the DEL key after you enter the number.

Column 2 starts off with the use of the negative key in calculations. Note that this key could also be a +/- key. Some calculators allow you to use the minus key and you may ask ….. why bother? The big difference is when power keys are used.

Column 2 and three then introduce the brackets key. Brackets keys are important when order of operations properties are important. Column 2 gives you the brackets in the questions, while in Column 3 the brackets aren't there, but you have to use them with your calculator or you will get the wrong answer.

Column 3 ends with some calculations. When you get the answer write the question in the first space. Then turn your calculator upside down, the inverted numbers can be read off like they are letters. Write the word that is spelt out. If the word doesn't make sense, you have probably made a calculator key stroke error.

Replay, Negatives & Brackets - Calculator Applications

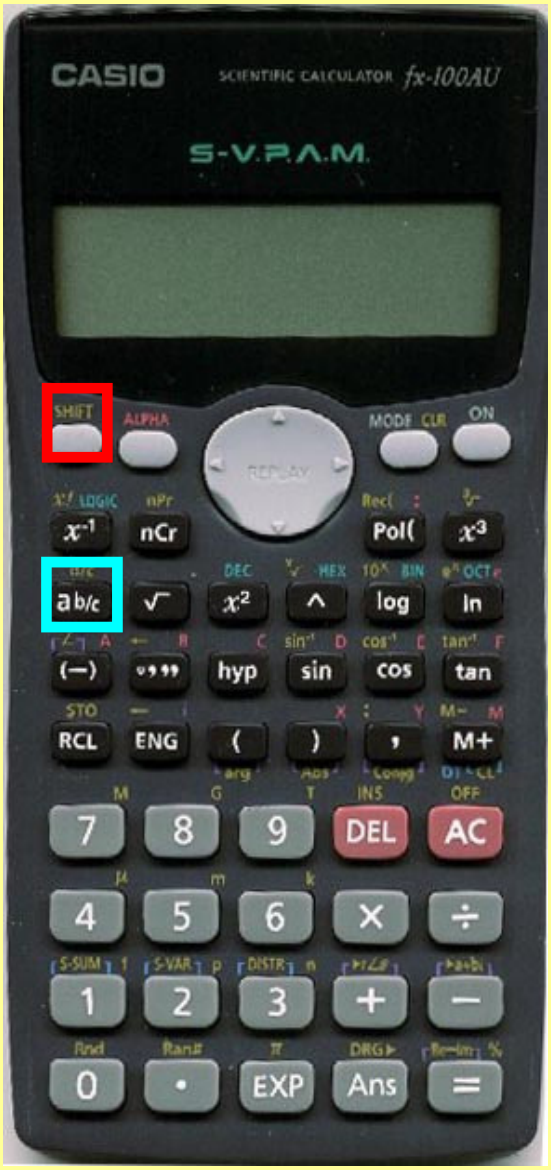
38 076 Globe

Fractions - Calculator Applications

This worksheet deals with the use of your calculator's fraction key. This key could also look like this: $\square\!\!\frac{\square}{\square}$ as well, it depends on the brand and model of your calculator. The first column starts with changing fractions to decimals. All columns have keystroke examples but this may differ from your calculator, depending on brand or the model used.

To change a fraction to a decimal, enter the fraction using the fraction key (example at the top of the column), press '=' and then the fraction key again. Your calculator may have a S→D button. If so press this button instead. To change decimals to a fraction, enter the decimal press the '=' button then the fraction key. (Or the S→D key).



Note that a fraction can be converted to a decimal by just using the division '÷' key as well.

Column 2 deals first with simplifying fractions. Enter the fraction then press the '=' button to simplify. The same process is used to change improper fractions to Mixed Numerals. Just enter the fraction and press '='. (Note that this may vary with some calculators, the S→D key with the Shift key may be required).

Converting mixed numerals to improper fractions is achieved by entering the mixed number, pressing the '=' button, then SHIFT & the fraction key. Some calculators are set to display fractions as improper fractions, this can be changed in the calculators settings.

Column 3 has mixed questions.

Converting fractions to decimals allows easier comparison. Make sure that when you write the decimals that they have the same number of decimal places, this makes it easier to compare them.

19 3.4 = $3\frac{2}{5}$ 20 4.56 = $4\frac{14}{25}$

Convert the fractions to decimals to compare, use < or > in the box

21 $\frac{3}{4}$ < $\frac{13}{16}$

0.7500 (Decimal 4 d.p.) 0.8125 (Decimal)

22 $\frac{4}{5}$ < $\frac{42}{48}$

0.800 0.875

Simplify these fractions.

Calc: 1 6 a b/c 2 0 =

23 $\frac{16}{20} = \frac{4}{5}$ 24 $\frac{72}{96} = \frac{3}{4}$

25 $\frac{225}{270} = \frac{5}{6}$ 26 $\frac{27}{126} = \frac{3}{14}$

27 $\frac{405}{500} = \frac{81}{100}$ 28 $\frac{325}{520} = \frac{5}{8}$

29 $\frac{68}{320} = \frac{17}{80}$ 30 $\frac{15}{85} = \frac{3}{17}$

Convert these improper fractions to mixed numerals.

Calc: 1 7 a b/c 4 =

31 $\frac{17}{4} = 4\frac{1}{4}$ 32 $\frac{7}{2} = 3\frac{1}{2}$

33 $\frac{40}{16} = 2\frac{1}{2}$ 34 $\frac{35}{3} = 11\frac{2}{3}$

35 $\frac{26}{7} = 3\frac{5}{7}$ 36 $\frac{35}{19} = 1\frac{16}{19}$

37 $\frac{50}{13} = 3\frac{11}{13}$ 38 $\frac{26}{9} = 2\frac{8}{9}$

Convert these mixed numerals to improper fractions.

Calc: 2 a b/c 3 a b/c 5 = SHIFT a b/c

39 $2\frac{3}{5} = \frac{13}{5}$ 40 $5\frac{7}{8} = \frac{47}{8}$

41 $6\frac{4}{7} = \frac{46}{7}$ 42 $1\frac{8}{13} = \frac{21}{13}$

43 $5\frac{1}{8} = \frac{41}{8}$ 44 $10\frac{2}{9} = \frac{92}{9}$

45 $8\frac{2}{17} = \frac{138}{17}$ 46 $3\frac{4}{23} = \frac{73}{23}$

47 $7\frac{3}{13} = \frac{94}{13}$ 48 $3\frac{24}{99} = \frac{107}{33}$

Perform these calculations on your calculator.

49 $\frac{1}{2} + \frac{1}{3} = \frac{5}{6}$

50 $5\frac{7}{8} - 3\frac{2}{5} = 2\frac{19}{40}$

51 $\frac{3}{7} \times \frac{5}{9} = \frac{5}{21}$

52 $\frac{11}{15} - \frac{2}{3} = \frac{1}{15}$

53 $\frac{6}{5} \div \frac{8}{15} = 2\frac{1}{4}$

54 $\frac{4}{9} + \frac{2}{3} \times \frac{7}{12} = \frac{5}{6}$

55 $\frac{1}{5} \div \frac{7}{8} + \frac{3}{10} = \frac{37}{70}$

56 $4\frac{7}{9} \times 4 - 5\frac{3}{4} = 13\frac{13}{36}$

57 $3\frac{2}{3} \div 1\frac{1}{2} + \frac{7}{10} = 3\frac{13}{90}$

Use decimals to arrange these in descending order

58 $\frac{3}{5}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{10}$

0.600 0.625 0.750 0.700

Write the decimals to 3 d.p.

Rewrite in Descending order → $\frac{3}{4}$, $\frac{7}{10}$, $\frac{5}{8}$, $\frac{3}{5}$.

59 $\frac{9}{12}$, $\frac{5}{2}$, $\frac{9}{4}$, $\frac{12}{5}$

0.750 2.500 2.250 2.400

Rewrite in Descending order → $\frac{5}{2}$, $\frac{12}{5}$, $\frac{9}{4}$, $\frac{9}{12}$.

Powers and Roots - Calculator Applications

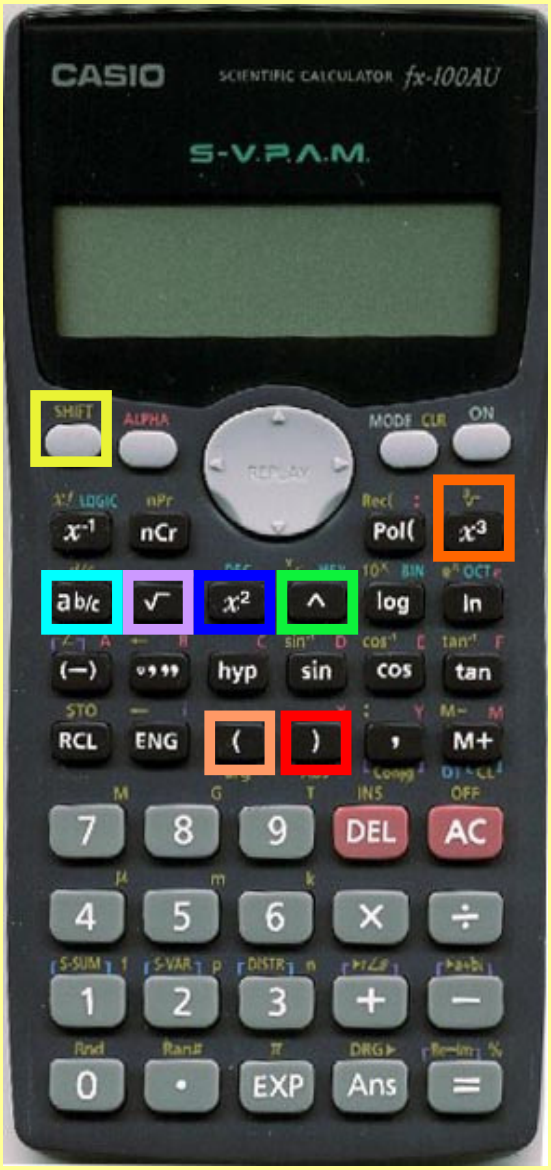
This sheet is about the use of powers and roots on a calculator. There are examples on the next sheet with a calculator image showing you the buttons. This calculator is probably different from yours but the symbols used on the keys should be the same, just look for the symbols.

Column 1 is all square roots, some calculators require you to type the number then the square root, the steps for these calculators are different than those shown, try your calculator on the examples on the next page and see the method you use to get the correct answer. The first part of the column doesn't require brackets, the second part does. Your calculator needs brackets to force order of operations on it, otherwise it will take the square root of the first number only.

Column 2 deals with squares (power of 2) and cubes (power of 3). Some calculators may not have a cube key, if this is your case then use the power key with a power of 3. Some calculators experience difficulty with fractions and powers, with the power being considered on the last number entered only (the denominator), so you may have to put fractions in brackets before entering the power.

Column 3 starts with using the power key, then the use of the cube root key. Your calculator may feature a cube root key or you may have to use shift first.

Some examples are on the next page.



Examples of steps in calculating square roots

$\sqrt{85}$ = √ 8 5 = = 9.22

$\sqrt{5\ ^2/_7}$ = √ 5 a b/c 2 a b/c 7 = a b/c = 2.30

$\sqrt{13.4 + 22 \times 3.6}$ These answers to 2 d.p.

= √ (1 3 . 4 + 2 2 × 3 . 6) = = 9.62

$\sqrt{\dfrac{34}{45 + 19.7}}$

= √ (3 4 ÷ (4 5 + 1 9 . 7)) = = 0.72

Use the same method with the cube root key only press Shift first

Examples of steps in calculating squares and cubes

5.6^2 = 5 . 6 x^2 = = 31.36

$(5\ ^2/_7)^2$ = (5 a b/c 2 a b/c 7) x^2 = a b/c = 27.94

Use the same method with the cube key x^3

These answers to 2 d.p.

Examples of steps using the power key

5.6^8 = 5 . 6 ^ 8 = = 967 173.12

These answers to 2 d.p.

$(5\ ^2/_7)^9$ = (5 a b/c 2 a b/c 7) ^ 9 = a b/c = 3 220 573.07

52 $2^{12} = 4\ 096$

53 $(1^2/_7)^6 = 4.52$

54 $8^9 - 8^8 = 117\ 440\ 512$

55 $2^{15} \div 2^{13} = 4$

Use the cube root key [∛] to answer these. Express your answer to 2 d.p. when required

56 $\sqrt[3]{216} = 6$

57 $\sqrt[3]{343} = 7$

58 $\sqrt[3]{1\ 000} = 10$

Brackets now required

59 $\sqrt[3]{\frac{5\ 375}{43}} = 5$

60 $\sqrt[3]{452 \times 17.3} = 19.85$

61 $\sqrt[3]{88^3 + 88^3} = 110.87$

62 $\sqrt[3]{5\ 833 - 18^3} = 1$

Careful with this one

63 $\sqrt[3]{\frac{5^3 + 2^7}{11^2}} = 1.45$

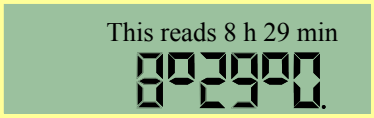
Time - Calculator Applications

Time calculations are performed every day, …..how long until lunch?, ….the bus arrives? When you become a wage earner it is important to be able to check that your hours worked is correct, but because minutes and hours are in groups of 60 min this is not always straight forward. But a calculator makes it easy.

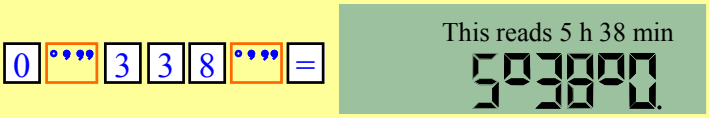
The calculator image on the next page shows the DMS key or the 'bubble button' (the key has an orange border on the next page). This key allows you work with hours and minutes.

IMPORTANT YOU MUST ENTER A 0 (THEN DMS KEY) IF THERE IS ONLY MINUTES (NO HOURS).

The calculator will always show the hours, minutes and seconds (we won't be using seconds other than in rounding) separated by a degree sign (a small raised o) →°.

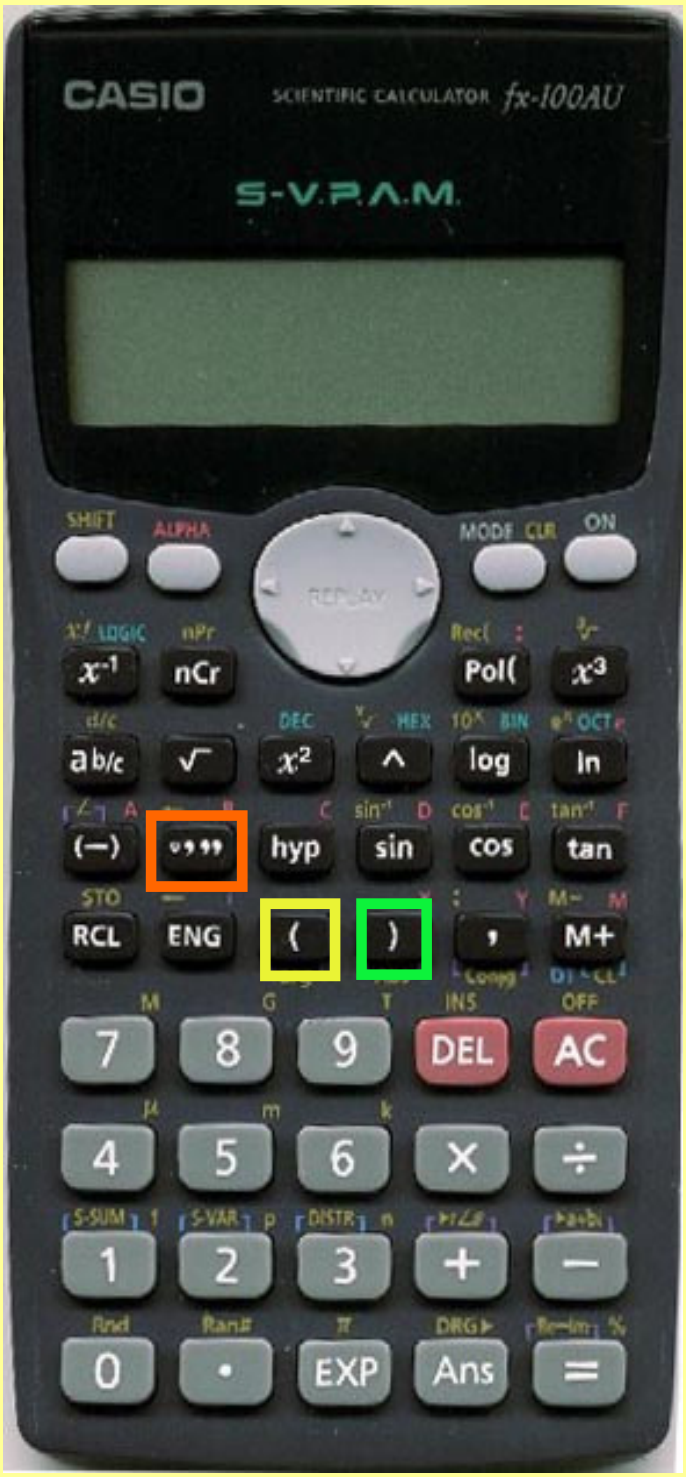


In column 1 you are asked to convert the times given in minutes to hours and minutes. This is done by pressing 0 then the DMS key, then the minutes in the question then the DMS key and then press = and the answer will be displayed. Example, change 338 min to hours and minutes.



Column 2 requires times in decimal format to be changed to h min format. Enter the decimal in your calculator then press the DMS key. Finding the difference between two times is done by subtraction. If times are in a.m. and p.m. then before the subtraction is undertaken you have to convert p.m. times to 24 h format. An example is above Q. 25.

The 3rd column is using × and ÷ these are done no differently just remember that you are multiplying by a number not a time and so only use the DMS on the time. The time sheet (Q.35) requires you to find the time difference for each day between start and finish times, put them in the spaces provided then add them. Monday is already done for you, check you get the same answer and don't forget to include it in your addition. Remember to use 24 h format for p.m. times. The calculation of an average time (Q 37) can be done in two ways refer to the text box below the calculator image for the full key stroke method on the next page.



Example of steps in calculating average time
of 11h 12 min, 8 h 57 min and 10 h 9 min

Using Brackets

(1 1 °’’’ 1 2 °’’’ + 8 °’’’ 5 7 °’’’ + 1 0 °’’’ 9 °’’’) ÷ 3 =

Using = to avoid order of operations

1 1 °’’’ 1 2 °’’’ + 8 °’’’ 5 7 °’’’ + 1 0 °’’’ 9 °’’’ = ÷ 3 =

if you get 10 h 6 min for the question above you are correct

Time - Calculator Applications

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Rewrite the calculator displays in h and min.

1 

2 

3 

4 

Convert the following times in min to h and min, there are two methods you can use.

Method 1

2 1 1 ÷ 6 0 = DMS ° ’ ’’

Method 2

0 DMS ° ’ ’’ 2 1 1 DMS ° ’ ’’ =

5 211 min

6 185 min

7 247 min

8 744 min

9 190 min

10 333 min

11 296 min

12 575 min

13 1 541 min

14 1 080 min

15 1 625 min

Change these times to hours and minutes.

5 • 4 = DMS ° ’ ’’

16 5.4 h

17 0.6 h

18 1.05 h

19 3.8 h

20 4.15 h

21 6.1 h

Perform the division which gives a decimal answer then change to hours and minutes. Round to the nearest minute.

22 22.4 ÷ 7

23 41 ÷ 8

24 165 ÷ 105

Find the time difference between these times that are on the same day. Use 24 hour time format.

Example

1853 h in 24 h format

11.07 a.m. and 6.53 p.m.

1 8 DMS ° ’ ’’ 5 3 DMS ° ’ ’’ -

1 1 DMS ° ’ ’’ 7 DMS ° ’ ’’ = 7 h 46 min

25 10.30 a.m. and 3.56 p.m.

26 3.52 a.m. and 11.27 a.m.

27 4.23 a.m. and 6.17 p.m.

28 1.09 p.m. and 10.57 p.m.

Now use × and ÷ with these times

29 8 × 23 min

30 7 × 1 h 46 min

31 1 h 55 min ÷ 5

32 19 h 57 min ÷ 9

33 54 min × 6 + 3 h 7 min ÷ 11 + 1 h 27 min

34 8 h 45 min ÷ 5 + 5 min × 17 + 1 h 31 min

Complete the time sheet below, then find the total hours worked

35

A. Jolie Time Sheet

Day	Start	Finish	Hours
Mon	9.30 a.m.	4.45 p.m.	7 h 15 min
Tues	10.45 a.m.	2.30 p.m.	h min
Wed	9.30 a.m.	5.00 p.m.	h min
Thur	9.30 a.m.	3.45 p.m.	h min
Fri	1.15 p.m.	6.00 p.m.	h min
		Total hours for the week	h min

Try these time problems

36 Sean watches 3 movies at a 6 hour movie marathon, if two films were 1 h 46 min and 1 h 50 min, find the duration of the other film.

37 Julie's time for return travel to school for 3 days were: 1h 15 min, 1h 22 min and 56 min. Find the average time for her return trip.

Time - Calculator Applications

Rewrite the calculator displays in h and min.

1  0 h 43 min

2  3 h 7 min

3  6 h 55 min

4  8 h 19 min

Convert the following times in min to h and min, there are two methods you can use.

Method 1

2 1 1 ÷ 6 0 = DMS ° ’ ’’

Method 2

0 DMS ° ’ ’’ 2 1 1 DMS ° ’ ’’ =

5 211 min — 3 h 31 min

6 185 min — 3 h 5 min

7 247 min — 4 h 7 min

8 744 min — 12 h 24 min

9 190 min — 3 h 10 min

10 333 min — 5 h 33 min

11 296 min — 4 h 56 min

12 575 min — 9 h 35 min

13 1 541 min — 25 h 41 min

14 1 080 min — 18 h

15 1 625 min — 27 h 5 min

Change these times to hours and minutes.

5 • 4 = DMS ° ’ ’’

16 5.4 h — 5 h 24 min

17 0.6 h — 36 min

18 1.05 h — 1 h 3 min

19 3.8 h — 3 h 48 min

20 4.15 h — 4 h 9 min

21 6.1 h — 6 h 6 min

Perform the division which gives a decimal answer then change to hours and minutes. Round to the nearest minute.

22 22.4 ÷ 7 — 3 h 12 min

23 41 ÷ 8 — 5 h 8 min (Nearest min)

24 165 ÷ 105 — 1 h 34 min (Nearest min)

Find the time difference between these times that are on the same day. Use 24 hour time format.

Example

1853 h in 24 h format

11.07 a.m. and 6.53 p.m.

1 8 DMS ° ’ ’’ 5 3 DMS ° ’ ’’ -

1 1 DMS ° ’ ’’ 7 DMS ° ’ ’’ = 7 h 46 min

25 10.30 a.m. and 3.56 p.m.

5 h 26 min

26 3.52 a.m. and 11.27 a.m.

7 h 35 min

27 4.23 a.m. and 6.17 p.m.

13 h 54 min

28 1.09 p.m. and 10.57 p.m.

9 h 48 min

Now use × and ÷ with these times

29 8 × 23 min — 3 h 4 min

30 7 × 1 h 46 min — 12 h 22 min

31 1 h 55 min ÷ 5 — 23 min

32 19 h 57 min ÷ 9 — 2 h 13 min

33 54 min × 6 + 3 h 7 min ÷ 11 + 1 h 27 min — 3 h 12 min

34 8 h 45 min ÷ 5 + 5 min × 17 + 1 h 31 min — 4 h 41 min

Complete the time sheet below, then find the total hours worked

35

A. Jolie Time Sheet

Day	Start	Finish	Hours
Mon	9.30 a.m.	4.45 p.m.	7 h 15 min
Tues	10.45 a.m.	2.30 p.m.	3 h 45 min
Wed	9.30 a.m.	5.00 p.m.	7 h 30 min
Thur	9.30 a.m.	3.45 p.m.	6 h 15 min
Fri	1.15 p.m.	6.00 p.m.	4 h 45 min
		Total hours for the week	29 h 30 min

Try these time problems

36 Sean watches 3 movies at a 6 hour movie marathon, if two films were 1 h 46 min and 1 h 50 min, find the duration of the other film.

2 h 24 min

37 Julie's time for return travel to school for 3 days were: 1h 15 min, 1h 22 min and 56 min. Find the average time for her return trip.

ALTITUDE

PERCENTAGES

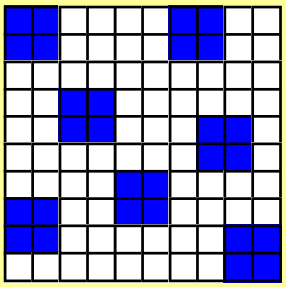
Fractions to Percentages

To convert a fraction to a percentage you multiply by 100 (×100). So that is pretty straight forward. The only difference is when it gets easier! If the fraction has a denominator of 100, then the percentage is simply the numerator. Or in non-mathematical speak, when the bottom number is 100, the percentage is the top number.

Column 1 starts with fractions that have a denominator of 100, you are asked to change them to percentages.

Example

There are 28 squares shaded and as this is a 100 grid, there are 100 - 28 = 72 72 squares unshaded.



Shaded = $\frac{28}{100}$ = 28 %

Unshaded = $\frac{72}{100}$ = 72 %

Denominator is 100 so that means the % is the numerator.

Column 2 involves fractions that have denominators that aren't 100. So with these put the fraction into your calculator and multiply by 100.

Examples $\frac{17}{32}$ = 53.1 % $\frac{15}{7}$ = 214.3 % $1\frac{5}{9}$ = 155.6 %

Using your calculator

[1][7][a b/c][3][2][×][1][0][0][=]

Answer on Screen 53⌟ 1⌟ 8

[a b/c]

Answer on Screen 53.125
Round to 1 decimal place
53.1%

Using your calculator

[1][5][a b/c][7][×][1][0][0][=]

Answer on Screen 214⌟ 2⌟ 7

[a b/c]

Answer on Screen
214.2857143
Round to 1 decimal place
214.3%

Using your calculator

[1][a b/c][5][a b/c][9][×][1][0][0][=]

Answer on Screen 155⌟ 5⌟ 9

[a b/c]

Answer on Screen
155.5555556
Round to 1 decimal place
155.6%

The second part of Column 2 asks you to find a mean percentage. Mean is "the average" so change both fractions to percentages then add them together and divide by 2. There are only two marks in each question so you only divide by two. When you divide by two you must press "=" first then divide by two, or you can use brackets.

Example. Mean (average) of 58.5% and 72.2%.

Using your calculator

Note 2 use of =

[5][8][.][5][+][7][2][.][2][=][÷][2][=]

Or with brackets

[(][5][8][.][5][+][7][2][.][2][)][÷][2][=]

Column 3 starts with changing fractions to percentages. Percentages can be used to compare fractions. Remember Descending (Down), so Ascending means to go up, from lowest to highest.

Fractions to Percentages

3

Shaded = $\frac{46}{100}$ = 46 % Unshaded = $\frac{54}{100}$ = 54 %

Change these fractions to percentages.

4 $\frac{75}{100}$ = 75 %

5 $\frac{38}{100}$ = 38 %

6 $\frac{93}{100}$ = 93 %

Multiply by 100 to change the fractions to percentages. Round to 1 d.p. if needed.

7 $\frac{16}{25}$ = 64 %

8 $\frac{3}{4}$ = 75 %

9 $\frac{30}{45}$ = 66.6 %

10 $\frac{5}{8}$ = 62.5 %

11 $1\frac{2}{5}$ = 140 %

12 $\frac{15}{11}$ = 136.4 %

13 $\frac{54}{78}$ = 69.2 %

14 $3\frac{5}{8}$ = 362.5 %

15 $\frac{43}{43}$ = 100 %

16 $\frac{255}{300}$ = 85 %

Each student sat two tests. Convert each to a % and find the mean percentage.

17 Eric 1: $\frac{15}{25}$ = 60 % 2: $\frac{16}{25}$ = 64 %

Add together and write here

$\bar{x} = \frac{124}{2}$ = 62 %

18 Jess 1: $\frac{8}{10}$ = 80 % 2: $\frac{34}{50}$ = 68 %

$\bar{x} = \frac{148}{2}$ = 74 %

19 Kurt 1: $\frac{11}{13}$ = 84.6 % 2: $\frac{17}{38}$ = 44.7 %

$\bar{x} = \frac{129.3}{2}$ = 64.65% (64.7)

Use percentages to arrange these test results (fractions) in ascending order. (1 d.p.)

20 $\frac{14}{20}$, $\frac{23}{40}$, $\frac{17}{50}$, $\frac{19}{26}$

70 % 57.5 % 34 % 73.1 %

Ascending Order → $\frac{17}{50}$, $\frac{23}{40}$, $\frac{14}{20}$, $\frac{19}{26}$

21 $\frac{6}{11}$, $\frac{43}{90}$, $\frac{26}{50}$, $\frac{17}{37}$

54.5 % 47.8 % 52 % 45.9 %

Ascending Order → $\frac{17}{37}$, $\frac{43}{90}$, $\frac{26}{50}$, $\frac{6}{11}$

22 $\frac{38}{41}$, $\frac{47}{50}$, $\frac{345}{360}$, $\frac{19}{20}$

92.7 % 94 % 95.8 % 95 %

Ascending Order → $\frac{38}{41}$, $\frac{47}{50}$, $\frac{19}{20}$, $\frac{345}{360}$

Now try these. Round all answers to 1 d.p.

23 Rod scored $^{14}/_{22}$ and Ally scored $^{15}/_{23}$. Who attained the highest %, and by how much?

R: $\frac{14}{22}$ = 63.6 % A: $\frac{15}{23}$ = 65.2 %

65.2 - 63.6 = 1.6 %

Ally scored highest by 1.6 %.

24 April scored $^{55}/_{72}$ and Jacob scored $^{27}/_{34}$. Who attained the highest %, and by how much?

A: $\frac{55}{72}$ = 76.4 % J: $\frac{27}{34}$ = 79.4 %

79.4 - 76.4 = 3%

Jacob scored highest by 3 %.

Application of Fractions to Percentages

To change a fraction to a percentage you multiply by 100 (× 100). The questions on this worksheet are different because you have to find the fraction first. Once found, multiply it by 100.

Column 1 starts with measuring the length of pencils. If the original length is 95 mm, this number is the denominator (or bottom number) of the fraction. Then measure the length of the pencils and the length (in mm) is the numerator, or top part of the fraction. Now multiply the fraction you have made by 100 to convert to a percentage.

The next part of column 1 is a vertical bar graph. The full height of the graph is the denominator. The height of the red section is the numerator. Convert to a percentage.

Column 2 starts with the four different types of tiles. List how many of each tile there is by counting them and striking them out as you go. Then answer the questions using the data you have collected.

The last part of column 2 is about the percentage of syrup in a milkshake. The amounts of syrup and milk are given in each question, realise that the denominator is found by adding the syrup and the milk together, it isn't just the amount of milk.

Application of Fractions to Percentages

$85 + 175 = 260$ mL

$\frac{85}{260} \times 100 = 32.7\ \%$

Percentages, Decimals and Fractions

This sheet is in two halves. The first half deals with changing between decimals and percentages. The second half is changing between decimals, fractions and percentages.

Column 1 starts with changing decimals to percentages. All the questions are answered by multiplying the decimal by 100. So type the number into your calculator then multiply by 100. A quicker way is to move the decimal point 2 places to the right, you won't even need a calculator!

Note that some decimals are shown with a dot above the number, this means that the number repeats itself. These are called repeating or recurring decimals.

Example $0.\dot{4} = 0.4444444444\ldots$
so multiply by 100
$= 44.4444444\ldots$
$= 44.4\%$ (1 d.p.)

Questions 11-20 are the opposite, you are changing percentages to decimals, so this time divide by 100. Questions 21-23 has decimals mixed up with percentages and you have to sort them out. Convert them all to decimals with the same number of decimal places on the line below. Then using those decimals as a guide rewrite them in ascending order. Remember to write the decimals and percentages in order, not the converted decimals as this doesn't answer the question.

Column 2 deals with changing decimals to fractions. If a decimal has one decimal place, then write it over 10. If it has two decimal places, write it over 100. Three places...1 000 and so on.

$$0.8 = \frac{8}{10} = \frac{4}{5} \qquad \div 2$$

Decimal: 1 Decimal Place

$$0.48 = \frac{48}{100} = \frac{12}{25} \qquad \div 4$$

Decimal: 2 Decimal Places

With the table in column 2, to change a percentage to a decimal, divide by 100. To change a fraction to a percentage multiply by 100, likewise with decimals to percentages, multiply by 100.

26 0.15 = $\frac{15}{100} = \frac{3}{20}$

27 0.6 = $\frac{6}{10} = \frac{3}{5}$

28 0.72 = $\frac{72}{100} = \frac{18}{25}$

29 3.36 = $3 + \frac{36}{100} = 3\frac{9}{25}$

30 0.5 = $\frac{5}{10} = \frac{1}{2}$

31 0.505 = $\frac{505}{1\,000} = \frac{101}{200}$

Complete the table by converting between fractions, decimals and percentages.

Q	Fraction	Decimal	Percentage
32	$\frac{1}{5}$	0.2	20%
33	$\frac{11}{20}$	0.55	55%
34	$\frac{8}{25}$	0.32	32%
35	$1\frac{3}{5}$	1.6	160%
36	$\frac{1}{20}$	0.05	5%
37	$\frac{19}{100}$	0.19	19%
38	$\frac{17}{25}$	0.68	68%
39	$1\frac{2}{5}$	2.4	240%
40	$\frac{4}{5}$	0.8	80%
41	$\frac{3}{4}$	0.75	75%
42	$\frac{1}{3}$	$0.\dot{3}$	33⅓%
43	$\frac{1}{200}$	0.005	0.5%
44	$\frac{47}{50}$	0.94	94%
45	$\frac{2}{3}$	$0.\dot{6}$	66⅔%
46	$1\frac{5}{8}$	1.625	162.5%

Percentage of a Quantity

This sheet involves comparing two amounts and finding the percentage one is of the other, as well as finding the percentage of a given quantity.

Column 1 starts with comparing two amounts. This is the same as converting a fraction to a percentage, so all you have to do is multiply by 100.

Example 18 targets from 24 targets

$$\frac{18}{24} \times 100 = 75\%$$

The answer to these questions is a percentage.

Column 2 gives a single quantity and a percentage. To answer these change the percentage to a fraction and multiply by the amount.

Example 62% of 225 L.

$$\frac{62}{100} \times 225 = 139.5 \text{ L}$$

The answer to these questions is a quantity so units are needed

Column 3 are worded questions which are solved by either of the two methods above.

Percentage of a Quantity

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Express the 1st quantity as a percentage of the 2nd. Round to 1 decimal place.

Example. 5 cm of 65 cm

$\frac{5}{65} \times 100$ $= 7.7\ \%$

1 27 points from 35 points.

2 5 pizza slices from 8 slices

3 19 t from 156 t.

4 120 posts from 435 posts.

5 38 frogs out of 196 frogs.

6 \$1 850 from \$7 216.

7 7.6 cm out of 12 cm.

8 650 g of 910 g.

9 14 s out of 15 s.

10 46 ha of 70 ha.

Find the percentage of these quantities. Round to the nearest whole number.

Example. 17% of 300 kg

$\frac{17}{100} \times 300$ $= 51$ kg

11 74% of 820 m.

$\frac{\quad}{\quad} \times 820$

Write % over 100 Remember units

12 45% of 710 mm.

13 85% of 150 kg.

14 15% of \$7 000.

15 125% of 400 mg.

16 71% of 48 m^2.

17 12.5% of \$63.

18 55% of 1 152 kg.

19 98% of 400 m.

20 0.2% of \$120 000.

Answer these, rounding to 1 d.p. when required.

21 38 500 vehicles pass an intersection in 12 hours. If 2% are buses and 87% are cars, find the amount of buses and cars.

Buses:

Cars:

22 The school shot put record is 19 m. If Ian threw a distance of 11.6 m what percentage of the record distance did he throw?

23 Tina has a four coloured spinner. She spins RED 22% of the time, how many times should red occur from 500 spins?

24 \$2 600 is to be split in the following way. Matt 20%, Bess 35% and Karen 45%. Find the amount each will earn.

Matt:

Bess:

Karen:

Express the 1st quantity as a percentage of the 2nd. Round to 1 decimal place.

Example. 5 cm of 65 cm

$\frac{5}{65} \times 100$ $= 7.7\ \%$

1 27 points from 35 points.

$\frac{27}{35} \times 100$ $= 77.1\ \%$

2 5 pizza slices from 8 slices

$\frac{5}{8} \times 100$ $= 62.5\ \%$

3 19 t from 156 t.

$\frac{19}{156} \times 100$ $= 12.2\ \%$

4 120 posts from 435 posts.

$\frac{120}{435} \times 100$ $= 27.6\ \%$

5 38 frogs out of 196 frogs.

$\frac{38}{196} \times 100$ $= 19.4\ \%$

6 \$1 850 from \$7 216.

$\frac{1\,850}{7\,216} \times 100$ $= 25.6\ \%$

7 7.6 cm out of 12 cm.

$\frac{7.6}{12} \times 100$ $= 63.3\ \%$

8 650 g of 910 g.

$\frac{650}{910} \times 100$ $= 71.4\ \%$

9 14 s out of 15 s.

$\frac{14}{15} \times 100$ $= 93.3\ \%$

10 46 ha of 70 ha.

$\frac{46}{70} \times 100$ $= 65.7\ \%$

Find the percentage of these quantities. Round to the nearest whole number.

Example. 17% of 300 kg

$\frac{17}{100} \times 300$ $= 51$ kg

11 74% of 820 m.

$\frac{74}{100} \times 820$ $= 607$ m

Write % over 100 — Remember units

12 45% of 710 mm.

$\frac{45}{100} \times 710$ $= 320$ mm

13 85% of 150 kg.

$\frac{85}{100} \times 150$ $= 128$ kg

14 15% of \$7 000.

$\frac{15}{100} \times 7\,000$ $= \$1\,050$

15 125% of 400 mg.

$\frac{125}{100} \times 400$ $= 500$ mg

16 71% of 48 m^2.

$\frac{71}{100} \times 48$ $= 34\ m^2$

17 12.5% of \$63.

$\frac{12.5}{100} \times 63$ $= \$8$

18 55% of 1 152 kg.

$\frac{55}{100} \times 1\,152$ $= 634$ kg

19 98% of 400 m.

$\frac{98}{100} \times 400$ $= 392$ m

20 0.2% of \$120 000.

$\frac{0.2}{100} \times 120\,000$ $= \$240$

Answer these, rounding to 1 d.p. when required.

21 38 500 vehicles pass an intersection in 12 hours. If 2% are buses and 67% are cars, find the amount of buses and cars.

Buses: $\frac{2}{100} \times 38\,500$

$= 770$ buses

Cars: $\frac{87}{100} \times 38\,500$

$= 33\,495$ cars

22 The school shot put record is 19 m. If Ian threw a distance of 11.6 m what percentage of the record distance did he throw?

$\frac{11.6}{19} \times 100$ $= 61.1\ \%$

23 Tina has a four coloured spinner. She spins RED 22% of the time, how many times should red occur from 500 spins?

$\frac{22}{100} \times 500$

$= 110$ times

24 \$2 600 is to be split in the following way. Matt 20%, Bess 35% and Karen 45%. Find the amount each will earn.

Matt: $\frac{20}{100} \times 2\,600$

$= \$520$

Bess: $\frac{35}{100} \times 2\,600$

$= \$910$

Karen: $\frac{45}{100} \times 2\,600$

$= \$1\,170$

Further Percentage of a Quantity

This sheet involves comparing two amounts and finding the percentage one is of the other, or finding the percentage of a given quantity.

Column 1 starts with changing units from the given unit to the one in brackets. Then from Question 9 two different units are to be compared. It usually the case that the larger unit is changed to the smaller unit, but it can be done in the opposite way with most questions also.

Example 186 m from 3.2 km

3.2 km = 3 200 m

$$\frac{186}{3\,200} \times 100 = 5.8\%$$

The answer to these questions is a percentage.
Round your answer to 1 decimal place.

Question 15 and 16 are the same style of question, the only difference is that you have to calculate the two areas before you can proceed to compare them.

Column 2 gives a single quantity and a percentage. To answer these change the percentage to a fraction and multiply by the amount.

From Question 17 a percentage of a quantity is to be found. To answer these change the percentage to a fraction over 100 then multiply by the quantity. Note that the quantity has to be changed into the units specified.

Example 65% of 0.86 kL. [L]

$$\frac{65}{100} \times 860 = 559 \text{ L}$$

0.86 kL = 860 L

The answer to these questions is a quantity so units are needed.
Round your answer, if needed, to the nearest whole number.

Further Percentage of a Quantity

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Convert these units to the one shown in brackets.

1 7 min = _____ [s]

2 5.2 L = _____ [mL]

3 17 m = _____ [cm]

4 8 weeks = _____ [days]

5 3.25 t = _____ [kg]

6 0.6 kg = _____ [g]

7 230 mm = _____ [m]

8 8 cm^2 = _____ [mm^2]

Express the 1st quantity as a percentage of the 2nd. Round to 1 decimal place.

Example. 24 s out of 3 min.

3 min = 180 s

$\frac{24}{180} \times 100 = 13.3\ \%$

9 420 kg from 3.6 t.

10 27 months from 3 years.

11 150 m from 1.4 km.

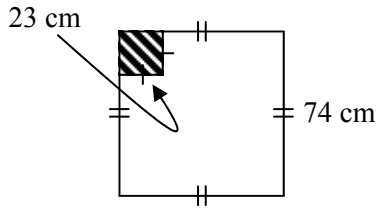
12 8 hrs of 3 days.

13 980 m^2 from 2.6 ha.

14 3 450 mg of 0.8 kg

Find the shaded area as a percentage of the total area Round to 1 decimal place.

15



$A_1 = l^2$ $A_2 = l^2$

16 A room measuring 4.2 m by 3.6 m has a wardrobe measuring 75 cm by 150 cm. Find the percentage of floor space taken by the wardrobe.

Find the percentages of these quantities. Give your answer in the units in the brackets. Round to the nearest whole number.

Example. 43% of 2.4 T [kg]

$\frac{43}{100} \times 2\,400 = 1\,032$ kg

Change T to kg

17 35% of 8.6 m [cm]

×

Change units to cm

18 45% of 9 min. [s]

19 12% of 3.9 L [mL]

20 23% of a year [weeks]

21 85% of 0.85 kg [g]

22 115% of 750 mL [L]

23 30% of 6 doz eggs [eggs]

24 84% of 62 300 m^2 [ha]

Don't round Q 25 and Q 26.

25 A 1 250 mL bottle of drink is increased by 40% extra, for free. Find its new volume in Litres.

26 A plane with 225 seats has a standard ticket price of $450. If 8% of the seats sell at a discount rate of 70% of the standard price, find the earnings for the fully booked flight.

Further Percentage of a Quantity

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Convert these units to the one shown in brackets.

1 7 min = 420 [s]

2 5.2 L = 5 200 [mL]

3 17 m = 1 700 [cm]

4 8 weeks = 56 [days]

5 3.25 t = 3 250 [kg]

6 0.6 kg = 600 [g]

7 230 mm = 0.23 [m]

8 8 cm^2 = 800 [mm^2]

Express the 1st quantity as a percentage of the 2nd. Round to 1 decimal place.

Example. 24 s out of 3 min.

3 min = 180 s

$\frac{24}{180} \times 100$ = 13.3 %

9 420 kg from 3.6 t.

$\frac{420}{3\,600} \times 100$ = 11.7 %

10 27 months from 3 years.

$\frac{27}{36} \times 100$ = 75 %

11 150 m from 1.4 km.

$\frac{150}{1\,400} \times 100$ = 10.7 %

12 8 hrs of 3 days.

$\frac{8}{72} \times 100$ = 11.1 %

13 980 m^2 from 2.6 ha.

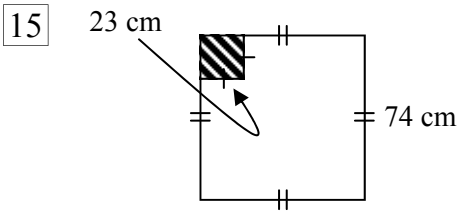
$\frac{980}{26\,000} \times 100$ = 3.8%

14 3 450 mg of 0.8 kg

$\frac{3\,450}{800\,000} \times 100$ = 0.4%

Find the shaded area as a percentage of the total area Round to 1 decimal place.

15



$A_1 = l^2$ $A_2 = l^2$

$= 23^2$ $= 74^2$

$A_1 = 529$ cm^2 $A_2 = 5\,476$ cm^2

$\frac{529}{5\,476} \times 100$ = 9.7%

16 A room measuring 4.2 m by 3.6 m has a wardrobe measuring 75 cm by 150 cm. Find the percentage of floor space taken by the wardrobe.

$A_1 = lb$ $A_2 = lb$

$= 3.6 \times 4.2$ $= 0.75 \times 1.5$

$A_1 = 15.1$ m^2 $A_2 = 1.1$ m^2

$\frac{1.1}{15.1} \times 100$ = 7.3%

Find the percentages of these quantities. Give your answer in the units in the brackets. Round to the nearest whole number.

Example. 43% of 2.4 T [kg]

$\frac{43}{100} \times 2\,400$ = 1 032 kg

Change T to kg

17 35% of 8.6 m [cm]

$\frac{35}{100} \times 860$ = 301 kg

Change units to cm

18 45% of 9 min. [s]

$\frac{45}{100} \times 540$ = 243 s

19 12% of 3.9 L [mL]

$\frac{12}{100} \times 3\,900$ = 468 mL

20 23% of a year [weeks]

$\frac{23}{100} \times 52$ = 12 weeks

21 85% of 0.85 kg [g]

$\frac{88}{100} \times 850$ = 748 g

22 115% of 750 mL [L]

$\frac{115}{100} \times 0.75$ = 1 L

23 30% of 6 doz eggs [eggs]

$\frac{30}{100} \times 72$ = 22 eggs

24 84% of 62 300 m^2 [ha]

$\frac{84}{100} \times 6.23$ = 5 ha

Don't round Q 25 and Q 26.

25 A 1 250 mL bottle of drink is increased by 40% extra, for free. Find its new volume in Litres.

$\frac{40}{100} \times 1.25$ = 0.5 L

1.25 + 0.5 = 1.75L

26 A plane with 225 seats has a standard ticket price of $450. If 8% of the seats sell at a discount rate of 70% of the standard price, find the earnings for the fully booked flight.

$\frac{70}{100} \times 450$ = $315

$\frac{8}{100} \times 225$ = 18 seats

18 × 315 = $5 670

207 × 450 = $93 150

5 670 + 93 150 = $98 820

Increasing and Decreasing by a Percentage

Increasing and decreasing by a percentage is done constantly in business. Prices are often set from percentage 'mark-ups' and discounts are often given by percentages also.

Column 1 asks you to increase by a percentage. These questions are done in 2 steps, the first step is to multiply the amount by the percentage as a fraction. This is the same as finding the percentage of a quantity. So change the percentage to a fraction over 100 ($/_{100}$) and multiply. The additional step is to then add the answer to the original amount. Note that all questions have units, eg. m, mL, $ so make sure your answer includes these.

Example : Increase 46.2 cm by 35%

Multiply amount by percentage as a fraction over 100. So 35% is changed to $\frac{35}{100}$ → $46.2 \times \frac{35}{100}$ → Show units → $= 16.17$ cm

Add the amount in the question to the answer you have just found ← $46.2 + 16.17$ ← Show units ← $= 62.37$ cm

Column 2 asks you to decrease by a percentage. The method starts off the same in that the amount is multiplied by the percentage as a fraction but then instead of adding, you subtract this amount from the original amount.

Example : Decrease 210 kg by 16%

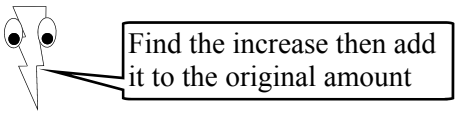
Multiply amount by percentage as a fraction over 100. So 16% is changed to $\frac{16}{100}$ → $210 \times \frac{16}{100}$ → Show units → $= 33.6$ kg

Subtract the answer you have just found from the number in the question. ← $210 - 33.6$ ← Show units ← $= 176.4$ kg

Column 3 is a mixture of the previous 2 columns, if the question is increase then you add the amount of change. If it is decrease you subtract. Colour the relevant circle, increase being addition, decrease being subtraction .

Increasing and Decreasing by a Percentage

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE



Example

Increase 235 kg by 20%

$235 \times \frac{20}{100}$ $235 + 47$

$= 47$ kg $= 282$ kg

1 Increase 140 L by 22%

2 Increase 23.5 cm by 18%

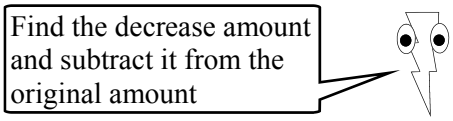
3 Increase \$542 by 134%

4 Increase 1 700 km by 85%

5 Increase 3 620 m by 95%

6 Increase 1 010 m by 64%

7 Increase 6 895 mL by 8%



8 Decrease \$868 by 6%

868 - ☐

9 Decrease 19.2 g by 75%

10 Decrease 45.6 cm by 85%

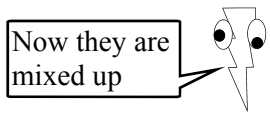
11 Decrease 1 250 mL by 38%

12 Decrease 35.34 sec by 50%

13 Decrease 308.6 kg by 5%

14 Decrease \$76.90 by 30%

15 Decrease 39.5 t by 82%



16 Increase \$3.95 by 20%

Select: ○ Addition ○ Subtraction

19 Increase 29.4 rpm by 180%

Select: ○ Addition ○ Subtraction

20 Decrease 5.38 m by 15%

Select: ○ Addition ○ Subtraction

21 Increase 373 ha by 60%

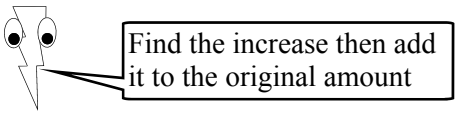
Select: ○ Addition ○ Subtraction

22 Increase \$7.50 by 142%

Select: ○ Addition ○ Subtraction

Increasing and Decreasing by a Percentage

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE



Example

Increase 235 kg by 20%

$235 \times \frac{20}{100}$ = 47 kg

235 + 47 = 282 kg

1 Increase 140 L by 22%

$140 \times \frac{22}{100}$ = 30.8 L

140 + 30.8 = 170.8 L

2 Increase 23.5 cm by 18%

$23.5 \times \frac{18}{100}$ = 4.23 cm

23.5 + 4.23 = 27.73 cm

3 Increase $542 by 134%

$542 \times \frac{134}{100}$ = $726.28

542 + 726.28 = $1 268.28

4 Increase 1 700 km by 85%

$1\,700 \times \frac{85}{100}$ = 1 445 km

1 700 + 1 445 = 3 142 km

5 Increase 3 620 m by 95%

$3\,620 \times \frac{95}{100}$ = 3 439 m

3 620 + 3 439 = 7 059 m

6 Increase 1 010 m by 64%

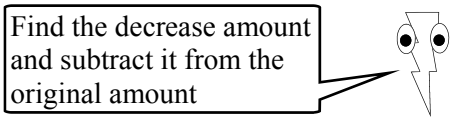
$1\,010 \times \frac{64}{100}$ = 646.4 m

1 010 + 646.4 = 1 656.4 m

7 Increase 6 895 mL by 8%

$6\,895 \times \frac{8}{100}$ = 551.6 mL

6 895 + 551.6 = 7 446.6 mL



8 Decrease $868 by 6%

$868 \times \frac{6}{100}$ = $52.08

868 - 52.08 = $815.92

9 Decrease 19.2 g by 75%

$19.2 \times \frac{75}{100}$ = 14.4 g

19.2 - 14.4 = 4.8 g

10 Decrease 45.6 cm by 85%

$45.6 \times \frac{85}{100}$ = 38.76 cm

45.6 - 38.76 = 6.84 cm

11 Decrease 1 250 mL by 38%

$1\,250 \times \frac{38}{100}$ = 475 mL

1 250 - 475 = 775 mL

12 Decrease 35.34 sec by 50%

$35.34 \times \frac{50}{100}$ = 17.67 sec

35.34 - 17.67 = 17.67 sec

13 Decrease 308.6 kg by 5%

$308.6 \times \frac{5}{100}$ = 15.43 kg

308.6 - 15.43 = 293.17 kg

14 Decrease $76.90 by 30%

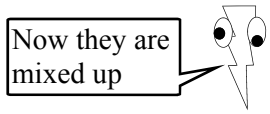
$76.90 \times \frac{30}{100}$ = $23.07

76.90 - 23.07 = $53.83

15 Decrease 39.5 t by 82%

$39.5 \times \frac{82}{100}$ = 32.39 t

39.5 - 32.39 = 7.11 t



16 Increase $3.95 by 20%

Select: ● Addition ○ Subtraction

$3.95 \times \frac{20}{100}$ = $0.79

3.95 + 0.79 = $4.74

17 Decrease 115 mL by 92%

Select: ○ Addition ● Subtraction

$115 \times \frac{92}{100}$ = 105.8 mL

115 - 105.8 = 9.2 mL

18 Decrease 465 m^3 by 38%

Select: ○ Addition ● Subtraction

$465 \times \frac{38}{100}$ = 176.7 m^3

465 - 176.7 = 288.3 m^3

19 Increase 29.4 rpm by 180%

Select: ● Addition ○ Subtraction

$29.4 \times \frac{180}{100}$ =52.92 rpm

29.4 + 52.92 = 82.32 rpm

20 Decrease 5.38 m by 15%

Select: ○ Addition ● Subtraction

$5.38 \times \frac{15}{100}$ = 0.807 m

5.38 - 0.807 = 4.573 m

21 Increase 373 ha by 60%

Select: ● Addition ○ Subtraction

$373 \times \frac{60}{100}$ = 223.8 ha

373 + 223.8 = 596.8 ha

22 Increase $7.50 by 142%

Select: ● Addition ○ Subtraction

$7.50 \times \frac{142}{100}$ = $10.65

7.50 + 10.65 = $18.15

Further Percentage Increase and Decrease

When you increase or decrease by a percentage an alternative method to the previous worksheet is to modify the percentage first before multiplying.

Column 1 is increasing by a percentage. If you increase by a percentage add the percentage to 100% first, then multiply the quantity by this percentage (as a fraction). Question 4 involves increasing by 120%. Be careful, many students forget to add 100% when the percentage is more than 100% in the first place, you still have to add 100% regardless. Remember that these involve quantities, the units must be shown in the answer, which is rounded to 2 decimal places. Money requires 2 decimal places...never just 1 decimal place.

Example : Increase 85 cm by 16%

Multiply changing the percentage to a fraction

Add the increase to 100% →	100% + 16%	85 × $\frac{116}{100}$ ←
Show % sign →	= 116%	= 98.6 cm ← Show units

When you have finished the question, look at the answer … has it increased on the amount in the question? If not recheck your working out.

Column 2 is decreasing, subtract the percentage from 100% first, then multiply the quantity by the new percentage.

Example : Decrease 120 kg by 27%

Multiply changing the percentage to a fraction

Subtract the percentage from 100%. →	100% - 27%	120 × $\frac{73}{100}$ ←
Show % sign →	= 73%	= 87.6 cm ← Show units

Again, check your answer...does it make sense….has it reduced the amount?

Column 3 involves increasing then decreasing a quantity, or the reverse. So apply the process twice. If you increase by a percentage don't use this percentage for the decrease, you always start with '100% +' or '100% -'. These are more difficult in concept and require care.

Example. Increase $540 by 17% then decrease the result by 5%.

So use 100% + 17% = 117% for the increase, then 100% - 5% = 95% for the decrease.
DON'T USE 117% - 5% = 112% decrease. Look below for the working out method.

STEP 1	100% + 17%	540 × $\frac{117}{100}$ STEP 3
	= 117%	= $631.80
STEP 2	100% - 5%	631.80 × $\frac{95}{100}$ STEP 4
	= 95%	= $600.21

Further Percentage Increase and Decrease

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Add the percentage increase to 100%, multiply by the total ÷ 100. Round to 2 d.p.

Example

Increase 135 cm by 42%

$100\% + 42\% = 142\%$

$135 \times \frac{142}{100} = 190.28$ cm

1 Increase \$8.30 by 65%

2 Increase 658 L by 38%

3 Increase 29 kg by 24%

4 Increase 385 m by 120%

5 Increase \$76.20 by 9%

6 Increase 83.65 kg by 230%

7 Increase 3 750 kL by 12%

Subtract the percentage to find the discounted amount. Round to 2 d.p.

Example

Decrease 1.2 m by 38%

$100\% - 38\% = 62\%$

$1.2 \times \frac{62}{100} = 0.74$ m

8 Decrease \$780 by 39%

9 Decrease 43.8 kL by 27%

10 Decrease 9.15 m by 11%

11 Decrease \$66.80 by 8%

12 Decrease 1 610 kg by 57%

13 Decrease 739.6 cm by 83%

14 Decrease \$4 586 by 15%

First increase and then decrease the amount given (or the reverse).

Important : If you increase for example, by 10% and then decrease by 10%, you won't finish with the original amount you started with.

15 Increase \$780 by 20% then decrease the result by 12%

100% +

100% -

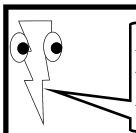
16 Increase \$680 by 5% then decrease the result by 95%

17 Decrease \$1 400 by 29% and increase the result by 29%

18 Decrease \$8 360 by 45% and increase the result by 45%

Further Percentage Increase and Decrease

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE



Add the percentage increase to 100%, multiply by the total ÷ 100. Round to 2 d.p.

Example

Increase 135 cm by 42%

100% + 42%	135 × $\frac{142}{100}$
= 142%	= 190.28 cm

1 Increase \$8.30 by 65%

100% + 65%	8.30 × $\frac{165}{100}$
= 165%	= \$13.70

2 Increase 658 L by 38%

100% + 38%	658 × $\frac{138}{100}$
= 138%	= 908.04 L

3 Increase 29 kg by 24%

100% + 24%	29 × $\frac{124}{100}$
= 124%	= 35.96 kg

4 Increase 385 m by 120%

100% + 120%	385 × $\frac{220}{100}$
= 220%	= 847 m

5 Increase \$76.20 by 9%

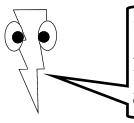
100% + 9%	76.20 × $\frac{109}{100}$
= 109%	= \$83.06

6 Increase 83.65 kg by 230%

100% + 230%	83.65 × $\frac{330}{100}$
= 330%	= 276.05 kg

7 Increase 3 750 kL by 12%

100% + 12%	3 750 × $\frac{112}{100}$
= 112%	= 4 200 kL



Subtract the percentage to find the discounted amount. Round to 2 d.p.

Example

Decrease 1.2 m by 38%

100% - 38%	1.2 × $\frac{62}{100}$
= 62%	= 0.74 m

8 Decrease \$780 by 39%

100% - 39%	780 × $\frac{61}{100}$
= 61%	= \$475.80

9 Decrease 43.8 kL by 27%

100% - 27%	43.8 × $\frac{73}{100}$
= 73%	= 31.97 kL

10 Decrease 9.15 m by 11%

100% - 11%	9.15 × $\frac{89}{100}$
= 89%	= 8.14 m

11 Decrease \$66.80 by 8%

100% - 8%	66.80 × $\frac{92}{100}$
= 92%	= \$61.46

12 Decrease 1 610 kg by 57%

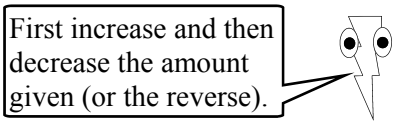
100% - 57%	1 610 × $\frac{43}{100}$
= 43%	= 692.3 kg

13 Decrease 739.6 cm by 83%

100% - 83%	739.6 × $\frac{17}{100}$
= 17%	= 125.73 cm

14 Decrease \$4 586 by 15%

100% - 15%	4 586 × $\frac{85}{100}$
= 85%	= \$3 898.10



First increase and then decrease the amount given (or the reverse).

Important : If you increase for example, by 10% and then decrease by 10%, you won't finish with the original amount you started with.

15 Increase \$780 by 20% then decrease the result by 12%

100% + 20%	780 × $\frac{120}{100}$
= 120%	= \$936
100% - 12%	936 × $\frac{88}{100}$
= 88%	= \$823.68

16 Increase \$680 by 5% then decrease the result by 95%

100% + 5%	680 × $\frac{105}{100}$
= 105%	= \$714
100% - 95%	714 × $\frac{5}{100}$
= 5%	= \$35.70

17 Decrease \$1 400 by 29% and increase the result by 29%

100% - 29%	1 400 × $\frac{71}{100}$
= 71%	= \$994
100% + 29%	994 × $\frac{129}{100}$
= 129%	= \$1 282.26

18 Decrease \$8 360 by 45% and increase the result by 45%

100% - 45%	8 360 × $\frac{55}{100}$
= 55%	= \$4 598
100% + 45%	4 598 × $\frac{145}{100}$
= 145%	= \$6 667.10

Profit, Cost Price and Sale Price

Shops operate by buying goods from suppliers and selling the goods to shoppers, often called consumers. The supplied goods are bought by the shop at "Cost Price" and sold to the consumer at the "Sale Price". The sale price is usually more than the cost price and the difference is the profit, the amount of money the shop makes from the sale.

Profit is usually positive, but it can be negative. Why? Because shops sometimes have to clear old stock fast and they actually sell it for less than the amount that they paid for it. Also, some shops take a loss (negative profit) on certain items to advertise a very cheap price, hoping that consumers will by other items as well, which they then make money on.

The three formulae to remember are:

Profit = Sale Price - Cost Price
Cost Price = Sale Price - Profit
Sale Price = Cost Price + Profit

In column 1 the first table uses the first formula. So find the profit by subtraction. Subtract the Cost Price from the Sale Price. Repeat this process for the second table but you may get negative answers, which is a loss. After you write your answer, colour in the circle "P" for Profit or "L" for Loss.

Questions 17 - 22 ask you to find the Cost price. Again this is achieved by subtraction. Subtract the profit from the Sale price. Make sure you show your working out, remember the dollar sign ($) and write your answer to 2 decimal places if cents are to be shown.

Column 2 asks you to determine the Sale Price to achieve a certain profit. Often shop owners refer to this as the "Mark-Up" - the percentage the cost price is increased by. Some shops will have a uniform mark-up amount on all goods, others will change the mark-up according to the popularity of certain items.

Questions 23 - 26 ask you to mark-up the goods by 40% of the cost price. Using this to calculate the profit and then the Sale Price. The method is as below:

Example Toothpaste: Cost Price $2.10 - Profit is 40% of the cost price.

$\text{Profit} = 2.10 \times \frac{40}{100}$	← Profit is found by multiplying the cost price by 40% ($\frac{40}{100}$)
$\text{Profit} = \$0.84$	← Profit
$SP = 2.10 + 0.84$	← Sale Price (SP for short) = Cost Price + Profit
$SP = \$\ 2.94$	← Complete the addition, dollar sign and 2 decimal places.. DONE!

Question 27 - 32 is the same as the above except the % is 65% rather than 40%. So use $\frac{65}{100}$ instead of $\frac{40}{100}$.

Profit, Cost Price and Sale Price

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Profit = Sale price - Cost price. Complete the table below.

	Sale Price	Cost Price	Profit
1	\$2.58 -	\$1.79 =	
2	\$1.14	\$0.59	
3	\$6.80	\$3.97	
4	\$8.11	\$5.76	
5	\$18.15	\$7.45	
6	\$35	\$26.47	
7	\$17.80	\$8.14	
8	\$25.90	\$21.85	

If Profit is negative it is a 'Loss'. Find the profit (+/-). Is it a loss?

	Sale Price	Cost Price	Profit	P/L
9	\$2.83	\$1.75		P L
10	\$5.24	\$8.89		P L
11	\$0.93	\$1.37		P L
12	\$7.32	\$4.82		P L
13	\$12.42	\$16.15		P L
14	\$3.35	\$2.51		P L
15	\$9.17	\$11.50		P L
16	\$20.10	\$11.95		P L

Cost price = Sale price - Profit. Find the Cost Price (CP) for these below.

17 Sale Price = \$1 360
Profit = \$419

CP = 1 360 -

18 Sale Price = \$1.83
Profit = \$0.37

19 Sale Price = \$2.85
Profit = \$0.64

20 Sale Price = \$9.20
Profit = \$4.47

21 Sale Price = \$417
Profit = \$263.80

22 Sale Price = \$9 999
Profit = \$4 579

Find the Sale Price using a profit of 40% of the Cost Price. First find the profit and then use SP = Cost Price + Profit.

23 Cost Price = \$8.20

Profit = $\times \frac{40}{100}$

Profit =

SP = 8.20 +

SP = \$

24 Cost Price = \$506

25 Cost Price = \$24.20

26 Cost Price = \$765

Now a Profit of 65% of Cost Price is required. Round answer to 2 d.p.

27 Cost Price = \$120

Profit = $\times \frac{65}{100}$

Profit =

SP = 120 +

SP = \$

28 Cost Price = \$14.30

29 Cost Price = \$82.50

30 Cost Price = \$39.70

31 Cost Price = \$118

32 Cost Price = \$1 360

Profit, Cost Price and Sale Price

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Profit = Sale price - Cost price. Complete the table below.

	Sale Price	Cost Price	Profit
1	$2.58 -	$1.79 =	$0.79
2	$1.14	$0.59	$0.55
3	$6.80	$3.97	$2.83
4	$8.11	$5.76	$2.35
5	$18.15	$7.45	$10.70
6	$35	$26.47	$8.53
7	$17.80	$8.14	$9.66
8	$25.90	$21.85	$4.05

If Profit is negative it is a 'Loss'. Find the profit (+/-). Is it a loss?

	Sale Price	Cost Price	Profit	P/L
9	$2.83	$1.75	$1.08	P ● L ○
10	$5.24	$8.89	- $3.65	P ○ L ●
11	$0.93	$1.37	- $0.44	P ○ L ●
12	$7.32	$4.82	$2.50	P ● L ○
13	$12.42	$16.15	- $3.73	P ○ L ●

15	$9.17	$11.50	- $2.33	P ○ L ●
16	$20.10	$11.95	$8.15	P ● L ○

Cost price = Sale price - Profit. Find the Cost Price (CP) for these below.

17 Sale Price = $1 360
Profit = $419

CP = 1 360 - $419

Cost Price = $941

18 Sale Price = $1.83
Profit = $0.37

CP = 1.83 - 0.37

Cost Price = $1.46

19 Sale Price = $2.85
Profit = $0.64

CP = 2.85 - 0.64

Cost Price = $2.21

20 Sale Price = $9.20
Profit = $4.47

CP = 9.20 - 4.47

Cost Price = $4.73

21 Sale Price = $417
Profit = $263.80

CP = 417 - 263.80

Cost Price = $153.20

22 Sale Price = $9 999
Profit = $4 579

CP = 9 999 - 4 579

Cost Price = $5 420

Find the Sale Price using a profit of 40% of the Cost Price. First find the profit and then use SP = Cost Price + Profit.

23 Cost Price = $8.20

Profit = $8.20 \times \frac{40}{100}$

Profit = $3.28

SP = 8.20 + 3.28

SP = $ 11.48

24 Cost Price = $506

Profit = $506 \times \frac{40}{100}$

Profit = $202.40

SP = 506 + 202.40

SP = $708.40

25 Cost Price = $24.20

Profit = $24.20 \times \frac{40}{100}$

Profit = $9.68

SP = 24.20 + 9.68

SP = $33.88

26 Cost Price = $765

Profit = $765 \times \frac{40}{100}$

Profit = $306

SP = 765 + 306

SP = $1 071

Now a Profit of 65% of Cost Price is required. Round answer to 2 d.p.

27 Cost Price = $120

Profit = $120 \times \frac{65}{100}$

Profit = $78

SP = 120 + 78

SP = $ 198

28 Cost Price = $14.30

Profit = $14.30 \times \frac{65}{100}$

Profit = $9.30

SP = 14.30 + 9.30

SP = $23.60

29 Cost Price = $82.50

Profit = $82.50 \times \frac{65}{100}$

Profit = $53.63

SP = 82.50 + 53.63

SP = $136.13

30 Cost Price = $39.70

Profit = $39.70 \times \frac{65}{100}$

Profit = $25.81

SP = 39.70 + 25.81

SP = $65.51

31 Cost Price = $118

Profit = $118 \times \frac{65}{100}$

Profit = $76.70

SP = 118 + 76.70

SP = $194.70

32 Cost Price = $1 360

Profit = $1 360 \times \frac{65}{100}$

Profit = $884

SP = 1 360 + 884

SP = $22.48

Further Profit, Cost Price and Sale Price

It is recommended that this sheet be attempted only after the previous worksheet has been completed.

The three formulae to remember are:

Profit = Sale Price - Cost Price
Cost Price = Sale Price - Profit
Sale Price = Cost Price + Profit

Column 1 starts with a table. You have to either add or subtract the amounts and you have to ensure the order in which you subtract them is correct. The three formulae above are shown at the top of the sheet … take your time and look at each row and ask yourself if it makes sense!

Negative answers for Profit will occur when the Sale Price is less than the Cost Price, show these with a minus sign (-).

Questions 16 to 21 ask you to find the Profit as a percentage of the cost price:

$$\% \text{ Profit} = \frac{\text{Profit}}{\text{Cost Price}} \times 100$$

Which using the table is the same as:

$$\% \text{ Profit} = \frac{\text{2nd Column}}{\text{1st Column}} \times 100$$

Note that question 16 shows you to use the value of B in the top box (numerator) and the value of A in the bottom box (Question 1 in the table). Question 17 the same, only use D and C (Question 4 in the table). Note that this question has a negative profit or Loss. So your answer will include a minus sign (-), round your answer to 1 decimal place and remember the % sign.

Column 2, Questions 22 - 27 ask you to find the Profit as a percentage of the sale price:

$$\% \text{ Profit} = \frac{\text{Profit}}{\text{Sale Price}} \times 100$$

Which using the table is the same as:

$$\% \text{ Profit} = \frac{\text{2nd Column}}{\text{3rd Column}} \times 100$$

Question 22 shows that you are to use E and F, to ensure you don't make a mistake. Refer to the item number shown in the table and use the second and third columns to answer the questions. Your profit always has to be less than the sale price so these percentages can't be more than 100%...but they can be negative!

Question 28 - 30 are worded questions. In all questions first find the profit. Then use either the cost price or sale price formulae above, depending on which is asked for in the question.

Further Profit, Cost Price and Sale Price

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Fill the table with the missing amounts, use:
Cost Price = Sale Price - Profit or,
Sale Price = Cost Price + Profit or,
Profit = Sale Price - Cost Price

Your Profit may be negative!

	Cost Price	Profit	Sale Price
1	A $2.46	B	$4.11
2	$11.20	$4.75	
3		$1.58	$4.75
4	C $19.87	- $2.45 D	
5	$10.25		$13.04
6	$24.65		$19.87
7		$0.58	$1.12
8	$20.20	$16.33	
9		$4.51	$13.87
10	$0.14	$0.54 E	F
11	$5.95		$8.30
12		$3.11	$7.23
13	$31.80	$21.33	
14	$17.46		$11.99
15		$12.94	$41.36

Calculate the Profit as a percentage of the Cost Price, for some of the items above. Round your answer to 1 decimal place.

16 Use Item 1

$\%Profit = \frac{B}{A} \times 100$

%Profit = %

Round to 1 decimal place

17 Use Item 4

$\%Profit = \frac{D}{C} \times$ ☐

%Profit =

Round to 1 decimal place

18 Use Item 12

$\%Profit = \frac{\square}{\square} \times 100$

19 Use Item 7

20 Use Item 9

21 Use Item 14

Calculate the Profit as a percentage of the Sale Price this time. Round your answer to 1 decimal place. Watch for negatives!

22 Use Item 10

$\%Profit = \frac{E}{F} \times 100$

%Profit = %

23 Use Item 3

24 Use Item 11

25 Use Item 5

26 Use Item 15

27 Use Item 6

Now answer these worded questions. Find profit first then the % Profit. Answer to 2 decimal places.

28 Crazy Tom buys TV's at $498 then sells them for $629. Calculate the %Profit on the cost price.

Profit = ☐ - ☐

%Profit =

Profit = ☐

29 A Pet food company sells food at $0.67/can. If costs are $0.34 per can. Find the % Profit of the sale price.

30 Jan buys toasters at $14.76 and kettles at $11.22. If she sells toaster/kettle packs (the two together) for $40, find the % Profit on the cost price for a pack.

Further Profit, Cost Price and Sale Price

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Fill the table with the missing amounts, use:
Cost Price = Sale Price - Profit or,
Sale Price = Cost Price + Profit or,
Profit = Sale Price - Cost Price

Your Profit may be negative!

	Cost Price	Profit	Sale Price
1	A $2.46	$1.65 B	$4.11
2	$11.20	$4.75	$15.95
3	$3.17	$1.58	$4.75
4	C $19.87	- $2.45 D	$17.42
5	$10.25	$2.79	$13.04
6	$24.65	- $4.78	$19.87
7	$0.54	$0.58	$1.12
8	$20.20	$16.33	$36.53
9	$9.36	$4.51	$13.87
10	$0.14	$0.54 E	$0.68 F
11	$5.95	$2.35	$8.30
12	$4.12	$3.11	$7.23
13	$31.80	$21.33	$53.13
14	$17.46	- $5.47	$11.99
15	$28.42	$12.94	$41.36

Calculate the Profit as a percentage of the Cost Price, for some of the items above. Round your answer to 1 decimal place.

16 Use Item 1

$\%Profit = \frac{B\ 1.65}{A\ 2.46} \times 100$

%Profit = 67.1%

Round to 1 decimal place

17 Use Item 4

$\%Profit = \frac{D\ -2.45}{C\ 19.87} \times 100$

%Profit = -12.3%

Round to 1 decimal place

18 Use Item 12

$\%Profit = \frac{3.11}{4.12} \times 100$

%Profit = 75.1%

19 Use Item 7

$\%Profit = \frac{0.58}{0.54} \times 100$

%Profit = 107.4%

20 Use Item 9

$\%Profit = \frac{4.51}{9.36} \times 100$

%Profit = 48.2%

21 Use Item 14

$\%Profit = \frac{-5.47}{17.46} \times 100$

%Profit = -31.3%

Calculate the Profit as a percentage of the Sale Price this time. Round your answer to 1 decimal place. Watch for negatives!

22 Use Item 10

$\%Profit = \frac{E\ 0.54}{F\ 0.68} \times 100$

%Profit = 79.4%

23 Use Item 3

$\%Profit = \frac{1.58}{4.75} \times 100$

%Profit = 33.3%

24 Use Item 11

$\%Profit = \frac{2.35}{8.30} \times 100$

%Profit = 28.3%

25 Use Item 5

$\%Profit = \frac{2.79}{13.04} \times 100$

%Profit = 21.4%

26 Use Item 15

$\%Profit = \frac{12.94}{41.36} \times 100$

%Profit = 31.3%

27 Use Item 6

$\%Profit = \frac{-4.78}{19.87} \times 100$

%Profit = -24.1%

Now answer these worded questions. Find profit first then the % Profit. Answer to 2 decimal places.

28 Crazy Tom buys TV's at $498 then sells them for $629. Calculate the %Profit on the cost price.

Profit = 629 - 498

Profit = $131

$\%Profit = \frac{131}{498} \times 100$

%Profit = 26.31%

29 A Pet food company sells food at $0.67/can. If costs are $0.34 per can. Find the % Profit of the sale price.

Profit = 0.67 - 0.34

Profit = $0.33

$\%Profit = \frac{0.33}{0.67} \times 100$

%Profit = 49.25%

30 Jan buys toasters at $14.76 and kettles at $11.22. If she sells toaster/kettle packs (the two together) for $40, find the % Profit on the cost price for a pack.

CP = 14.76 + 11.22

CP = $25.98

Profit = 40 - 25.98

Profit = $14.02

$\%Profit = \frac{14.02}{25.98} \times 100$

%Profit = 53.97%

The Unitary Method

The Unitary Method is a process of determining a percentage of a quantity. The word 'unitary' meaning that you find the value of a single unit, which is 1%. Once you have found 1% you then use it to find any other percentage that you require.

Column 1 starts with a % and its value, divide both sides by the percentage and that will give you the value of 1%.

Example. If 34% = 612, how much is 1%?

To change 34% to 1%, you have to divide (÷) by 34.

34% = 612

÷ 34 ÷ 34

1% = 18

So divide 612 by 34 and you get your answer. 612 ÷ 34 = 18

The next part of column 1 asks you to find 100% when you are given the 1% value. Multiply both sides by 100. If these steps seem easy then remember all you have to do is combine these two steps and that is the Unitary Method.

Example. If 1% = 5.2, how much is 100%?

To change 1% to 100%, you have to multiply (×) by 100.

1% = 5.2

× 100 × 100

100% = 520

So multiply 5.2 by 100 and you get your answer. 5.2 × 100 = 520

Column 2 gives you a % and you are asked to find 100%. Follow the example by first dividing (by the percentage) to find the value of 1% then multiplying this value by 100 to get 100%. Note that these answers are rounded to 2 decimal places if required.

Note that on the 2nd line the decimal places aren't to 2 d.p, this is the middle step and doesn't have to be to 2 d.p, DON'T CLEAR YOUR SCREEN, use the number on the screen in the multiplication and multiply it by 100 otherwise your answer will be inaccurate.

Example. If 20% = 1 645 kg, how much is 100%?

To change 20% to 1%, you have to divide (÷) by 20.

20% = 1 645 kg

÷ 20 ÷ 20

1% = 82.25 kg

× 100 × 100

100% = 8 225 kg

To change 1% to 100% you have to multiply by 100. So multiply 82.25 by 100 and you get your answer. 82.25 × 100 = 8 225 kg.

The Unitary Method

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Given these percentages find the value of 1%, your answer may be a decimal.

Example. If 45% is 765, then find 1%.

45% = 765

÷ 45 ÷ 45

1% = 17

Example. If 30% is 576, then find 1%.

30% = 576

÷ 30 ÷ 30

1% = 19.2

1 15% = 390 ÷ 15 ÷ 15 1% =

2 7% = 56 ÷ 7 ÷ 7

3 22% = 99

4 72% = 504

5 120% = 288

6 19% = 114

7 4.5% = 90

8 8.2% = 328

9 1.3% = 65

Now given 1% find 100%.

Example. If 1% is 28, find 100%.

1% = 28

× 100 × 100

100% = 2 800

10 1% = 17.1 × 100 × 100 100% =

11 1% = 43.6 × 100 × 100

12 1% = 0.94

13 1% = 131

14 1% = 20.2

15 1% = 0.035

16 1% = 8.536

17 1% = 12.07

Find 100% in 2 steps, first find 1% (by ÷) then find 100% (by ×100), round to 2 d.p.

Example

34% is $15, find 100%.

34% = $15

÷ 34 ÷ 34

1% = $0.44117 ← Don't round, don't clear your calculator screen

× 100 × 100

100% = $44.12 ← Round to 2 d.p.

18 19% = $23.37 ÷ 19 ÷ 19 1% = × 100 × 100 100% =

19 23% = 163.76 m ÷ ÷ 1% = × 100 × 100 100% =

20 86% = 44.72 g

21 55% = 195.91 mm

22 105% = $2 850.75

23 125% = $5 650

24 Airline tickets are being sold at $1 232 which is 88% of the standard price. Find the standard price.

25 An auction is selling goods at 45% of their normal price. If Kim paid $2 790 for a rug, calculate its normal price.

The Unitary Method

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Given these percentages find the value of 1%, your answer may be a decimal.

Example. If 45% is 765, then find 1%.

45% = 765
÷ 45 ÷ 45
1% = 17

Example. If 30% is 576, then find 1%.

30% = 576
÷ 30 ÷ 30
1% = 19.2

1 15% = 390
÷ 15 ÷ 15
1% = 26

2 7% = 56
÷ 7 ÷ 7
1% = 8

3 22% = 99
÷ 22 ÷ 22
1% = 4.5

4 72% = 504
÷ 72 ÷ 72
1% = 7

5 120% = 288
÷ 120 ÷ 120
1% = 2.4

6 19% = 114
÷ 19 ÷ 19
1% = 6

7 4.5% = 90
÷4.5 ÷4.5
1% = 20

8 8.2% = 328
÷8.2 ÷8.2
1% = 40

9 1.3% = 65
÷1.3 ÷1.3
1% = 50

Now given 1% find 100%.

Example. If 1% is 28, find 100%.

1% = 28
× 100 × 100
100% = 2 800

10 1% = 17.1
× 100 × 100
100% = 1 710

11 1% = 43.6
× 100 × 100
100% = 4 360

12 1% = 0.94
× 100 × 100
100% = 94

13 1% = 131
× 100 × 100
100% =13 100

14 1% = 20.2
× 100 × 100
100% = 2 020

15 1% = 0.035
× 100 × 100
100% = 3.5

16 1% = 8.536
× 100 × 100
100% = 853.6

17 1% = 12.07
× 100 × 100
100% = 1 207

Find 100% in 2 steps, first find 1% (by ÷) then find 100% (by ×100), round to 2 d.p.

Example
34% is $15, find 100%.

34% = $15
÷ 34 ÷ 34
1% = $0.44117 ← Don't round, don't clear your calculator screen
× 100 × 100
100% = $44.12 ← Round to 2 d.p.

18
19% = $23.37
÷ 19 ÷ 19
1% = $1.23
× 100 × 100
100% = $123

19
23% = 163.76 m
÷ 23 ÷ 23
1% = 7.12 m
× 100 × 100
100% = 712 m

20
86% = 44.72 g
÷ 86 ÷ 86
1% = 0.52 g
× 100 × 100
100% = 52 g

21
55% = 195.91 mm
÷ 55 ÷ 55
1% = 3.562 mm
× 100 × 100
100% = 356.2 mm

22
105% = $2 850.75
÷105 ÷105
1% = $27.15
× 100 × 100
100% = $2 715

23
125% = $5 650
÷125 ÷125
1% = $45.20
× 100 × 100
100% = $4 520

24
Airline tickets are being sold at $1 232 which is 88% of the standard price. Find the standard price.

88% = $1 232
÷ 88 ÷ 88
1% = $14
× 100 × 100
100% = $1 400

25
An auction is selling goods at 45% of their normal price. If Kim paid $2 790 for a rug, calculate its normal price.

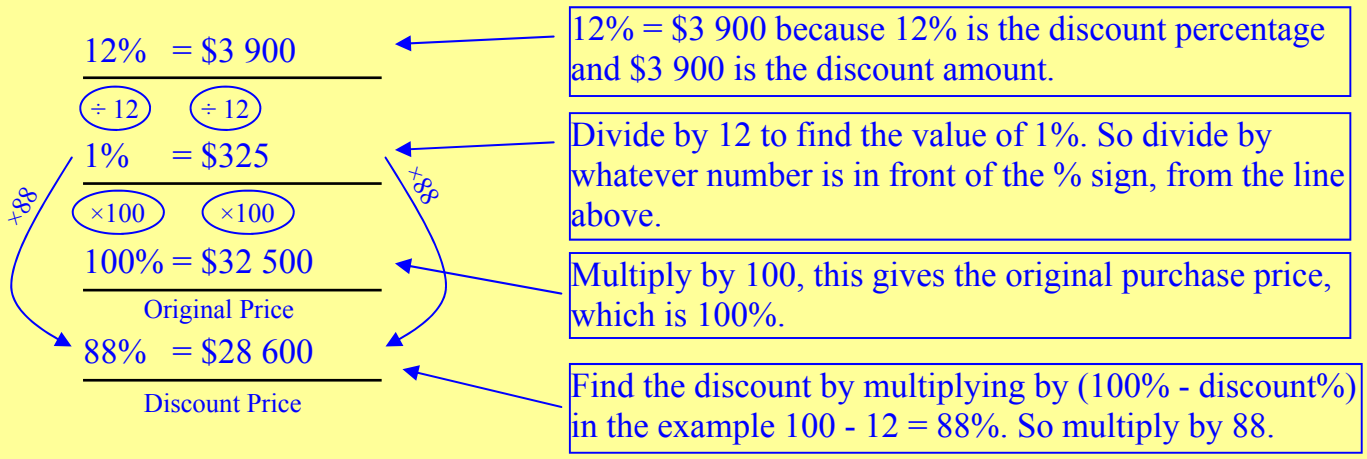
45% = $2 790
÷ 45 ÷ 45
1% = $62
× 100 × 100
100% = $6 200

Further Unitary Method - Discounts and Pricing

This sheet involves discounts, increases, original prices and discounted prices. The most difficult part of these questions is determining what the percentage means...is it the discount or increase?...or is it the amount after the discount or increase? Note that these questions are different to decreasing and incresing by a percentage because you are not given the original amount, you are given either the amount after the increase/decrease has been applied or the increase/decrease amount.

Column 1 involves a discount and its percentage, you aren't given the new price after the discount or the old price. Use this percentage to find the value of 1%, then find the original price (100% ..so multiply by 100) and the discount price, which is 100% minus the discount percentage. Money is always 2 d.p.

Example Car, 12% off, save $3 900



Column 2 gives you the amount after the increase/decrease is applied. This means that if it is an increase you add the increase % to 100%, then solve for 1%. If it is a decrease you subtract the % from 100% and use it to find 1%. The original amount will be 100% and the amount of discount/increase is the percentage in the question.

Your percentage on the first line is
100 + the increase with increase questions
or
100 - the decrease with decreasing questions

In these questions you are given the final amount. You are asked to find the original amount (100%) and then the amount of the increase/decrease (which is the percentage in the question).

Column 3 is a mix of columns 1 and 2, you have to examine the labels and decide what you are being given, the increase/decrease or the amount after the increase/decrease has been applied. This may be challenging so think about these carefully and look at your final answer and ask yourself if the answer looks right.

100% = $68

Commission on Sales

Commission is when you are paid a percentage of your sales. This means the more you sell, the more you make. So it is a motivational method of payment to pay you more if you make more money for the business. It can result in low pay also for people who aren't good in sales, so commission can be a poor payment option for some people.

Commission is the same as finding a percentage of a quantity, except it is easier because the units are always $, and are always rounded to 2 decimal places.

Column 1 is completed by multiplying the sales amount by the percentage as a decimal. See below.

Example. Sales = $17 315, Rate = 6%

Commission = $17\,315 \times \frac{6}{100}$ ← Multiply the amount by the percentage expressed as a fraction (over 100)

Commission = $1 038.90 ← Write your answer with a ($) and show two decimal places so write 1038.9 as $1 038.90

Column 2 starts with a table. Complete the table the same way as column 1 except no working out is required. If you don't know how to turn the screen click on "View", then "Rotate View" then "Counter Clockwise". Repeat only select "Clockwise" to return to standard view. After you answer the table, rank the earnings of the employees from 1 (Most earned) to 7 (Least earned).

The rest of the sheet, Q17 onwards, is answered the same way. Calculate the commission earned by one or more people and fill in the circle for the person who earned the most. Note that some people are paid a wage (not a commission), their wage requires no calculation, just calculate commission earnings and compare it with the wage earner.

Tom earns $560/wk, Jessica earns 15% comm. on sales of $3 970. ← Tom earns a wage so no calculation is required for Tom. Jessica is paid by commission, so her pay must be calculated.

Jessica = $3\,970 \times \frac{15}{100}$ ← Multiply the amount by the percentage expressed as a fraction (over 100), just as in earlier questions.

Jessica = $595.50

Jessica ● Tom ○ ← Jessica is paid $595.50 and Tom is paid $560. So Jessica earns the most, fill in the circle with her name next to it.

Commission on Sales

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the commission on these sales given the rates of commission below. Answer to 2 d.p.

Example

Sales = \$15 540, Rate = 12%

Further Commission and Base Salary

An alternative to being paid "Straight Commission" which is commission only, is to receive a base salary each week but receive commission as well, as an incentive to sell more and increase your pay.

Column 1 gives you the base salary and then a sales figure and commission rate. To calculate the pay earned add the base salary to the commission earned. See example below.

Example. Base salary of $415/wk plus 11% comm. on sales of $6 770

Pay = $415 + 6\,770 \times \frac{11}{100}$ ← Base salary + sales × percentage as a fraction (over 100)

Pay = $1 159.70 ← Base salary + sales × percentage as a fraction (over 100)

Note that Q6 and Q7 have two different commission rates, so calculate them separately then add them to the base salary to get the total pay.

Column 2 (from Q8) and Column 3 use the Real Estate agent's sliding scale shown above Q8. This scale starts with a fee of $3000. Then the sale amount of the property determines the rate or rates of commission that apply.

Sale Price $362 000

$362 500

$150 000 $\times \frac{3}{100}$ ← The first $150 000 of the sale price has a commission of 3% payable. So multiply $150 000 by 3% expressed as a fraction.

= $4 500

$216 000 $\times \frac{1.5}{100}$ ← $362 000 - $150 000 = $216 000 the second rate of commission applies for the next $250 000, so all of the $216 000 has a rate of 1.5% payable

= $3 240

Comm = 3 000 + 4 500 + 3 240

= $10 740 ← Remember that the commission must include the $3000 basic fee then the other amounts added to it.

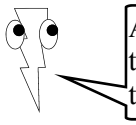
Further Commission and Base Salary

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE



Add the commission to the base salary to find the total weekly pay.

1 Base salary of $210/wk plus 4% comm. on sales of $14 656

Pay = $210 + 14\,656 \times \frac{4}{100}$

Pay = $796.24

2 Base salary of $135/wk plus 7% comm. on sales of $9 898

Pay = $135 + 9\,898 \times \frac{7}{100}$

Pay = $827.86

3 Base salary of $340/wk plus 2% comm. on sales of $6 470

Pay = $340 + 6\,470 \times \frac{2}{100}$

Pay = $469.40

4 Base salary of $175/wk plus 5% comm. on sales of $19 176

Pay = $175 + 19\,176 \times \frac{5}{100}$

Pay = $1 133.80

5 Base salary of $338/wk plus 1.5% comm. on sales of $42 376

Pay = $338 + 42\,376 \times \frac{1.5}{100}$

Pay = $973.64

6 Base salary of $643/wk plus 0.5% comm. on sales of $35 600 and 0.75% on sales of $11 200

0.5% comm. $= 35\,600 \times \frac{0.5}{100}$ = $ 178

0.75% comm. $= 11\,200 \times \frac{.75}{100}$ = $ 84

Pay = 643 + 178 + 84

Pay = $905

7 Base salary of $371/wk plus 0.3% comm. on sales of $18 299 and 0.45% on sales of $38 011.

0.3% comm. $= 18\,299 \times \frac{0.3}{100}$ = $ 54.90

0.45% comm. $= 38\,011 \times \frac{.45}{100}$ =$ 171.05

Pay = 371 + 54.90 + 171.05

Pay = $596.95

Use the real estate agent fee schedule below to find the commission payable

Basic commission of $3 000, then add:
3% on first $150 000 of sale price
1.5% on next $250 000 of sale price
1% on remaining balance

8 Sale Price $98 950

Comm = $3\,000 + 98\,950 \times \frac{3}{100}$

Comm = $5 968.50

9 Sale Price $175 000

$175 000

$150 000 × 3/100 = $4 500

$25 000 × 1.5/100 = $375

Comm = 3 000 + 4 500 + 375 = $7 875

10 Sale Price $345 000

$345 000

$150 000 × 3/100 = $4 500

$195 000 × 1.5/100 = $2 925

Comm = 3 000 + 4 500 + 2 925 = $10 425

11 Sale Price $535 000

$535 000

$150 000 × 3/100 = $4 500

$250 000 × 1.5/100 = $3 750

$135 000 × 1/100 = $1 350

Comm = 3 000 + 4 500 + 3 750 + 1 350

Comm = $12 600

12 Sale Price $1 410 000

$1 410 000

$150 000 × 3/100 = $4 500

$250 000 × 1.5/100 = $3 750

$1 010 000 × 1/100 = $10 100

Comm = 3 000 + 4 500 + 3 750 + 10 100

Comm = $21 350

13 Sale Price $282 500

$282 500

$150 000 × 3/100 = $4 500

$132 500 × 1.5/100 = $1 987.50

Comm = 3 000 + 4 500 + 1 987.50 =$9 487.50

Simple Interest

It's a big formula, so what is so simple about it? It is called simple interest because at the end of each year no interest is paid, it is only paid when the total time period of the investment is reached. So interest isn't paid at the end of the each year, just when the investment is completed.

There are 4 variables in the formula, these are:

$$I = \frac{PRT}{100}$$

I = Interest earned on the investment (or payable on a loan)
P = Principle, the amount invested (or borrowed if a loan)
R = interest rate applied to the investment (or loan)
T = the term, the time period the investment (or loan) is over

To find the interest payable, multiply the given Principal, rate and term then divide by 100. There is an example below. As you are dealing with money remember to round your answer to 2 decimal places (2 d.p.)

Example. $710 at 5.85% for 6 years ← P = $710, r = 5.85% and T = 6

$$I = \frac{PrT}{100} = \frac{710 \times 5.85 \times 6}{100}$$

$$I = \$249.21$$

Using your calculator

7	1	0	×	5	.	8	5	×	6	÷	1	0	0	=

In column 3 you are asked to calculate the account balance, to do this, use the same method as Columns 1 and 2 except you add the Interest to the Principle as a last step. So don't clear your calculator, add the principle to the answer on your calculator screen. This gives you the Account Balance or "A". For the example above.

$$A = 710 + 249.21$$

$$A = \$959.21$$

A = P + I
or
Acc Bal = Principle + Interest

Warning - you may prefer to use the fraction key rather than divide. If you do, you may get a fraction answer, after you press the equals (=) button press the fraction key again and it will change the answer back to a decimal.

Simple Interest

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Calculate the interest earned on the investments below, round your answer to 2 d.p.

Example

P T R

$800 for 3 years at 6% p.a.

$$I = \frac{PRT}{100} = \frac{800 \times 6 \times 3}{100}$$

Calculator

8 0 0 × 6 × 3 ÷ 1 0 0 =

$I = \$144$

1 $235 for 5 years at 8% p.a.

$$I = \frac{PRT}{100} = \_\_\_\_\_$$

2 $788 for 9 weeks at 0.2% per week.

3 $771 for 7 months at 1.4% per month.

4 $5 370 for 200 days at 0.015% per day.

5 $65 at 9.25% p.a. for a year

6 $428 for 3 years at 4.3% p.a.

7 $43 200 at 3% p.a. for 7 years.

8 $400 for 9 weeks at 0.17% per week.

9 $8 509 for 3 quarters at 3.9% per quarter.

10 0.02% per day is paid on a $86 700 investment for 75 days.

11 $580 is invested at 0.9% per month for 10 months.

Add the interest (I) to the principle (P) to calculate the account balance (A).

Principle	+ Interest	= Balance
$1 200	$855.20	$2 055.20
$375	$212.72	$587.72
$7 700	$2 795.10	$10 495.10
$95 676	$17 392	$113 068

12 $5 700 for 4 years at 8% p.a.

$$I = \frac{PRT}{100} = \_\_\_\_\_$$

$A = 5700 +$ _____

$A =$ _____

13 $750 for 3 years at 4.3% p.a.

14 $175 at 9.3% p.a. for 2 years

15 $900 for 4 months at 0.64% per month.

Simple Interest

Calculate the interest earned on the investments below, round your answer to 2 d.p.

Example

P T R

$800 for 3 years at 6% p.a.

$$I = \frac{PRT}{100} = \frac{800 \times 6 \times 3}{100}$$

Calculator

8 0 0 × 6 × 3 ÷ 1 0 0 =

$I = \$144$

1 $235 for 5 years at 8% p.a.

$$I = \frac{PRT}{100} = \frac{235 \times 8 \times 5}{100}$$

$I = \$94$

2 $788 for 9 weeks at 0.2% per week.

$$I = \frac{PRT}{100} = \frac{788 \times 0.2 \times 9}{100}$$

$I = \$14.18$

3 $771 for 7 months at 1.4% per month.

$$I = \frac{PRT}{100} = \frac{771 \times 1.4 \times 7}{100}$$

$I = \$75.56$

4 $5 370 for 200 days at 0.015% per day.

$$I = \frac{PRT}{100}$$

$$= \frac{5\,370 \times 0.015 \times 200}{100}$$

$I = \$161.10$

5 $65 at 9.25% p.a. for a year

$$I = \frac{PRT}{100} = \frac{65 \times 9.25 \times 1}{100}$$

$I = \$6.01$

6 $428 for 3 years at 4.3% p.a.

$$I = \frac{PRT}{100} = \frac{428 \times 4.3 \times 3}{100}$$

$I = \$55.21$

7 $43 200 at 3% p.a. for 7 years.

$$I = \frac{PRT}{100} = \frac{43\,200 \times 3 \times 7}{100}$$

$I = \$9\,072$

8 $400 for 9 weeks at 0.17% per week.

$$I = \frac{PRT}{100} = \frac{400 \times 0.17 \times 9}{100}$$

$I = \$6.12$

9 $8 509 for 3 quarters at 3.9% per quarter.

$$I = \frac{PRT}{100} = \frac{8\,509 \times 3.9 \times 3}{100}$$

$I = \$995.55$

10 0.02% per day is paid on a $86 700 investment for 75 days.

$$I = \frac{PRT}{100}$$

$$= \frac{86\,700 \times 0.02 \times 75}{100}$$

$I = \$1\,300.50$

11 $580 is invested at 0.9% per month for 10 months.

$$I = \frac{PRT}{100} = \frac{580 \times 0.9 \times 10}{100}$$

$I = \$52.20$

Add the interest (I) to the principle (P) to calculate the account balance (A).

Principle	+ Interest	= Balance
$1 200	$855.20	$2 055.20
$375	$212.72	$587.72
$7 700	$2 795.10	$10 495.10
$95 676	$17 392	$113 068

12 $5 700 for 4 years at 8% p.a.

$$I = \frac{PRT}{100} = \frac{5\,700 \times 8 \times 4}{100}$$

$I = \$1\,824$

$A = 5700 + 1\,824$

$A = \$7\,524$

13 $750 for 3 years at 4.3% p.a.

$$I = \frac{PRT}{100} = \frac{750 \times 4.3 \times 3}{100}$$

$I = \$96.75$

$A = 750 + 96.75$

$A = \$846.75$

14 $175 at 9.3% p.a. for 2 years

$$I = \frac{PRT}{100} = \frac{175 \times 9.3 \times 2}{100}$$

$I = \$32.55$

$A = 175 + 32.55$

$A = \$207.55$

15 $900 for 4 months at 0.64% per month.

$$I = \frac{PRT}{100} = \frac{900 \times 0.64 \times 4}{100}$$

$I = \$23.04$

$A = 900 + 23.04$

$A = \$923.04$

Further Simple Interest

This sheet uses periods of investment that don't match the interest rate period. The previous simple interest sheet should have been completed before this sheet is attempted.

Column 1 uses weeks or months but the interest rate is always p.a., so write the number of weeks as a fraction of a year (/52) or write months as a fraction of a year (/12). look at the examples below.

Example 1. $6 050 at 9% for 34 weeks

$$I = \frac{PRT}{100} = \frac{6\,050 \times 9 \times \frac{34}{52}}{100}$$

$I = \$356.02$

Example 2. $3 100 at 7.7% for 8 months

$$I = \frac{PRT}{100} = \frac{3\,100 \times 7.7 \times \frac{8}{12}}{100}$$

$I = \$159.13$

Note that time periods can exceed 1 year. For example you could have an investment for 75 weeks. This would be (75/52). Likewise with months, 20 month investment would use (20/12).

Column 2 starts by using days so write the days over 365 (/365). Then a combination of days, months and years are used. Write the years as the whole number part of the mixed numeral, then make the fraction up using either days, weeks or months (/365 /52 or /12). Examples are below.

Example 1. $800 at 4% for 170 days

$$I = \frac{PRT}{100} = \frac{800 \times 4 \times \frac{170}{365}}{100}$$

$I = \$14.90$

Example 2. $1 950 at 5.6% for 4 yrs 6 wks

$$I = \frac{PRT}{100} = \frac{1\,950 \times 5.6 \times 4\frac{6}{52}}{100}$$

$I = \$449.40$

Column 3 asks you to find the account balance, complete the interest calculation just the same way but then add the interest and principle together.

$A = P + I$
or
Acc Bal = Principle + Interest

Warning - if you use the fraction key for the term (ie: 4 months = 4/12) don't use the calculator fraction key again to divide by 100. If you do, the calculator will change the $^{4}/_{12}$ to $4\ ^{12}/_{100}$. So use ÷ 100 instead of the fraction key to avoid this.

Further Simple Interest

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

For investments less than 1 year use fractions. Put weeks over 52 and months over 12. So 3 weeks = $^{3}/_{52}$.

Change days to fractions (/365) and years & months to mixed numbers.

7 $2 830 at 7.6% p.a. for 210 days

$$I = \frac{PRT}{100} = \frac{2\,830 \times 7.6 \times \frac{210}{365}}{100}$$

$I = \$123.74$

8 $9 500 at 8.7% p.a. for 85 days

$$I = \frac{PRT}{100} = \frac{9\,500 \times 8.7 \times \frac{85}{365}}{100}$$

$I = \$192.47$

9 $5 810 at 11% p.a. for 303 days

$$I = \frac{PRT}{100} = \frac{5\,810 \times 11 \times \frac{303}{365}}{100}$$

$I = \$530.54$

10 $600 at 3% p.a. for 2 years and 4 months

$$I = \frac{PRT}{100} = \frac{600 \times 3 \times 2\frac{4}{12}}{100}$$

$I = \$42$

11 $850 at 8% p.a for 6 years and 9 weeks

$$I = \frac{PRT}{100} = \frac{850 \times 8 \times 6\frac{9}{52}}{100}$$

$I = \$419.77$

12 $3 095 at 12% p.a for 3 years and 7 months

$$I = \frac{PRT}{100} = \frac{3\,095 \times 12 \times 3\frac{7}{12}}{100}$$

$I = \$1\,330.85$

Find the interest then add it to the principle to find the new balance

Principle	+ Interest	= Balance
$13 954	$2 883	$14 237
$5 793	$1 609	$7 402
$36 271	$7 030	$43 301
$19 430	$890.68	$20 320.68
$948	$56.94	$1 004.94
$29 300	$42 339	$71 639

13 $532 at 4% p.a. for 5 years and 2 months.

$$I = \frac{PRT}{100} = \frac{532 \times 4 \times 5\frac{2}{12}}{100}$$

$I = \$109.95$

$A = 532 + 109.95$

$A = \$641.95$

14 $8 225 for 172 days at 7.6% p.a.

$$I = \frac{PRT}{100} = \frac{8\,225 \times 7.6 \times \frac{172}{365}}{100}$$

$I = \$294.57$

$A = 8\,225 + 294.57$

$A = \$8\,519.57$

15 $3 777 at 6% p.a. for 2 years and 94 days.

$$I = \frac{PRT}{100} = \frac{3\,777 \times 6 \times 2\frac{94}{365}}{100}$$

$I = \$511.60$

$A = 3\,777 + 511.60$

$A = \$4\,288.60$

GST Calculations - Unitary Method - Australia GST 10%

GST is short for Goods and Services Tax, it is a tax that is applied to day to day items at a rate of 10%*. While there is another way of calculating GST on an item (÷ 11), this method won't work when the rate changes to another amount or you travel to a country such as New Zealand which has a different rate, 12.5%*.

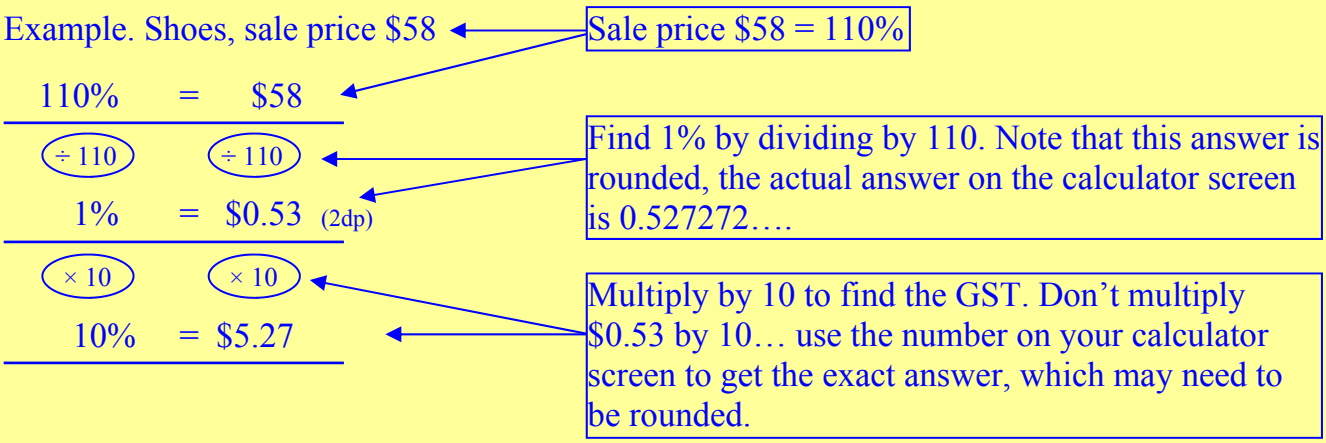
The following describes GST:

Ex-GST price + GST = Sale Price

Ex-GST = Price excluding GST GST = TAX Sale Price = Price paid for item

Prices calculated may need to be rounded, the customer gets a rounded GST figure to the nearest cent.

Column 1 uses the unitary method to find the GST in an item. Because the sale price is the item vale (100%) + GST (10%) the sale price is effectively 110% of the item's value. So using the unitary method:



Column 2 asks you to calculate the sale price given the ex-GST price. Because there is no tax the percentage is 100%. So you are given 100% and have to find 110%. Follow the ovals in Questions 8 and 9 to get you started.

Column 3 is just the reverse of Column 2. This time you are given the sale price and have to find the ex-GST price. So you are given 110% and have to find 100%. Follow questions 16 and 17 tips to get the method.

* GST is 10% in Australia and 12.5% in New Zealand at the time of software release.

GST Calculations - Unitary Method - New Zealand GST 15%

GST is short for Goods and Services Tax, it is a tax that is applied to day to day items at a rate of 15%*. There is a quick method to calculate GST and that is to multiply by $^{3}/_{23}$, but the rate can change and this rule won't work if the rate changes.

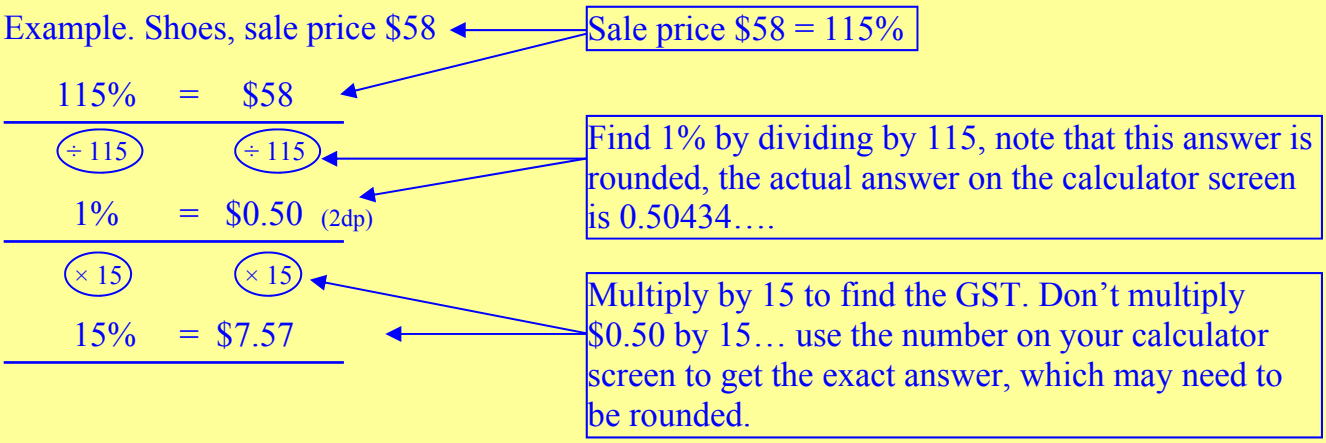
The following describes GST:

Ex-GST price + GST = Sale Price

Ex-GST = Price excluding GST GST = TAX Sale Price = Price paid for item

Prices calculated may need to be rounded, the customer gets a rounded GST figure to the nearest cent.

Column 1 uses the unitary method to find the GST in an item. Because the sale price is the item vale (100%) + GST (15%) the sale price is effectively 115% of the item's value. So using the unitary method:



Column 2 starts by asking you to calculate the sale price given the ex-GST price. Because there is no tax the percentage is 100%. So you are given 100% and have to find 115%. Follow the ovals in Questions 10 and 11 to get you started.

The second group of questions in Column 2 is just the reverse of the previous questions. This time you are given the sale price and have to find the ex-GST price. So you are given 115% and have to find 100%. Follow questions 14 and 15 tips to get the method.

* GST is 12.5% in New Zealand at the time of software release. But it has been suggested that from October 2010, it will rise to 15%.

115% = $8.55
÷ 115 ÷ 115
1% = $0.07 (2dp)
× 100 × 100
100% = $7.43

Depreciation

When you buy an item it goes down in value each year. This is called depreciation. Items depreciate at different rates, depending on how popular or rare they are or their expected life. Depreciation is given as a percentage and it is calculated just the same as finding a percentage of a quantity.

Column 1 involves calculating the depreciation of an item for its first three years of life. An example is shown below.

Car \$39 400 value depreciates by 14% p.a. ← Each year the value of this car will drop by 14%. Note that p.a. stands for per annum which means "per year".

Depreciation = $39\,400 \times \frac{14}{100}$

Depreciation = \$5 516 ← This is the amount of depreciation. So each year the car will go down by this amount. (\$5 516)

Yr 1: 39 400 - 5 516 = \$33 884 ← At the end of the first year the car will have this value.

Yr 2: 33 884 - 5 516 = \$28 368 ← At the end of the second year the car will have this value.

Yr 3: 28 368 - 5 516 = \$22 852 ← At the end of the third year the car will have this value.

Depreciation is only a mathematical model. For example with the car above, would the value be the same after three years if the car wasn't looked after? ..... If the car was considered rare? So its application ignores other factors that could affect the value.

Column 2 is the same as Column 1 except that the values are plotted. So complete all of the calculations first, then:

On Year 0 (The vertical axis) : Go up to the value of the new item, as shown with the Jet Ski in Q5. Plot a point, this has been done for the Jet Ski.

Year 1: Go up to the year 1 value that you calculated and plot a point.

Repeat for Years 2 and 3.

Then draw a line through the points the full size of the graph. At Year 5 draw a line up until it hits your sketched line then draw the line across and read off the value on the scale. This will give the value at the end of the fifth year. Because it is done graphically answers will vary.

You might also like to consider after what amount of time the item will be worth nothing. When the value is zero it is referred to as being "Written Off".

Depreciation

Depreciation = $296

Yr 1: 1 850 - 296 = $1 554

Yr 2: 1 554 - 296 = $1 258

Yr 3: 1 258 - 296 = $962

4 Forklift $8 300 depreciates by 30% p.a.

Depreciation = $8\,300 \times \frac{30}{100}$

Depreciation = $2 490

Yr 1: 8 300 - 2 490 = $5 810

Yr 2: 5 810 - 2 490 = $3 320

Yr 3: 3 320 - 2 490 = $830

Find the value after depreciation after 1, 2 and 3 years. Plot the values on the graph then draw a line. Estimate the value after 5 years using the graph.

5 Jet ski $7 950 value depreciates by 16% p.a.

Depreciation = $7\,950 \times \frac{16}{100}$

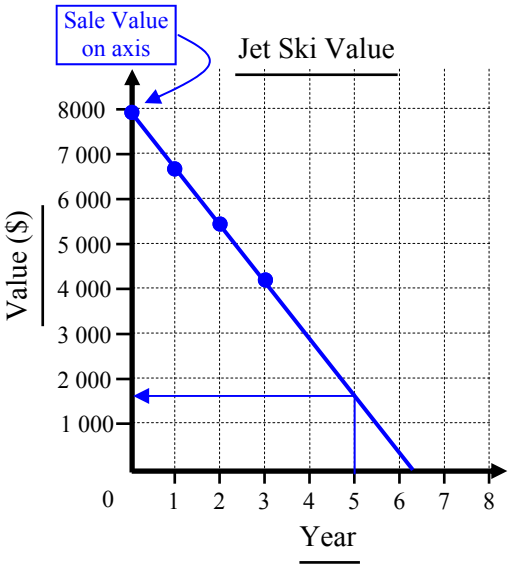
Depreciation = $1 272

Yr 1: 7 950 - 1 272 = $6 678

Yr 2: 6 678 - 1 272 = $5 406

Yr 3: 5 406 - 1 272 = $4 134

Yr 5 (Graph): ≈ $1 600



6 Motorcycle $9 900 value depreciates by 18% p.a.

Depreciation = $9\,900 \times \frac{18}{100}$

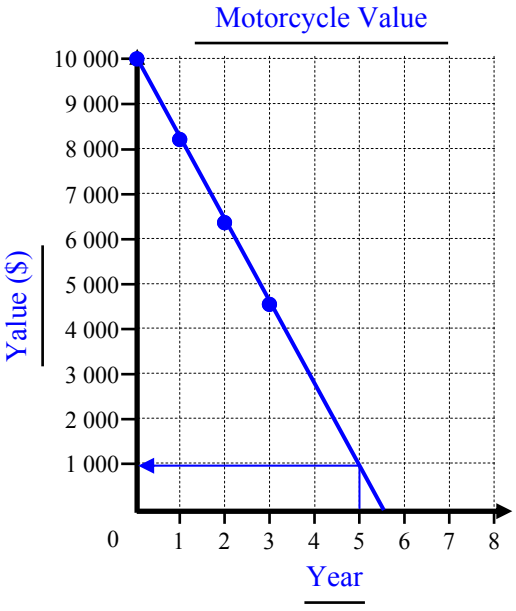
Depreciation = $1 782

Yr 1: 9 900 - 1 782 = $8 118

Yr 2: 8 118 - 1 782 = $6 336

Yr 3: 6 336 - 1 782 = $4 554

Yr 5 (Graph): ≈ $1 000



7 Phone $420 value depreciates by 20% p.a.

Depreciation = $420 \times \frac{20}{100}$

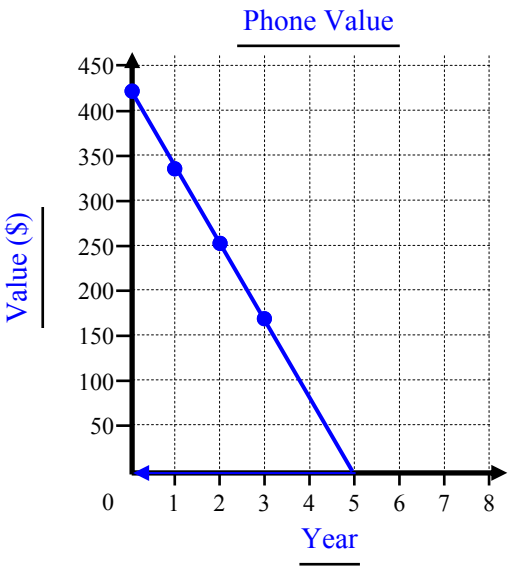
Depreciation = $84

Yr 1: 420 - 84 = $336

Yr 2: 336 - 84 = $252

Yr 3: 252 - 84 = $168

Yr 5 (Graph): ≈ $0



Percentages - Find A Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don’t colour it in too dark (using a texta for example) so that you can still read it.

Percentages - Find a Word

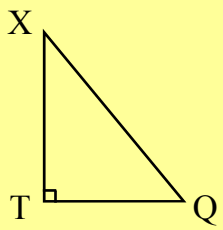
ALTITUDE

PYTHAGORAS THEOREM

The Hypotenuse

The hypotenuse is the longest side of a right-angled triangle. So look for the longest side or, use the right angle symbol to help you, as the hypotenuse is always opposite (it doesn't touch) the right angle.

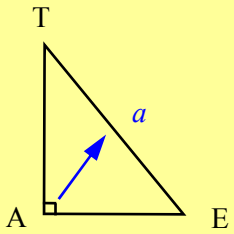
Column 1 starts with asking you to name the triangle and then the hypotenuse. The name for the triangle can be answered starting from any point and moving either clockwise or anti-clockwise, so answers will vary. The hypotenuse only has two alternatives using the letters at each end, forwards or backwards.



$\frac{\Delta QTX}{\text{Triangle}}$

$\frac{XQ \text{ or } QX}{\text{Hypotenuse}}$

Column 2 keeps on with naming but this time instead of using the capital letters on the triangle to name the hypotenuse we will use one single lower case letter. Using the letter that is on the right angle, name the hypotenuse the same letter, except in lower case. All sides can be labeled in this way, side '*a*' is always opposite angle 'A' and so on.



$\frac{\Delta ATE}{\text{Triangle}}$

$\frac{a}{\text{Hypotenuse}}$

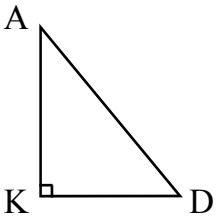
Column 3 asks you to construct triangles with the names provided. So draw the triangles first, make sure you include the right angle symbol. Once it is drawn then put the letters on the diagram. Label the hypotenuse first as it has been specified so make sure your drawing matches! Then put the other letter on the last angle, which is of course the right angle.

The Hypotenuse

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Name the triangle and the side that is opposite the right angle (hypotenuse)

Example



ΔAKD
Triangle

AD or DA
Hypotenuse

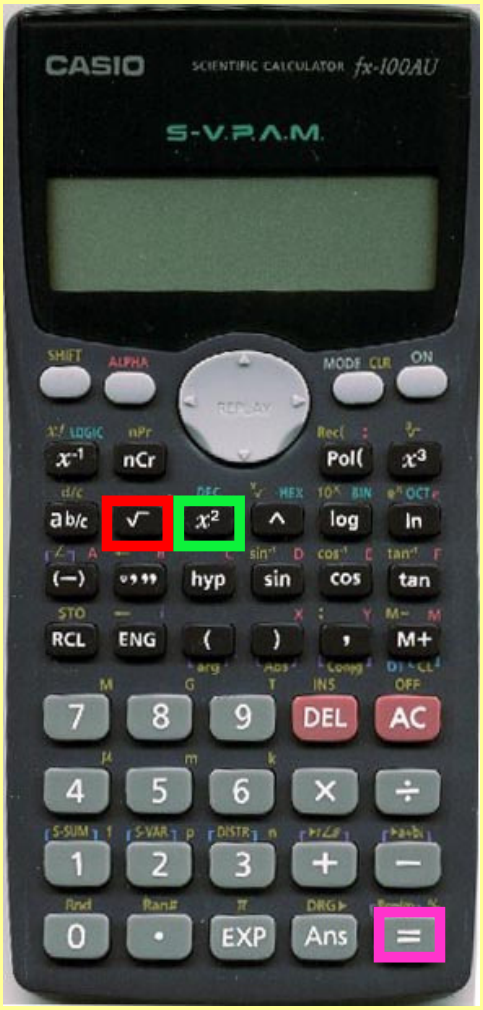
Calculator Use and Rounding

To complete the Pythagoras Theorem calculations to be introduced in the worksheets that follow you must be able to:

- Square a number (Multiply it by itself)
- Square root a number (find the number that when multiplied by itself, equals the number)
- Round a decimal (reduce a decimal in size using rounding methods)



Squaring a Number Calculator Steps:	Square rooting a Number Calculator Steps:
Find 72^2 7 2 x^2 =	Find $\sqrt{361}$ √ 3 6 1 =
Answer is 5 184	Answer is 19

Column 1 introduces squaring numbers. Using the x^2 key on your calculator, enter the number to be squared, press the x^2 key, press '=' and you are done. The first four questions you should know and allow you to check the answer obtained with your calculator.

Square roots are then shown from Q.11. To answer these press the √ key, then the number, then the '=' key, done. You will probably know the answers to the first three questions, use that knowledge to ensure you are using your calculator correctly.

Column 2 introduces rounding decimals. To round to one decimal place you look at the 2nd number after the decimal point.

Rounding to 1 decimal place (1 d.p.)

Example 1. Round 9.567 to 1 decimal place. 9.(5)[6]7

Answer could be 9.5 or 9.6
Because the boxed number is a 6, which is 5 or more, the answer is 9.6

Example 2. Round 6.246 to 1 decimal place. 6.(2)[4]6

Answer could be 6.2 or 6.3
Because the boxed number is a 4, which is less than 5, the answer is 6.2

Rounding to 2 decimal places (2 d.p.)

Example 3. Round 35.708 to 2 decimal places. 35.7(0)[8]

Answer could be 35.70 or 35.71
Because the boxed number is an 8, which is 5 or more, the answer is 35.71

Calculator Use and Rounding

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use your calculator's x^2 key to find these.

Example 18^2

[1] [8] [x^2] [=] 324

1. 5^2
2. 8^2
3. 7^2
4. 9^2
5. 17^2
6. 26^2
7. 19^2
8. 45^2
9. 34^2
10. 53^2

Now find these square roots use your calculator's $\sqrt{\ }$ key.

Example $\sqrt{1\,936}$

[$\sqrt{\ }$] [1] [9] [3] [6] [=] 44

11. $\sqrt{100}$
12. $\sqrt{25}$
13. $\sqrt{49}$
14. $\sqrt{529}$
15. $\sqrt{1\,369}$
16. $\sqrt{441}$
17. $\sqrt{6\,084}$
18. $\sqrt{7\,225}$
19. $\sqrt{9\,801}$
20. $\sqrt{4\,624}$

Round these decimals to one decimal place (1 d.p.)

Example $2.7\,9\,31$ 2.8

Look at the digit two numbers behind the decimal point (box around it). If it is 5 or more round up the first number behind the decimal point (circled number changes to an '8' and answer becomes 2.8 If < 5 the decimal would be shortened to 2.7

21. 5.87
22. 9.315
23. 27.249
24. 11.191
25. 16.3333
26. 35.6666
27. 117.062
28. 34.9601
29. 12.209
30. 75.0499

Now use your calculator & round the result to 1 d.p.

31. $\sqrt{19}$
32. $\sqrt{84}$
33. 2.5^2
34. $\sqrt{131}$
35. 9.6^2
36. 8.18^2
37. $\sqrt{98.32}$
38. $\sqrt{37}$
39. $\sqrt{63.5}$
40. 24.77^2
41. $\sqrt{398.4}$

Round these decimals to two decimal places (2 d.p.)

Example $5.3\,2\,6\,04$ 5.33

Look at the digit three numbers behind the decimal point (box around it). If it is 5 or more round up the second number behind the decimal point (circled number changes to an '3' and answer becomes 5.33 If < 5 the decimal would be changed to 5.32

42. 0.9527
43. 8.39823
44. 56.2371
45. 80.8081
46. 28.9962
47. 14.2229
48. 19.0993
49. 43.8172
50. 39.9964
51. 20.2217

Use your calculator & round the result to 2 d.p.

52. 4.39^2
53. $\sqrt{308}$
54. 8.76^2
55. $\sqrt{5}$
56. $\sqrt{41}$
57. $\sqrt{19.6}$
58. 32.17^2
59. $\sqrt{4\,000}$
60. 45.75^2
61. $\sqrt{138.2}$
62. $\sqrt{38}$
63. $\sqrt{23}$

Calculator Use and Rounding

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use your calculator's x^2 key to find these.

Example 18^2

[1] [8] [x^2] [=] 324

1	5^2	25
2	8^2	64
3	7^2	49
4	9^2	81
5	17^2	289
6	26^2	676
7	19^2	361
8	45^2	2 025
9	34^2	1 156
10	53^2	2 809

Now find these square roots use your calculator's [$\sqrt{\ }$] key.

Example $\sqrt{1\ 936}$

[$\sqrt{\ }$] [1] [9] [3] [6] [=] 44

11	$\sqrt{100}$	10
12	$\sqrt{25}$	5
13	$\sqrt{49}$	7
14	$\sqrt{529}$	23
15	$\sqrt{1\ 369}$	37
16	$\sqrt{441}$	21
17	$\sqrt{6\ 084}$	78
18	$\sqrt{7\ 225}$	85
19	$\sqrt{9\ 801}$	99
20	$\sqrt{4\ 624}$	68

Round these decimals to one decimal place (1 d.p.)

Example 2.7931 2.8

Look at the digit two numbers behind the decimal point (box around it). If it is 5 or more round up the first number behind the decimal point (circled number changes to an '8' and answer becomes 2.8 If < 5 the decimal would be shortened to 2.7

21	5.87	5.9
22	9.315	9.3
23	27.249	27.2
24	11.191	11.2
25	16.3333	16.3
26	35.6666	35.7
27	117.062	117.1
28	34.9601	35 / 35.0
29	12.209	12.2
30	75.0499	75 / 75.0

Now use your calculator & round the result to 1 d.p.

31	$\sqrt{19}$	4.4
32	$\sqrt{84}$	9.2
33	2.5^2	6.3
34	$\sqrt{131}$	11.4
35	9.6^2	92.2
36	8.18^2	66.9
37	$\sqrt{98.32}$	9.9
38	$\sqrt{37}$	6.1
39	$\sqrt{63.5}$	8 / 8.0
40	24.77^2	613.6
41	$\sqrt{398.4}$	20 / 20.0

Round these decimals to two decimal places (2 d.p.)

Example 5.32604 5.33

Look at the digit three numbers behind the decimal point (box around it). If it is 5 or more round up the second number behind the decimal point (circled number changes to an '3' and answer becomes 5.33 If < 5 the decimal would be changed to 5.32

42	0.9527	0.95
43	8.39823	8.4/8.40
44	56.2371	56.24
45	80.8081	80.81
46	28.9962	29/29.00
47	14.2229	14.22
48	19.0993	19.10
49	43.8172	43.82
50	39.9964	40/40.00
51	20.2217	20.22

Use your calculator & round the result to 2 d.p.

52	4.39^2	19.27
53	$\sqrt{308}$	17.55
54	8.76^2	76.74
55	$\sqrt{5}$	2.24
56	$\sqrt{41}$	6.40
57	$\sqrt{19.6}$	4.43

61	$\sqrt{138.2}$	11.76
62	$\sqrt{38}$	6.16
63	$\sqrt{23}$	4.80

Squares and Square Roots

This sheet practices the skills required to perform Pythagoras Theorem. You need to know how to find the square root of a number and how to square a number.

Column 1 starts with squaring numbers, using a calculator. To answer the questions follow the method at the top of the column. So enter the number into your calculator, press the x^2 key, then the equals key and you are done.

Column 2 is the reverse. finding the square root of a number. The square root of a number is finding the 'number that when multiplied by itself, will equal the first number'. With a calculator press the square root key then the number then the equals button.

The table may look complicated but it isn't. The value in the column 'a^2' is found by finding the square of the number in the first column. The value 'b^2' is found by finding the square of the number in the second column. Now add the two values you calculated, don't clear your calculator screen, just press '+' and retype in the first value you calculated, press '=' and you are done. Now leave that number on your calculator screen and press the square root key then the '=' key, all done.

The answer above, and in column 3, is to be rounded to 2 decimal places, so look at the number 3 places behind the decimal point, if it is 5 or larger round your answer up, otherwise …..don't. Or just fix your calculator to 2 decimal places.

Column 3 asks you to square two numbers and add them. This is entered into the calculator as the example at the top of the column shows. Next you are asked to find the square root of the number you just found. To do this don't clear your calculator screen, press the square root key then the '=' sign. The answer is to be rounded to 2 decimal places, so look at the number 3 places behind the decimal point, if it is 5 or larger round your answer up, otherwise …..don't. Or fix your calculator to 2 decimal places.

Squares and Square Roots

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Square these numbers, use your calculator's x^2 key

Example 12.6^2

1 2 • 6 x^2 = 158.76

1. 13^2
2. 16^2
3. 29.2^2
4. 85.4^2
5. 39.6^2
6. 4.7^2
7. 55.3^2
8. 71.8^2
9. 62.5^2
10. 43.1^2

Find the square root, use your calculator's $\sqrt{\ }$ key

Example $\sqrt{11.56}$

$\sqrt{\ }$ 1 1 • 5 6 = 3.4

11. $\sqrt{169}$
12. $\sqrt{1\ 225}$
13. $\sqrt{31.36}$
14. $\sqrt{2\ 025}$
15. $\sqrt{123.21}$
16. $\sqrt{1\ 274.49}$
17. $\sqrt{7\ 482.25}$
18. $\sqrt{558.8496}$
19. $\sqrt{2\ 323.24}$
20. $\sqrt{948.64}$

Add the squares of these numbers then square root the total (answer to 2 d.p.)

Example $15^2 + 20^2$

1 5 x^2 + 2 0 x^2 = 625

Don't clear your calculator screen $\sqrt{\ }$ = 25

32. $14^2 + 18^2$
    Now square root the answer above
    2 decimal places
33. $12^2 + 20^2$
    Now square root the answer above
34. $11^2 + 17^2$
    Now square root the answer above
35. $6.3^2 + 9.2^2$
    Now square root the answer above
36. $13.4^2 + 8.3^2$
    Now square root the answer above
37. $45^2 + 26^2$
    Now square root the answer above
38. $46.5^2 + 35^2$
    Now square root the answer above
39. $1.4^2 + 2.7^2$
    Now square root the answer above
40. $122^2 + 106^2$
    Now square root the answer above
41. $0.82^2 + 0.6^2$
    Now square root the answer above
42. $490^2 + 350^2$
    Now square root the answer above

Complete the table by working across each row.
Column 3 = (Column 1)^2. Column 4 = (Column 2)^2.
Column 5 = Column 3 + Column 4 and the last step,
Column 6 = $\sqrt{\text{Column 5}}$ (answer to 2 d.p. if needed)

	Column 1 a	Column 2 b	Column 3 a^2	Column 4 b^2	Column 5 $a^2 + b^2$	Column 6 $\sqrt{a^2 + b^2}$
21	10	24				
22	27	36				
23	25	15				
24	9	16				
25	78	35				
26	29	55				
27	52	44				
28	78	108				
29	210	504				
30	186	322				
31	555	740

11	$\sqrt{169}$	13
12	$\sqrt{1\ 225}$	35
13	$\sqrt{31.36}$	5.6
14	$\sqrt{2\ 025}$	45
15	$\sqrt{123.21}$	11.1
16	$\sqrt{1\ 274.49}$	35.7
17	$\sqrt{7\ 482.25}$	86.5
18	$\sqrt{558.8496}$	23.96
19	$\sqrt{2\ 323.24}$	48.2
20	$\sqrt{948.64}$	30.8

Add the squares of these numbers then square root the total (answer to 2 d.p.)

Example $15^2 + 20^2$

1 5 x^2 + 2 0 x^2 = 625

Don't clear your calculator screen $\sqrt{\ }$ = 25

32	$14^2 + 18^2$	= 520
	Now square root the answer above	= 22.80
		2 decimal places
33	$12^2 + 20^2$	= 544
	Now square root the answer above	= 23.32
34	$11^2 + 17^2$	= 410
	Now square root the answer above	= 20.25
35	$6.3^2 + 9.2^2$	= 124.33
	Now square root the answer above	= 11.15
36	$13.4^2 + 8.3^2$	= 248.45
	Now square root the answer above	= 15.76
37	$45^2 + 26^2$	= 2 701
	Now square root the answer above	= 51.97
38	$46.5^2 + 35^2$	= 3 387.25
	Now square root the answer above	= 58.20
39	$1.4^2 + 2.7^2$	= 9.25
	Now square root the answer above	= 3.04
40	$122^2 + 106^2$	= 26 120
	Now square root the answer above	= 161.62
41	$0.82^2 + 0.6^2$	= 1.03
	Now square root the answer above	= 1.02
42	$490^2 + 350^2$	= 362 600
	Now square root the answer above	= 602.16

Complete the table by working across each row.
Column 3 = (Column 1)^2. Column 4 = (Column 2)^2.
Column 5 = Column 3 + Column 4 and the last step,
Column 6 = $\sqrt{\text{Column 5}}$ (answer to 2 d.p. if needed)

	Column 1 a	Column 2 b	Column 3 a^2	Column 4 b^2	Column 5 $a^2 + b^2$	Column 6 $\sqrt{a^2 + b^2}$

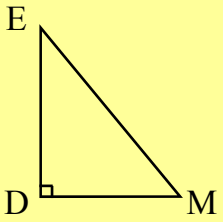
Pythagorean Result + Right-Angled Triangle Proof

Pythagoras found that with right-angled triangles, if you square the hypotenuse it is equal to the square of the two short sides added together.

Column 1 askes you to find the Pythagorean Result, which as there are no side lengths given, this uses the sides themselves.

$$EM^2 = ED^2 + DM^2$$

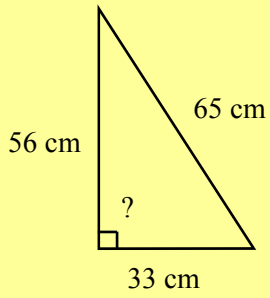
$$\text{Hypotenuse}^2 = \text{Short Side}^2 + \text{Short side}^2$$



The letters could also be back to front, and it doesn't matter which of the short sides is shown first

Questions 5 and 6 ask you to use lower case letters so write the sides in lower case, using the opposite angle to name each side.

Column 2 (and 3) deal with proving if a triangle is right-angled or not. As Pythagoras Theorem applies only to right-angled triangles, it can be used to determine if a triangle is right-angled. So as with the previous column, hypotenuse^2 = short side^2 + short side^2. In the example below, the hypotenuse is 65 and the two short sides are 33 and 56. So $65^2 = 33^2 + 56^2$.



$65^2 = 33^2 + 56^2$

$4\,225 = 4\,225$

LHS = RHS Δ is right-angled

Calculate 65^2, write '=' then calculate $33^2 + 56^2$. Are they equal? If they are you have a right angled triangle. Make sure you say "LHS = RHS", this is the statement of proof. That the left hand side (of the equals sign) is equal to the right hand side (of the equals sign). If they aren't equal strike out the equals sign, to make 'not equal to' which is $\neq$. Of course you also have to answer the question which is "Yes the triangle is right angled" or the opposite.

Column 3 continues with asking if the three sides given would make a right-angled triangle. Find $a^2 + b^2$ then find c^2. If they are equal, you have a right angled triangle.

a	b	c	$a^2 + b^2$	c^2

Graphical Application of Pythagoras Theorem

Pythagoras' Theorem $c^2 = a^2 + b^2$ applies to all right-angled triangles. This sheet contains 7 right-angled triangles. The question is …… does Pythagoras' Theorem apply to them?

To apply P.T. to these triangles measure the length of each side of the triangle. There are boxes on each side of these triangles, but this isn't for writing the length inside, it is for writing the 'square of' the length inside. So measure the side then either using your grey matter or your calculator square the length, then write it in the box. Once all three sides are done, check that when you add the square of the two short sides you get the square of the long side.

Or in other words: $c^2 = a^2 + b^2$.

The first question has been started for you, the base of the triangle is 3 cm long, $3^2 = 9$ or if you prefer $3 \times 3 = 9$ so a '9' has been written in the box.

The side lengths are in whole centimetres, so if you measure a length as 16.9 cm, consider it as being 17 cm.

MAKE SURE THAT WHEN YOU PRINT THIS SHEET YOU HAVE 'NONE' IN THE PAGE SCALING WINDOW, OR THE SHEET WON'T PRINT OUT CORRECTLY.

Graphical Application of Pythagoras Theorem

Measure each side of the right-angled triangles below to the nearest centimetre, then using a calculator, square each of the side lengths. Write your 'squared' answer in the boxes. Check that $c^2 = a^2 + b^2$.

Counting Squares + Triples

Pythagoras Theorem relates the squares of the side lengths of a right angled triangle. By drawing squares on each short side you can find the size of the square on the hypotenuse, its size is found by adding the two smaller squares together.

In column 1 you are given triangles with squares drawn on each side. The two small squares called a^2 and b^2 have grids inside, to find c^2 count the number of grid squares in a^2 and b^2 and add them together. You can count all the grid squares or you can count the grid squares along the side of the square …and square it!

Column 2 is the same as column 1 but this time after finding c^2, take the square root of it to find just c, which is the length of the hypotenuse. The numbers of grid squares is larger in these questions, so as you count the squares in a^2 and b^2 write them in the spaces. Add the two numbers together and that is c^2, like before. The next step is to square root this number to find c, you may need a calculator with the larger squares. Now that you know c, you can construct the grid squares along the hypotenuse, then grid the entire square.

Column 3 deals with Pythagorean triples. These are the three sides of right triangles that have whole number lengths on all three sides, no decimal answers. The numbers in black at the top of the table are know as Pythagorean ‘triples’ or ‘triads’, by multiplying these by 2, 3, 4 and so on …. you can create other triples. Remember that you can add down the column instead of multiplying to find each successive triple, that way you can use your mental skills rather than a calculator. Just add the top black triple to the previous blue triple to solve for the next row.

Counting Squares + Triples

Further Creating Pythagorean Triples

When a right-angled triangle has three sides that are all whole numbers, the lengths can be called Pythagorean triples.

To create these triples, three algebraic formulae can be used. These are:

When m and n are consecutive counting numbers, where $m = n + 1$:

Hypotenuse length is found by $m^2 + n^2$.
Short side length is found by $m^2 - n^2$.
Other short side length is found by $2mn$.

So using $m = 2$ and $n = 1$, would generate the first triple. Then use $m = 3$ and $n = 2$ to generate the next. Continue on to make as many triples as you want always using a value of n that is one less then m.

The first triple is shown as an example at the top of the first column. Continue the pattern to create seven more triples. The third column asks you to check that the triples are correct. Use the Pythagorean proof:

$$c^2 = a^2 + b^2$$

To show that the triples you created in questions 1, 2, 3 and 4 are correct complete the Pythagorean proof for each question. An example is shown at the top of the column, showing the proof being used on the example question from the first column.

Further Creating Pythagorean Triples

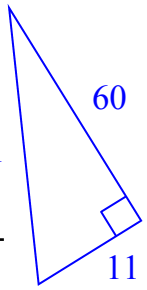
$61^2 = 11^2 + 60^2$

$3\,721 = 3\,721$

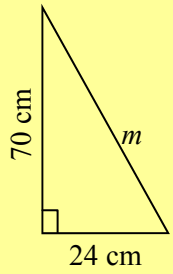
LHS = RHS

$\therefore \Delta$ is right-angled



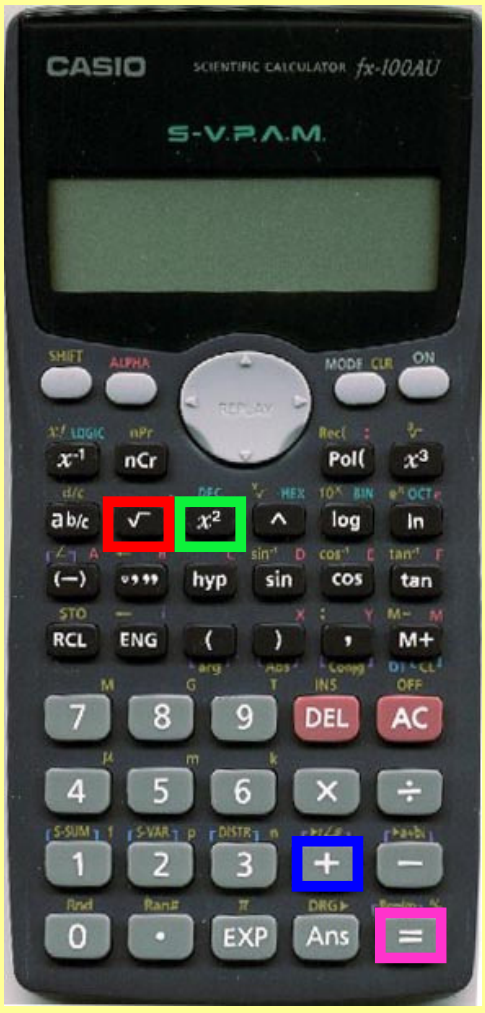
Finding the Length of the Hypotenuse - Whole Number Answers

Pythagoras' Theorem $c^2 = a^2 + b^2$ can be used to find the length of the hypotenuse given the two short sides of the right-angled triangle. The process is shown in the example below.



$m^2 = 24^2 + 70^2$	This is P.T. with c replaced with the letter m, and a and b replaced with the short side lengths.
$m^2 = 5\,476$	Rewrite m^2 then calculate the sum of the squares.
$m = \sqrt{5\,476}$	Rewrite the line above but change m^2 to m and write the number in a square root sign.
$m = 74$ cm	Solve the square root, on this sheet all the answers are whole numbers, include the units.

The entire sheet is answered in the same way as the method above. The diagrams in column 3 include triangles within other shapes but the process is just the same. Except with Q.14 which requires a little extra work before you can apply Pythagoras Theorem.



$m^2 = 24^2 + 70^2$	Calculator Steps:
$m^2 = 5\,476$	2 4 x^2 + 7 0 x^2 =
$m = \sqrt{5\,476}$	$\sqrt{\ }$ =
$m = 74$ cm

Finding the Length of the Hypotenuse - Whole Number Answers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the length of the hypotenuse, the answer will be a whole number.

Example

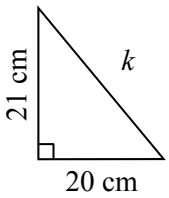
$x^2 = 12^2 + 35^2$ (First two lines are x^2)

$x^2 = 1\,369$

$x = \sqrt{1\,369}$ (Last two lines are x)

$x = 37$ m (Write the units)

1



$k^2 = 20^2 + 21^2$

$k^2 = 841$

$k = \sqrt{841}$

$k = 29$ cm

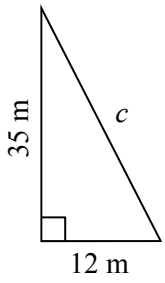
2

$c^2 = 12^2 + 35^2$

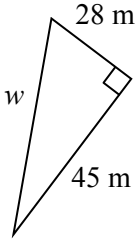
$c^2 = 1\,369$

$c = \sqrt{1\,369}$

$c = 37$ m



3



$w^2 = 28^2 + 45^2$

$w^2 = 2\,809$

$w = \sqrt{2\,809}$

$w = 53$ m

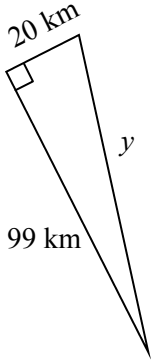
4

$y^2 = 99^2 + 20^2$

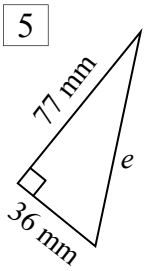
$y^2 = \sqrt{10\,201}$

$y = 10\,201$

$y = 101$ km



5



$e^2 = 36^2 + 77^2$

$e^2 = 7\,225$

$e = \sqrt{7\,225}$

$e = 85$ mm

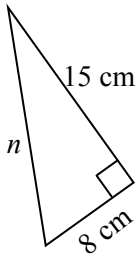
6

$n^2 = 8^2 + 15^2$

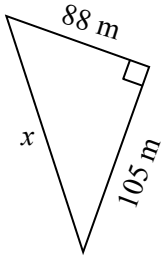
$n^2 = 289$

$n = \sqrt{289}$

$n = 17$ cm



7



$x^2 = 88^2 + 105^2$

$x^2 = 18\,769$

$x = \sqrt{18\,769}$

$x = 137$ m

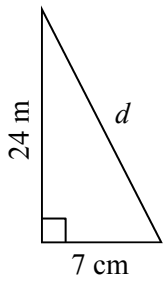
8

$d^2 = 7^2 + 24^2$

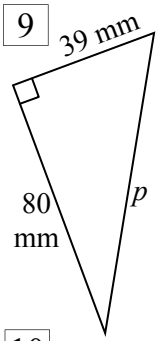
$d^2 = 625$

$d = \sqrt{625}$

$d = 25$ m



9



$p^2 = 39^2 + 80^2$

$p^2 = 7\,921$

$p = \sqrt{7\,921}$

$p = 89$ mm

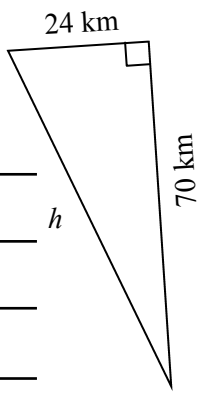
10

$h^2 = 24^2 + 70^2$

$h^2 = 5\,476$

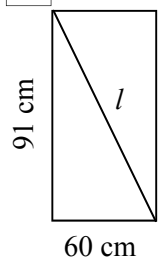
$h = \sqrt{5\,476}$

$h = 74$ km



Find the length of the unknown side(s), answers are all whole numbers.

11



$l^2 = 60^2 + 91^2$

$l^2 = 11\,881$

$l = \sqrt{11\,881}$

$l = 109$ cm

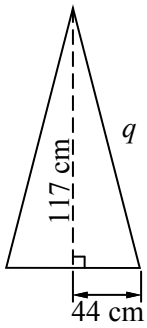
12

$q^2 = 44^2 + 117^2$

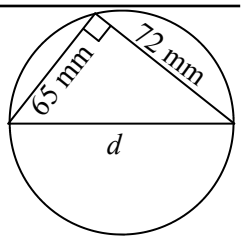
$q^2 = 15\,625$

$q = \sqrt{15\,625}$

$q = 125$ cm



13



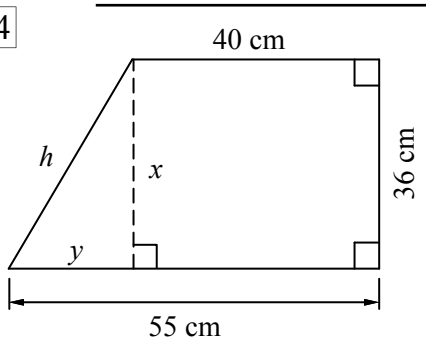
$d^2 = 65^2 + 72^2$

$d^2 = 9\,409$

$d = \sqrt{9\,409}$

$d = 97$ mm

14



$x = 36$ cm

$y = 55 - 40 = 15$ cm

Now use x and y to find h

$h^2 = 36^2 + 15^2$

$h^2 = 1\,521$

$h = \sqrt{1\,521}$

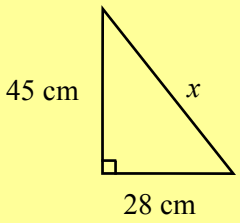
$h = 39$ cm

Finding the Hypotenuse - Rounding

This sheet uses Pythagoras theorem to find the length of the hypotenuse, the longest side of a right-angled triangle.

Pythagoras Theorem: $c^2 = a^2 + b^2$

Column 1 starts with an example that shows the method required. The hypotenuse is called x so the equation is x^2 = short side^2 + short side^2. Or put simply, square the two sides you are given and add them together. After you do this you square root the number to get the answer.



$x^2 = 28^2 + 45^2$ ← Write the letter on the hypotenuse squared. Then write the sum of the square of the two sides.

$x^2 = 2\,809$ ← Write '$x^2 =$' then calculate the right hand side and write the answer.

$x = \sqrt{2\,809}$ ← Change '$x^2 =$' to '$x =$' then write the answer in line two within a square root symbol or 'radical'.

$x = 53$ cm ← Complete the square root, check if rounding is required then write the units to complete.

Note that there are 4 lines of working, the first 2 lines are x^2, the next 2 are just x, try to remember this as some students forget. Look at the example above if you need help.

Column 2 is the same as column 1 except answers are to be rounded to 1 decimal place and the distance to be found isn't x, the letter used in each question varies.

Column 3 again the same method as column 1 but round to 2 decimal places.

Finding the Hypotenuse - Rounding

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Round these decimals to 1 decimal place. (1 d.p.)

22 173 cm and 104.5 cm

$x^2 = 173^2 + 104.5^2$

$x^2 = 40\,849.25$

$x = \sqrt{40\,849.25}$

$x = 202.11$ cm

23 2.09 m and 4.63 m

$x^2 = 2.09^2 + 4.63^2$

$x^2 = 25.81$

$x = \sqrt{25.81}$

$x = 5.08$ m

24 574 mm and 422 mm

$x^2 = 574^2 + 422^2$

$x^2 = 507\,560$

$x = \sqrt{507\,560}$

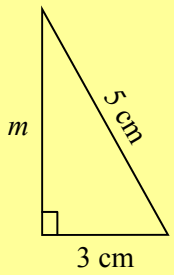
$x = 712.43$ mm

Finding a Short Side - Whole Number Answers

Pythagoras' Theorem $c^2 = a^2 + b^2$ can be used to find the length of the hypotenuse given the two short sides of the right-angled triangle. The process can be reversed when given the length of the hypotenuse and one of the short sides of the triangle.

$$b^2 = c^2 - a^2$$

In other words, use subtraction instead of addition. Just remember to use the hypotenuse length as 'c' as if you don't you will get a calculator error.

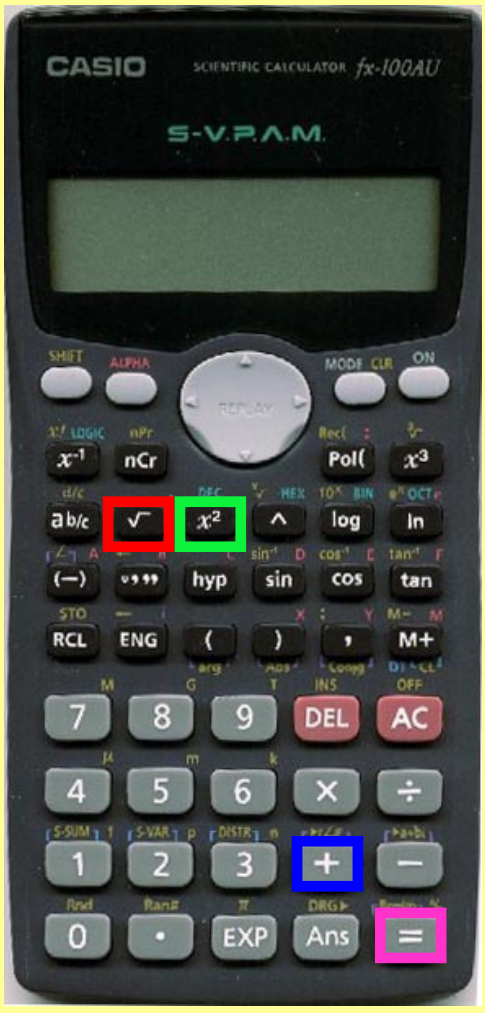


$m^2 = 5^2 - 3^2$ ← Remember to use '-' not '+' and it is the hypotenuse squared minus the short side squared.

$m^2 = 16$ ← Rewrite m^2 then subtract the two squared numbers.

$m = \sqrt{16}$ ← Rewrite the line above but change m^2 to m and write the number in a square root sign.

$m = 4$ cm ← Solve the square root, on this sheet all the answers are whole numbers, include the units.



The entire sheet is answered in the same way as the method above. The diagrams in column 3 include triangles within other shapes but the process is just the same. Except with Q.15 which requires a little extra work before you can apply Pythagoras Theorem.

$m^2 = 74^2 - 24^2$

$m^2 = 4\,900$

$m = \sqrt{4\,900}$

$m = 70$ cm

Calculator Steps:
7 4 x^2 - 2 4 x^2 =

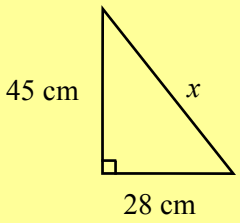
Pythagoras - Mixed Rounding and Surds

This sheet should only be attempted after finding the hypotenuse and finding the short side worksheets have been completed.

Column 1 is a mixture of finding the short side and finding the hypotenuse, so some are subtraction and some are addition. Note that the pronumeral (or letter) changes, it isn't always 'x'.

Example - Finding the Hypotenuse



$x^2 = 28^2 + 45^2$

$x^2 = 2\,809$

$x = \sqrt{2\,809}$

$x = 53$ cm

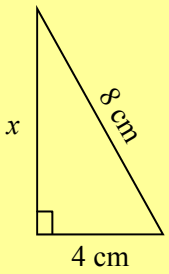
Write the letter on the hypotenuse squared. Then write the sum of the square of the two sides.

Write '$x^2 =$' then calculate the right hand side and write the answer.

Change '$x^2 =$' to '$x =$' then write the answer in line two within a square root symbol or 'radical'.

Complete the square root, check if rounding is required then write the units to complete.

Example - Finding the Short side



$x^2 = 8^2 - 4^2$

$x^2 = 48$

$x = \sqrt{48}$

$x = 6.9$ cm

Remember to use '-' not '+' and it is the hypotenuse squared minus the short side squared.

Rewrite x^2 then subtract the two squared numbers.

Rewrite the line above but change x^2 to x and write the number in a square root sign.

Solve the square root, on this sheet the answers will require rounding, include the units.

Column 2 asks to give the answers in surd form. These are easier as you don't have to calculate the square root, the 4th line is left out. Remember units, and if none are supplied then write 'units'.

Lower in Column 2 a truss is shown, a truss is a structure used to support load, such as in building roof structures and bridges. The lengths of all the external members are given, you have to calculate the lengths of the internal members. You have to start from the right hand side (R.H.S) and move left through the truss. This continues through Column 3 to complete all six of the internal members.

Pythagoras - Mixed Rounding and Surds

3

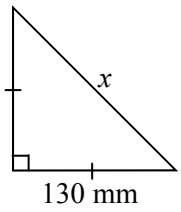
$d^2 = 4.9^2 + 11.6^2$

$d^2 = 158.57$

$d = \sqrt{158.57}$

$d = 45.7$ m

4



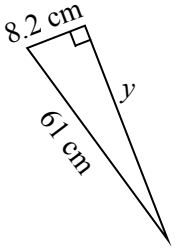
$x^2 = 130^2 + 130^2$

$x^2 = 33\,800$

$x = \sqrt{33\,800}$

$x = 183.8$ mm

5



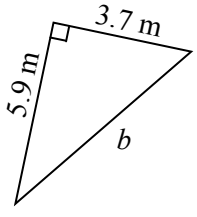
$y^2 = 61^2 - 8.2^2$

$y^2 = 3\,653.76$

$y = \sqrt{3\,653.76}$

$y = 60.4$ cm

6



$b^2 = 5.9^2 + 3.7^2$

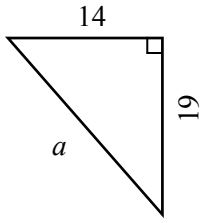
$b^2 = 48.5$

$b = \sqrt{48.5}$

$b = 7.0$ cm

Leave your answer as a surd. That means don't square root. Write 'units' if none shown.

Example

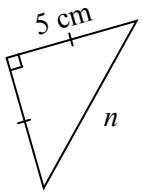


$a^2 = 14^2 + 19^2$

$a^2 = 557$

$a = \sqrt{557}$ units

7

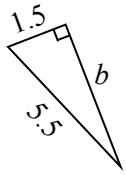


$n^2 = 5^2 + 5^2$

$n^2 = 50$

$n = \sqrt{50}$ cm

8

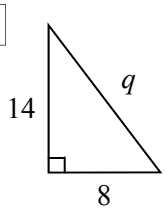


$b^2 = 5.5^2 - 1.5^2$

$b^2 = 28$

$b = \sqrt{28}$ units

9

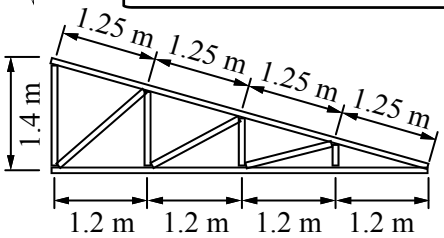


$q^2 = 14^2 + 8^2$

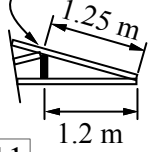
$q^2 = 260$

$q = \sqrt{260}$ units

Find the lengths of the internal members of the truss below, round to 2 d.p.



10 Black vertical



$x^2 = 1.25^2 - 1.2^2$

$x^2 = 0.1225$

$x = \sqrt{0.1225}$

$x = 0.35$ m

11

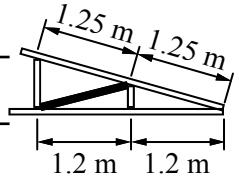
$x^2 = 1.2^2 + 0.35^2$

$x^2 = 1.5625$

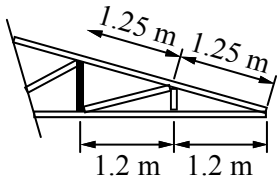
$x = \sqrt{1.5625}$

$x = 1.25$ m

Use your answer from Q. 10



12



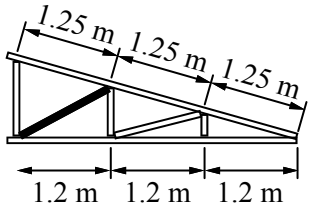
$x^2 = 2.5^2 - 2.4^2$

$x^2 = 0.49$

$x = \sqrt{0.49}$

$x = 0.7$ m

13



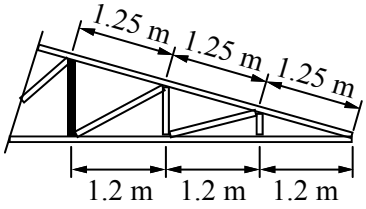
$x^2 = 0.7^2 + 1.2^2$

$x^2 = 1.93$

$x = \sqrt{1.93}$

$x = 1.39$ m

14



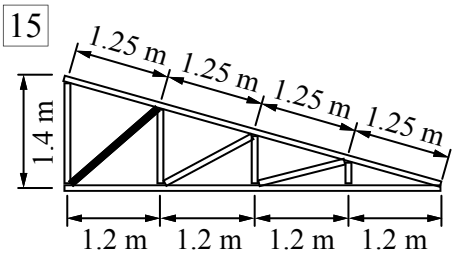
$x^2 = 3.75^2 - 3.6^2$

$x^2 = 1.1025$

$x = \sqrt{1.1025}$

$x = 1.05$ m

15



$x^2 = 1.05^2 + 1.2^2$

$x^2 = 2.5425$

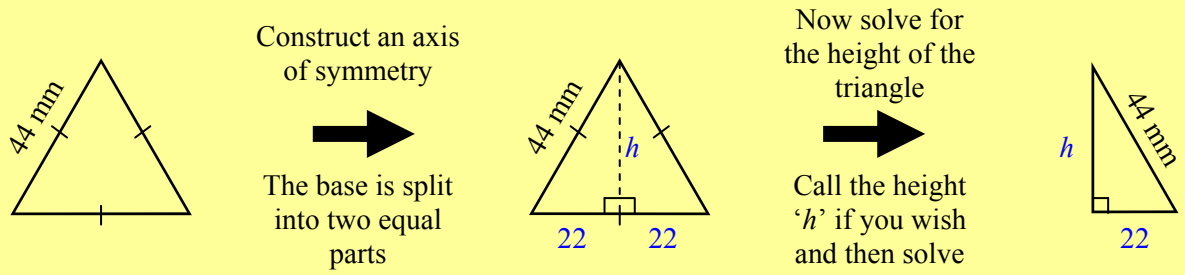
$x = \sqrt{2.5425}$

$x = 1.59$ m

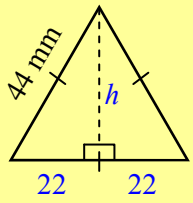
Pythagoras Theorem - Equilateral and Isosceles Triangles

Equilateral triangles and Non-Right angled Isosceles triangles don't have a right angle. So Pythagoras Theorem can't be applied to them unless a right angle is introduced. Because there are matching sides an axis of symmetry can be drawn through the triangle to create two right-angles triangles. Then Pythagoras can be applied.

Example



Solution



$h^2 = 44^2 - 22^2$

$h^2 = 1\ 452$

$h = \sqrt{1\ 452}$

$h = 38.11$ mm (2 d.p.)

Column 1 uses the above method, but Column 2 gives you the height and a side length and asks you to calculate the base length. Again use the method above but realise that you will be calculating 'half the base length' with some questions and may need to double the answer. The last two questions are more challenging.

Column 3 is an extension of the previous work and ties in algebra. This uses index laws and is more difficult. A full worked solution is at the top of the column, the good news is the algebra procedure doesn't change, so you can follow the process with just a different number in the questions below the example.

Pythagoras Theorem - Equilateral and Isosceles Triangles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the height of these triangles. Make sure you ½ the base length. (1 d.p.)

1

$\sqrt{}$ $\sqrt{}$

$x = 14.43....$calc

Side length

$= 28.87$ cm

$2x = 28.87$ cm

Pythagoras Theorem - Problems

These are problems involving Pythagoras Theorem. These questions should be only attempted after previous worksheets have been completed.

The questions are just like 'triangle' questions, the only difference is that you may have to:

- Interpret how a diagram converts to a triangle
- Transfer the details from the question to a diagram
- Draw a diagram yourself to represent the data in the question
- Make a statement after achieving the solution

Problems require you to answer a question, not simply find what 'x equals'. So after you find the solution write a statement that answers the question. If you are after the height of a tower for example "x = 240 m" doesn't adequately answer the question. "The tower is 240 m high" does answer the question.

Pythagoras Theorem - Problems

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Solve these problems using Pythagoras Theorem, answer to 2 decimal places.

1 A 2.3 m ladder is resting against a wall as shown. If the foot of the ladder is 0.8 m from the base of the wall, how far up the wall will the ladder reach? Start by filling in the boxes.

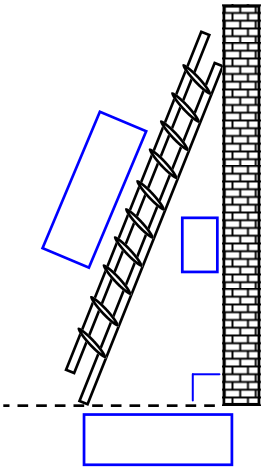
$h^2 =$

$h^2 =$

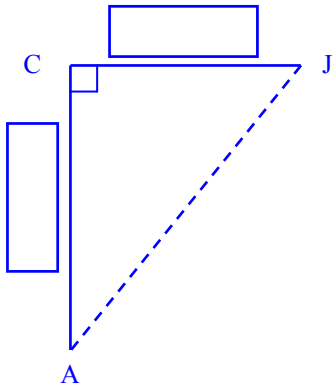
$h = \sqrt{}$

$h =$

The ladder will reach



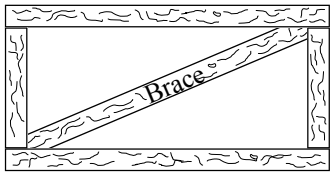
2 Jake and Amy left the same campsite (C). Jake (J) walked 4.2 km East while Amy (A) walked 5.6 km South. How far apart are they?



Answer using a sentence

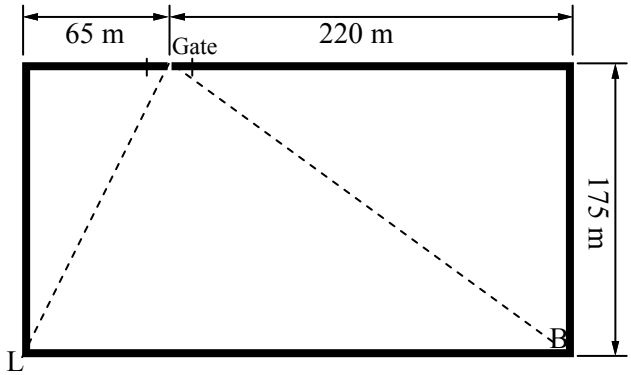
3 A kite is on a 35 m string and is a horizontal distance of 22 m from the flier. How high is the kite above the ground? Construct a diagram showing all relevant details.

4 A driveway gate (3.4 m × 1.2 m) is shown, calculate the length of the wooden brace.



5 Calculate the cost to build the gate given that the wood costs $7.30 per metre.

6 Leaping Larry always takes a shortcut through Farmer Fred's paddock. Bezerko the bull chases Larry because Larry wears red socks. If Larry is at point L and Bezerko is at B, how far does each have to run to get to the gate?



Larry:

Berzerko:

7 Find Larry's distance as a percentage of Berzerko's, round to the nearest whole number.

Pythagoras Theorem - Problems

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Solve these problems using Pythagoras Theorem, answer to 2 decimal places.

1 A 2.3 m ladder is resting against a wall as shown. If the foot of the ladder is 0.8 m from the base of the wall, how far up the wall will the ladder reach? Start by filling in the boxes.

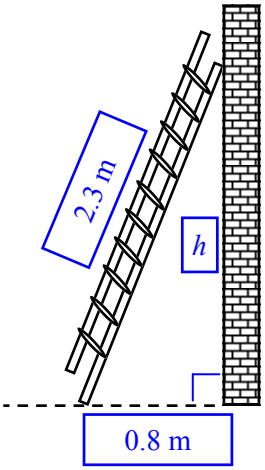
$h^2 = 2.3^2 - 0.8^2$

$h^2 = 4.65$

$h = \sqrt{4.65}$

$h = 2.16$ m

The ladder will reach 2.16 m up the wall.



2 Jake and Amy left the same campsite (C). Jake (J) walked 4.2 km East while Amy (A) walked 5.6 km South. How far apart are they?

$JA^2 = 5.6^2 + 4.2^2$

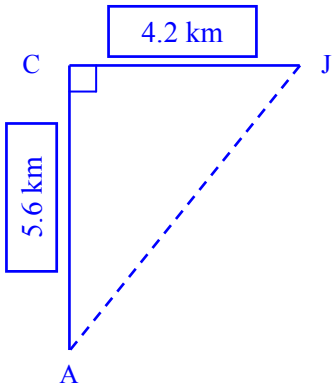
$JA^2 = 49$

$JA = \sqrt{49}$

$JA = 7$ km

They are 7 km apart.

Answer using a sentence



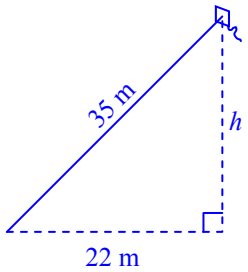
3 A kite is on a 35 m string and is a horizontal distance of 22 m from the flier. How high is the kite above the ground? Construct a diagram showing all relevant details.

$h^2 = 35^2 - 22^2$

$h^2 = 741$

$h = \sqrt{741}$

$h = 27.22$ m



The kite is 27.22 m above the ground.

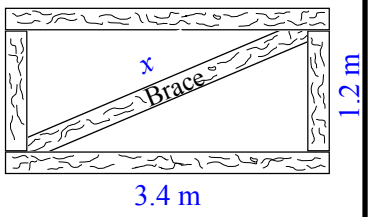
4 A driveway gate (3.4 m × 1.2 m) is shown, calculate the length of the wooden brace.

$x^2 = 3.4^2 + 1.2^2$

$x^2 = 13$

$x = \sqrt{13}$

$x = 3.61$ m



The brace is 3.61 m long.

5 Calculate the cost to build the gate given that the wood costs $7.30 per metre.

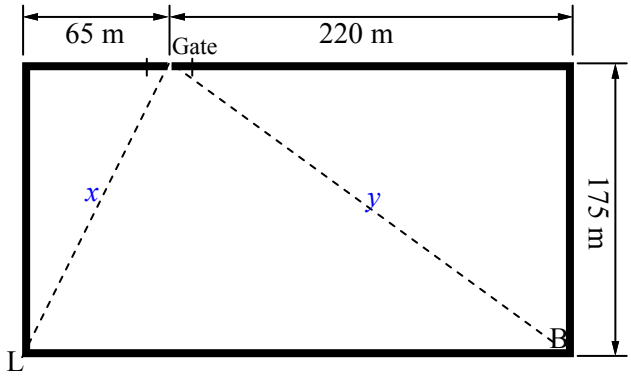
$P = 2 \times 3.4 + 2 \times 1.2$

$+ 3.61 = 12.81$ m

Cost @ 12.81=$93.51

Cost @ 13 m=$94.90

6 Leaping Larry always takes a shortcut through Farmer Fred's paddock. Bezerko the bull chases Larry because Larry wears red socks. If Larry is at point L and Bezerko is at B, how far does each have to run to get to the gate?



Larry:

$x^2 = 175^2 + 65^2$

$x^2 = 34\,850$

$x = \sqrt{34\,850}$

$x = 186.68$ m

Larry has to run a distance of 186.68 m.

Berzerko:

$y^2 = 175^2 + 220^2$

$y^2 = 79\,025$

$y = \sqrt{79\,025}$

$y = 281.11$ m

Berzerko charges a distance of 281.11 m.

7 Find Larry's distance as a percentage of Berzerko's, round to the nearest whole number.

$\frac{186.68}{281.11} \times 100 = 66.4\ldots$ calc $= 66\%$

Pythagoras Theorem - Further Problems

These are challenging problems involving Pythagoras Theorem. These questions should be only attempted after previous worksheets have been completed.

The questions are just like 'triangle' questions, the only difference is that you may have to:

- Interpret how a diagram converts to a triangle
- Transfer the details from the question to a diagram
- Draw a diagram yourself to represent the data in the question
- Make a statement after achieving the solution

Problems require you to answer a question, not simply find what 'x equals'. So after you find the solution write a statement that answers the question. If you are after the height of a tower for example "x = 240 m" doesn't adequately answer the question. "The tower is 240 m high" does answer the question.

Pythagoras Theorem - Further Problems

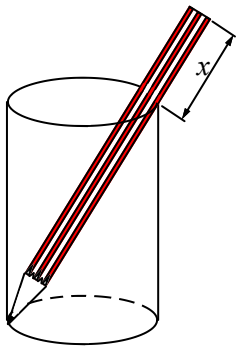
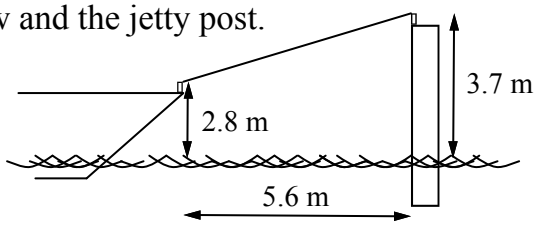
Solve these problems using Pythagoras Theorem, answer to 2 decimal places.

1 The glass below is 65 mm wide and 9.2 cm tall. If the pencil is 14 cm long, what length of the pencil is above the rim of the glass. Ignore the thickness of the pencil in your calculation.



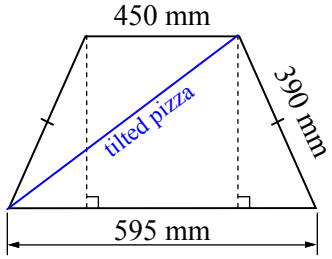
2 Calculate the length of rope between the boat's bow and the jetty post.



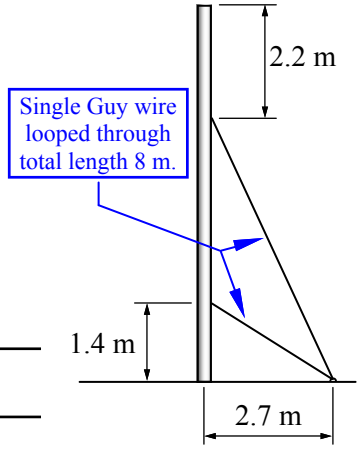
3 Alec walked South 1.42 km, West 850 m then North 2.01 km. How far from his starting location is he? Answer to the nearest metre.

Diagram

4 Lou's pizza prides itself on the largest pizza in its area. A competitor has released a 60 cm pizza, which is larger than the width of his pizza oven door, shown below. Lou thinks that if he tilts the pizza through the door, as shown, he can increase the size of his pizza. What size pizza can he make to the nearest cm, if he does so?



5 A flagpole shown below has a single guy wire attached to it 2.2 m from its tip. The 8 m guy wire is anchored 2.7 m from the base of the flagpole, loops through an eyelet and reconnects to the flagpole 1.4 m above the ground. Find the height of the flagpole.

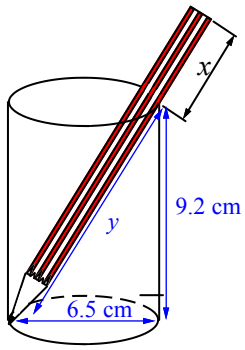


Pythagoras Theorem - Further Problems

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Solve these problems using Pythagoras Theorem, answer to 2 decimal places.

1 The glass below is 65 mm wide and 9.2 cm tall. If the pencil is 14 cm long, what length of the pencil is above the rim of the glass. Ignore the thickness of the pencil in your calculation.



$y^2 = 6.5^2 + 9.2^2$

$y^2 = 126.89$

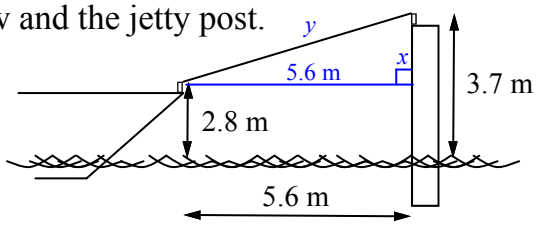
$y = \sqrt{126.89}$

$y = 11.26$ cm

$x = 14 - 11.26 = 2.74$ cm

2.74 cm of pencil is protruding

2 Calculate the length of rope between the boat's bow and the jetty post.



$x = 3.7 - 2.8 = 0.9$ m

$y^2 = 0.9^2 + 5.6^2$

$y^2 = 32.17$

$y = \sqrt{32.17}$

$y = 5.67$ m

The length of rope is 5.67 m.

3 Alec walked South 1.42 km, West 850 m then North 2.01 km. How far from his starting location is he? Answer to the nearest metre.

$x = 2\,010 - 1\,420$

$x = 590$ m

$y^2 = 590^2 + 850^2$

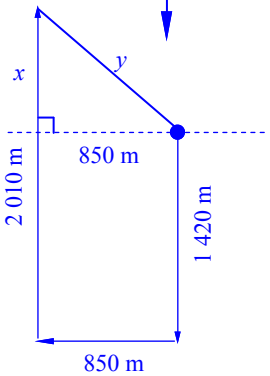
$y^2 = 1\,070\,600$

$y = \sqrt{1\,070\,600}$

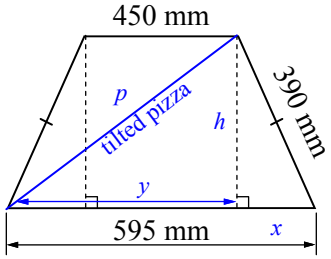
$y = 1\,035$ m

Alec is 1 035 m away from his original position.

Diagram



4 Lou's pizza prides itself on the largest pizza in its area. A competitor has released a 60 cm pizza, which is larger than the width of his pizza oven door, shown below. Lou thinks that if he tilts the pizza through the door, as shown, he can increase the size of his pizza. What size pizza can he make to the nearest cm, if he does so?



$h^2 = 390^2 - 72.5^2$

$h^2 = 146\,843.75$

$h = \sqrt{146\,843.75}$

$h = 383.20$ mm

$p^2 = 383.2^2 + 522.5^2$

$p^2 = 419\,848.49$

$p = \sqrt{419\,848.49}$

$p = 647.96$ mm

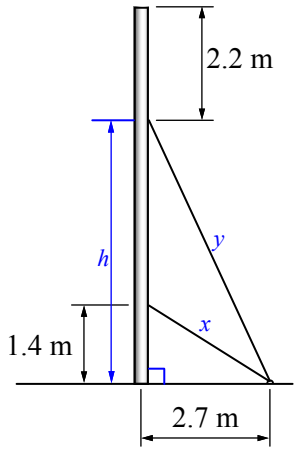
$x = (595 - 450) \div 2$

$x = 72.5$ mm

$y = 595 - 72.5 = 522.5$ mm

Largest pizza size is 64 cm

5 A flagpole shown below has a single guy wire attached to it 2.2 m from its tip. The 8 m guy wire is anchored 2.7 m from the base of the flagpole, loops through an eyelet and reconnects to the flagpole 1.4 m above the ground. Find the height of the flagpole.



$x^2 = 1.4^2 + 2.7^2$

$x^2 = 9.25$

$x = \sqrt{9.25}$

$x = 3.04$ m

$y = 8 - 3.04$

$y = 4.96$ m

$h^2 = 4.96^2 - 2.7^2$

$h^2 = 17.3116$

$h = \sqrt{17.3116}$

$h = 4.16$ m

Flagpole height = 4.16 + 2.2 = 6.36 m

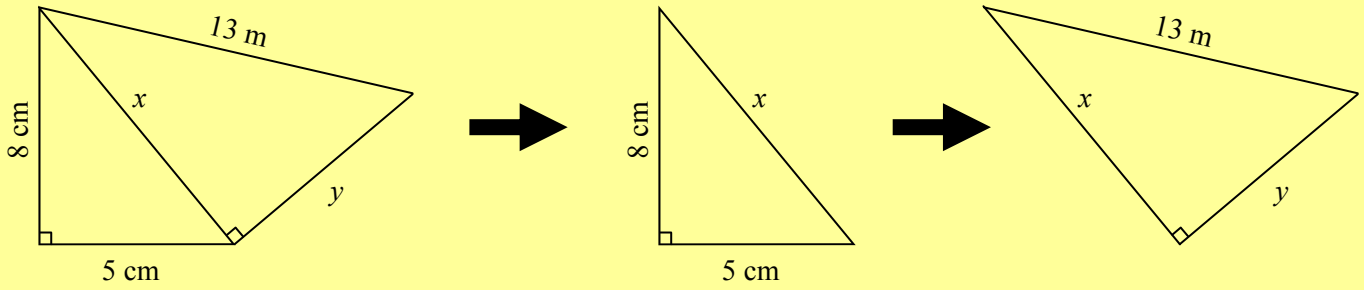
Pythagoras Theorem - Two Triangle Application

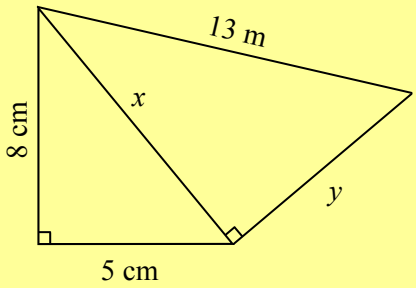
These questions require a double application of Pythagoras Theorem to solve. So apply P.T. to get your first answer, leave it as a surd for accuracy, then apply P.T. the second time.

Example - Find the length 'y'

First Application
Find x
(Leave as a surd)

Second Application
Use x and the other
given side to find y





First Application

$x^2 = 5^2 + 8^2$

$x^2 = 89$

$x = \sqrt{89}$ m

Leave this answer as a surd

Second Application

$y^2 = 13^2 - (\sqrt{89})^2$

$y^2 = 80$

$y = \sqrt{80}$

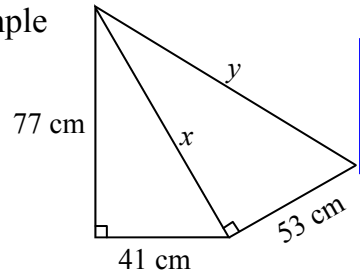
$y = 8.9$ m (1 d.p.)

Pythagoras Theorem - Two Triangle Application

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use Pythagoras Theorem to find y to 1 d.p. by first finding x as a surd.

Example



The squaring of a square root simply removes the square root.
So $(\sqrt{7\,610})^2 = 7\,610$

$x^2 = 41^2 + 77^2$

$x^2 = 7\,610$

$x = \sqrt{7\,610}$ cm

Leave this answer as a surd

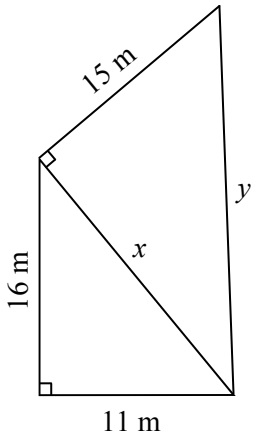
$y^2 = 53^2 + (\sqrt{7\,610})^2$

$y^2 = 10\,419$

$y = \sqrt{10\,419}$

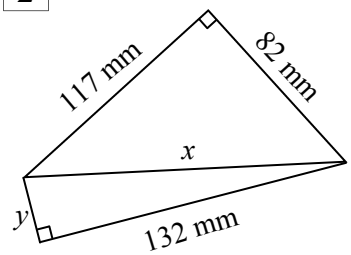
$y = 102.1$ cm

1



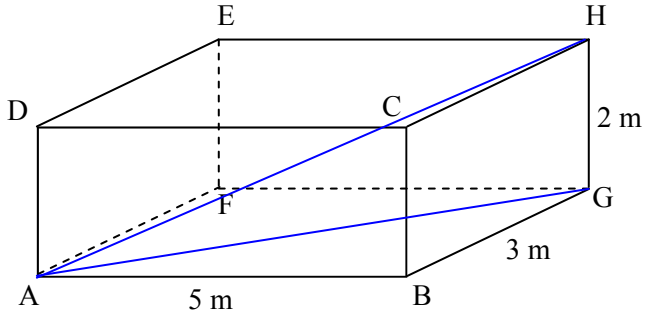
Leave this answer as a surd

2

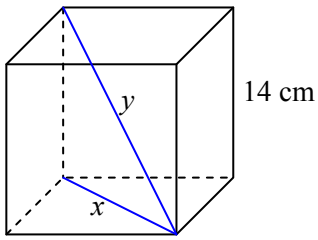


3 Calculate the perimeter of the shape above.

4 Find AG as a surd then calculate AH (1 d.p.)

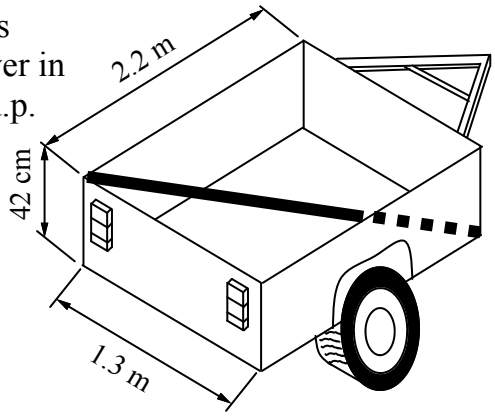


5 Find x as a surd then calculate y. (1 d.p.)



Cube, side length of 14 cm.

6 Find the maximum length iron bar that can fit in Tucky's trailer. Answer in metres to 2 d.p.

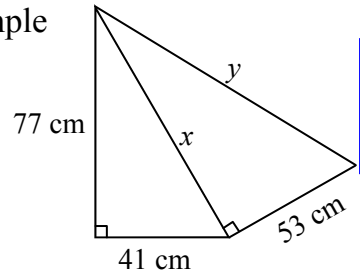


Pythagoras Theorem - Two Triangle Application

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use Pythagoras Theorem to find y to 1 d.p. by first finding x as a surd.

Example



The squaring of a square root simply removes the square root.
So $(\sqrt{7\,610})^2 = 7\,610$

$x^2 = 41^2 + 77^2$

$x^2 = 7\,610$

$x = \sqrt{7\,610}$ cm

Leave this answer as a surd

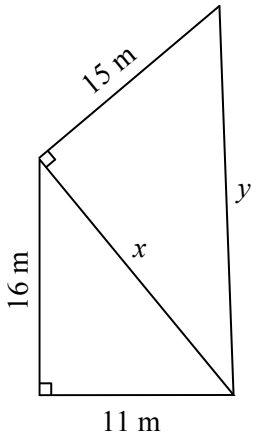
$y^2 = 53^2 + (\sqrt{7\,610})^2$

$y^2 = 10\,419$

$y = \sqrt{10\,419}$

$y = 102.1$ cm

1



$x^2 = 11^2 + 16^2$

$x^2 = 377$

$x = \sqrt{377}$ m

Leave this answer as a surd

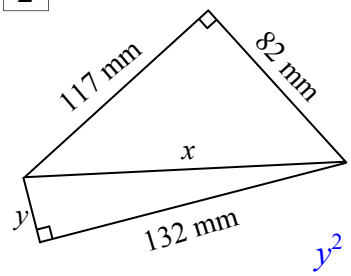
$y^2 = 15^2 + (\sqrt{377})^2$

$y^2 = 602$

$y = \sqrt{602}$

$y = 24.5$ m

2



$x^2 = 82^2 + 117^2$

$x^2 = 20\,413$

$x = \sqrt{20\,413}$ mm

$y^2 = (\sqrt{20\,413})^2 - 132^2$

$y^2 = 2\,989$

$y = \sqrt{2\,989}$

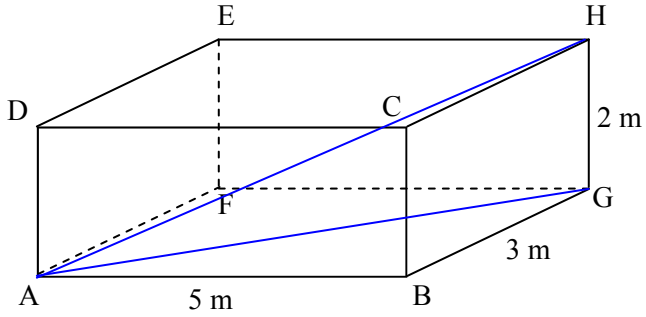
$y = 54.7$ mm

3 Calculate the perimeter of the shape above.

$P = 117 + 82 + 132 + 54.7$

$P = 385.7$ mm

4 Find AG as a surd then calculate AH (1 d.p.)



$AG^2 = 5^2 + 3^2$

$AG^2 = 34$

$AG = \sqrt{34}$ m

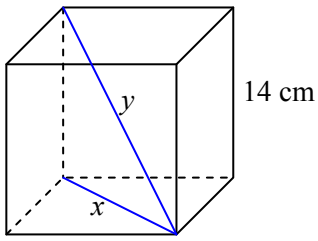
$AH^2 = 2^2 + (\sqrt{34})^2$

$AH^2 = 38$

$AH = \sqrt{38}$

$AH = 6.2$ m

5 Find x as a surd then calculate y. (1 d.p.)



Cube, side length of 14 cm.

$x^2 = 14^2 + 14^2$

$x^2 = 392$

$x = \sqrt{392}$ cm

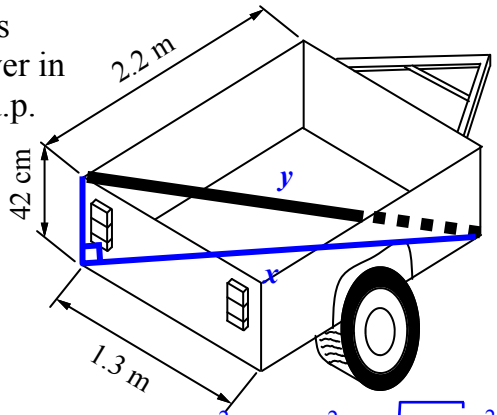
$y^2 = 14^2 + (\sqrt{392})^2$

$y^2 = 588$

$y = \sqrt{588}$

$y = 24.2$ cm

6 Find the maximum length iron bar that can fit in Tucky's trailer. Answer in metres to 2 d.p.



$x^2 = 1.3^2 + 2.2^2$

$x^2 = 6.53$

$x = \sqrt{6.53}$ m

$y^2 = 0.42^2 + (\sqrt{6.53})^2$

$y^2 = 6.7064$

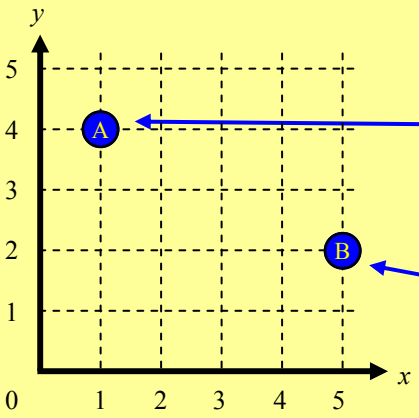
$y = \sqrt{6.7064}$

$y = 2.59$ m

Pythagoras Co-Ordinate Geometry Application - Positive Quadrant

This sheet uses Pythagoras Theorem to find the distance between two points. When two points are plotted on a cartesian plane a triangle can be created after a third point is plotted. The steps are shown below.

Example A (1, 4) and B (5, 2). Label right angle C.

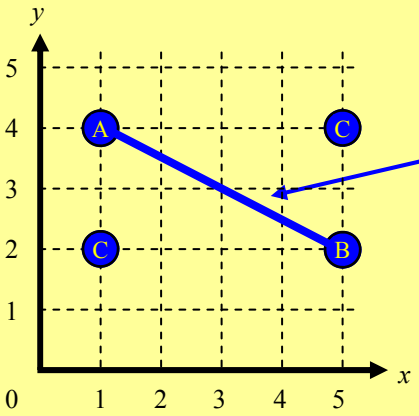


STEP 1

Plot point 'A', from the origin (0,0) move across 1 and up 4. Plot the point with an 'A' inside.

STEP 2

Plot point 'B', from the origin (0,0) move across 5 and up 2. Plot the point with an 'B' inside.

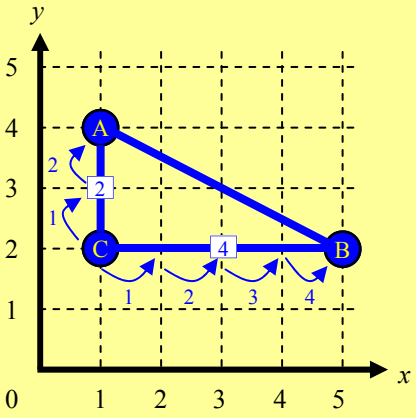


STEP 3

Draw a line between the two points

STEP 4

Now plot point 'C' to form a right-angle triangle. It can be in either of the two positions shown. Not both.



STEP 5

Construct the two short sides of the Triangle.

STEP 6

Count off the lengths to find the length of both of the short sides. In the example one side is 2 units, the other is 4 units.

STEP 7

Now apply Pythagoras Theorem to the triangle to find the hypotenuse. Answer to 2 d.p. and the length is in 'units'.

AC = 2

CB = 4

$AB^2 = 2^2 + 4^2$

$AB^2 = 20$

$AB = \sqrt{20}$

AB = 4.47 units (2 d.p.)

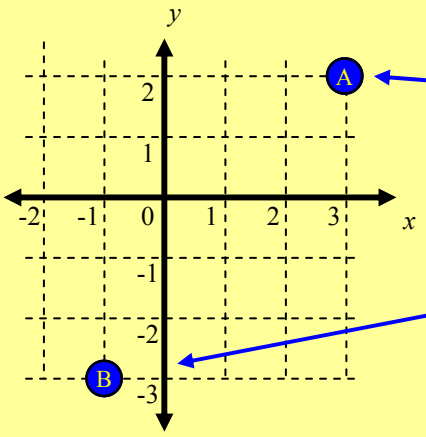
Pythagoras Co-Ordinate Geometry Application - All Quadrants

This sheet uses Pythagoras Theorem to find the distance between two points. When two points are plotted on a cartesian plane a triangle can be created after a third point is plotted. The steps are shown below.

Example A (3, 2) and B (-1, -3). Label right angle C.

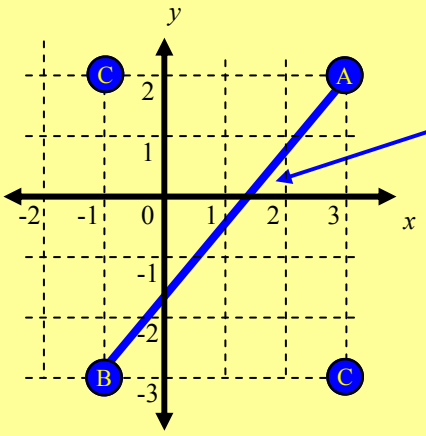


STEP 1

Plot point 'A', from the origin (0,0) move right, across 3, then up 2. Plot the point with an 'A' inside.

STEP 2

Plot point 'B', from the origin (0,0) move left across 1, to -1, and then down 3, to -3. Plot the point with an 'B' inside.

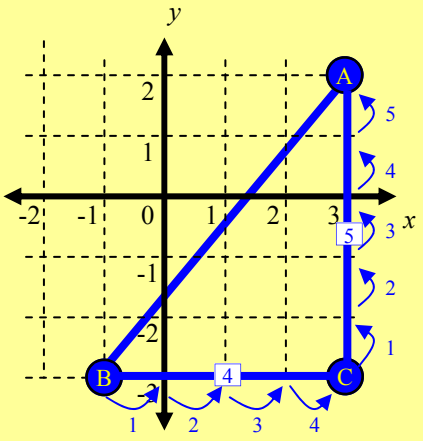


STEP 3

Draw a line between the two points

STEP 4

Now plot point 'C' to form a right-angle triangle. It can be in either of the two positions shown. Not both.



STEP 5

Construct the two short sides of the Triangle.

STEP 6

Count off the lengths to find the length of both of the short sides. In the example one side is 5 units, the other is 4 units.

STEP 7

Now apply Pythagoras Theorem to the triangle to find the hypotenuse. Answer to 2 d.p. and the length is in 'units'.

AC = 5

CB = 4

$AB^2 = 5^2 + 4^2$

$AB^2 = 41$

$AB = \sqrt{41}$

AB = 6.40 units (2 d.p.)

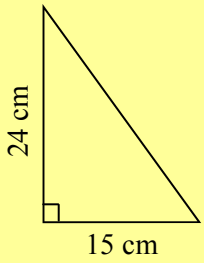
Pythagoras - Area and Perimeter Applications

Perimeter is measurement of distance, the distance around a shape. So to find the perimeter of a triangle you add all the side lengths together. An example is at the top of column 1 of the worksheet.

The area of a triangle is found by $A = \frac{1}{2}bh$ which is 'a half times the base times the height'. Note that ½ = 0.5, it may be easier to type '0.5' into your calculator, also note that the 'base' isn't necessarily on the bottom of the triangle, due to rotation. Below is an example of finding the area of a triangle.

Example - Area of a Triangle



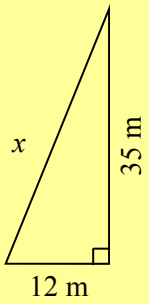
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 15 \times 24$

$A = 180 \text{ cm}^2$

Column 2 is all calculating the perimeter of a triangle. Note that you are given two sides only, but to calculate perimeter you need to know all three sides. So first calculate the unknown side using P.T., once you have calculated the side, add all three sides together. That gives you the perimeter. Remember that you may have subtraction or addition using Pythagoras, it depends if you are finding the length of the hypotenuse (addition or +) or finding a short side (subtraction or -). The first question reminds you of the process but there is also an example below.

Example - Using P.T. then finding the perimeter.



$x^2 = 35^2 + 12^2$

$x^2 = 1\,369$

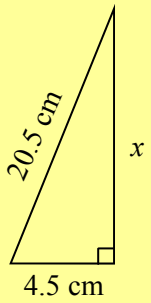
$x = \sqrt{1\,369}$

$x = 37 \text{ m}$

$P = 12 + 35 + 37 = 84 \text{ m}$

Column 3 deals with finding the area of a triangle. Again, like above you will need to use P.T. first to calculate the unknown side. Then use the area formula: $A = \frac{1}{2}bh$.

Example - Using P.T. then finding the area.



$x^2 = 20.5^2 - 4.5^2$

$x^2 = 400$

$x = \sqrt{400}$

$x = 20 \text{ cm}$

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 4.5 \times 20$

$A = 45 \text{ cm}^2$

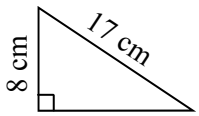
Pythagoras - Area and Perimeter Applications

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the perimeter for these triangles.

Example

Add all the sides

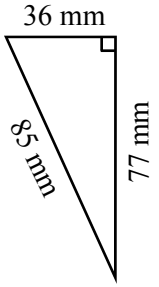


$P = 8 + 15 + 17$

$P = 40$ cm

Remember the units

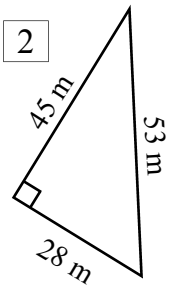
1



$P =$

$P =$ mm

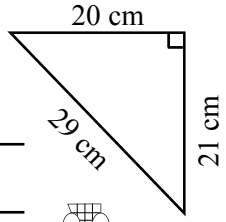
2



$P =$

$P =$

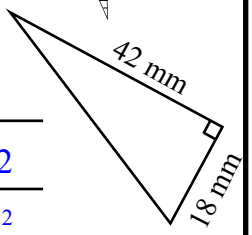
3



Now find the area.

Remember ½ = 0.5

4

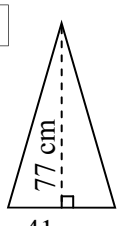


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 18 \times 42$

$A =$ mm^2

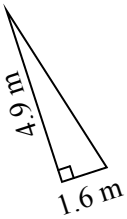
5



$A =$

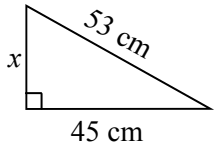
$A =$ cm^2

6



Calculate the missing side using Pythagoras Theorem then find the perimeter.

7



$x^2 =$

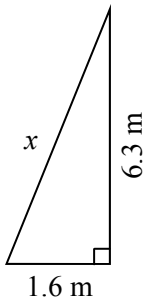
$x^2 =$

$x = \sqrt{}$

$x =$

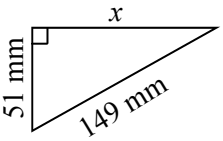
$P =$ + + = cm

8

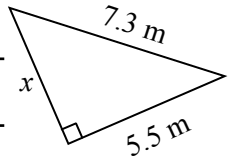


$P =$

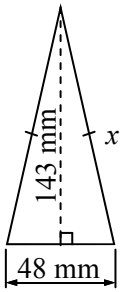
9



10

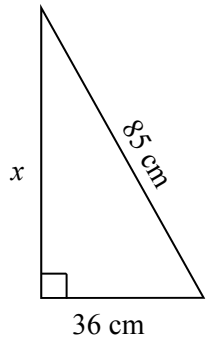


11



Now find the area. You need the base and the perpendicular height.

12



$x^2 =$

$x^2 =$

$x =$

$x =$

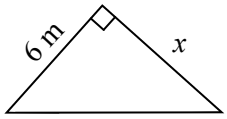
$A = \frac{1}{2}bh$

$= \times \times$

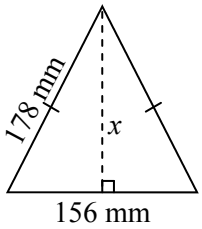
$A =$ cm^2

Area is measured in square units

13



14

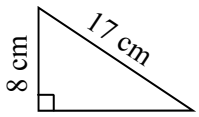


Pythagoras - Area and Perimeter Applications

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the perimeter for these triangles.

Example



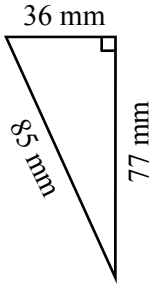
Add all the sides

$P = 8 + 15 + 17$

$P = 40$ cm

Remember the units

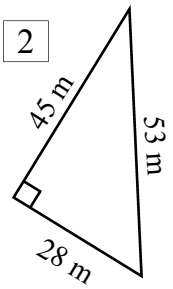
1



$P = 36 + 77 + 85$

$P = 198$ mm

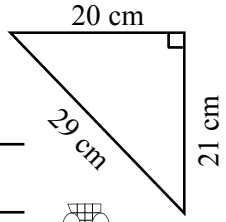
2



$P = 45 + 28 + 53$

$P = 126$ m

3

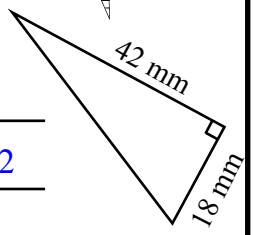


$P = 20 + 21 + 29$

$P = 70$ cm

Now find the area.

4 Remember ½ = 0.5

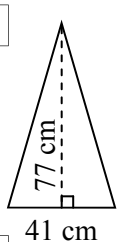


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 18 \times 42$

$A = 378$ mm^2

5

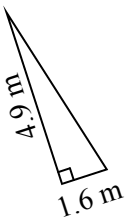


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 41 \times 77$

$A = 1\,578.5$ cm^2

6



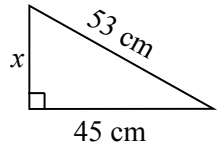
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 1.6 \times 4.9$

$A = 3.92$ m^2

Calculate the missing side using Pythagoras Theorem then find the perimeter.

7



$x^2 = 53^2 - 45^2$

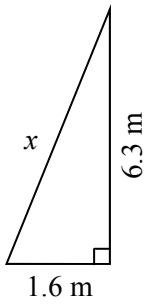
$x^2 = 784$

$x = \sqrt{784}$

$x = 28$ cm

$P = 28 + 45 + 53 = 126$ cm

8



$x^2 = 1.6^2 + 6.3^2$

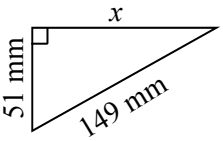
$x^2 = 42.25$

$x = \sqrt{42.25}$

$x = 6.5$ m

$P = 1.6 + 6.3 + 6.5 = 14.4$ m

9



$x^2 = 149^2 - 51^2$

$x^2 = 19\,600$

$x = \sqrt{19\,600}$

$x = 140$ mm

$P = 51 + 140 + 149 = 340$ mm

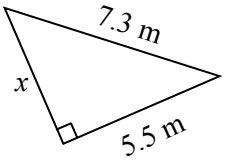
10

$x^2 = 7.3^2 - 5.5^2$

$x^2 = 23.04$

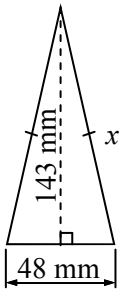
$x = \sqrt{23.04}$

$x = 4.8$ m



$P = 5.5 + 7.3 + 4.8 = 17.6$ m

11



$x^2 = 24^2 + 143^2$

$x^2 = 21\,025$

$x = \sqrt{21\,025}$

$x = 145$ mm

$P = 48 + 2 \times 145 = 338$ mm

Now find the area. You need the base and the perpendicular height.

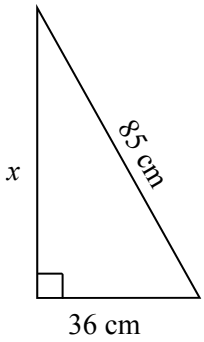
12

$x^2 = 85^2 - 36^2$

$x^2 = 5\,929$

$x = \sqrt{5\,929}$

$x = 77$ cm



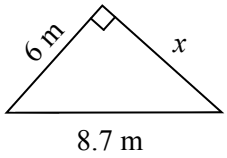
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 36 \times 77$

$A = 1\,386$ cm^2

Area is measured in square units

13



$x^2 = 8.7^2 - 6^2$

$x^2 = 39.69$

$x = \sqrt{39.69}$

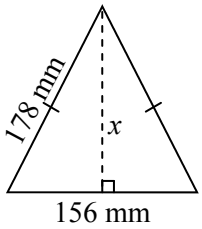
$x = 6.3$ m

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 6 \times 6.3$

$A = 18.9$ cm^2

14



$x^2 = 178^2 - 78^2$

$x^2 = 25\,600$

$x = \sqrt{25\,600}$

$x = 160$ mm

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 156 \times 160$

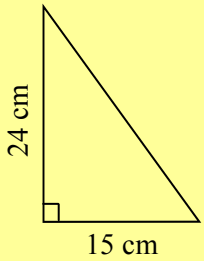
$A = 12\,480$ mm^2

Pythagoras - Further Area and Perimeter Applications

Perimeter is measurement of distance, the distance around a shape. So to find the perimeter of a triangle you add all the side lengths together. This sheet features problems which will require subtraction or some other calculation before applying Pythagoras Theorem. The questions can be challenging and so the previous 'Perimeter and Area' sheet should b attempted first.

The area of a triangle is found by $A = \frac{1}{2}bh$ which is 'a half times the base times the height'. Note that ½ = 0.5, it may be easier to type '0.5' into your calculator, also note that the 'base' isn't necessarily on the bottom of the triangle, due to rotation. Below is an example of finding the area of a triangle.

Example - Area of a Triangle



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 15 \times 24$

$A = 180 \text{ cm}^2$

Column 1 is calculating the perimeter of a shape. These are composite shapes which require you to calculate either two or three unknown lengths before you can find the perimeter.

Column 2 and Column 3 are area questions, calculate all required sides first, then calculate the two areas individually and add them together. Question 6 is a subtraction question, with two identical triangles being removed from a rectangle to form the composite shape.

Pythagoras - Further Area and Perimeter Applications

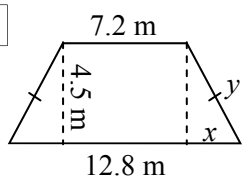
Find the missing side length(s) then find the perimeter in metres.

1



Find x first then use P.T. to find y

$x = \dfrac{12.8 - 7.2}{2}$

$x = 2.8$ m

$y^2 = 2.8^2 + 4.5^2$

$y^2 = 28.09$

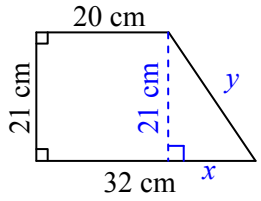
$y = \sqrt{28.09}$

$y = 5.3$ m

$P = 12.8 + 7.2 + 2 \times 5.3$

$P = 30.6$ m

2



$x = 32 - 20$

$x = 12$ cm

$y^2 = 12^2 + 21^2$

$y^2 = 585$

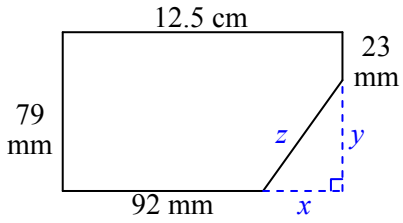
$y = \sqrt{585}$

$y = 24.2$ m

$P = 20 + 24.2 + 32 + 21$

$P = 97.2$ cm $= 0.972$ m

3



$x = 125 - 92$

$x = 33$ mm

$z^2 = 33^2 + 56^2$

$z^2 = 4\,225$

$z = \sqrt{4\,225}$

$z = 65$ mm

$y = 79 - 23$

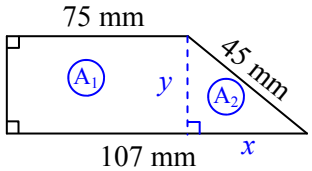
$y = 56$ mm

$P = 79 + 125 + 23 + 65 + 92$

$P = 384$ mm $= 0.384$ m

Now find the area. Answer to 1 d.p. when required.

4



$x = 107 - 75$

$x = 32$ mm

$y^2 = 45^2 - 32^2$

$y^2 = 1\,001$

$y = \sqrt{1\,001}$

$y = 31.6$ mm

$A_1 = lb$

$= 75 \times 31.6$

$A_1 = 2\,370$ mm^2

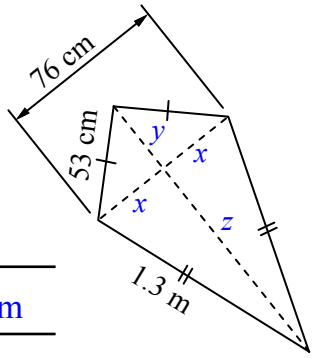
$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 32 \times 31.6$

$A_2 = 505.6$ mm^2

$A_T = 2\,370 + 505.6 = 2875.6$ mm^2

5



$2x = 76$

$x = 38$ cm

$y^2 = 53^2 - 38^2$

$y^2 = 1\,365$

$y = \sqrt{1\,365}$

$y = 36.9$ cm

$z^2 = 130^2 - 38^2$

$z^2 = 15\,456$

$z = \sqrt{15\,456}$

$z = 124.3$ cm

$A_1 = \frac{1}{2}bh$

$= \frac{1}{2} \times 76 \times 36.9$

$A_1 = 1\,402.2$ cm^2

$A_2 = \frac{1}{2}bh$

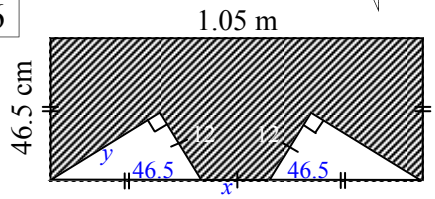
$= \frac{1}{2} \times 76 \times 124.3$

$A_2 = 4\,723.4$ cm^2

$A_T = 1402.2 + 4\,723.4 = 6\,125.6$ cm^2

Find the area, shaded area in Q6, to 1 d.p.

6



$x = 105 - 2 \times 46.5$

$x = 12$ cm

$y^2 = 46.5^2 - 12^2$

$y^2 = 2\,018.25$

$y = \sqrt{2\,018.5}$

$y = 44.9$ cm

$A_1 = lb$

$= 105 \times 46.5$

$A_1 = 4\,882.5$ cm^2

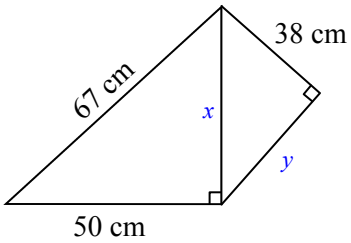
$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 44.9 \times 12$

$A_2 = 269.4$ cm^2

$A_S = 4\,882.5 - 2 \times 269.4 = 4343.7$ cm^2

7



$x^2 = 67^2 - 50^2$

$x^2 = 1\,989$

$x = \sqrt{1\,989}$

$x = 44.6$ cm

$y^2 = 44.6^2 - 38^2$

$y^2 = 545.16$

$y = \sqrt{545.16}$

$y = 23.3$ cm

$A_1 = \frac{1}{2}bh$

$= \frac{1}{2} \times 50 \times 44.6$

$A_1 = 1\,115$ cm^2

$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 38 \times 23.3$

$A_2 = 442.7$ cm^2

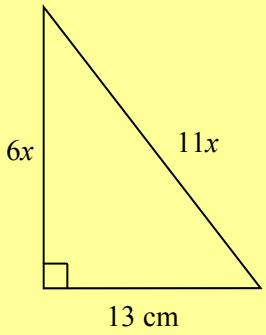
$A_T = 1\,115 + 442.7 = 1\,557.7$ cm^2

Pythagoras Theorem - Algebra Extension

This is an extension and should only be attempted once the core of the Pythagoras Theorem chapter has been completed.

This worksheet involves finding two unknown sides on a right-angled triangle. The unknown sides have ratio applied to them, such that one is a multiple of the other. In other words if one is 'x' then the other may be '$5x$'. So one side is 5 times longer than the other.

Example



$(6x)^2 + 13^2 = (11x)^2$ — Write the Pythagorean Result for the Triangle, it can be: $a^2 + b^2 = c^2$ Or the reverse: $c^2 = a^2 + b^2$

$36x^2 + 169 = 121x^2$ — Simplify the equation.

$-36x^2$ $-36x^2$

$169 = 85x^2$ — Get the x^2 term on one side. In this case by $-36x^2$ from each side.

$85x^2 = 169$ — Swap the equation so that the x^2 is on the left hand side.

÷ 85 ÷ 85

$x^2 = 19.882\ldots$(calc) — Divide by 85 to get x^2 on its own.

$\sqrt{}$ $\sqrt{}$

$x = 1.41$ cm (2 d.p.) — Square root to find x.

$6x = 8.46$ cm (2 d.p.)

$11x = 15.51$ cm (2 d.p.)

Once you have x, you can multiply by 6 to get a value for $6x$ and multiply by 11 to get $11x$.

FINISHED!!!! ….. Not quite. This is a complex process and you may have made a mistake along the way, so to ensure you have found the correct answer, do a quick check to see that P.T. applies.

$15.51^2 = 13^2 + 8.46^2$

$240.5601 = 240.5716$

LHS ≈ RHS

Note that answers aren't exact due to the rounding that has taken place, but they are close enough to verify that the solution is correct.

The left hand side of the equation is approximately equal to the right hand side of the equation.

$x = 1.43$ km (2 d.p.)

Jason's walk is 1.43 km.

Amy's walk is 2.86 km.

5 Find the width and height of a 106 cm TV, given it has a ratio of 16:9. TV size is the diagonal length across the screen.

$(9x)^2 + (16x)^2 = 106^2$

$81x^2 + 256x^2 = 11\ 236$

$337x^2 = 11\ 236$

$x^2 = 33.341\ldots$ (calc)

$x = 5.77$ cm (2 d.p.)

H: 51.93 cm W: 92.32 cm

6 Repeat for a 120 cm screen.

$(9x)^2 + (16x)^2 = 120^2$

$81x^2 + 256x^2 = 14\ 400$

$337x^2 = 14\ 400$

$x^2 = 42.729\ldots$ (calc)

$x = 6.54$ cm (2 d.p.)

H: 58.86 cm W: 104.64 cm

Find the side lengths of these triangles. (2 d.p.)

7

$(3x)^2 + 4.2^2 = (4x)^2$

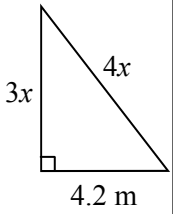
$9x^2 + 17.62 = 16x^2$

$17.62 = 7x^2$

$7x^2 = 17.62$

$x^2 = 2.517\ldots$(calc)

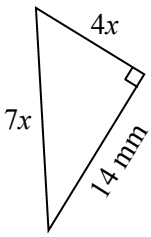
$x = 1.59$ m (2 d.p.)



$3x = 4.77$ m

$4x = 6.36$ m

8



$(4x)^2 + 14^2 = (7x)^2$

$16x^2 + 196 = 49x^2$

$196 = 33x^2$

$33x^2 = 196$

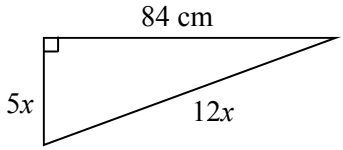
$x^2 = 5.939\ldots$(calc)

$x = 2.44$ mm (2 d.p.)

$4x = 9.76$ mm

$7x = 17.08$ mm

9



$(5x)^2 + 84^2 = (12x)^2$

$25x^2 + 7\ 056 = 144x^2$

$7\ 056 = 119x^2$

$119x^2 = 7\ 056$

$x^2 = 59.294\ldots$(calc)

$x = 7.70$ cm (2 d.p.)

$5x = 38.5$ cm

$12x = 92.40$ cm

Pythagoras Theorem - Find A Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don't colour it in too dark (using a texta for example) so that you can still read it.

ALTITUDE

Worksheets in this chapter are also in Chapters 4, 7 and 16.

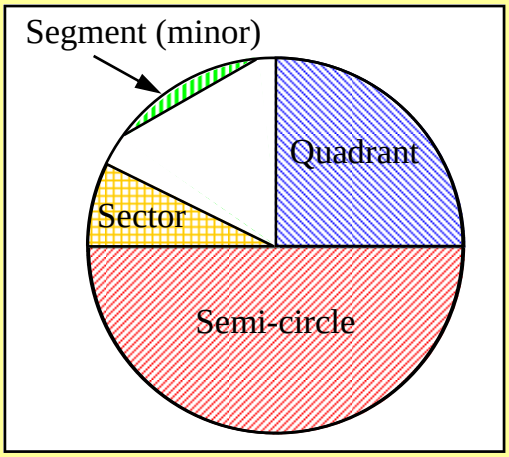
THE CIRCLE

The Circle (Sheet 1)

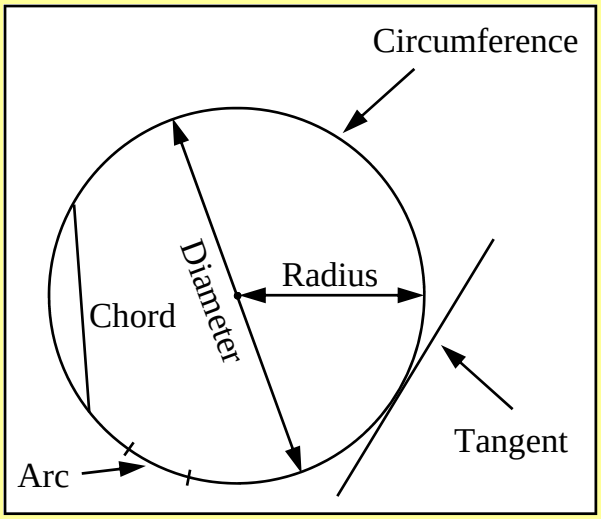
This sheet deals with naming parts of a circle, these are areas of circles created by particular lines and also the lines themselves.

Column 1 starts with matching diagrams showing the features of the circle with the words on the right of the column. Draw a line between the diagram and the correct word. The areas and lengths are shown below.

Circle Areas



Circle Lengths



Column 2 asks you to draw lines between points on the circle, this will create areas. Name the lines (using words like radius, diameter ….) as well as the areas.

Questions 29 and 30 require you to draw the lines and label points yourself, you will need a protractor to answer question 30.

The Circle (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

The diagram on the left shows a shaded area or a feature in black. Match the diagram with the list on the right, using a ruler to draw a line between the two black dots.

30 Name the point 'O' at the centre of the circle. Draw two radii, OA and OB, with an acute angle between the two. Plot a point C away from points A and B. Draw chords AC & BC. Protractor?

∠AOB = 70° ∠ACB = 35°

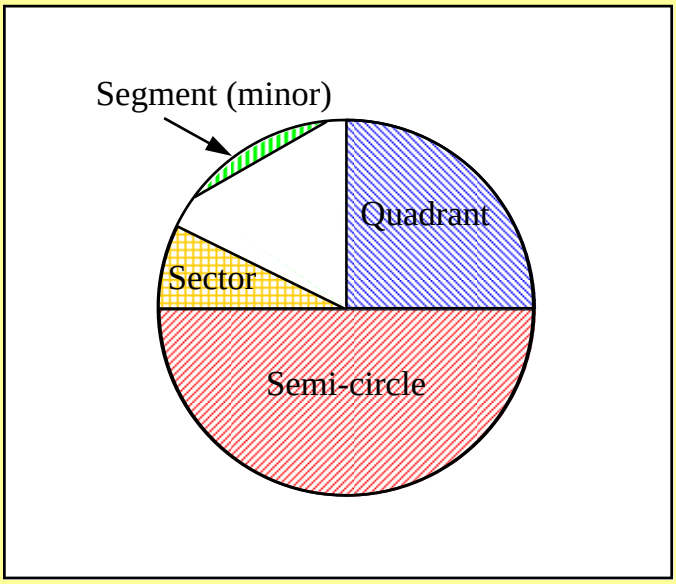
The Circle (Sheet 2)

This sheet deals with naming parts of a circle, these are areas of circles created by particular lines and also the lines themselves.

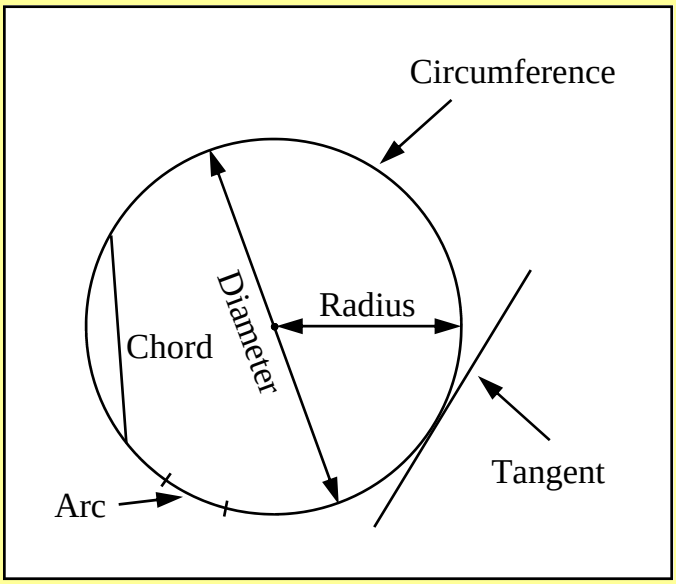
The sheet has 2 columns with diagrams at the top of each. In the spaces provided, name the parts of the circle that are being pointed to.

The questions below the diagrams all refer to the parts that have just been named, so look at the diagrams below if you need help. A word you may not be familiar with is radii - this is the plural of radius (so 1 radius, 2 radii). Also segments may be named minor segments when they are smaller than a semi-circle and major segments when they are larger than a semi-circle. Though for this sheet the word 'segment' alone is adequate, ask your teacher if minor/major is also required.

Column 1 - Circle Areas



Column 2 - Circle Lengths



The Circle (Sheet 2)

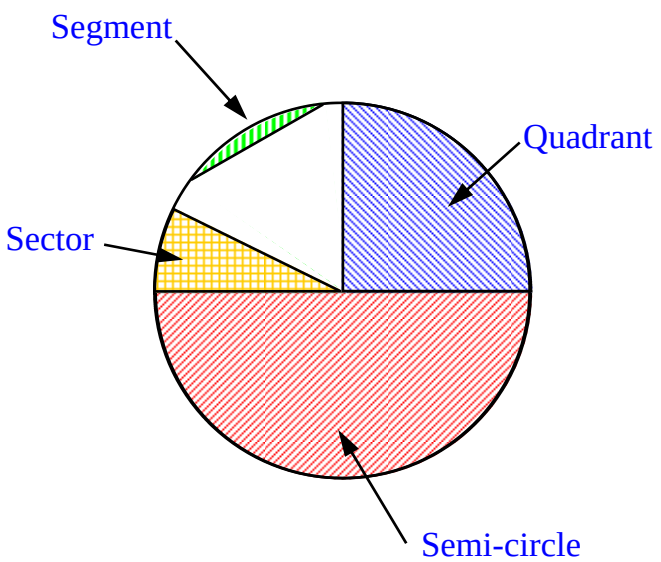
Here are the different areas within a circle



The answers for these will be found on the diagram above

1 Pizzas are sliced into these sectors

2 Two of these makes a semi-circle quadrants

3 This is the only shape that doesn't touch the centre of the circle segment

4 When two or more of these are combined they could make a quadrant sectors

5 A chord is used to make this shape segment

6 This shape has the circle's diameter as its straight side semi-cicle

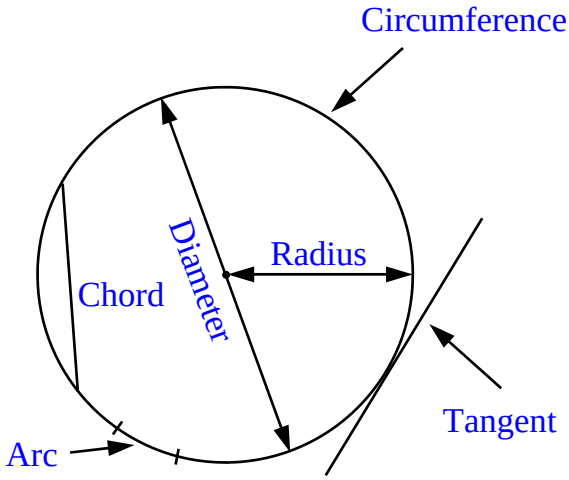
7 This shape has a right angle quadrant

8 When an arc is combined with two radii the shape that is made is a sector or quadrant

9 If 6 identical sectors form a quadrant what shape is formed by 12 sectors ? semi-circle

10 If 6 identical sectors form a quadrant what shape is formed by 3 sectors ? sector

Here are the different distances and features of a circle



The answers for these will be one of the lengths shown above

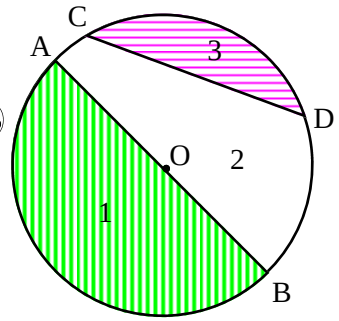
11 This distance is half the diameter radius

12 If a wheel rolled one revolution, the distance traveled would be the circumference

13 A right angle is formed where the radius meets this line tangent

14 A segment is formed by an arc and one of these chord

Name lengths/areas described by these letters



15 AC: arc

16 OB: radius

17 AB: diameter

18 CD: chord

19 OD: radius

20 BC: chord

21 1: semi-circle

22 3: segment

23 1 + 2: major segment

Exact & Estimation - Circumference

The circumference of a circle is its perimeter, the distance around its outside. The way to measure circumference when you don't know how to calculate it is to place a mark on the circle roll it one revolution and see how far the mark has travelled. But you can use this formula:

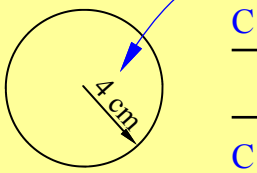
$$C = 2\pi r \text{ or } C = \pi d$$

Where: C = the circumference (length is same units as the radius/diameter)
π = Pi, it's a value on your calculator 3.14159….. Which is a bit more than 3!
r = the radius, the length from the centre to any point on the circumference
d = the diameter, the width of the circle.

Note that if life is complicated enough, just use $C = 2\pi r$ only, then remember to always use the radius. You don't have to remember both formulae. If given a diameter, halve it!

Column 1 starts with circles that have a radius shown, you will require a ruler for question 4. To find the circumference in terms of π, also called the exact length, use the value of r given in the circle. To find the estimate, use the exact circumference and substitute 3 for π.

Example



$C = 2\pi r$

$= 2\times\pi\times4$ ← Replace r with 4, (the radius of the circle)

$C = 8\pi$ cm ← $2 \times 4 = 8$, leave π as is. Write the units.

So the circumference is 8π cm. This is the exact length, to estimate the length without a calculator use $\pi = 3$. This is less than the actual value for π, but it gives a fairly accurate answer without too much calculation.

Estimate:

$C = 8\pi$ cm ← Rewrite the circumference from previous step

$\approx 8 \times 3$ ← Replace π with 3 and = with ≈

$C \approx 24$ cm ← Solve, use either ≈ or ≒ to indicate 'approximately'.

Column 2 uses diameters. You can either halve the diameter for the radius and solve as before, or use $C = \pi d$. So just multiply the diameter by 3 for an estimate of the circumference.

At the bottom of the page are four circles. Measure the diameter accurate to the nearest 0.5 cm, then calculate the exact circumference (in terms of π) and then an estimate, again using $\pi = 3$. Use the working out spaces in the third column to answer these.

Exact & Estimation - Circumference

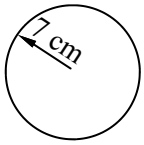
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the circumference in terms of π. Then using π = 3, estimate the circumference.

1 $C = 2\pi r$

$= 2 \times \pi \times \square$

$C = \square\ \pi$ cm



Estimate: $C = \square\ \pi$ cm

$\approx \square \times 3$

$C \approx \square$ cm

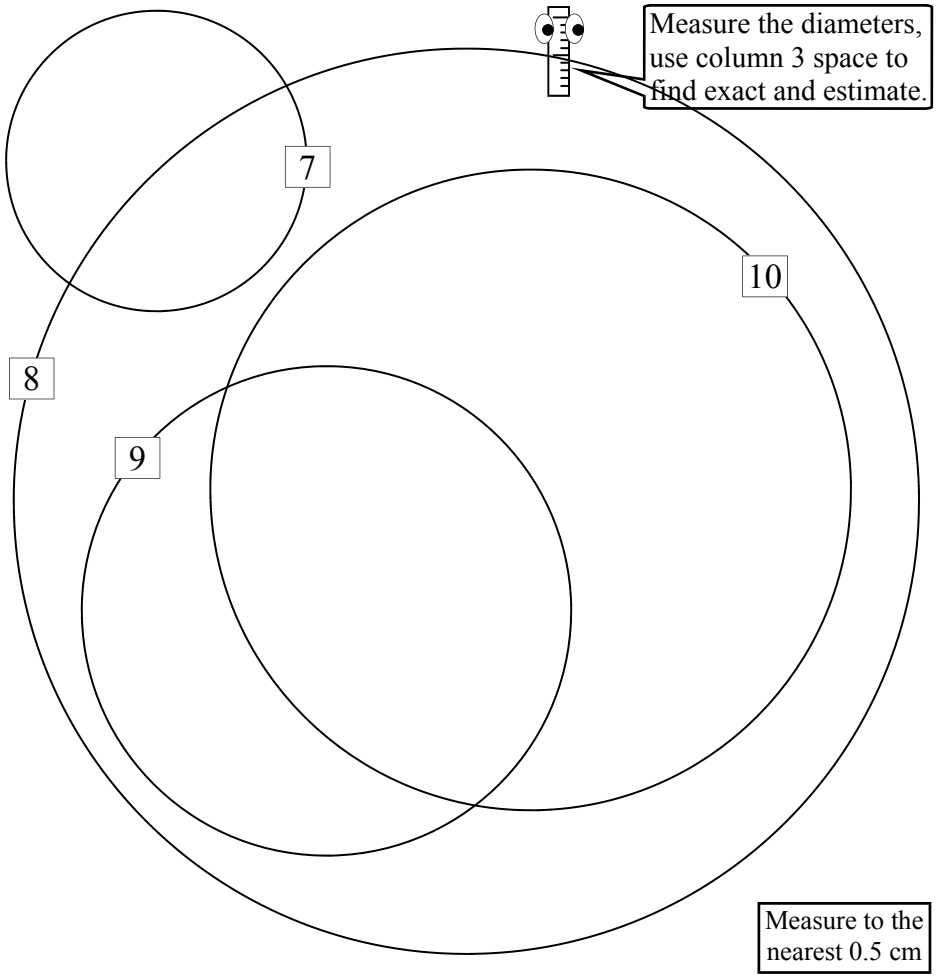
Measure the diameters, use column 3 space to find exact and estimate.



Measure to the nearest 0.5 cm

Exact & Estimation - Circumference

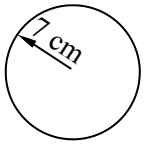
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the circumference in terms of π. Then using π = 3, estimate the circumference.

1 $C = 2\pi r$

$= 2 \times \pi \times 7$

$C = 14\pi$ cm

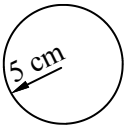


Estimate: $C = 14\pi$ cm

$\approx 14 \times 3$

$C \approx 42$ cm

2



$C = 2\pi r$

$= 2 \times \pi \times 5$

$C = 10\pi$ cm

Estimate: $C = 10\pi$ cm

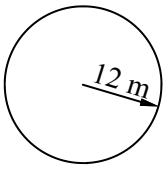
$\approx 10 \times 3$

$C \approx 30$ cm

3 $C = 2\pi r$

$= 2 \times \pi \times 12$

$C = 24\pi$ m

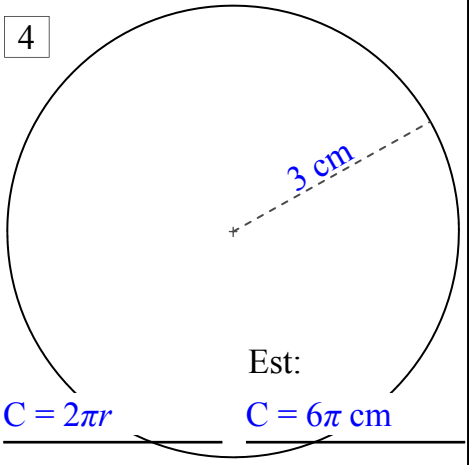


Estimate: $C = 24\pi$ cm

$\approx 24 \times 3$

$C \approx 72$ m

4



$C = 2\pi r$

$= 2 \times \pi \times 3$

$C = 6\pi$ cm

Est:

$C = 6\pi$ cm

$\approx 6 \times 3$

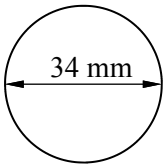
$C \approx 18$ cm

Divide the diameter by 2 or use $C = \pi d$ to find the circumference & estimate.

5 $C = \pi d$

$= \pi \times 34$

$C = 34\pi$ mm

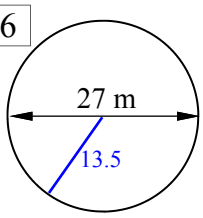


Estimate: $C = 34\pi$ mm

$\approx 34 \times 3$

$C \approx 102$ mm

6



$C = \pi d$

$= \pi \times 27$

$C = 27\pi$ m

Estimate: $C = 27\pi$ m

$\approx 27 \times 3$

$C \approx 81$ m

7

$C = \pi d$

$= \pi \times 4$

$C = 4\pi$ cm

$C = 4\pi$ cm

$\approx 4 \times 3$

$C \approx 12$ cm

8

$C = \pi d$

$= \pi \times 12$

$C = 12\pi$ cm

$C = 12\pi$ cm

$\approx 12 \times 3$

$C \approx 36$ cm

9

$C = \pi d$

$= \pi \times 6.5$

$C = 6.5\pi$ cm

$C = 6.5\pi$ cm

$\approx 6.5 \times 3$

$C \approx 19.5$ cm

10

$C = \pi d$

$= \pi \times 8.5$

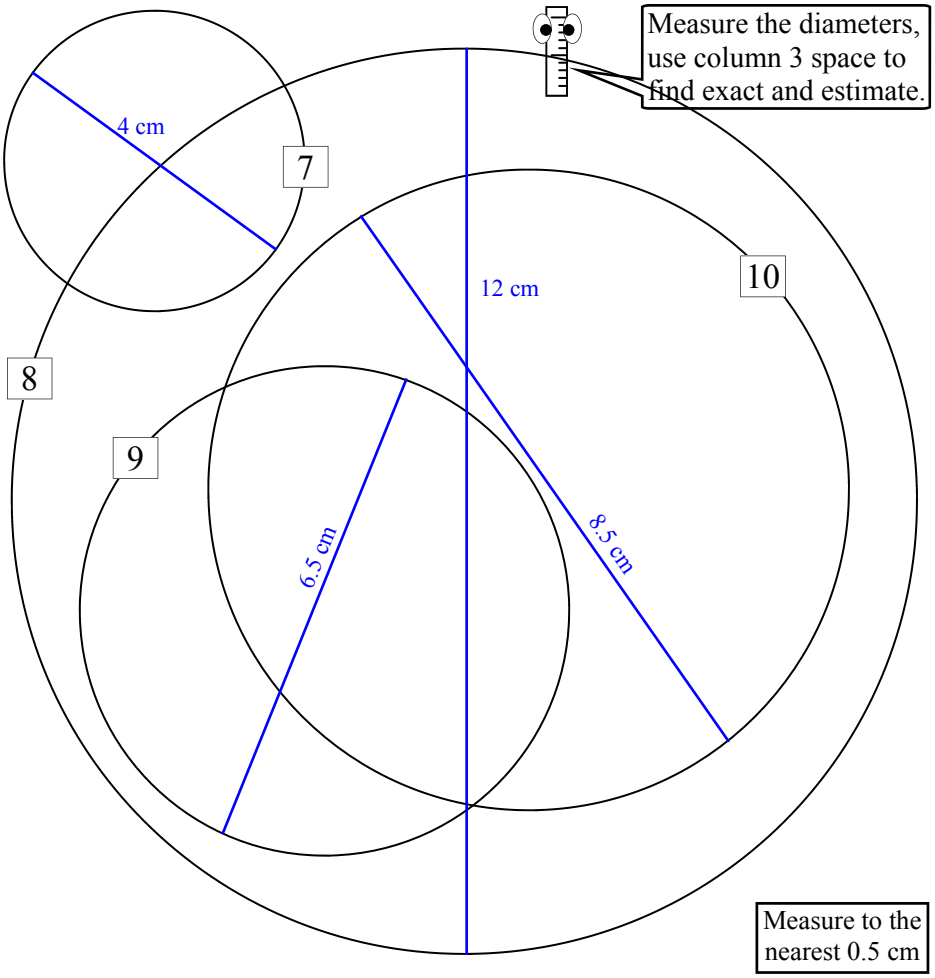
$C = 8.5\pi$ cm

$C = 8.5\pi$ cm

$\approx 8.5 \times 3$

$C \approx 25.5$ cm

Measure the diameters, use column 3 space to find exact and estimate.



Measure to the nearest 0.5 cm

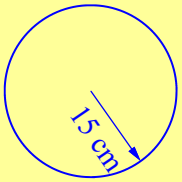
Circumference (Sheet 1)

The circumference of a circle is its perimeter, the distance around the outside of the circle. This distance is found by using this formula:

$$C = 2\pi r$$

Where: C = Circumference of circle
r = radius of the circle

Example



$C = 2\pi r$ ← Write the formula.

$= 2 \times \pi \times 15$ ← Show × signs and replace r with the radius (15 on diagram).

$C = 94.2$ cm (1 d.p.) ← Calculate, round and show units.

Calculator 2 × π × 1 5 × = Answer on Screen 94.24777961

Round to 1 decimal place 94.2 cm (1 d.p.)

Column 1 uses the above process for all questions.

Column 2 gives you a diameter rather than a radius. So you can divide by the diameter by 2 to find the radius then use $C = 2\pi r$, but an easier way is to use:

$$C = \pi d$$

Where: C = Circumference of circle
d = diameter of the circle (note that $d = 2r$)

Column 3 are problem style questions using the circumference of a circle.

Circumference (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use $C=2\pi r$ to find the circumference of these circles to 1 decimal place.

Example

$C = 2\pi r$

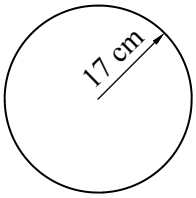
Write formula

$= 2 \times \pi \times 17$

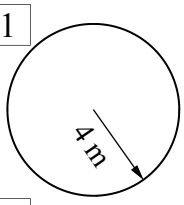
Substitute value for r

$C = 106.8$ cm

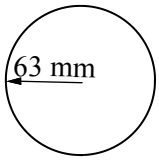
Answer 1 d.p., show units



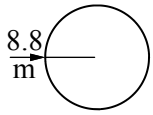
1



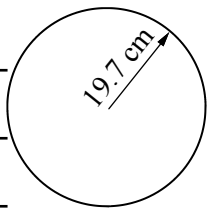
2



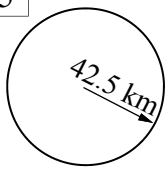
3



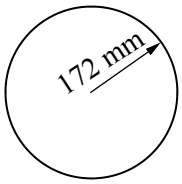
4



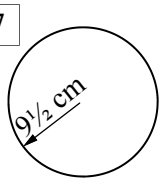
5



6

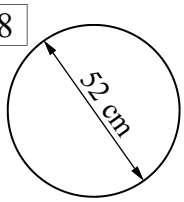


7

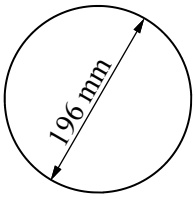


These use diameter. Either divide by 2 for the radius *OR* use $C=\pi d$. Answer to 2 d.p.

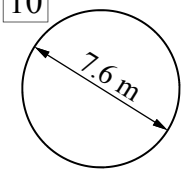
8



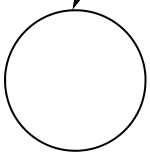
9



10

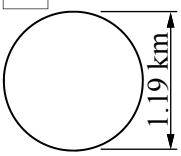


11

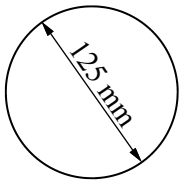


$*\phi$ = *'phi'* = d

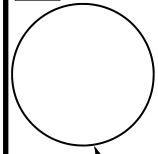
12



13

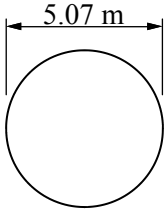


14



15

$\phi = 7.89$ m



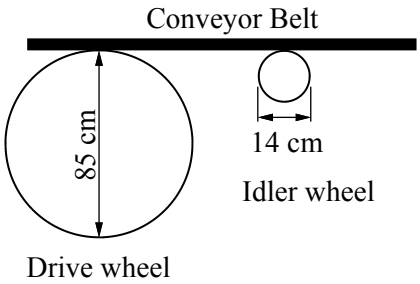
Now apply your skills to these problems. Answer to 2 d.p. where appropriate.

16 A car tyre has a diameter of 63 cm. Find its circumference. Give your answer in metres.

17 How far does the tyre travel when it rotates 150 times?

18 How many complete rotations of the tyre will occur if 1 km is travelled?

19 Calculate the amount of conveyor belt fed by 1 rotation of the drive wheel.



20 1 rotation of the idler wheel

21 Complete:

$$\frac{C_{(\text{Drive})}}{C_{(\text{Idler})}} = \frac{\square}{\square} = \_\_\_\_$$

Circumference (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use $C=2\pi r$ to find the circumference of these circles to 1 decimal place.

Example

$C = 2\pi r$

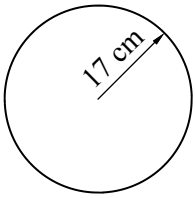
Write formula

$= 2 \times \pi \times 17$

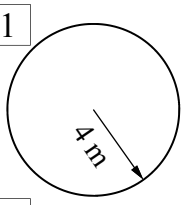
Substitute value for r

$C = 106.8$ cm

Answer 1 d.p., show units



1



$C = 2\pi r$

$= 2 \times \pi \times 4$

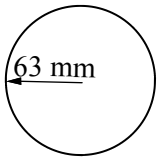
$C = 25.1$ m

2

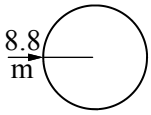
$C = 2\pi r$

$= 2 \times \pi \times 63$

$C = 395.8$ mm



3



$C = 2\pi r$

$= 2 \times \pi \times 8.8$

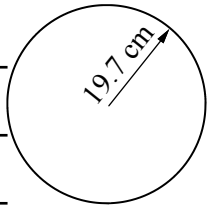
$C = 55.3$ m

4

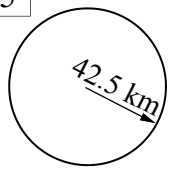
$C = 2\pi r$

$= 2 \times \pi \times 19.7$

$C = 123.8$ cm



5



$C = 2\pi r$

$= 2 \times \pi \times 42.5$

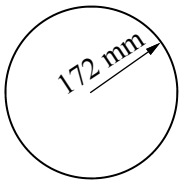
$C = 267$ km

6

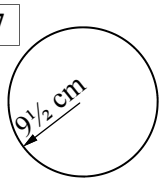
$C = 2\pi r$

$= 2 \times \pi \times 172$

$C = 1\,080.7$ mm



7



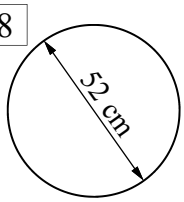
$C = 2\pi r$

$= 2 \times \pi \times 9.5$

$C = 59.7$ cm

These use diameter. Either divide by 2 for the radius *OR* use $C=\pi d$. Answer to 2 d.p.

8



$C = \pi d$

$= \pi \times 52$

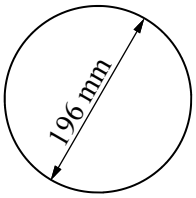
$C = 163.36$ cm

9

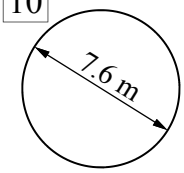
$C = \pi d$

$= \pi \times 196$

$C = 615.75$ mm



10



$C = \pi d$

$= \pi \times 7.6$

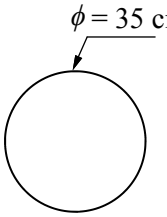
$C = 23.88$ m

11

$C = \pi d$

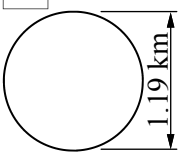
$= \pi \times 35$

$C = 109.96$ cm



* ϕ = 'phi' = d

12



$C = \pi d$

$= \pi \times 1.19$

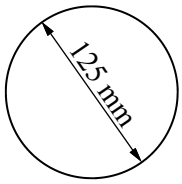
$C = 3.74$ km

13

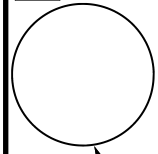
$C = \pi d$

$= \pi \times 125$

$C = 392.70$ mm



14



$C = \pi d$

$= \pi \times 7.89$

$C = 24.79$ m

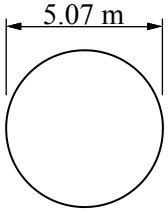
15

$\phi = 7.89$ m

$C = \pi d$

$= \pi \times 5.07$

$C = 15.93$ m



Now apply your skills to these problems. Answer to 2 d.p. where appropriate.

16 A car tyre has a diameter of 63 cm. Find its circumference. Give your answer in metres.

$C = \pi d$

$= \pi \times 0.63$

$C = 1.98$ m

17 How far does the tyre travel when it rotates 150 times?

Distance $= 150 \times 1.98$

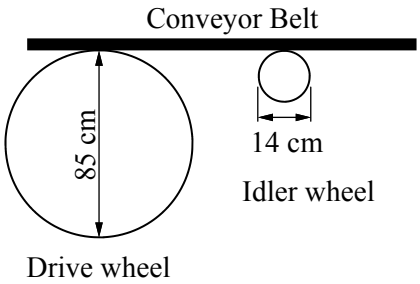
Distance $= 297$ m (296.88 m If 16 unrounded)

18 How many complete rotations of the tyre will occur if 1 km is travelled?

Rotations $= 1\,000 \div 1.98$

Rotations $= 505$

19 Calculate the amount of conveyor belt fed by 1 rotation of the drive wheel.



$C = \pi d$

$= \pi \times 85$

$C = 267.04$ cm

20 1 rotation of the idler wheel

$C = \pi d$

$= \pi \times 14$

$C = 43.98$ cm

21 Complete:

$$\frac{C_{(\text{Drive})}}{C_{(\text{Idler})}} = \frac{267.04}{43.98} = 6.07$$

Circumference (Sheet 2)

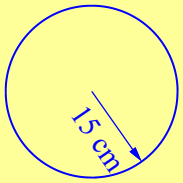
The circumference of a circle is its perimeter, the distance around the outside of the circle. This distance is found by using this formula:

$$C = 2\pi r$$

Where: C = Circumference of circle
r = radius of the circle

The usual process is to use your π key, but there are two common approximations for π. These are $\pi = 3.14$ (as a decimal) and $\pi = {}^{22}/_{7}$ (as a fraction).

Example - $\pi = 3.14$

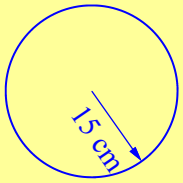


$C = 2\pi r$ ← Write the formula.

$= 2 \times 3.14 \times 15$ ← Show × signs and replace π with 3.14 and r with the radius .

$C = 94.2$ cm (1 d.p.) ← Calculate, round and show units.

Example - $\pi = {}^{22}/_{7}$



$C = 2\pi r$ ← Write the formula.

$= 2 \times {}^{22}/_{7} \times 15$ ← Show × signs and replace π with $^{22}/_{7}$ and r with the radius .

$C = 94.3$ cm (1 d.p.) ← Calculate, round and show units.

Column 1 uses the above process for all questions.

Column 2 gives you a diameter rather than a radius. Use:

$$C = \pi d$$

Where: C = Circumference of circle
d = diameter of the circle (note that $d = 2r$)

There are two tables at the base of the column, just write the answer with units, no working out required.

Column 3 finds the diameter (and later radius) given the circumference. If you divide the circumference by π then you find the diameter. If you halve this answer you get the radius.

$$C = \pi d$$

$\div \pi \quad \div \pi$

$$\frac{C}{\pi} = d$$

$$d = \frac{C}{\pi}$$

Circumference (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use $C=2\pi r$ with $\pi = 3.14$, to find the circumference. Round your answer to 1 decimal place.

Example

$C = 2\pi r$

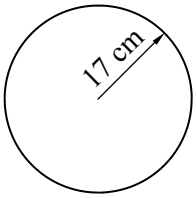
Write formula

$= 2 \times 3.14 \times 17$

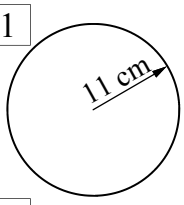
Substitute 3.14 and r

$C = 106.8$ cm

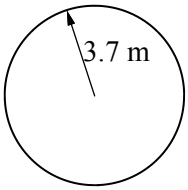
Answer 1 d.p., show units



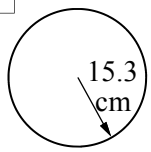
1



2

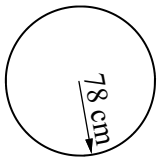


3

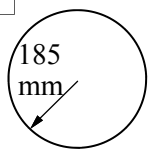


Now use $\pi = {}^{22}/_{7}$, to find the circumference. Round to the nearest whole number.

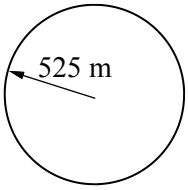
4



5

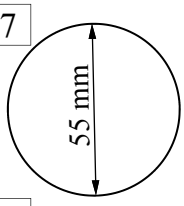


6

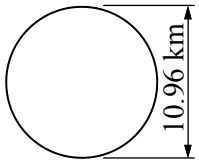


Now use $C = \pi d$ & $\pi = 3.14$, find the circumference and round to 1 decimal place.

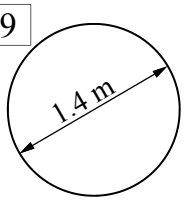
7



8



9



Now use $C = \pi d$ & $\pi = {}^{22}/_{7}$, to complete the table to 1 dp No working out required.

Q.	d	Circumference
10	23 cm	
11	83.2 m	
12	19.6 mm	
13	16.07 km	
14	208 m	
15	485 km	

Now use $C = \pi d$ & the π key on your calculator, to complete the table to 1 d.p.

Q.	d	Circumference
16	5.6 m	
17	0.9 km	
18	93 mm	
19	408 m	
20	317 mm	
21	13.68 km	
22	80.1 cm	

This time you are given the circumference. Divide C by π (π key) to find d to 1 d.p.

23 Find d if C = 27.3 cm.

$d = \frac{C}{\pi} = \frac{\square}{\pi}$ $d =$ _____

24 Find d if C = 1.6 km.

$d = \frac{C}{\pi} = \frac{\square}{\pi}$ $d =$ _____

25 Find d if C = 192.3 mm.

A cylindrical spool spins 400 times and gathers 125 m of thread. Find, to 2 d.p. :

26 The amount gathered in 1 revolution. Answer in cm.

27 Find the spool's diameter.

$d \div 2 = r$

This time you want the radius. Divide C by π to get d but then halve your answer to find r. Answer to one decimal place.

Q.	C	Radius (r)
28	17 m	
29	85 mm	
30	116 cm	
31	70.4 m	
32	41 km	
33	250 mm	
34	60 cm	
35	782 mm	
36	98 m	
37	410 cm	

Circumference (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use $C=2\pi r$ with $\pi = 3.14$, to find the circumference. Round your answer to 1 decimal place.

Example

$C = 2\pi r$

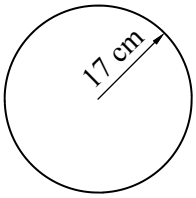
Write formula

$= 2 \times 3.14 \times 17$

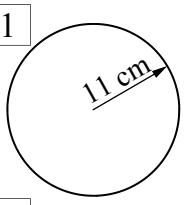
Substitute 3.14 and r

$C = 106.8$ cm

Answer 1 d.p., show units



1

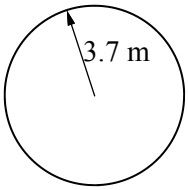


$C = 2\pi r$

$= 2 \times 3.14 \times 11$

$C = 69.1$ cm

2

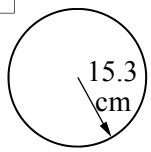


$C = 2\pi r$

$= 2 \times 3.14 \times 3.7$

$C = 23.2$ m

3



$C = 2\pi r$

$= 2 \times 3.14 \times 15.3$

$C = 96.1$ cm

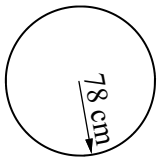
Now use $\pi = {}^{22}/_{7}$, to find the circumference. Round to the nearest whole number.

4

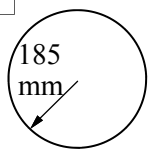
$C = 2\pi r$

$= 2 \times {}^{22}/_{7} \times 78$

$C = 490$ cm



5



$C = 2\pi r$

$= 2 \times {}^{22}/_{7} \times 185$

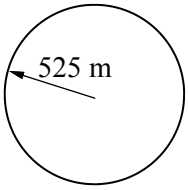
$C = 1\,163$ mm

6

$C = 2\pi r$

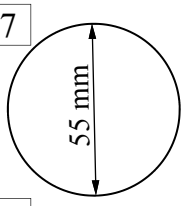
$= 2 \times {}^{22}/_{7} \times 525$

$C = 3\,300$ m



Now use $C = \pi d$ & $\pi = 3.14$, find the circumference and round to 1 decimal place.

7



$C = \pi d$

$= 3.14 \times 55$

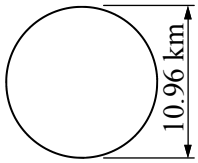
$C = 172.7$ mm

8

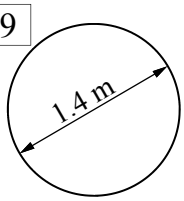
$C = \pi d$

$= 3.14 \times 10.96$

$C = 34.4$ km



9



$C = \pi d$

$= 3.14 \times 1.4$

$C = 4.4$ m

Now use $C = \pi d$ & $\pi = {}^{22}/_{7}$, to complete the table to 1 dp No working out required.

Q.	d	Circumference
10	23 cm	72.3 cm
11	83.2 m	261.5 m
12	19.6 mm	61.6 mm
13	16.07 km	50.5 km
14	208 m	653.7 m
15	485 km	1 524.3 km

Now use $C = \pi d$ & the π key on your calculator, to complete the table to 1 d.p.

Q.	d	Circumference
16	5.6 m	17.6 m
17	0.9 km	2.8 km
18	93 mm	292.2 mm
19	408 m	1 281.8 m
20	317 mm	995.9 mm
21	13.68 km	43.0 km
22	80.1 cm	251.6 cm

This time you are given the circumference. Divide C by π (π key) to find d to 1 d.p.

23 Find d if C = 27.3 cm.

$d = \frac{C}{\pi} = \frac{27.3}{\pi}$ $d =$ 8.7 cm

24 Find d if C = 1.6 km.

$d = \frac{C}{\pi} = \frac{1.6}{\pi}$ $d =$ 0.5 km

25 Find d if C = 192.3 mm.

$d = \frac{C}{\pi} = \frac{192.3}{\pi}$ $d =$ 61.2 mm

A cylindrical spool spins 400 times and gathers 125 m of thread. Find, to 2 d.p. :

26 The amount gathered in 1 revolution. Answer in cm.

$125 \div 400 = 0.3125$ m $= 31.25$ cm

27 Find the spool's diameter.

$d = \frac{C}{\pi} = \frac{31.25}{\pi}$ $d =$ 9.95 cm

$d \div 2 = r$

This time you want the radius. Divide C by π to get d but then halve your answer to find r. Answer to one decimal place.

Q.	C	Radius (r)
28	17 m	2.7 cm
29	85 mm	13.5 mm
30	116 cm	18.5 cm
31	70.4 m	11.2 m
32	41 km	6.5 km
33	250 mm	39.8 mm
34	60 cm	9.5 cm
35	782 mm	124.5 mm
36	98 m	15.6 m
37	410 cm	65.3 cm

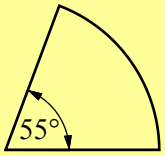
Fractions of a Circle and Arc Length

This sheet finds the length of an arc of a sector. The arc is the curved length which is a fraction of a whole circle's circumference. So in other words, this sheet deals with the circumference of a circle but multiplied by a fraction.

Column 1 starts with sectors (including quadrants and semi-circles) and finding the fraction of the circle that they represent. This requires you to identify the internal angle and write it 'over' 360°. That answers the question but the next step is to simplify the fraction. This can be done in your head by dividing by the LCM, or using a calculator.

Example

$\frac{55}{360} = \frac{11}{72}$ (÷ 5 above, ÷ 5 below)



Calculator 5 5 $a^b/_c$ 3 6 0 =

Answer on Screen 11⌟72 But you write $\frac{11}{72}$

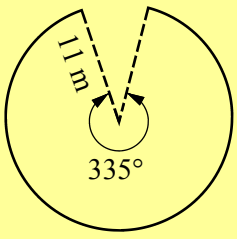
Column 2 relates the fraction to the arc length. The circumference of a circle is $C = 2\pi r$, but as these are sectors then the arc length is a fraction of the circumference (if the circle was whole).

$$l = \frac{\theta}{360} \times 2\pi r$$

Where:

l = the arc length (curved length)
θ = the internal angle of the sector
r = radius of sector

Example



$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{335}{360} \times 2 \times \pi \times 11$

$l = 64.3$ m (1 d.p.)

Column 3 asks you to find the perimeter of the sectors. So the method is just the same as above, but then add on the straight lengths as well. The straight lines are the radii, there are two of them. So work out the arc length, add two radii and you are done.

$$l = \frac{\theta}{360} \times 2\pi r + 2r$$

Fractions of a Circle and Arc Length

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Calculate the fraction of a circle shown by these sectors, simplify if possible.

1 
$\frac{\square}{360} = \frac{\square}{4}$

2 
$\frac{\square}{360} = \frac{\square}{\square}$

3 
$\frac{\square}{\square} = \frac{\square}{\square}$

4 
$\frac{\square}{\square} = \frac{\square}{\square}$

5 
$\frac{\square}{\square} = \frac{\square}{\square}$

6 
$\frac{\square}{\square} = \frac{\square}{\square}$

7 
$\frac{\square}{\square} = \frac{\square}{\square}$

8 
$\frac{\square}{\square} = \frac{\square}{\square}$

9 
$\frac{\square}{\square} = \frac{\square}{\square}$

Find the fraction of a circle and multiply by $2\pi r$ to find the arc length 'l' to 1 d.p.

10 
$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{\square}{360} \times 2 \times \pi \times \square$

$l =$ cm

11 
$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{\square}{\square} \times 2 \times \pi \times \square$

$l =$

12 
13 
14 
15 
Now find the perimeter, to 1 d.p. Include the radii.

16 
$l = \frac{\theta}{360} \times 2\pi r + 2r$

$= \frac{\square}{360} \times 2 \times \pi \times \square + 2 \times \square$

$l =$

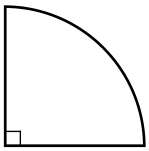
Fractions of a Circle and Arc Length

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

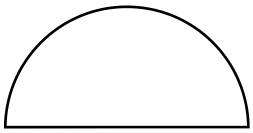
Calculate the fraction of a circle shown by these sectors, simplify if possible.

1



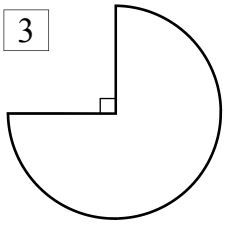
$\frac{90}{360} = \frac{1}{4}$

2



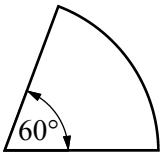
$\frac{180}{360} = \frac{1}{2}$

3



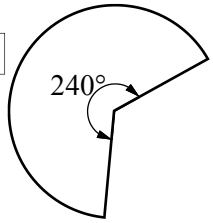
$\frac{270}{360} = \frac{3}{4}$

4



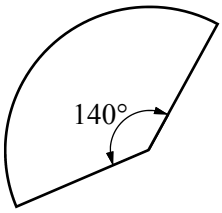
$\frac{60}{360} = \frac{1}{6}$

5



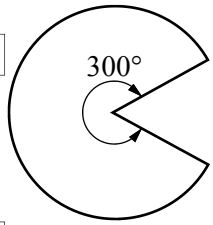
$\frac{240}{360} = \frac{1}{3}$

6



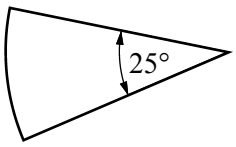
$\frac{140}{360} = \frac{7}{18}$

7



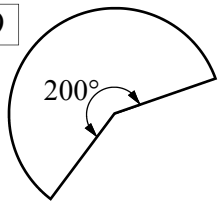
$\frac{300}{360} = \frac{5}{6}$

8



$\frac{25}{360} = \frac{5}{72}$

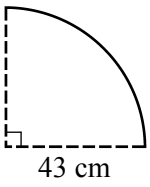
9



$\frac{200}{360} = \frac{5}{9}$

Find the fraction of a circle and multiply by $2\pi r$ to find the arc length 'l' to 1 d.p.

10

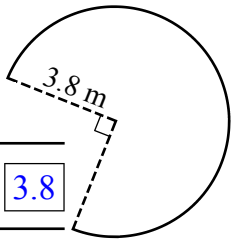


$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{90}{360} \times 2 \times \pi \times 43$

$l = 67.5$ cm

11

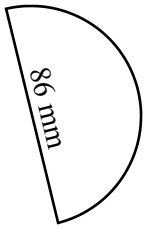


$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{270}{360} \times 2 \times \pi \times 3.8$

$l = 17.9$ m

12

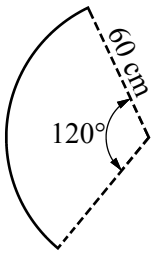


$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{180}{360} \times 2 \times \pi \times 86$

$l = 270.2$ mm

13

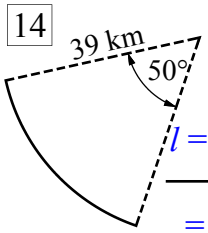


$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{120}{360} \times 2 \times \pi \times 60$

$l = 125.7$ cm

14



$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{50}{360} \times 2 \times \pi \times 39$

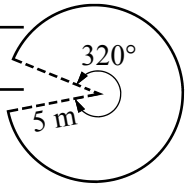
$l = 34$ km

15

$l = \frac{\theta}{360} \times 2\pi r$

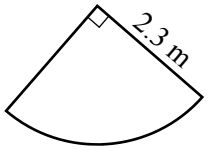
$= \frac{320}{360} \times 2 \times \pi \times 5$

$l = 27.9$ m



Now find the perimeter, to 1 d.p. Include the radii.

16

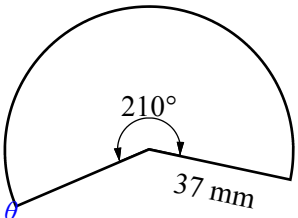


$l = \frac{\theta}{360} \times 2\pi r + 2r$

$= \frac{90}{360} \times 2 \times \pi \times 2.3 + 2 \times 2.3$

$l = 8.2$ m

17

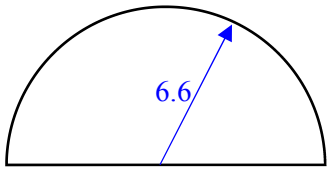


$l = \frac{\theta}{360} \times 2\pi r + 2r$

$= \frac{210}{360} \times 2 \times \pi \times 37 + 2 \times 37$

$l = 209.6$ mm

18

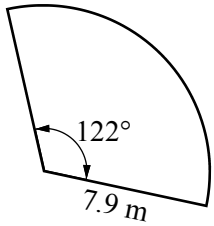


$l = \frac{\theta}{360} \times 2\pi r + d$

$= \frac{180}{360} \times 2 \times \pi \times 6.6 + 13.2$

$l = 33.9$ cm

19



$l = \frac{\theta}{360} \times 2\pi r + 2r$

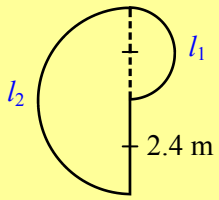
$= \frac{122}{360} \times 2 \times \pi \times 7.9 + 2 \times 7.9$

$l = 32.6$ m

Perimeter of Composite Shapes

This sheet shouldn't be attempted before the previous sheet on Arc Length is attempted. The circumference of a circle is found by $C = 2\pi r$ or $C = \pi d$. But with composite shapes parts of a circle are involved with other shapes/lengths, so you need to use fractions to find the arc length, then add that length to the other sides of the shape.

Example - Finding the perimeter to 1 d.p.



Label l_1 on the diagram and calculate the arc length.

$l_1 = {}^1/_2 \times \pi d$

$= {}^1/_2 \times \pi \times 2.4$

$l_1 = 3.8$ m

$l_2 = {}^1/_2 \times \pi d$

$= {}^1/_2 \times \pi \times 4.8$

$l_2 = 7.5$ m

Label l_2 on the diagram and calculate the arc length.

Add the three lengths. That is the two arc lengths and the 2.4 m straight length.

$P = 3.8 + 7.5 + 2.4$

$P = 13.7$ m

This sheet is answered by the above method, except sometimes quadrants are involved. So instead of using ${}^1/_2$ you will use ${}^1/_4$ to find the arc length.

Column 3 has the last two questions requiring an extra step, these require Pythagoras Theorem before solving.

Perimeter of Composite Shapes

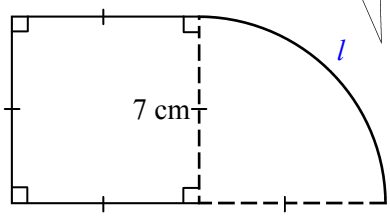
Perimeter of Composite Shapes

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the perimeter to 1 d.p.

1



$l = {}^1/_4 \times 2\pi r$

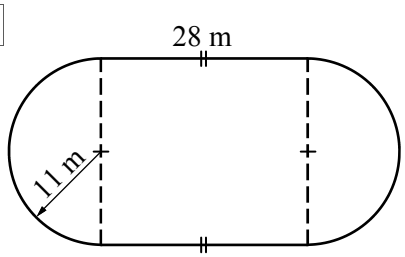
$= {}^1/_4 \times 2 \times \pi \times$ 7

$l =$ 11 cm (1 d.p.)

P = 11 + 4 × 7

P = 39 cm

2



$C = 2\pi r$

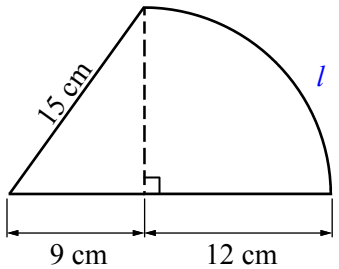
$= 2 \times \pi \times 11$

C = 69.1 m (1 d.p.)

P = 69.1 + 2 × 28

P = 125.1 m

3



$l = {}^1/_4 \times 2\pi r$

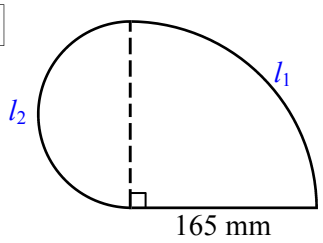
$= {}^1/_4 \times 2 \times \pi \times 12$

l = 18.8 cm (1 d.p.)

P = 18.8 + 15 + 9 + 12

P = 54.8 cm

4



$l_1 = {}^1/_4 \times 2\pi r$ $l_2 = {}^1/_2 \times 2\pi r$

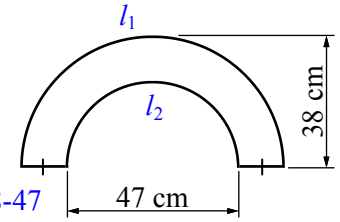
$= {}^1/_4 \times 2 \times \pi \times 165$ $= {}^1/_2 \times 2 \times \pi \times 82.5$

l_1 = 259.2 mm l_2 = 259.2 mm

P = 2 × 259.2 + 165

P = 683.4 mm

5



2×38-47 = 29

$l_1 = {}^1/_2 \times 2\pi r$ $l_2 = {}^1/_2 \times \pi d$

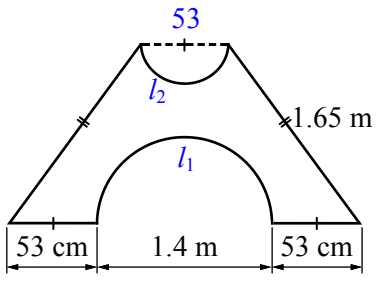
$= {}^1/_2 \times 2 \times \pi \times 38$ $= {}^1/_2 \times \pi \times 47$

l_1 = 119.4 cm l_2 = 73.8 cm

P = 119.4 + 73.8 + 29

P = 222.2 cm

6



$l_1 = {}^1/_2 \times \pi d$ $l_2 = {}^1/_2 \times \pi d$

$= {}^1/_2 \times \pi \times 1.4$ $= {}^1/_2 \times \pi \times 0.53$

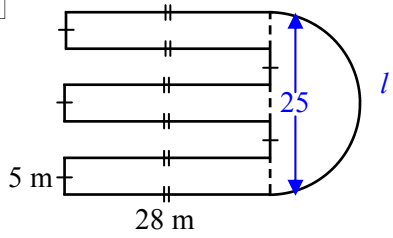
l_1 = 2.2 m (1 d.p) l_2 = 0.8 m (1 d.p)

P = 2×0.53 + 2.2 + 2×1.65 + 0.8

P = 7.4 m (1 d.p) or

P = 739.2 cm

7



$l = {}^1/_2 \times \pi d$

$= {}^1/_2 \times \pi \times 25$

l = 39.27 m

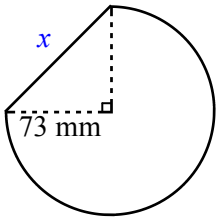
P = 39.27 + 3 × (5 + 2 × 28) + 10

P = 39.27 + 183 + 10

P = 232.27 m

Pythagoras required, round to 2 d.p.

8



$x^2 = 73^2 + 73^2$ $l = {}^3/_4 \times 2\pi r$

x^2 = 10 658 $= {}^3/_4 \times 2 \times \pi \times 73$

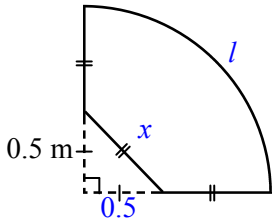
$x = \sqrt{10\,658}$ l = 344 mm

x = 103.24 mm

P = 103.24 + 344

P = 447.24 mm

9



$x^2 = 0.5^2 + 0.5^2$ r=0.5+0.71=1.21

$x^2 = 0.5$ $l = {}^1/_4 \times 2\pi r$

$x = \sqrt{0.5}$ $= {}^1/_4 \times 2 \times \pi \times 1.21$

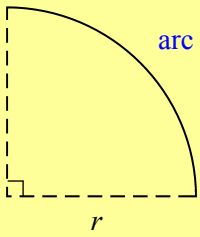
x = 0.71 m l = 1.9 m

P = 1.9 + 3 × 0.71

P = 4.03 m

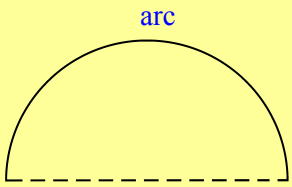
Further Perimeter Circles (Exact)

When finding the perimeter of a shape all the sides are added together. With the shapes in this worksheet an arc length is included, which has to be calculated in terms of π. This arc length will always be a fraction of a circle. For example:



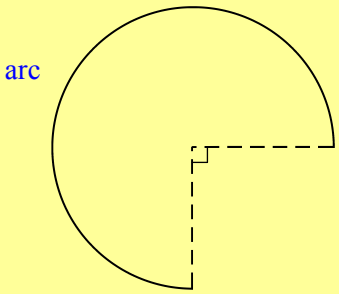
The arc length is:

$\frac{1}{4} \times 2\pi r$



The arc length is:

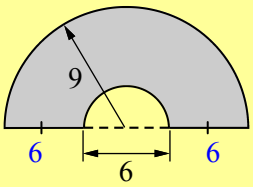
$\frac{1}{2} \times 2\pi r$ *or* $\frac{1}{2} \times \pi d$



The arc length is:

$\frac{3}{4} \times 2\pi r$

Example - Find the perimeter of the shape below



Because 18 - 6 = 12
shared equally = 6

$P = \frac{1}{2} \times 2\pi r + \frac{1}{2} \times \pi d + 2 \times 6$

Outside arc | Inside arc | Straight lengths

$= \frac{1}{2} \times 2 \times \pi \times 9 + \frac{1}{2} \times \pi \times 6 + 12$

Sub $r = 9$ | Sub $d = 6$ | $2 \times 6 = 12$

$= 9\pi + 3\pi + 12$

Solve each part

$P = 12\pi + 12$ units

Gather like terms and include 'units'

Column 1 starts with finding the perimeter of sectors, quadrants and semi-circles. These are all solved by finding the fraction of a circle shown and multiplying this by $2\pi r$. Then add the arc length with the other straight side lengths to get the perimeter.

Column 2 involve composite shapes and so include more sides in the calculation, watch for repetition to speed up your calculation remembering that two halves will make a whole circle. Note that Pythagoras Theorem is required at times.

Column 3 uses algebra-style questions, where letters are introduced rather than numbers. These may be more challenging.

Further Perimeter Circles (Exact)

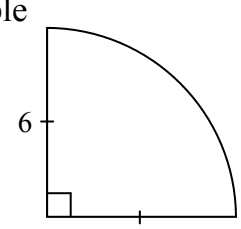
Find the perimeter in terms of π for these shapes.

Example



$P = \frac{1}{4}\times 2\pi r + 2r$

$= \frac{1}{4}\times 2\times\pi\times 6 + 2\times 6$

$P = 3\pi + 12$ units

1

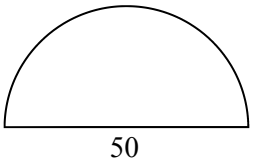
$P = \frac{3}{4}\times 2\pi r + 2r$

$= \frac{3}{4}\times 2\times\pi\times 18 + 2\times 18$

$P = 27\pi + 36$ units

2

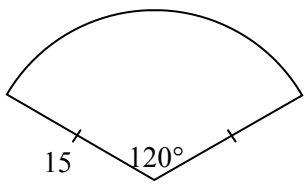


$P = \frac{1}{2}\times\pi d + d$

$= \frac{1}{2}\times\pi\times 50 + 50$

$P = 25\pi + 50$ units

3

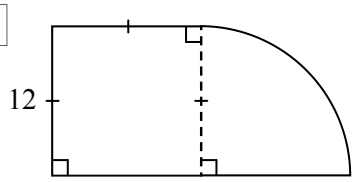


$P = \frac{1}{3}\times 2\times\pi\times r + 2\times r$

$= \frac{1}{3}\times 2\times\pi\times 15 + 2\times 15$

$P = 10\pi + 30$ units

4

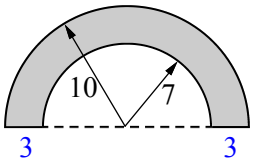


$P = \frac{1}{4}\times 2\pi r + 4r$

$= \frac{1}{4}\times 2\times\pi\times 12 + 4\times 12$

$P = 6\pi + 48$ units

5



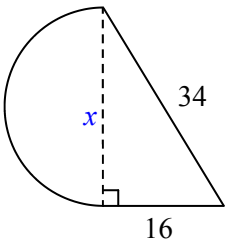
$P = \frac{1}{2}\times 2\pi R + \frac{1}{2}\times 2\pi r + 2\times 3$

$= \frac{1}{2}\times 2\times\pi\times 10 + \frac{1}{2}\times 2\times\pi\times 7 + 6$

$= 10\pi + 7\pi + 6$ units

$P = 17\pi + 6$ units

6



$x^2 = 34^2 - 16^2$

$x^2 = 900$

$x = \sqrt{900}$

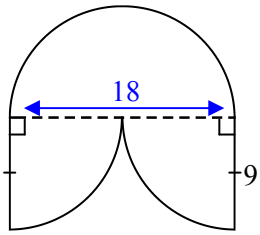
$x = 30$ units

$P = \frac{1}{2}\times\pi d + 16 + 34$

$= \frac{1}{2}\times\pi\times 30 + 50$

$P = 15\pi + 50$ units

7



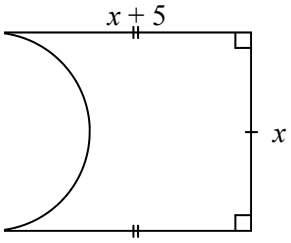
$P = \pi d + 2\times 9$

$= \pi\times 18 + 18$

$P = 18\pi + 18$ units

Keep finding the perimeter but this time using algebra.

8

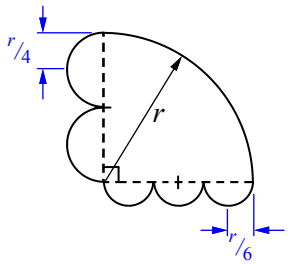


$P = \frac{1}{2}\times\pi d + 2(x + 5) + x$

$= \frac{1}{2}\times\pi\times x + 2x + 10 + x$

$P = \frac{1}{2}\pi x + 3x + 10$ units

9

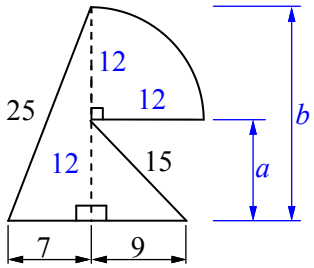


$P = \frac{1}{4}\times 2\pi r + 2\pi(\frac{r}{4}) + 1\frac{1}{2}\times 2\pi(\frac{r}{6})$

$= \frac{1}{2}\pi r + \frac{1}{2}\pi r + \frac{1}{2}\pi r$

$= \frac{3}{2}\pi r$ units or $1\frac{1}{2}\pi r$ units

10



$a^2 = 15^2 - 9^2$ | $b^2 = 25^2 - 7^2$

$a^2 = 144^2$ | $b^2 = 576^2$

$a = \sqrt{144}$ | $b = \sqrt{576}$

$a = 12$ units | $b = 24$ units

$P = \frac{1}{4}\times 2\pi r + 25 + 16 + 15 + r$

$= \frac{1}{4}\times 2\times\pi\times 12 + 56 + 12$

$P = 6\pi + 68$ units

Exact & Estimate - Area

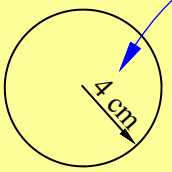
The area of a circle is the measurement of space inside the circle. Formula:

$$A = \pi r^2$$

Where: A = the area (square units, same as the radius/diameter except ^{2}, ie. cm^2, m^2, mm^2)
π = Pi, it's a value on your calculator 3.14159….. Which is a bit more than 3!
r = the radius, the length from the centre to any point on the circumference

Column 1 starts with circles that have a radius shown, to find the area in terms of π (also called the exact area) use the value of r given in the circle. To make an estimate, use the exact area and substitute 3 for π.

Example



$A = \pi r^2$

$= \pi \times 4^2$ ← Replace r with 4, (the radius of the circle)

$A = 16\pi$ cm^2 ← $4^2 = 16$, remember ^{2} is the number times itself not the number times 2. Leave π as is. Write the units.

So the area is 16π cm^2. This is the exact area, to estimate the area without a calculator use $\pi = 3$. This is less than the actual value for π, but it gives a fairly accurate answer without too much calculation.

Estimate:

$A = 16\pi$ cm^2 ← Rewrite the area from previous step

$\approx 16 \times 3$ ← Replace π with 3 and = with ≈

$A \approx 48$ cm^2 ← Solve, use either ≈ or ≒ to indicate 'approximately'.

Column 2 uses diameters. Halve the diameter for the radius and solve as before, there is a formula for calculating the area using d. But it won't be introduced on this sheet.

At the bottom of the page are four circles. Measure the diameter accurate to the nearest cm, then calculate the exact area (in terms of π) and then an estimate, again using $\pi = 3$. Use the working out spaces in the third column to answer these.

Exact and Estimate - Area

$A = \pi r^2$

$= \pi \times 5^2$

$A = 25\pi$ cm^2

$A = 25\pi$ cm^2

$\approx 25 \times 3$

$A \approx 75$ cm^2

11

$A = \pi r^2$

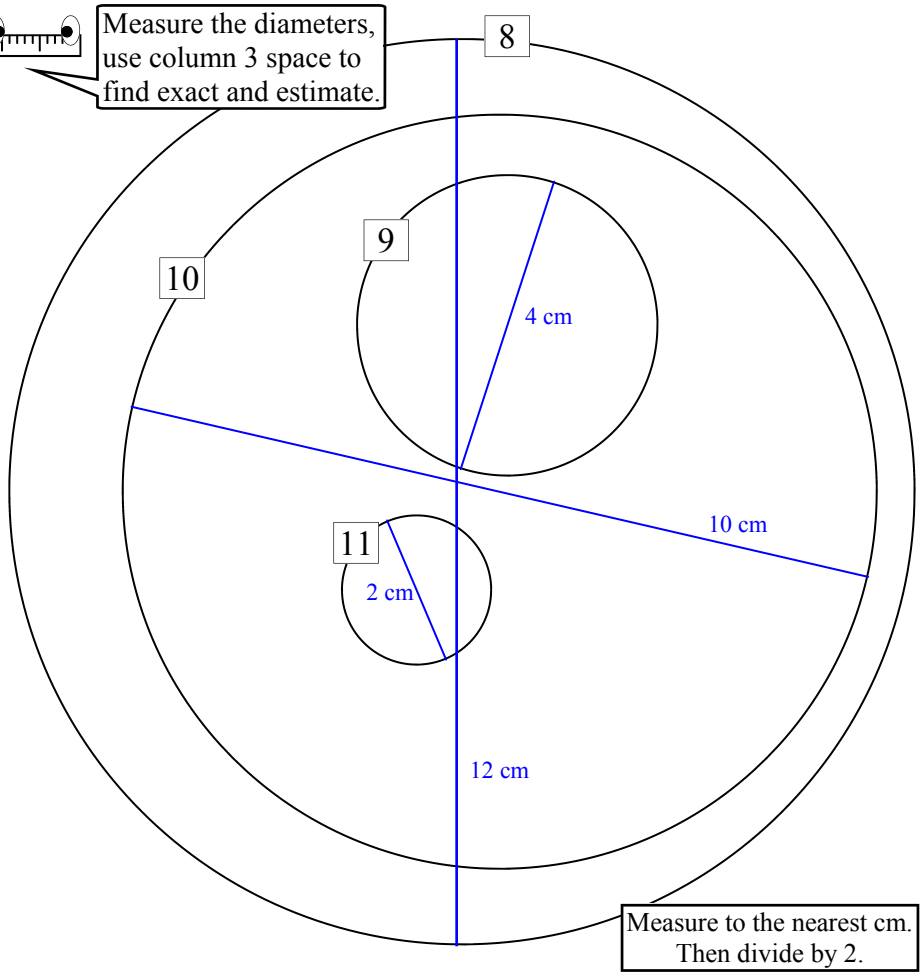
$= \pi \times 1^2$

$A = \pi$ cm^2

$A = \pi$ cm^2

$A \approx 3$ cm^2

Measure the diameters, use column 3 space to find exact and estimate.



Measure to the nearest cm. Then divide by 2.

Area of a Circle (Sheet 1)

The formula for calculating the area of a circle is:

$$A = \pi r^2$$

Where:

A = Area of the circle, in the same units as the radius, but squared. (cm^2, m^2, mm^2)
r = The radius of the circle (distance from centre to circumference).

Column 1 features circles with the radius shown. Use the area formula above to calculate the answer. The answer should be rounded to 2 decimal places and the units should be shown as square units. There is an example at the top of the column.

Column 2 is the same as Column 1 except for one additional step. Instead of the radius you are given the diameter. So convert the diameter to a radius by dividing it by 2, write the radius in the space provided, either in or beside the circle. Then solve the questions the same way, but round to one decimal place this time.

Column 3 starts with a mixture of questions that are either radius or diameter, so the questions are solved the same way as either Column 1 or Column 2.

At the bottom of the column a circle is fit perfectly into a square, so the circle's diameter is the same as the side length of the square. Calculate the square's total area (as if the circle wasn't there), then calculate the circle's area. Then calculate the %Area that the circle accommodates within the square, by multiplying the fraction by 100. Did you expect the circle to take up more space, or less?

$\text{Percentage} = \frac{754.8}{961} \times 100$

$\text{Percentage} = 78.5\%$

Round to 1 d.p.

Area of a Circle (Sheet 2)

The formula for calculating the area of a circle is:

$$A = \pi r^2$$

Where:

A = Area of the circle, in the same units as the radius, but squared. (cm^2, m^2, mm^2)
r = The radius of the circle (distance from centre to circumference).

This sheet uses three values for π: Decimal 3.14; Fraction $^{22}/_{7}$ and Calculator 3.14159….

Column 1 features circles with the radius shown. Use the area formula above to calculate the answer. But for the first part of the column use $\pi = 3.14$ to calculate your answer. Then round to 1 decimal place. The second part of the column use $\pi = {}^{22}/_{7}$ to find your answer rounded to the nearest whole number. Note that your answer could be an improper fraction or a mixed number depending on the calculator you use. Press the fraction key after the fractional answer is displayed to convert it to a decimal. Decimals are easier to round for most students.

Column 2 requires you to halve the diameter first to get a radius, write the radius on the circle next to the dotted line, or draw your own line. Then solve the same way as column 1 except round to 2 decimal places, note that you use $\pi = 3.14$.

Two tables are then shown. Divide the diameter by 2 to get the radius column, then calculate the area. Note that the first table uses $\pi = {}^{22}/_{7}$, all lengths are in cm. The second table requires you to use the π key on your calculator, answer in m^2 rounded to 2 decimal places.

Column 3 asks you to find the radius given the area. First it asks you to manipulate the area formula to make r the subject. The steps are shown, see how you go. The rest of the column uses the formula you created to answer the rest of the column. If you couldn't rearrange the formula don't worry, Fizzle tells you the formula above question 24.

Note that you have to use brackets as the calculator step shows in question 24, or work out the inside first, press the 'equals button' then the 'square root button' and 'equals' again.

Area of a Circle (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use $A=\pi r^2$ with $\pi = 3.14$, to find the area. Round your answer to 1 decimal place.

Example

$A = \pi r^2$

Write formula

$= 3.14 \times 17^2$

Substitute 3.14 and r

$A = 907.5\ cm^2$

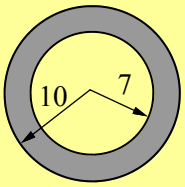
The Annulus

An annulus is a ring-like figure, in other words a circle within another circle. Most students recognise the similarity with the word 'anus', as well as the similar appearance. For this reason it is usually an easy word to remember!

Column 1 deals with calculating the area of an annulus. The process is to calculate the outside circle's area, then calculate the inside circle's area, then subtract them. An example is below.

Example - Area of an Annulus



Lengths are in cm

$A_1 = \pi R^2$

$= \pi \times 10^2$

$A_1 = 314.2 \text{ cm}^2$ (1 dp)

Capital *R*, means 'big'.

So A_1 is the area of the outside circle.

$A_2 = \pi r^2$

$= \pi \times 7^2$

$A_2 = 153.9 \text{ cm}^2$ (1 dp)

Lower case *r*, means 'small'.

So A_2 is the area of the inside circle.

$A = A_1 - A_2 = 314.2 - 153.9$

$A = 160.3 \text{ cm}^2$

Then subtract for the annulus area. The larger area - smaller area.

Column 2 introduces the annulus formula. This is a faster way of solving exercises but it is important that you understand the process above as well. The formula is:

$$A = \pi (R^2 - r^2)$$

Where:

R = outside circle's radius
r = inside circle's radius

This formula is created by factorising $\pi R^2 - \pi r^2$. If you take out π you get the above formula.

Column 2 starts with assistance in showing the working out. After the first 3 questions fractions need to be used because the area for 'fractions of' annuli are required. Use the internal angle within the annulus, then multiply by the angle over 360°.

So if the angle was 90°, you would use $A = {}^{90}/_{360} \times \pi(R^2 - r^2)$ but you may also recognize that this is the same as $A = \frac{1}{4} \times \pi(R^2 - r^2)$.

The Annulus

9

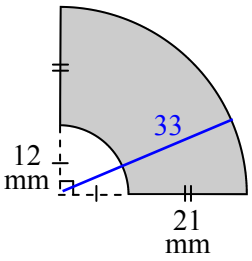
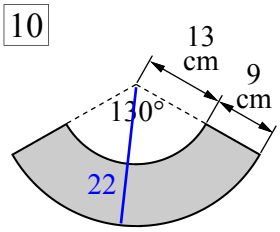
$A = ¼ \times \pi(R^2 - r^2)$

$= ¼ \times \pi \times (33^2 - 12^2)$

$A = 742.2\ mm^2$



10



$A = {}^{130}/_{360} \times \pi(R^2 - r^2)$

$= {}^{130}/_{360} \times \pi \times (22^2 - 13^2)$

$A = 357.4\ cm^2$

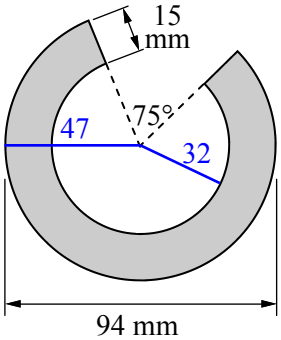
11

Internal angle = 360 - 75 = 285°

$A = {}^{285}/_{360} \times \pi(R^2 - r^2)$

$= {}^{285}/_{360} \times \pi \times (47^2 - 32^2)$

$A = 2\,947.2\ mm^2$



Area of Sectors, Quadrants And Semi-Circles

If you know how to multiply by a fraction and how to find the area of a circle, then this worksheet simply blends the two.

The formula for calculating the area of a circle is:

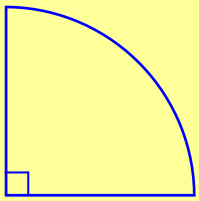
$$A = \pi r^2$$

Where:

A = Area of the circle, in the same units as the radius, but squared. (cm^2, m^2, mm^2)
r = The radius of the circle (distance from centre to circumference).

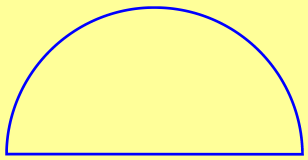
But with semi-circles (half a circle), quadrants (quarter of a circle) and sectors the above formula is multiplied by a fraction.

Quadrants



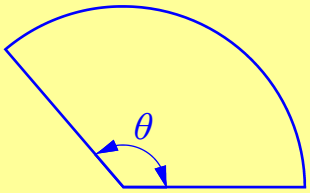
$$A = \frac{1}{4}\pi r^2$$

Semi-Circles



$$A = \frac{1}{2}\pi r^2$$

Sectors



$$A = \frac{\theta}{360} \times \pi r^2$$

Column 1 starts with semi-circles, so use the middle formula above, in other words multiply πr^2 by ½. Question 5 sees a change to quadrants, use the first formula shown above, multiply πr^2 by ¼.

Column 2 again features semi-circles, but this time instead of being given the radius you are given a diameter, so find the radius (by dividing the diameter by 2) then solve as before.

Sectors are then introduced at the bottom of the column. The internal angle (commonly called 'pheta') is written over 360, then simplified with your calculator. The calculator steps for simplifying are shown on the sheet if you have forgotten the process.

Then sector area is required to be found. Use the third formula above, so make a fraction from the internal angle and 360 as the denominator. Multiply this by the area formula and you are done!

Area of Composite Shapes

A composite shape is a shape that is composed of two or more plane shapes. These two shapes can add together to create an area, or be subtracted. Before this sheet is attempted you should have completed earlier sheets on area of a circle.

Column 1 are all exercises using addition. So calculate the individual areas and then add them together. The process is shown in question 1.

Column 2 is essentially the same process, find the areas that make the shape but then subtract the areas. Question 8 will require Pythagoras Theorem to first be applied.

Area of Composite Shapes

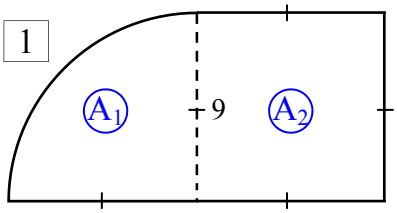
Find the areas, sum for the total area. Round to 1 d.p. All lengths are cm.

1



$A_1 = \frac{1}{4}\pi r^2$

$= \frac{1}{4} \times \pi \times 9^2$

$A_1 = 63.6 \text{ cm}^2$ (1 dp)

$A_2 = l^2$

$= 9^2$

$A_2 = 81 \text{ cm}^2$

$A = A_1 + A_2 = 63.6 + 81$

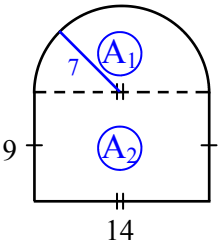
$A = 144.6 \text{ cm}^2$

2

$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 7^2$

$A_1 = 77 \text{ cm}^2$ (1 d.p.)



$A_2 = lb$

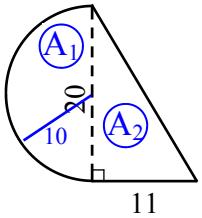
$= 14 \times 9$

$A_2 = 126 \text{ cm}^2$

$A = A_1 + A_2 = 77 + 126$

$A = 203 \text{ cm}^2$

3



$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 10^2$

$A_1 = 157.1 \text{ cm}^2$ (1 d.p.)

$A_2 = \frac{1}{2}bh$

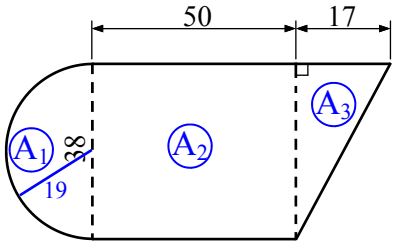
$= \frac{1}{2} \times 11 \times 20$

$A_2 = 110 \text{ cm}^2$

$A = A_1 + A_2 = 157.1 + 110$

$A = 267.1 \text{ cm}^2$

4



$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 19^2$

$A_1 = 567.1 \text{ cm}^2$ (1 d.p.)

$A_2 = lb$

$= 50 \times 38$

$A_2 = 1\,900 \text{ cm}^2$

$A_3 = \frac{1}{2}bh$

$= \frac{1}{2} \times 38 \times 17$

$A_3 = 323 \text{ cm}^2$

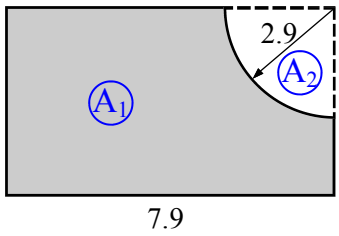
$A = A_1 + A_2 + A_3$

$= 567.1 + 1\,900 + 323$

$A = 2\,790.1 \text{ cm}^2$

This time subtract the areas. Round to 1 d.p. All measurements in metres.

5



$A_1 = lb$

$= 7.9 \times 4.7$

$A_1 = 37.1 \text{ m}^2$ (1 d.p.)

$A_2 = \frac{1}{4}\pi r^2$

$= \frac{1}{4} \times \pi \times 2.9^2$

$A_2 = 6.6 \text{ m}^2$ (1 d.p.)

$A = A_1 - A_2 = 37.1 - 6.6$

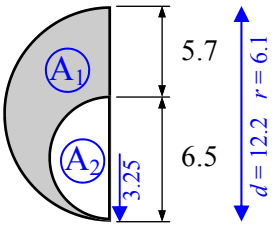
$A = 30.5 \text{ m}^2$

6

$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 6.1^2$

$A_1 = 58.4 \text{ m}^2$ (1 d.p.)



$A_2 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 3.25^2$

$A_2 = 16.6 \text{ m}^2$ (1 d.p.)

$A = A_1 - A_2 = 58.4 - 16.6$

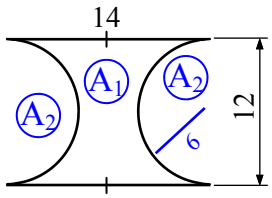
$A = 41.8 \text{ m}^2$

7

$A_1 = lb$

$= 14 \times 12$

$A_1 = 168 \text{ m}^2$



$A_2 = \pi r^2$

$= \pi \times 6^2$

$A_2 = 113.1 \text{ m}^2$ (1 d.p.)

$A = A_1 - A_2 = 168 - 113.1$

$A = 54.9 \text{ m}^2$

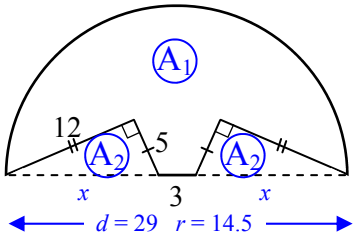
8

$x^2 = 5^2 + 12^2$

$x^2 = 169$

$x = \sqrt{169}$

$x = 13 \text{ m}$



$A_2 = 2 \times \frac{1}{2}bh$

$= 2 \times \frac{1}{2} \times 5 \times 12$

$A_2 = 60 \text{ m}^2$

$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 14.5^2$

$A_1 = 330.3 \text{ m}^2$ (1 d.p.)

$A = A_1 - A_2 = 330.3 - 60$

$A = 270.3 \text{ m}^2$

Area and Perimeter Problems

These are problem based questions based on circles or composite solids with circular elements. So before attempting this sheet ensure you have covered composite areas.

Column 1 are area questions, so use $A = \pi r^2$ to find the area, then apply other skills to solve the questions.

Column 2 are circumference questions, so use $C = \pi d$ *or* $C = 2\pi r$ to find the circumference or use fractions when arcs are involved.

As these questions require earlier exercises to be completed first, no examples have been included.

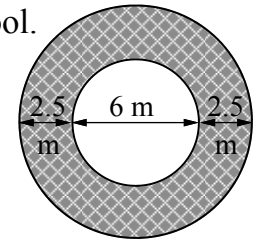
Area and Perimeter Problems

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use $A = \pi r^2$ to find the area and then apply your skills to answer these. Answer to 1 decimal place when needed.

A circular pool shown below in plan view has a diameter of 6 m. The pool fence encloses a 2.5 m wide paved area around the pool. Find:

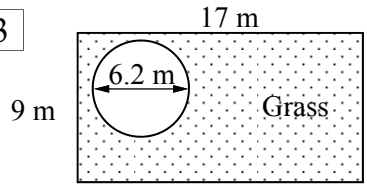
1 The area occupied by the pool.



2 The area occupied by the tiles.

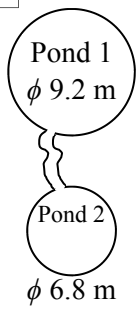
Tom has built a 6.2 m diameter pergola in his backyard. The rest of his backyard is covered by grass. Calculate the percentage of his backyard that has to be mowed.

3



Laura is constructing a wastewater system using two round settling ponds. Pond 1 is to have reeds covering 80% of its area, Pond 2 is to have 34% of its area covered with reeds. Calculate the amount of reeds (in m^2) required.

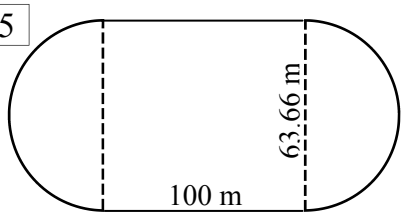
4



Use $C = 2\pi r$ or $C = \pi d$ to find the circle's circumference then apply your skills to answer these. Answer to 1 decimal place.

Calculate the distance around the track field shown below.

5

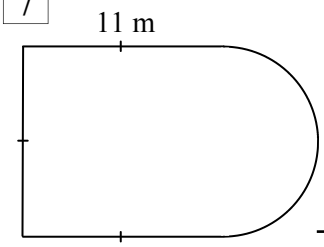


If Eve can run at an average speed of 3 m/s calculate the time, in minutes and seconds, that it would take her to complete one lap of the track above.

6

A tiger exhibit at the zoo is shown below. The curved length is a glass viewing wall costing $1 450 per metre. While the remaining three walls are concrete and cost $845 per metre. Find the cost of constructing the walls.

7



Jen's hamster 'Spartacus' runs in his 30 cm diameter exercise wheel. Jen has fitted a counter to the wheel and finds that Spartacus completed 800 revolutions one day, 560 the next and 725 on the third day. Find, in m, the:

8 Total distance Spartacus covers in three days.

9 Average distance travelled per day.

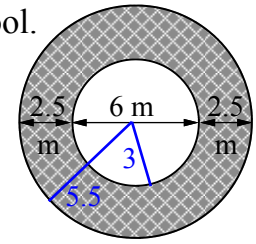
A circular pool shown below in plan view has a diameter of 6 m. The pool fence encloses a 2.5 m wide paved area around the pool. Find:

1 The area occupied by the pool.



$A = \pi r^2$

$= \pi \times 3^2$

$A = 28.3 \text{ m}^2$

2 The area occupied by the tiles.

$A = \pi r^2$

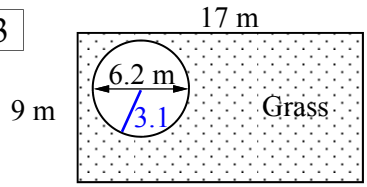
$= \pi \times 5.5^2$

$A = 95 \text{ m}^2$

$A = 95 - 28.3 = 66.7 \text{ m}^2$

Tom has built a 6.2 m diameter pergola in his backyard. The rest of his backyard is covered by grass. Calculate the percentage of his backyard that has to be mowed.

3



$A = \pi r^2$

$= \pi \times 3.1^2$

$A = 30.2 \text{ m}^2$

$A = lb$

$= 17 \times 9$

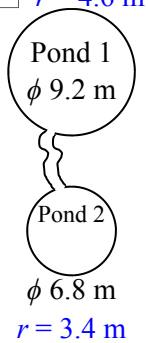
$A = 153 \text{ m}^2$

$\%\text{ Mowed} = \frac{30.2}{153} \times 100$

$\%\text{ Mowed} = 19.7\%$

Laura is constructing a wastewater system using two round settling ponds. Pond 1 is to have reeds covering 80% of its area, Pond 2 is to have 34% of its area covered with reeds. Calculate the amount of reeds (in m^2) required.

4



$r = 4.6$ m

$r = 3.4$ m

$A_1 = \pi r^2$

$= \pi \times 4.6^2$

$A_1 = 66.5 \text{ m}^2$

$A_2 = \pi r^2$

$= \pi \times 3.4^2$

$A_2 = 36.3 \text{ m}^2$

$\text{Pond 1} = 66.5 \times 0.80$

$\text{Pond 1} = 53.2 \text{ m}^2$

$\text{Pond 2} = 36.3 \times 0.34$

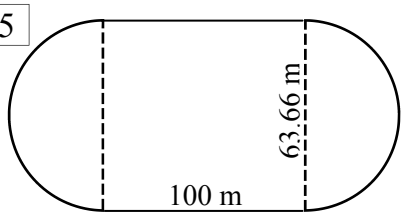
$\text{Pond 2} = 12.3 \text{ m}^2$

$\text{Total Reeds} = 53.2 + 12.3 = 65.5 \text{ m}^2$

Use $C = 2\pi r$ or $C = \pi d$ to find the circle's circumference then apply your skills to answer these. Answer to 1 decimal place.

Calculate the distance around the track field shown below.

5



$C = \pi d$

$= \pi \times 63.66$

$C = 200 \text{ m}$

$\text{Distance} = 200 + 2 \times 100$

$\text{Distance} = 400 \text{ m}$

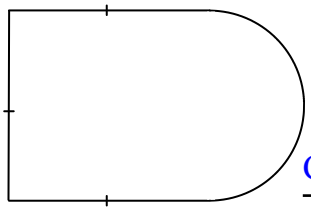
If Eve can run at an average speed of 3 m/s calculate the time, in minutes and seconds, that it would take her to complete one lap of the track above.

6 $\text{Time} = \frac{400}{3}$

$\text{Time} = 133.\dot{3} \text{ secs} = 2 \text{ m } 13 \text{ s}$

A tiger exhibit at the zoo is shown below. The curved length is a glass viewing wall costing \$1 450 per metre. While the remaining three walls are concrete and cost \$845 per metre. Find the cost of constructing the walls.

7



$l = \frac{1}{2}\pi d$

$= \frac{1}{2} \times \pi \times 11$

$l = 17.3 \text{ m}$

$\text{Cost}_{\text{GLASS}} = 17.3 \times 1\,450$

$\text{Cost}_{\text{GLASS}} = \$25\,085$

$\text{Cost}_{\text{CONCRETE}} = 11 \times 3 \times 845$

$\text{Cost}_{\text{CONCRETE}} = \$27\,885$

Jen's hamster 'Spartacus' runs in his 30 cm diameter exercise wheel. Jen has fitted a counter to the wheel and finds that Spartacus completed 800 revolutions one day, 560 the next and 725 on the third day. Find, in m, the:

8 Total distance Spartacus covers in three days.

$C = \pi d$

$= \pi \times 0.3$

$C = 0.9 \text{ m}$

$D = 2\,085 \times 0.9$

$D = 1\,876.5 \text{ m}$

Or 1 965.1 m (No rounding)

9 Average distance travelled per day.

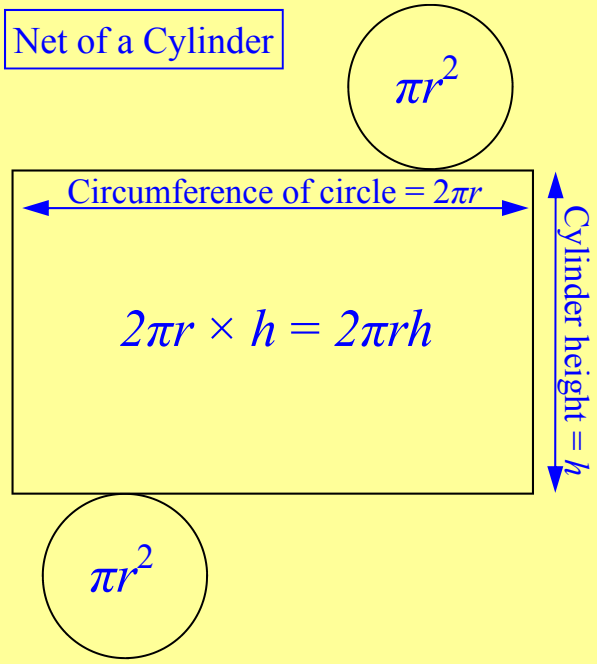
$\text{Average Dist} = 1\,876.5 \div 3 = 625.5 \text{ m}$

Or No Rounding $\text{Average Dist} = 1\,965.1 \div 3 = 655 \text{ m}$

Estimation/Terms of π - Surface Area of Cylinders

When you calculate the SA of a cylinder, or the area of a cylinder wall (the curved part of a cylinder) you will generally use a calculator. A calculator uses an approximation for π because π is irrational, its decimal component goes on forever. So if an exact value is required, the answer must be expressed 'in terms of π'.

Net of a Cylinder



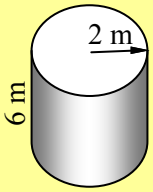
As the net shows, each circle has an area of πr^2. So the two circles added gives an area of $2\pi r^2$.

The cylinder wall, the rectangle in the net, wraps around the circle so one of its sides is the same length as the circumference of the circular ends, which is $2\pi r$. Its height is the height of the cylinder, which is h. As this area is a rectangle, its area is one side times the other, or $2\pi r \times h = 2\pi rh$.

SA of a Cylinder = $2\pi r^2 + 2\pi rh$

SA of a Cylinder Wall = $2\pi rh$

Example - Exact Area of a Cylinder Wall & Estimation of area (using π =3).



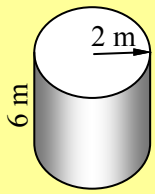
$A = 2\pi rh$	Write the formula
$= 2\times\pi\times2\times6$	Substitute r and h
$A = 24\pi$ m^2	Find area

Estimate:

$A = 24\pi$ m^2	
$\approx 24 \times 3$	Replace π with 3
$A \approx 72$ m^2	

Example - Exact Surface Area of a Cylinder & Estimation of area (using π =3).

$SA = 2\pi r^2 + 2\pi rh$	Write the formula
$= 2\times\pi\times2^2 + 2\times\pi\times2\times6$	Substitute r and h
$= 8\pi + 24\pi$	Simplify parts
$SA = 32\pi$ m^2	Find SA



Estimate: using $\pi = 3$

$SA = 32\pi$ m^2
$\approx 32 \times 3$
$SA \approx 96$ m^2

Note that as π = 3.14 to 2 d.p., using π = 3 will always give an answer that is below the actual surface area/area. But it is a simple estimate and a quick way to check your calculations.

Estimation/Terms of π - Surface Area of Cylinders

$= 32\pi + 120\pi$

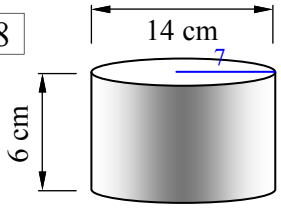
$SA = 152\pi$ cm^2

Estimate: $SA = 152\pi$ cm^2 using $\pi = 3$

$\approx 152 \times 3$

$SA \approx 456$ cm^2

8



$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times7^2 + 2\times\pi\times7\times6$

$= 98\pi + 84\pi$

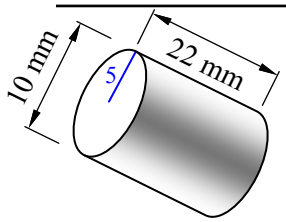
$SA = 182\pi$ cm^2

Estimate: $SA = 182\pi$ cm^2 using $\pi = 3$

$\approx 182 \times 3$

$SA \approx 546$ cm^2

9



$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times5^2 + 2\times\pi\times5\times22$

$= 50\pi + 220\pi$

$SA = 270\pi$ mm^2

Estimate: $SA = 270\pi$ mm^2 using $\pi = 3$

$\approx 270 \times 3$

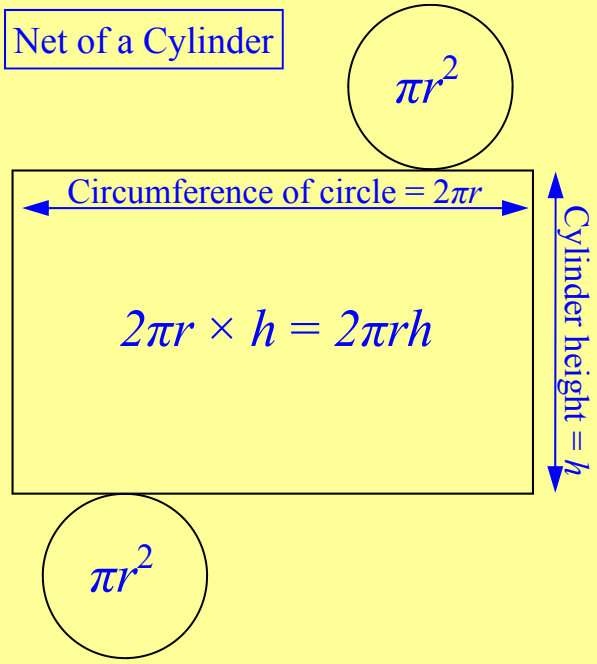
$SA \approx 810$ mm^2

Surface Area of Cylinders

The surface area of a cylinder is the sum of the areas of the solid. As the net of a cylinder below shows, each circle has an area of πr^2. So the two circles added together gives an area of $2\pi r^2$. The cylinder wall, (also called the curved surface) is the rectangle in the net, it wraps around the circles so one of its sides is the same length as the circumference of the circular ends, which is $2\pi r$. Its height is the height of the cylinder, which is h.

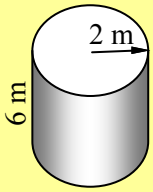
As this area is a rectangular area, its area is one side times the other, or $2\pi r \times h = 2\pi rh$.

Net of a Cylinder



SA of a Cylinder = $2\pi r^2 + 2\pi rh$

Example - SA of a cylinder - Using $\pi = {}^{22}/_{7}$



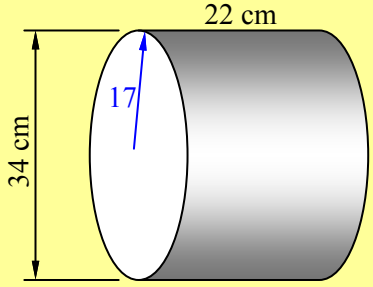
$SA = 2\pi r^2 + 2\pi rh$	Write the formula
$= 2\times{}^{22}/_{7}\times 2^2 + 2\times{}^{22}/_{7}\times 2\times 6$	Substitute r and h, Change π to ${}^{22}/_{7}$.
$SA = 100.57\ m^2$ (2 d.p.)	Find surface area

Calculator 2 × 2 2 $a^b/_c$ 7 × 2 x^2 + 2 × 2 2 $a^b/_c$ 7 × 2 × 6 =

Answer on Screen 100⌟4⌟7

Calculator $a^b/_c$ Answer on Screen 100.5714286 Round to 2 decimal places $100.57\ m^2$ (2 d.p.)

Example - SA of a cylinder - Given the diameter instead of radius - Using π key



Divide the diameter by two. Then on the diagram draw the radius.

Use that number in your calculation. It may be a decimal.

$SA = 2\pi r^2 + 2\pi rh$	Write the formula
$= 2\times\pi\times 17^2 + 2\times\pi\times 17\times 22$	Substitute r and h
$SA = 4\ 165.75\ cm^2$ (2 d.p.)	Find surface area

Calculator 2 × π × 1 7 x^2 + 2 × π × 1 7 × 2 2 =

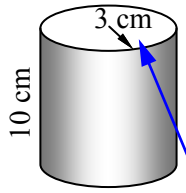
Answer on Screen 4165.751859 Round to 2 decimal places $4\ 165.75\ cm^2$ (2 d.p.)

Surface Area of Cylinders

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the surface area of these cylinders.
Use π = 3.14, not the π key. Round to 2 dp.

Example

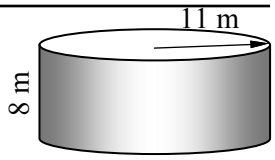


$SA = 2\pi r^2 + 2\pi rh$

$= 2\times3.14\times3^2 + 2\times3.14\times3\times10$

$SA = 244.92\ cm^2$ (2 d.p.)

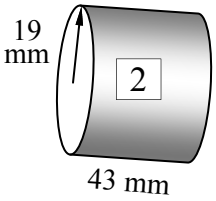
$units^2$ must match

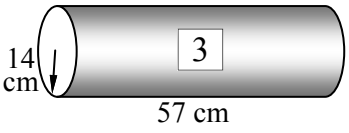


1 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times3.14\times\square^2 + 2\times3.14\times\square\times\square$

$SA =$ m^2





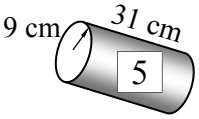
2 $SA = 2\pi r^2 + 2\pi rh$

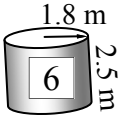
$=$

$SA =$

3

Now use π = $^{22}/_{7}$. Use the fraction key after '=' to change to a decimal, round to 1 d.p.



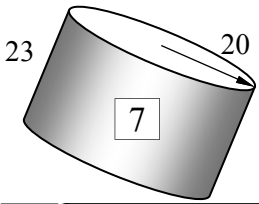


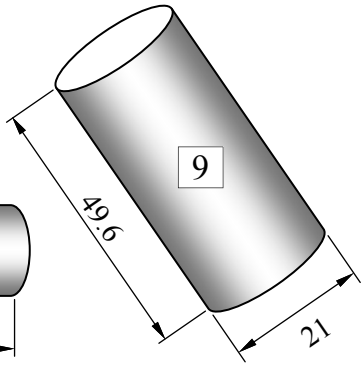
4

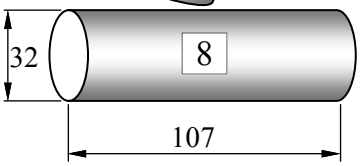
5

6

Now use your calculator's π key. These questions can include diameters. All measurements are in cm. Round to 1 d.p.







7 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times\square^2 + 2\times\pi\times\square\times\square$

8

9

10 Bubblin' Bobs cylindrical water tanks are 4.2 m high and 5.1 m in diameter. Metal sheeting costs \$9.10/m^2, find the cost to build 4 tanks.

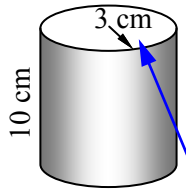
11 Slow & Slim's steam rollers have a cylinder for a front wheel that is 1.9 m diameter and 3.1 m wide (height). The roller needs painting, if a tin of paint covers 11 m^2 how many tins are required to paint the roller.

Surface Area of Cylinders

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the surface area of these cylinders.
Use $\pi = 3.14$, not the π key. Round to 2 dp.

Example

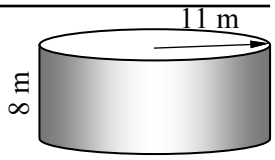


$SA = 2\pi r^2 + 2\pi rh$

$= 2\times3.14\times3^2 + 2\times3.14\times3\times10$

$SA = 244.92 \text{ cm}^2$ (2 d.p.)

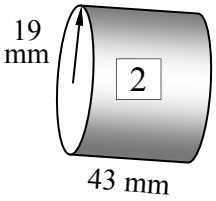
units^2 must match

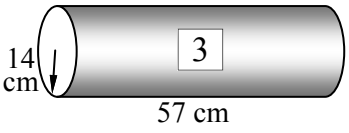


1 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times3.14\times\boxed{11}^2 + 2\times3.14\times\boxed{11}\times\boxed{8}$

$SA = 1\,312.52 \text{ m}^2$ (2 d.p.)





2 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times3.14\times19^2 + 2\times3.14\times19\times43$

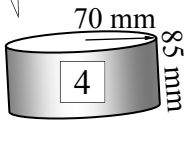
$SA = 7\,397.84 \text{ mm}^2$ (2 d.p.)

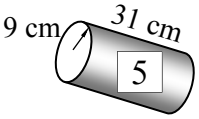
3 $SA = 2\pi r^2 + 2\pi rh$

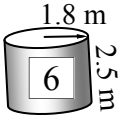
$= 2\times3.14\times14^2 + 2\times3.14\times14\times57$

$SA = 7\,121.52 \text{ mm}^2$ (2 d.p.)

Now use $\pi = {}^{22}/_{7}$. Use the fraction key after '=' to change to a decimal, round to 1 d.p.







4 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times{}^{22}/_{7}\times70^2 + 2\times{}^{22}/_{7}\times70\times85$

$SA = 68\,200 \text{ mm}^2$

5 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times{}^{22}/_{7}\times9^2 + 2\times{}^{22}/_{7}\times9\times31$

$SA = 2\,262.9 \text{ cm}^2$ (1 d.p.)

6 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times{}^{22}/_{7}\times1.8^2 + 2\times{}^{22}/_{7}\times1.8\times2.5$

$SA = 48.7 \text{ m}^2$ (1 d.p.)

Now use your calculator's π key. These questions can include diameters. All measurements are in cm. Round to 1 d.p.
