

7 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times\boxed{20}^2 + 2\times\pi\times\boxed{20}\times\boxed{23}$

$SA = 5\,403.5 \text{ cm}^2$ (1 d.p.)

8 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times16^2 + 2\times\pi\times16\times107$

$SA = 12\,365.3 \text{ cm}^2$ (1 d.p.)

9 $SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times10.5^2 + 2\times\pi\times10.5\times49.6$

$SA = 3\,965 \text{ cm}^2$ (1 d.p.)

10 Bubblin' Bobs cylindrical water tanks are 4.2 m high and 5.1 m in diameter. Metal sheeting costs \$9.10/m^2, find the cost to build 4 tanks.

$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times2.55^2 + 2\times\pi\times2.55\times4.2$

$SA = 108.15 \text{ m}^2$ (2 d.p.)

$Cost = 108.15 \times 4 \times 9.10 = \$3\,936.66$ \$3 936.64 No rounding

11 Slow & Slim's steam rollers have a cylinder for a front wheel that is 1.9 m diameter and 3.1 m wide (height). The roller needs painting, if a tin of paint covers 11 m^2 how many tins are required to paint the roller.

$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times0.95^2 + 2\times\pi\times0.95\times3.1$

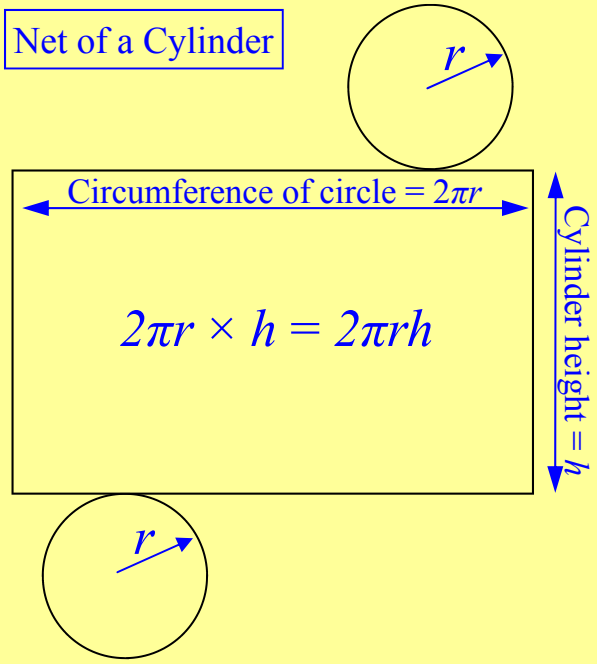
$SA = 24.17 \text{ m}^2$ (2 d.p.)

$Cost = 24.17 \div 11 = 2.19 \ldots = 3$ tins required

Area of Curved Surface - Cylinders

The cylinder wall of a cylinder, (also called the curved surface) is the rectangle shown in the net below, it wraps around the circular ends so one of its sides is the same length as the circumference of the circular ends, which is $2\pi r$. Its height is the height of the cylinder, which is h.

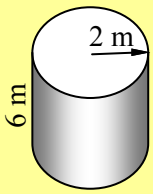
Net of a Cylinder



As this area is a rectangular area, its area is one side times the other,
or $2\pi r \times h = 2\pi rh$.

Area = $2\pi rh$

Example - Area of a cylinder wall - Using $\pi = {}^{22}/_{7}$



SA = $2\pi rh$	Write the formula
= $2\times{}^{22}/_{7}\times2\times6$	Substitute r and h, Change π to ${}^{22}/_{7}$.
SA = 75.4 m^2 (1 d.p.)	Find area of the curved surface

Calculator 2 × 2 2 $a^b/_c$ 7 × 2 × 6 =

Answer on Screen 75⌟ 3⌟ 7

Calculator $a^b/_c$ Answer on Screen 75.42857143 Round to 1 decimal place 75.4 m^2

Column 1 uses $\pi = 3.14$ first. So use the formula $A = 2\pi rh$ and calculate the area. The lower part of the sheet uses $\pi = {}^{22}/_{7}$, solve as above in the example.

Column 2 uses the π key on your calculator, also you may be given the radius or the diameter. If you are given the diameter then halve it (÷ 2) to change the length to the radius, then solve as before. There is a table at the bottom of the column, this doesn't require working out, just answers. The last two questions are different and require division and brackets, see how you go.

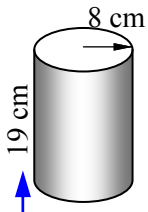
Column 3 features problem style questions, they require an extra step or two to complete.

Area of Curved Surface - Cylinders

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the area of the curved surface of these cylinders. Use $\pi = 3.14$. Round to 2 d.p.

Example



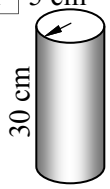
$A = 2\pi rh$

$= 2 \times 3.14 \times 8 \times 19$

$A = 954.56$ cm^2

units^2 must match

1



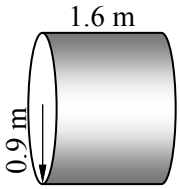
$A = 2\pi rh$

$= 2 \times 3.14 \times \square \times \square$

$A =$ cm^2

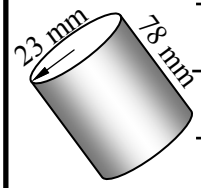
2

$A = 2\pi rh$

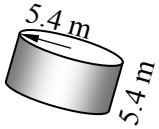


$A =$ m^2

3

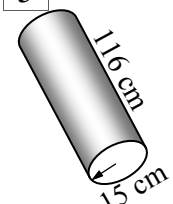


4

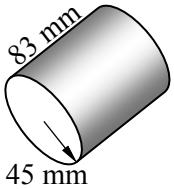


Now use $\pi = {}^{22}/_{7}$. Round to 1 decimal place.

5

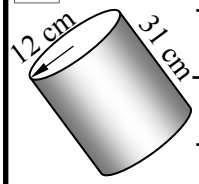


6

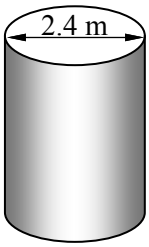


Use the π key for these and round to 1 d.p. Divide the diameter by 2 for the radius.

7



8



9

$A = 189.64$ cm^2

$A = \pi r^2$

$= \pi\times2.1^2$

$A = 13.85$ cm^2

Percentage $= \frac{13.85}{189.64} \times 100$

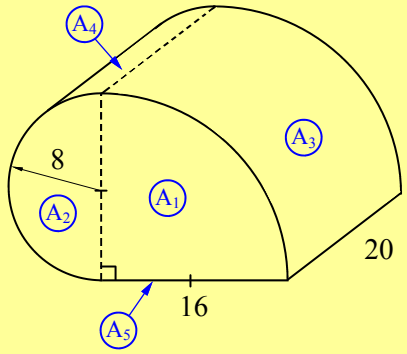
Percentage $= 7.30$ %

Surface Area of Composite Solids - Circles

Finding the SA of a composite solids can be difficult as it requires visualizing the solid, identifying all the face/curved surface areas and then a complicated process of adding them all. The questions on this worksheet all prisms except for question 2. The method is to:

- Find the area of the front face and double it (as the rear face is the same - prisms only)
- Find the face/curved surface areas around the sides of the solid
- Add the areas together

Example - Find the SA of the solid below, measurements are in cm.



STEP 1

Break the front face up into 2 areas, label all faces/curved surfaces around the outside of the solid.

$A_1 = \frac{1}{4} \times \pi \times 16^2$

$A_1 = 201.06 \text{ cm}^2$

$A_2 = \frac{1}{2} \times \pi \times 8^2$

$A_2 = 100.53 \text{ cm}^2$

$A_3 = \frac{1}{4} \times 2 \times \pi \times 16 \times 20$

$A_3 = 502.65 \text{ cm}^2$

$A_4 = \frac{1}{2} \times 2 \times \pi \times 8 \times 20$

$A_4 = 502.65 \text{ cm}^2$

$A_5 = 16 \times 20 = 320 \text{ cm}^2$

STEP 2

Calculate the individual areas.

$SA = 2 \times (201.06 + 100.53) + 502.65 + 502.65 + 320$

$SA = 1\,568.48 \text{ cm}^2$

STEP 3

Find the SA by adding each of the areas.

Surface Area of Composite Solids - Circles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the SA for the composite solids. All measurements are in cm. Round to 2 d.p.

1

$A_1 = 14^2 = 196$ cm^2

$A_2 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 7^2 = 76.97$ cm^2

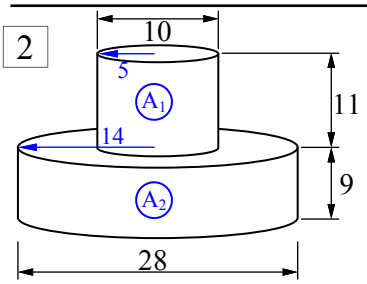
$A_3 = 12^2 = 144$ cm^2

$A_4 = \frac{1}{2} \times 2\pi rh = \frac{1}{2} \times 2 \times \pi \times 7 \times 12 = 263.89$ cm^2

SA = 2 × (196 + 76.97) + 3 × 144 + 263.89

SA = 1 241.83 cm^2

2



$A_1 = 2\pi rh$

$= 2 \times \pi \times 5 \times 11$

$= 345.58$ cm^2

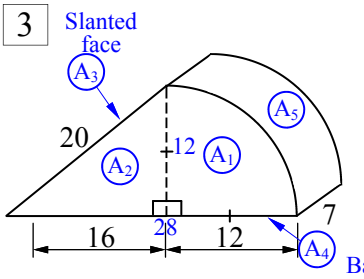
$A_2 = 2\pi r^2 + 2\pi rh$

$= 2 \times \pi \times 14^2 + 2 \times \pi \times 14 \times 9 = 2\,023.19$ cm^2

SA = 345.58 + 2 023.19

SA = 2 368.77 cm^2 (or 2 368.76 cm^2 in 1 step)

3



$A_1 = \frac{1}{4} \times \pi \times 12^2$

$= 113.10$ cm^2

$A_2 = \frac{1}{2} \times 16 \times 12 = 96$ cm^2

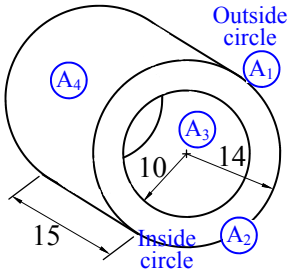
$A_3 = 20 \times 7 = 140$ cm^2

$A_4 = 28 \times 7 = 196$ cm^2 A_5: $\frac{1}{4} \times 2 \times \pi \times 12 \times 7 = 131.94$ cm^2

SA = 2 × (113.10 + 96) + 140 + 196 + 131.94

SA = 886.14 cm^2

4



$A_1 = \pi \times 14^2 = 615.75$ cm^2

$A_2 = \pi \times 10^2 = 314.16$ cm^2

$A_3 = 2 \times \pi \times 10 \times 15$

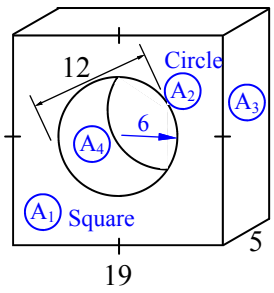
$= 942.48$ cm^2

$A_4 = 2 \times \pi \times 14 \times 15 = 1\,319.47$ cm^2

SA = 2 × (615.75 - 314.16) + 942.48 + 1 319.47

SA = 2 865.13 cm^2 (or 2 865.14 cm^2 in 1 step)

5



$A_1 = 19^2 = 361$ cm^2

$A_2 = \pi r^2 = \pi \times 6^2$

$= 113.10$ cm^2

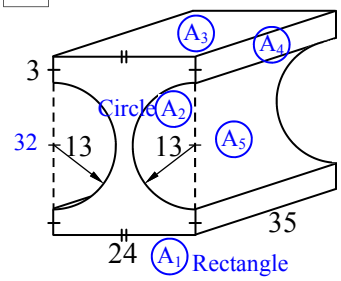
$A_3 = 19 \times 5 = 95$ cm^2

$A_4 = 2\pi rh = 2 \times \pi \times 6 \times 5 = 188.50$ cm^2

SA = 2 × (361 - 113.10) + 4 × 95 + 188.50

SA = 1 064.30 cm^2

6



$A_1 = 24 \times 32 = 768$ cm^2

$A_2 = \pi r^2 = \pi \times 13^2$

$= 530.93$ cm^2

$A_3 = 24 \times 35 = 840$ cm^2

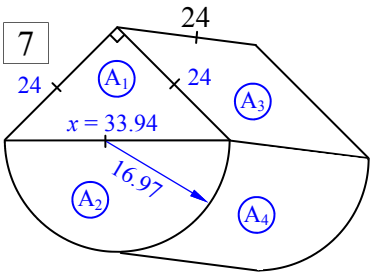
$A_4 = 3 \times 35 = 105$ cm^2

$A_5 = 2\pi rh = 2 \times \pi \times 13 \times 35 = 2\,858.85$ cm^2

SA = 2×(768 - 530.93)+2×840+4×105+2 858.85

SA = 5 432.99 cm^2

7



Pythagoras needed!

$x^2 = 24^2 + 24^2$

$x^2 = 1\,152$

$x = \sqrt{1\,152}$

$x = 33.94$ cm (2 d.p.)

$A_1 = \frac{1}{2} \times 24 \times 24 = 288$ cm^2

$A_2 = \frac{1}{2}\pi r^2 = \frac{1}{2} \times \pi \times 16.97^2 = 452.36$ cm^2

$A_3 = 24^2 = 576$ cm^2

$A_4 = \frac{1}{2} \times 2 \times \pi \times 16.97 \times 24 = 1\,279.51$ cm^2

SA = 2 × (288 + 452.36) + 2 × 576 + 1 279.51

SA = 3 912.23cm^2

Estimation/Terms of π - Volume of Cylinders

While mostly a calculator will be used to calculate the volume of a cylinder, it may be that you are asked to express the volume 'in terms of π' or the 'exact volume'. Both of these requests mean that π is left in the answer.

Being able to estimate volume is a valuable skill, because you can get a rough idea of the answer without a calculator, or before using a calculator. It also is a good 'self-check' mechanism in case you make a mistake using the calculator.

Column 1 has three cylinders in the column. The procedure is the same as the example at the top of the column. Use the Volume formula:

$$V = \pi r^2 h$$

Where: V = the volume of the prism
r = the radius of the circular face
h = the height of the cylinder

This will give an answer in terms of π, in other words, the exact volume.

The second step is to make an estimate, write the volume out again but then substitute the value of 3 for π. Multiply the two numbers and you have your estimate.

Because π is 3.14159..... It is more than 3, so when you use 3 as an estimate the answer will always be slightly less than the answer achieved by using a calculator.

Columns 2 and 3 use the diagrams at the base of the page. Measure the diameter, halve it for the radius, then measure the height. Record these lengths in the spaces provided on each Cylinder. Once you have done that solve the same way as Column 1.

Estimation/Terms of π - Volume of Cylinders

Volume of Cylinders

The standard formula for a prism is V = Ah.

Where: V = the volume of the prism
A = the uniform cross sectional area
h = the height of the prism

But with cylinders the cross sectional area is a circle, which has an area of πr^2. So if you replace A with πr^2 you have:

The formula for a cylinder is V = $\pi r^2 h$.

Where: V = the volume of the prism
r = the radius of the circular face
h = the height of the cylinder

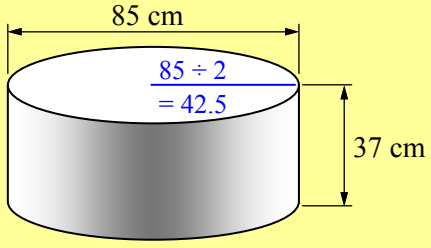
Column 1 starts with an example showing the formula line, substitution and then answer. Make sure you show cubic units. Eg. mm^3, cm^3 and m^3.

Column 2 has an extra step, you are given the diameter of the circle. So before you start, divide the diameter by 2 to get the radius and then use the formula as you did in column 1.

Column 3 applies what you have learned to some worded problems. There is also a table at the bottom of the column, no working required, just answers.

Below is an example of finding the volume when given the cylinder height and diameter.

Example - Find the volume to 1 decimal place.



r = 42.5 cm

$V = \pi r^2 h$ ← Write the formula

$= \pi \times 42.5^2 \times 37$ ← Substitute r and h

$V = 209\ 956.6\ cm^3$ ← Solve showing cubic units

10

$r = 27.5$ cm

$V = \pi r^2 h$

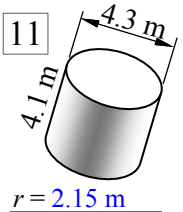
$= \pi \times 27.5^2 \times 62$

$V = 147\,301.4 \text{ cm}^3$

11



$r = 2.15$ m

$V = \pi r^2 h$

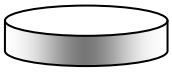
$= \pi \times 2.15^2 \times 4.1$

$V = 59.5 \text{ m}^3$

12



$r = 43.5$ mm

$V = \pi r^2 h$

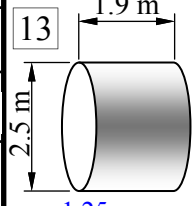
$= \pi \times 43.5^2 \times 15$

$V = 89\,170.2 \text{ mm}^3$

13



$r = 1.25$ m

$V = \pi r^2 h$

$= \pi \times 1.25^2 \times 1.9$

$V = 9.3 \text{ m}^3$

Solve these problems involving cylinders.

Calculate the volume of concrete in the cylindrical pylon below to 2 d.p. Calculate its weight (W) given the concrete weighs 2.4 T/m^3.

14

$V = \pi r^2 h$

$= \pi \times 0.15^2 \times 9.6$

$V = 0.68 \text{ m}^3$

$W = 0.68 \times 2.4$

$W = 1.63 \text{ T}$

The glass below contains 45 cm^3 of HCL acid. If water is added to fill the glass find, to 1 decimal place, the:

15 Volume of the empty glass (cm^3).

$V = \pi r^2 h$

$= \pi \times 3^2 \times 11$

$V = 311 \text{ cm}^3$

16 Percentage of acid in the full glass.

$\%_{ACID} = \frac{45}{311} \times 100$

$\%_{ACID} = 14.5\%$

Complete the table, which is in cm. Find the volume to the nearest cm^3.

Q.	17	18	19	20	21	22

Volume of Cylinders - Different Units, finding *r* and *h*.

Imagine you require a container to hold a specific amount but it must also be a specific height. Finding the radius required needs the formula to be rearranged, that is what this sheet deals with.

Column 1 starts with asking you to rearrange the question given the steps. Then the new rearranged formula is used to find the height of cylinders given the volume and radius (or diameter).

Column 2 is a break away from rearranging/use of formulae. It is finding the volume but the answer is required in cm3, while the dimensions are in various units. So change the units to cm and solve. The last question in the column requires you to rearrange $C=2\pi r$ first, then use the volume formula.

Column 3 gives you the height and the volume and asks you to rearrange the volume formula to find the radius. Then apply to solve for *r*.

Volume of Cylinders - Different Units, finding *r* and *h*.

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Rearrange the volume formula to make *h* the subject. Follow the steps.

1 $V = \pi r^2 h$

$\div \pi r^2$ $\div \pi r^2$ Divide both sides by πr^2.

Rewrite with *h* on the L.H.S

Using $h = \frac{V}{\pi r^2}$ find the height of the cylinder given the volume and radius. To 1 d.p.

2 $V = 550$ cm^3, $r = 5$ cm.

5 5 0 ÷ (π × 5 x^2) =

$h = \frac{V}{\pi r^2} = \frac{\square}{\pi \times \square^2}$

$h =$

3 $V = 11\,680$ cm^3, $r = 13$ cm.

$h = \frac{V}{\pi r^2} = \frac{\square}{\pi \times \square^2}$

$h =$

4 $V = 2\,386$ mm^3, $r = 7$ mm.

5 $V = 5\,917$ mm^3, $d = 12.4$ mm

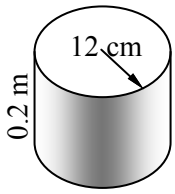
6 $V = 10\,781$ cm^3, $d = 34.4$ cm.

Find the volume of these cylinders in cm^3. Round to 2 decimal places.

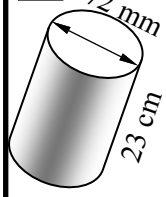
7

$V = \pi r^2 h$

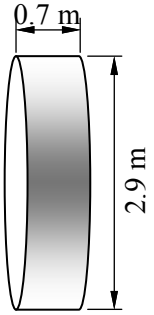
$V =$ cm^3



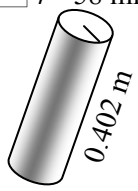
8



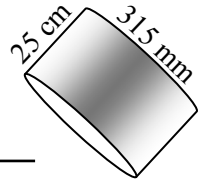
9



10 $r = 58$ mm



11



Find the volume (2 d.p.) of a cylinder which has a 15 cm height and a circumference of 0.75 m around its circular face.

12

Rearrange the volume formula to make *r* the subject. Follow the steps.

13 $V = \pi r^2 h$

$\div \pi h$ $\div \pi h$ Divide both sides by πh

$\sqrt{\ }$ $\sqrt{\ }$ Square root both sides

$\Rightarrow$

Rewrite with *r* on the L.H.S

Using $r = \sqrt{\frac{V}{\pi h}}$ find the radius given V and *h*. To 1 d.p.

14 $V = 282$ cm^3, $h = 10$ cm.

2 8 2 ÷ (π × 1 0) =

$r = \sqrt{\frac{V}{\pi h}} = \sqrt{\frac{7\,581}{\pi \times 15.2}}$

$r = 12.6$ cm

Volume of Composite Solids - Circles

Composite solids are solids that are made by combining two or more solids. To calculate the total volume, separate them into the two volumes (except question 4 - which has 3 solids) and calculate them individually. Then add them together, or subtract them.

Column 1 of the worksheet is answered by adding the volumes together. So calculate the individual volumes and sum them.

Question 1 starts you off with the formulae written and the solid's parts being labeled with V_1 and V_2. Make sure you label each solid. Then the volumes as individual volumes are calculated. Then the last stage is adding the two together. So if you can work out the volume of a cylinder then you just do this twice. Add them and you are done.

Remember to look for when you are given a radius or a diameter, it also may be that you need to calculate some lengths by adding sides together.

Column 2 is also answered by calculating individual volumes but instead of addition use subtraction. It is like a hole has been 'punched' through the solids and because these holes have been removed from the solid, subtraction is used.

Question 5 starts with a rectangular block which has two holes drilled through it. So calculate the volume of the block as if the holes weren't there. Then calculate the volume of one cylindrical hole. The volume will be found by subtracting two 'hole' volumes from the rectangular prism.

You will notice that all of these questions are prisms except the first two questions. Another method of calculating volume is to find the **AREA** of the front face of the prism, then use $\mathbf{V = A}\boldsymbol{h}$ to find the volume. Both methods will result in the same answer.

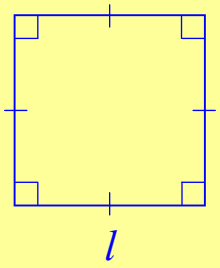
ALTITUDE

AREA & PERIMETER

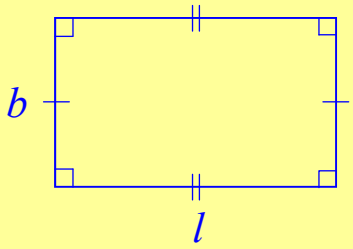
Area of Squares and Rectangles

The area of a square and rectangle is found in the same way. Multiply one side by the other. As squares have sides all the same length, this means you just 'square' the side length.

Square $A = l^2$

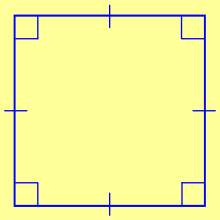


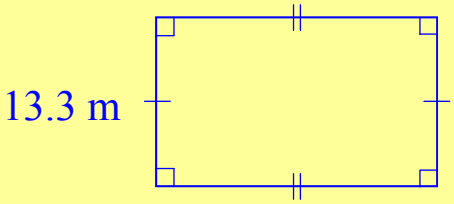
Rectangle $A = lb$



While the answer isn't affected, the length is usually considered the longest length in a rectangle.

Examples - Find the area to 1 decimal place.





$A = l^2$	Write the formula	$A = lb$
$= 17.1^2$	Substitute l (or l & b)	$= 25.2 \times 13.3$
$A = 292.4$ cm^2 (1 d.p.)	Solve showing square units. Round to 1 decimal place.	$A = 335.2$ m^2 (1 d.p.)

In the 2nd column watch for units requiring conversion. Always change the units before multiplying, don't multiply the numbers as they are, then change the answer. Area conversion is more difficult than length conversion.

The last two questions in the third column have the area given, you have to find the side lengths. When finding the side length of a square, square root the area. With rectangles, given one side and the area, divide the area by the given side.

Area of Squares and Rectangles

$A = 12.25$ m^2

Cost $= 12.25 \times 73.20$

Cost = \$896.70

17 A rectangular field has sides 980 m and 660m. Find its area in ha given 1 ha = 10 000 m^2.

$A = lb$

$= 980 \times 660$

$A = 646\,800$ m^2

$A = \frac{646\,800}{10\,000}$

$A = 64.68$ ha

18 Office paper often weighs 80 grams per m^2. Find the weight of an A4 sheet, which has sides 29.7 cm and 21 cm. Answer to the nearest gram.

$A = lb$

$= 0.297 \times 0.21$

$A = 0.06237$ m^2

Weight $= 0.06237 \times 80 = 5$ g Nearest g

19 A square has an area of 275.56 cm^2. What is its side length?

$l = \sqrt{A}$

$= \sqrt{275.56}$

$l = 16.6$ cm

20 A rectangle has an area of 630.8 mm^2. Find its length in cm if it has a breadth of 16.6 mm.

$l = A \div B$

$= \frac{630.8}{16.6}$

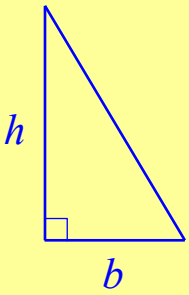
$l = 38$ mm

$l = 3.8$ cm

Area of Triangles

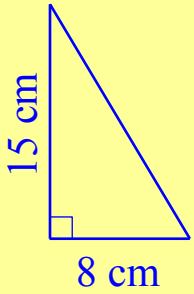
The area of a triangle is found by "half times the base times the perpendicular height." A triangle is half of a rectangle, so it makes sense that the formula is the same as that of a rectangle except it is halved.

Triangle $A = \frac{1}{2}bh$



Where:
b = base length
h = perpendicular height

Note that the height is the perpendicular height, the base and the height must always be at right angles to each other. Below is an example of finding the area of a triangle.



$A = \frac{1}{2}bh$ ← Write the formula

$= \frac{1}{2} \times 8 \times 15$ ← Substitute b and h

$A = 60 \text{ cm}^2$ ← Solve showing square units. Round answer if required.

Column 1 asks you to find the area for a triangle. Remember to watch for units.

Column 2 continues finding the area of a triangle but this time you have to select which numbers you multiply, remember that the height must be perpendicular to the base length.

The end of column 2 and start of column 3 has two worded questions for you to attempt.

Column 3 then has a field that has been broken up into separate areas. Find the areas of the triangles, square and rectangle. Add them together for a total area for the field.

Area of Triangles

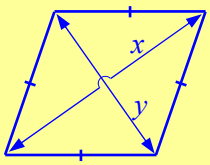
Area = 300+480+120+209+361

+ 133 = 1 603 m^2

Area of Parallelograms and Rhombuses

A parallelogram looks like a rectangle that has been pushed. A rhombus, also called a diamond, looks like a square that has been pushed over. So a parallelogram has two pairs of parallel sides of the same length, like a rectangle. A rhombus has four sides all the same length, with two pairs of parallel sides.

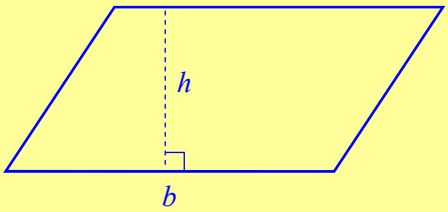
Rhombus $A = \frac{1}{2}xy$



Where:

x and y are the lengths of the diagonals.

Parallelogram $A = bh$

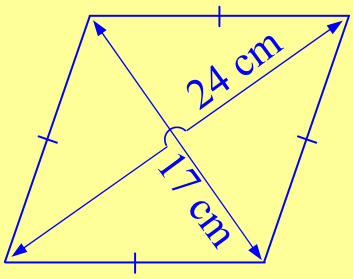


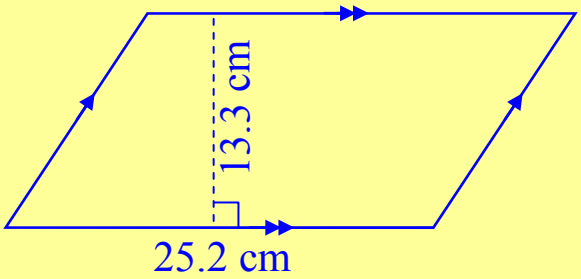
Where:

b = base length

h = perpendicular height

Below are two examples.





$A = \frac{1}{2}xy$	Write the formula	$A = bh$
$= \frac{1}{2} \times 17 \times 24$	Substitute x & y (or b & h)	$= 25.2 \times 13.3$
$A = 204$ cm^2	Solve showing square units. Round to 1 decimal place.	$A = 335.2$ m^2 (1 d.p.)

What happens if you aren't given the diagonals of a rhombus, but instead base and its perpendicular height? Solve just like it is a parallelogram. By definition all rhombuses (or rhombi) are parallelograms.

$A = \frac{1}{2}xy$

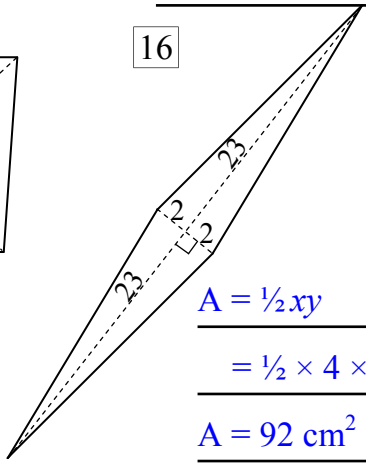
$= \frac{1}{2} \times 54 \times 48$

$A = 1\,296 \text{ cm}^2$

16



$A = \frac{1}{2}xy$

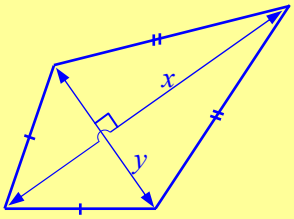
$= \frac{1}{2} \times 4 \times 46$

$A = 92 \text{ cm}^2$

Area of Kites and Trapeziums

A kite is the easiest shape to remember because its name is the same as the kite that you see flying. To find its area the same formula as the rhombus formula is used, that is, its internal diagonal lengths are multiplied together and by a half. Trapeziums are similar to rectangles in a way. The height is the perpendicular height like in a rectangle, but the base is the average of the top and bottom lengths. This average is then multiplied by the height. The formulae are below:

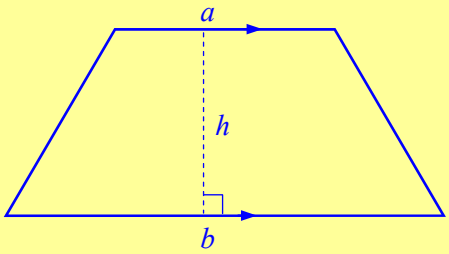
Kite $A = \frac{1}{2}xy$



Where:

x and y are the lengths of the diagonals.

Trapezium $A = \frac{1}{2}(a + b)h$

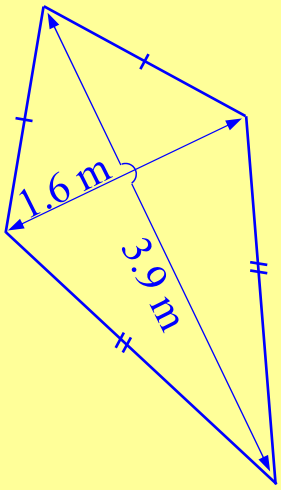


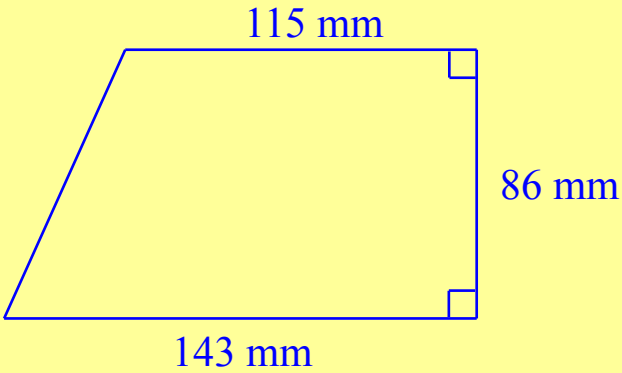
Where:

a, b = parallel side lengths

h = perpendicular height

Here are two examples. With trapeziums you need to use the brackets keys on your calculator.





$A = \frac{1}{2}xy$	Write the formula	$A = \frac{1}{2}(a + b)h$
$= \frac{1}{2} \times 3.9 \times 1.6$	Substitute x & y (or a, b & h)	$= \frac{1}{2} \times (115 + 143) \times 86$
$A = 3.1$ m^2 (1 d.p.)	Solve showing square units. Round to 1 decimal place.	$A = 11\,094$ mm^2

Area of Kites and Trapeziums

$= \frac{1}{2} \times (8.6 + 11.8) \times 2.2$

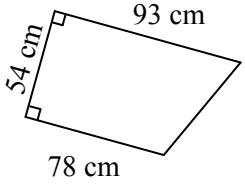
$A = 22.4 \text{ m}^2$ (1 d.p.)

13

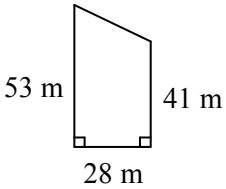
$A = \frac{1}{2}(a + b)h$

$= \frac{1}{2} \times (78 + 93) \times 54$

$A = 4\,617 \text{ cm}^2$



14



$A = \frac{1}{2}(a + b)h$

$= \frac{1}{2} \times (41 + 53) \times 28$

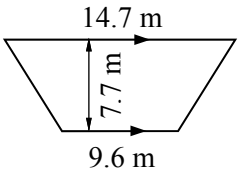
$A = 1\,3\,16 \text{ m}^2$

15

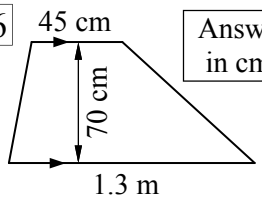
$A = \frac{1}{2}(a + b)h$

$= \frac{1}{2} \times (9.6 + 14.7) \times 7.7$

$A = 93.6 \text{ m}^2$ (1 d.p.)



16



Answer in cm^2

$A = \frac{1}{2}(a + b)h$

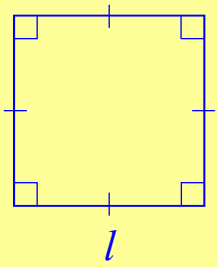
$= \frac{1}{2} \times (45 + 130) \times 70$

$A = 6\,125 \text{ cm}^2$

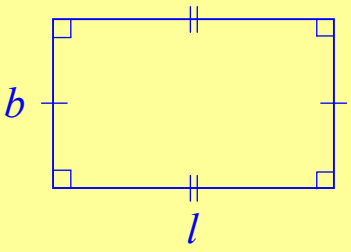
Area of Composite Shapes - Non Circular

Composite shapes are shapes that are made by combining one or more shapes. The area is found by either adding or subtracting the areas. The shapes involved are shown below.

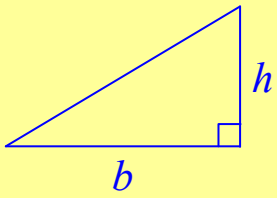
Square: $A = l^2$



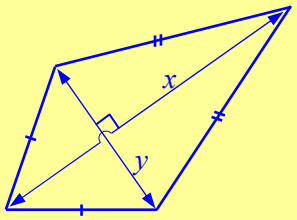
Rectangle: $A = lb$



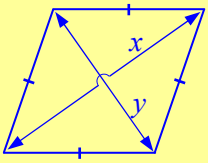
Triangle $A = \frac{1}{2}bh$



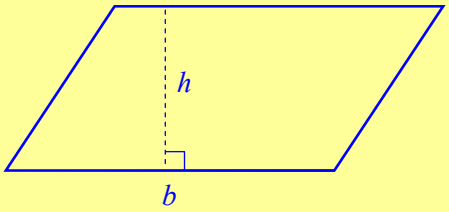
Kite: $A = \frac{1}{2}xy$



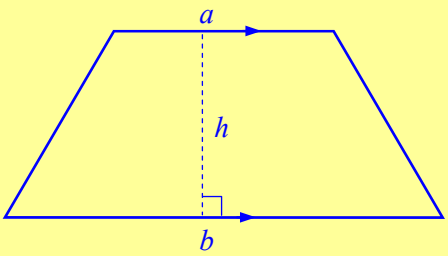
Rhombus $A = \frac{1}{2}xy$



Parallelogram $A = bh$

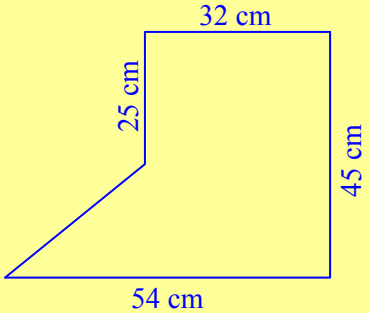


Trapezium $A = \frac{1}{2}(a + b)h$

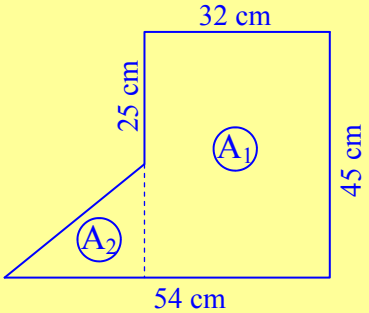


The process for the sheet is to label the areas in the composite shape A_1, A_2 and so on. This may require the shape to have lines drawn inside it to break it up into the plane shapes. Below is an example.

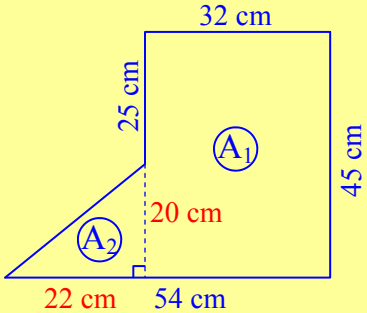
Find the area of the shape.



Break the shape up and label the areas



Find missing lengths (in red)



Solve by finding individual areas and then adding them.

$A_1 = lb$

$= 32 \times 45$

$A_1 = 1\,440 \text{ cm}^2$

$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 22 \times 20$

$A_2 = 220 \text{ cm}^2$

$A = A_1 + A_2 = 1\,440 + 220$

$A = 1\,660 \text{ cm}^2$

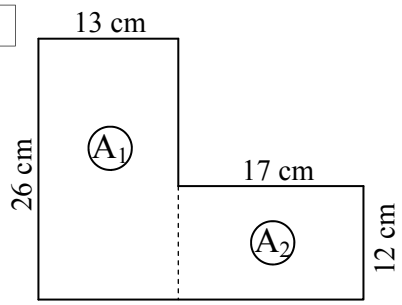
1



$A_1 = lb$

$= 26 \times 13$

$A_1 = 338$ cm^2

$A_2 = lb$

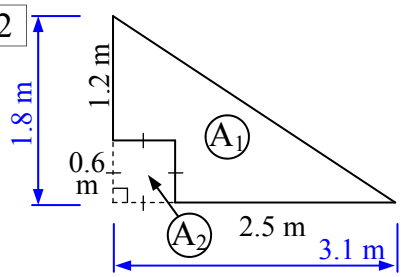
$= 17 \times 12$

$A_2 = 204$ cm^2

$A = A_1 + A_2 = 338 + 204$

$A = 542$ cm^2

2



$A_1 = \frac{1}{2}bh$

$= \frac{1}{2} \times 3.1 \times 1.8$

$A_1 = 2.79$ m^2

$A_2 = l^2$

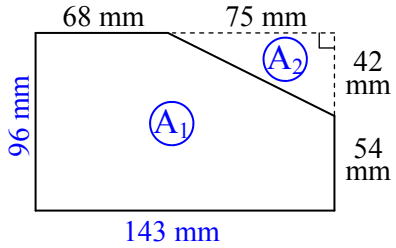
$= 0.6^2$

$A_2 = 0.36$ m^2

$A = A_1 - A_2 = 2.79 - 0.36$

$A = 2.43$ m^2

3



$A_1 = lb$

$= 143 \times 96$

$A_1 = 13\,728$ mm^2

$A_2 = \frac{1}{2}bh$

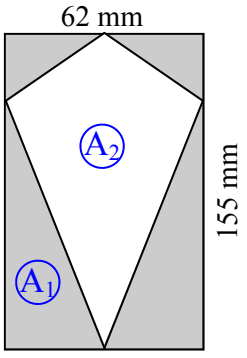
$= \frac{1}{2} \times 42 \times 75$

$A_2 = 1\,575$ mm^2

$A = A_1 - A_2 = 13\,728 - 1\,575$

$A = 12\,153$ mm^2

4 Find the shaded area.



$A_1 = lb$

$= 155 \times 62$

$A_1 = 9\,610$ mm^2

$A_2 = \frac{1}{2}xy$

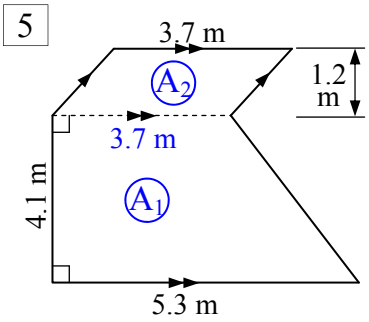
$= \frac{1}{2} \times 62 \times 155$

$A_2 = 4\,805$ mm^2

$A = A_1 - A_2 = 9\,610 - 4\,805$

$A = 4\,805$ mm^2

5



$A_1 = \frac{1}{2}(a + b)h$

$= \frac{1}{2} \times (5.3 + 3.7) \times 4.1$

$A_1 = 18.45$ m^2

$A_2 = bh$

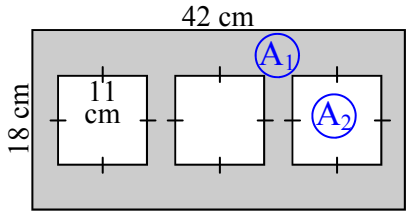
$= 3.7 \times 1.2$

$A_2 = 4.44$ m^2

$A = A_1 + A_2 = 18.45 + 4.44$

$A = 22.89$ m^2

6 Find the shaded area.



$A_1 = lb$

$= 42 \times 18$

$A_1 = 756$ cm^2

$A_2 = l^2$

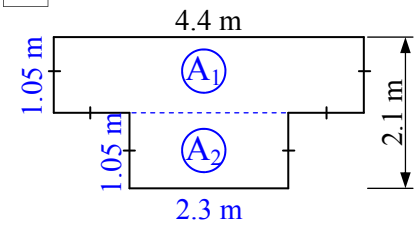
$= 11^2$

$A_2 = 121$ cm^2

$A = A_1 - 3A_2 = 756 - 3 \times 121$

$A = 393$ cm^2

7



$A_1 = lb$

$= 4.4 \times 1.05$

$A_1 = 4.62$ m^2

$A_2 = lb$

$= 2.3 \times 1.05$

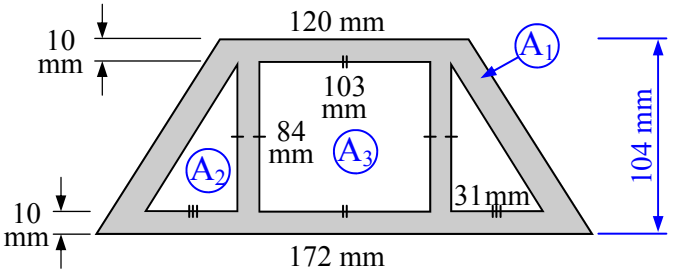
$A_2 = 2.42$ m^2

(2 d.p.)

$A = A_1 + A_2 = 4.62 + 2.42$

$A = 7.04$ m^2

8 Find the shaded area.



$A_1 = \frac{1}{2}(a + b)h$

$= \frac{1}{2} \times (172 + 120) \times 104$

$A_1 = 15\,184$ mm^2

$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 31 \times 84$

$A_2 = 1\,302$ mm^2

$A_3 = lb$

$= 103 \times 84$

$A_3 = 8\,652$ mm^2

$A = A_1 - 2 \times A_2 - A_3 = 15\,184 - 2 \times 1\,302 - 8\,652$

$A = 3\,928$ mm^2

Exact & Estimate - Area

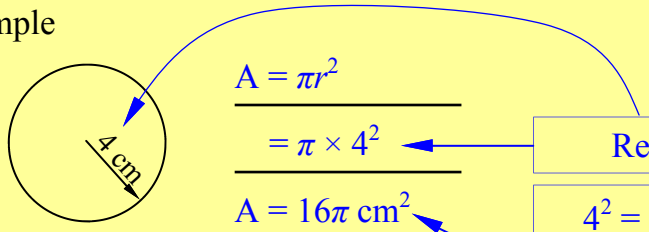
The area of a circle is the measurement of space inside the circle. Formula:

$$A = \pi r^2$$

Where: A = the area (square units, same as the radius/diameter except ^{2}, ie. cm^2, m^2, mm^2)
π = Pi, it's a value on your calculator 3.14159….. Which is a bit more than 3!
r = the radius, the length from the centre to any point on the circumference

Column 1 starts with circles that have a radius shown, to find the area in terms of π (also called the exact area) use the value of r given in the circle. To make an estimate, use the exact area and substitute 3 for π.

Example



$A = \pi r^2$

$= \pi \times 4^2$ ← Replace r with 4, (the radius of the circle)

$A = 16\pi$ cm^2 ← $4^2 = 16$, remember ^{2} is the number times itself not the number times 2. Leave π as is. Write the units.

So the area is 16π cm^2. This is the exact area, to estimate the area without a calculator use $\pi = 3$. This is less than the actual value for π, but it gives a fairly accurate answer without too much calculation.

Estimate:

$A = 16\pi$ cm^2 ← Rewrite the area from previous step

$\approx 16 \times 3$ ← Replace π with 3 and = with ≈

$A \approx 48$ cm^2 ← Solve, use either ≈ or ≒ to indicate 'approximately'.

Column 2 uses diameters. Halve the diameter for the radius and solve as before, there is a formula for calculating the area using d. But it won't be introduced on this sheet.

At the bottom of the page are four circles. Measure the diameter accurate to the nearest cm, then calculate the exact area (in terms of π) and then an estimate, again using $\pi = 3$. Use the working out spaces in the third column to answer these.

Exact and Estimate - Area

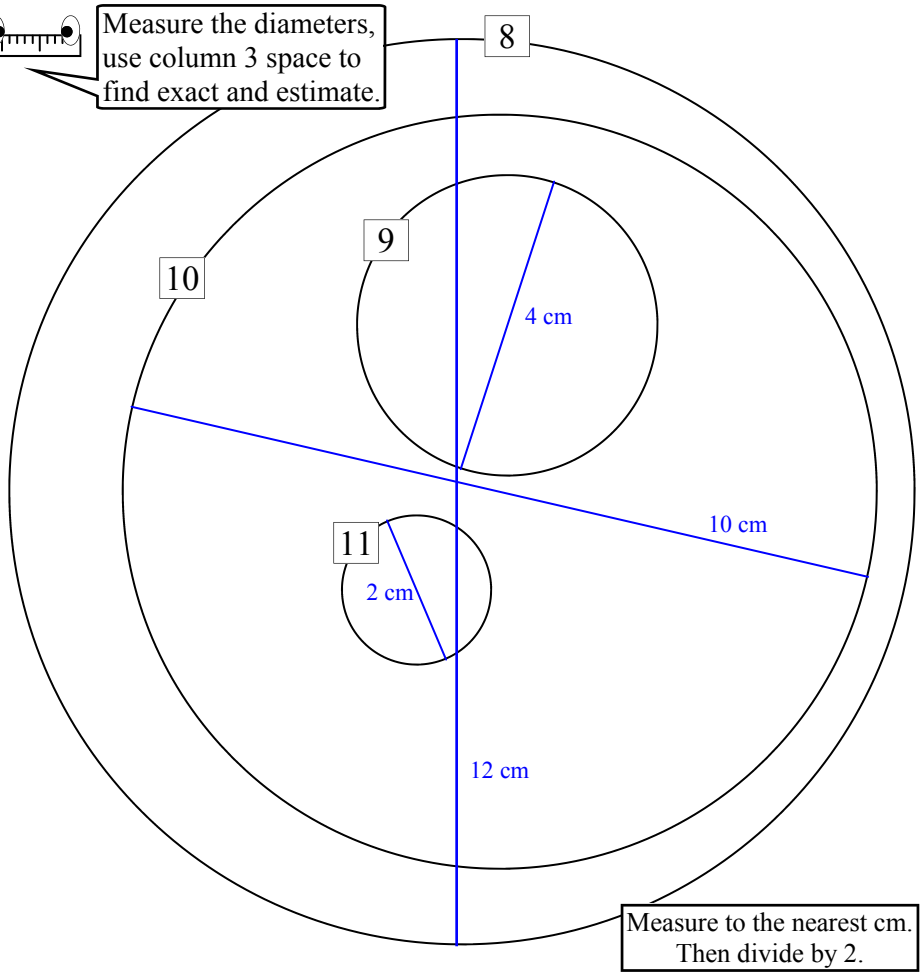
$= \pi \times 1^2$

$A = \pi$ cm^2

$A = \pi$ cm^2

$A \approx 3$ cm^2

Measure the diameters, use column 3 space to find exact and estimate.



Measure to the nearest cm. Then divide by 2.

Area of a Circle (Sheet 1)

The formula for calculating the area of a circle is:

$$A = \pi r^2$$

Where:

A = Area of the circle, in the same units as the radius, but squared. (cm^2, m^2, mm^2)
r = The radius of the circle (distance from centre to circumference).

Column 1 features circles with the radius shown. Use the area formula above to calculate the answer. The answer should be rounded to 2 decimal places and the units should be shown as square units. There is an example at the top of the column.

Column 2 is the same as Column 1 except for one additional step. Instead of the radius you are given the diameter. So convert the diameter to a radius by dividing it by 2, write the radius in the space provided, either in or beside the circle. Then solve the questions the same way, but round to one decimal place this time.

Column 3 starts with a mixture of questions that are either radius or diameter, so the questions are solved the same way as either Column 1 or Column 2.

At the bottom of the column a circle is fit perfectly into a square, so the circle's diameter is the same as the side length of the square. Calculate the square's total area (as if the circle wasn't there), then calculate the circle's area. Then calculate the %Area that the circle accommodates within the square, by multiplying the fraction by 100. Did you expect the circle to take up more space, or less?

$\text{Percentage} = \frac{754.8}{961} \times 100$

$\text{Percentage} = 78.5\%$

Round to 1 d.p.

Area of a Circle (Sheet 2)

The formula for calculating the area of a circle is:

$$A = \pi r^2$$

Where:

A = Area of the circle, in the same units as the radius, but squared. (cm^2, m^2, mm^2)
r = The radius of the circle (distance from centre to circumference).

This sheet uses three values for π: Decimal 3.14; Fraction $^{22}/_{7}$ and Calculator 3.14159….

Column 1 features circles with the radius shown. Use the area formula above to calculate the answer. But for the first part of the column use $\pi = 3.14$ to calculate your answer. Then round to 1 decimal place. The second part of the column use $\pi = {}^{22}/_{7}$ to find your answer rounded to the nearest whole number. Note that your answer could be an improper fraction or a mixed number depending on the calculator you use. Press the fraction key after the fractional answer is displayed to convert it to a decimal. Decimals are easier to round for most students.

Column 2 requires you to halve the diameter first to get a radius, write the radius on the circle next to the dotted line, or draw your own line. Then solve the same way as column 1 except round to 2 decimal places, note that you use $\pi = 3.14$.

Two tables are then shown. Divide the diameter by 2 to get the radius column, then calculate the area. Note that the first table uses $\pi = {}^{22}/_{7}$, all lengths are in cm. The second table requires you to use the π key on your calculator, answer in m^2 rounded to 2 decimal places.

Column 3 asks you to find the radius given the area. First it asks you to manipulate the area formula to make r the subject. The steps are shown, see how you go. The rest of the column uses the formula you created to answer the rest of the column. If you couldn't rearrange the formula don't worry, Fizzle tells you the formula above question 24.

Note that you have to use brackets as the calculator step shows in question 24, or work out the inside first, press the 'equals button' then the 'square root button' and 'equals' again.

Area of a Circle (Sheet 2)

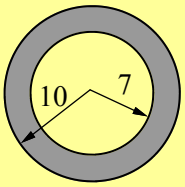
$= 173 \text{ km}$ (1d.p.) diameter

The Annulus

An annulus is a ring-like figure, in other words a circle within another circle. Most students recognise the similarity with the word 'anus', as well as the similar appearance. For this reason it is usually an easy mathematical word to remember!

Column 1 deals with calculating the area of an annulus. The process is to calculate the outside circle's area, then calculate the inside circle's area, then subtract them. An example is below.

Example - Area of an Annulus



Lengths are in cm

$A_1 = \pi R^2$

$= \pi \times 10^2$

$A_1 = 314.2 \text{ cm}^2$ (1 dp)

Capital R, means 'big' radius.

So A_1 is the area of the outside circle.

$A_2 = \pi r^2$

$= \pi \times 7^2$

$A_2 = 153.9 \text{ cm}^2$ (1 dp)

Lower case r, means 'small' radius.

So A_2 is the area of the inside circle.

$A = A_1 - A_2 = 314.2 - 153.9$

$A = 160.3 \text{ cm}^2$

Then subtract for the annulus area. The larger area - smaller area.

Column 2 introduces the annulus formula. This is a faster way of solving exercises but it is important that you understand the process above as well. The formula is:

$$A = \pi (R^2 - r^2)$$

Where:

R = outside circle's radius
r = inside circle's radius

This formula is created by factorising $\pi R^2 - \pi r^2$. If you take out π you get the above formula.

Column 2 starts with assistance in showing the working out. After the first 3 questions fractions need to be used because the area for 'fractions of' annuli are required. Use the internal angle within the annulus, then multiply by the angle over 360°.

So if the angle was 90°, you would use $A = {}^{90}/_{360} \times \pi(R^2 - r^2)$ but you may also recognize that this is the same as $A = \frac{1}{4} \times \pi(R^2 - r^2)$.

The Annulus

2

$A_1 = \pi R^2$

$= \pi \times$ 17 ^{2}

$A_1 =$ 907.9 cm^2 (1 dp)

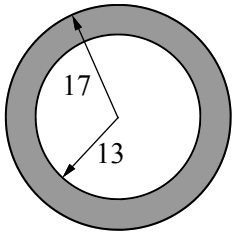
$A_2 = \pi r^2$

$= \pi \times$ 13 ^{2}

$A_2 =$ 530.9 cm^2 (1 dp)

$A = A_1 - A_2 = 907.9 - 530.9$

$A = 377\ cm^2$



3 Watch for diameters!

$A_1 = \pi R^2$

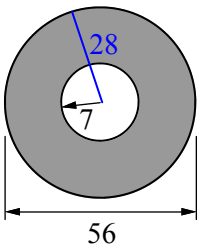
$= \pi \times 28^2$

$A_1 = 2\,463\ cm^2$ (1 dp)

$A_2 = \pi r^2$

$= \pi \times 7^2$

$A_2 = 153.9\ cm^2$ (1 dp)



$A = A_1 - A_2 = 2\,463 - 153.9$

$A = 2\,309.1\ cm^2$

4

$A_1 = \pi R^2$

$= \pi \times 52^2$

$A_1 = 8\,494.9\ cm^2$ (1 dp)

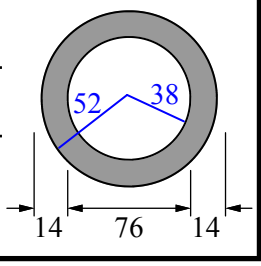
$A_2 = \pi r^2$

$= \pi \times 38^2$

$A_2 = 4\,536.5\ cm^2$ (1 dp)

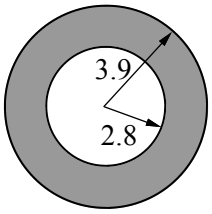
$A = A_1 - A_2 = 8\,494.9 - 4\,536.5$

$A = 3\,958.4\ cm^2$



Now use the Annulus formula $A = \pi(R^2 - r^2)$. All lengths are in metres. Answer to 1 d.p.

5



$A = \pi(R^2 - r^2)$

$= \pi \times$ (3.9 ^{2} - 2.8 ^{2})

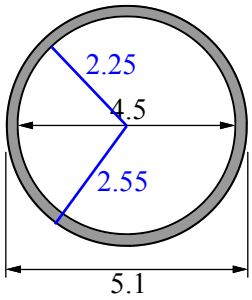
$A =$ 23.2 m^2 (1 dp)

6

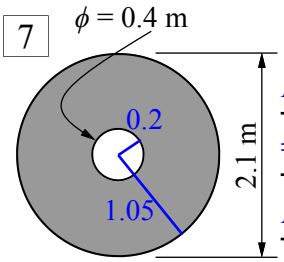
$A = \pi(R^2 - r^2)$

$= \pi \times (2.55^2 - 2.25^2)$

$A = 4.5\ m^2$



7



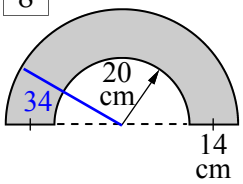
$A = \pi(R^2 - r^2)$

$= \pi \times (1.05^2 - 0.2^2)$

$A = 3.3\ m^2$

Use the Annulus formula, but put a fraction before the π, to find the shaded area. (1 d.p.)

8



$A =$ 1/2 $\times \pi(R^2 - r^2)$

$= ½ \times \pi \times (34^2 - 20^2)$

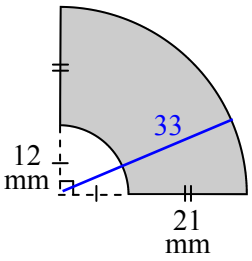
$A = 1\,187.5\ cm^2$

9

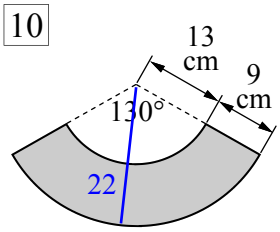
$A = ¼ \times \pi(R^2 - r^2)$

$= ¼ \times \pi \times (33^2 - 12^2)$

$A = 742.2\ mm^2$



10



$A = {}^{130}/_{360} \times \pi(R^2 - r^2)$

$= {}^{130}/_{360} \times \pi \times (22^2 - 13^2)$

$A = 357.4\ cm^2$

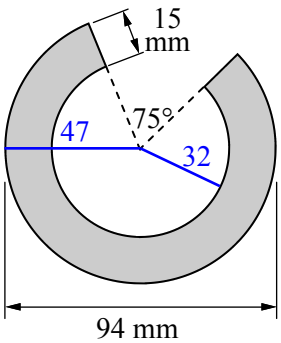
11

Internal angle = 360 - 75 = 285°

$A = {}^{285}/_{360} \times \pi(R^2 - r^2)$

$= {}^{285}/_{360} \times \pi \times (47^2 - 32^2)$

$A = 2\,947.2\ mm^2$



Area of Sectors, Quadrants And Semi-Circles

If you know how to multiply by a fraction and how to find the area of a circle, then this worksheet simply blends the two.

The formula for calculating the area of a circle is:

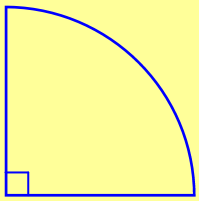
$$A = \pi r^2$$

Where:

A = Area of the circle, in the same units as the radius, but squared. (cm^2, m^2, mm^2)
r = The radius of the circle (distance from centre to circumference).

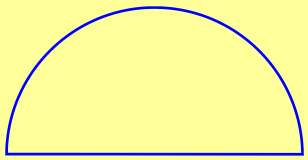
But with semi-circles (half a circle), quadrants (quarter of a circle) and sectors the above formula is multiplied by a fraction.

Quadrants



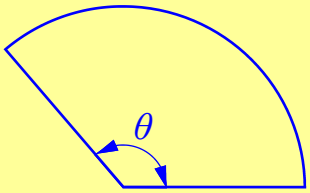
$$A = \frac{1}{4}\pi r^2$$

Semi-Circles



$$A = \frac{1}{2}\pi r^2$$

Sectors



$$A = \frac{\theta}{360} \times \pi r^2$$

Column 1 starts with semi-circles, so use the middle formula above, in other words multiply πr^2 by ½. Question 5 sees a change to quadrants, use the first formula shown above, multiply πr^2 by ¼.

Column 2 again features semi-circles, but this time instead of being given the radius you are given a diameter, so find the radius (by dividing the diameter by 2) then solve as before.

Sectors are then introduced at the bottom of the column. The internal angle (commonly called 'pheta') is written over 360, then simplified with your calculator. The calculator steps for simplifying are shown on the sheet if you have forgotten the process.

Then sector area is required to be found. Use the third formula above, so make a fraction from the internal angle and use 360 as the denominator. Multiply this by the area formula and you are done!

Area of Sectors, Quadrants And Semi-Circles

$A = 1\,704.97$ m^2

Area of Composite Shapes

A composite shape is a shape that is composed of two or more plane shapes. These two shapes can add together to create an area, or be subtracted. Before this sheet is attempted you should have completed earlier sheets on area of a circle.

Column 1 are all exercises using addition. So calculate the individual areas and then add them together. The process is shown in question 1.

Column 2 is essentially the same process, find the areas that make the shape but then subtract the areas. Question 8 will require Pythagoras Theorem to first be applied.

Area of Composite Shapes

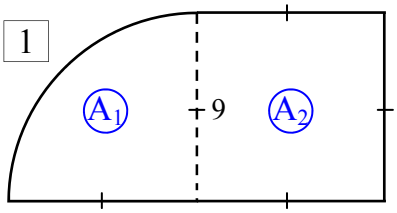
Area of Composite Shapes

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the areas, sum for the total area. Round to 1 d.p. All lengths are cm.

1



$A_1 = \frac{1}{4}\pi r^2$

$= \frac{1}{4} \times \pi \times 9^2$

$A_1 = 63.6 \text{ cm}^2$ (1 dp)

$A_2 = l^2$

$= 9^2$

$A_2 = 81 \text{ cm}^2$

$A = A_1 + A_2 = 63.6 + 81$

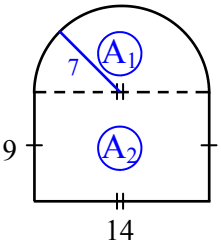
$A = 144.6 \text{ cm}^2$

2

$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 7^2$

$A_1 = 77 \text{ cm}^2$ (1 d.p.)



$A_2 = lb$

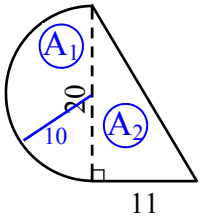
$= 14 \times 9$

$A_2 = 126 \text{ cm}^2$

$A = A_1 + A_2 = 77 + 126$

$A = 203 \text{ cm}^2$

3



$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 10^2$

$A_1 = 157.1 \text{ cm}^2$ (1 d.p.)

$A_2 = \frac{1}{2}bh$

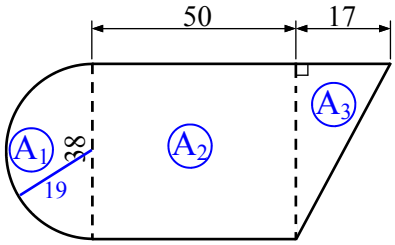
$= \frac{1}{2} \times 11 \times 20$

$A_2 = 110 \text{ cm}^2$

$A = A_1 + A_2 = 157.1 + 110$

$A = 267.1 \text{ cm}^2$

4



$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 19^2$

$A_1 = 567.1 \text{ cm}^2$ (1 d.p.)

$A_2 = lb$

$= 50 \times 38$

$A_2 = 1\,900 \text{ cm}^2$

$A_3 = \frac{1}{2}bh$

$= \frac{1}{2} \times 38 \times 17$

$A_3 = 323 \text{ cm}^2$

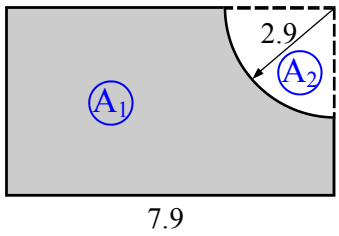
$A = A_1 + A_2 + A_3$

$= 567.1 + 1\,900 + 323$

$A = 2\,790.1 \text{ cm}^2$

This time subtract the areas. Round to 1 d.p. All measurements in metres.

5



$A_1 = lb$

$= 7.9 \times 4.7$

$A_1 = 37.1 \text{ m}^2$ (1 d.p.)

$A_2 = \frac{1}{4}\pi r^2$

$= \frac{1}{4} \times \pi \times 2.9^2$

$A_2 = 6.6 \text{ m}^2$ (1 d.p.)

$A = A_1 - A_2 = 37.1 - 6.6$

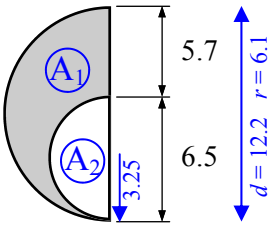
$A = 30.5 \text{ m}^2$

6

$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 6.1^2$

$A_1 = 58.4 \text{ m}^2$ (1 d.p.)



$A_2 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 3.25^2$

$A_2 = 16.6 \text{ m}^2$ (1 d.p.)

$A = A_1 - A_2 = 58.4 - 16.6$

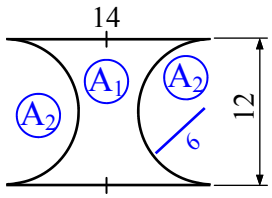
$A = 41.8 \text{ m}^2$

7

$A_1 = lb$

$= 14 \times 12$

$A_1 = 168 \text{ m}^2$



$A_2 = \pi r^2$

$= \pi \times 6^2$

$A_2 = 113.1 \text{ m}^2$ (1 d.p.)

$A = A_1 - A_2 = 168 - 113.1$

$A = 54.9 \text{ m}^2$

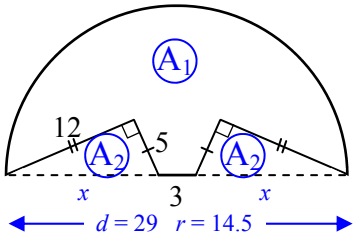
8

$x^2 = 5^2 + 12^2$

$x^2 = 169$

$x = \sqrt{169}$

$x = 13 \text{ m}$



$A_2 = 2 \times \frac{1}{2}bh$

$= 2 \times \frac{1}{2} \times 5 \times 12$

$A_2 = 60 \text{ m}^2$

$A_1 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 14.5^2$

$A_1 = 330.3 \text{ m}^2$ (1 d.p.)

$A = A_1 - A_2 = 330.3 - 60$

$A = 270.3 \text{ m}^2$

Changing Units of Area

This is one of the easiest parts of area calculations to make a mistake. Students often forget this work. The reason is that because there are 10 mm in 1 cm, students automatically use this to convert mm^2 to cm^2, but this isn't the case. There is infact 100 mm^2 in 1 cm^2. The same with converting cm^2 to m^2, there is 10 000 cm^2 in a m^2, not 100 cm^2.

Column 1 first converts areas from cm^2 to mm^2. Note the diagram at the top of the column. A 1 cm square is redrawn with grid lines at each millimetre. The square has 10 mm sides and as you know the area of a square is its side length squared. As $10^2 = 100$ there are 100 1 mm^2 squares in a square cm. So to convert the measurements multiply each number by 100. This means move the decimal point 2 places to the right. So 5 cm^2 would be 500 mm^2, 5.5 cm^2 would be 550 mm^2 and 5.05 cm^2 would be 505 mm^2. Questions 11- 20 are the reverse, move the decimal point 2 places to the left. So 8 mm^2 is 0.08 cm^2, 130 mm^2 is 1.3 cm^2 and 130.02 mm^2 would be 1.3002 cm^2.

Column 2 then deals with converting between m^2 and cm^2. Look at the diagram and note that the same method is used to calculate that there are (100×100) 10 000 cm^2 in 1 m^2. So to change cm^2 to m^2 multiply the number by 10 000 or move the decimal point 4 places to the right. So 8 m^2 would be 80 000 cm^2 and 8.02 m^2 would be 80 200 cm^2. Then the method is reversed for the second part of the column. When you divide by 10 000 move the decimal place 4 places to the left. So 9 cm^2 would be 0.0009 m^2 and 136 cm^2 would be 0.0136 m^2.

Column 3 are worder questions that you solve using the units as given in the question. Then after you answer the question express the answer in the other unit that is requested.

41 A rectangular piece of fabric is size 1.5 m × 2.7 m. Find its area in m² and then convert to cm².

$A = lb$

$= 1.5 \times 2.7$

$A = 4.05$ m²

Fabric area:

m²: 4.05 m²

cm²: 40 500 cm²

42 A kite has axis lengths of 58 cm and 85 cm. Find its area in cm², then convert this to m².

$A = \frac{1}{2}xy$

$= \frac{1}{2} \times 58 \times 85$

$A = 2\,465$ cm²

Kite area:

cm²: 2 465 cm²

m²: 0.2465 m²

43 A triangular sail has a base length of 2.2 m and a height 4.1 m. Find the area of the sail in m² & cm².

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 2.2 \times 4.1$

$A = 4.51$ m²

Sail area:

m²: 4.51 m²

cm²: 45 100 cm²

A square steel plate with sides 8.2 cm has a rectangular slot cut into it with sides 52 mm and 14 mm. Find:

44 The size of the plate

$A = l^2$

$= 8.2^2$

$A = 67.24$ cm²

Plate area:

cm²: 67.24 cm²

mm²: 6 724 mm²

45 The size of the slot.

$A = lb$

$= 52 \times 14$

$A = 728$ mm²

Slot area:

mm²: 728 mm²

cm²: 7.28 cm²

46 The total area of the plate

mm²: A = 6 724-728 = 5 996 mm²

cm²: A = 67.24-7.28 = 6 cm² (2 d.p.)

Using a Ruler - Line Measurement

When a line is measured using a ruler the answer can be expressed in mm or cm. If the ruler has both units on it you can use the side needed for the answer. However you should also be able to convert between the two units. You should know that:

1 cm = 10 mm, so 2 cm = 20 mm, and decimals 3.8 cm = 38 mm etc.

Column 1 has horizontal lines and vertical lines. It is the thick blue lines you are measuring, don't confuse them with the thin black lines for writing your answer on. The first column asks for answers in cm (to 1 d. p.), that means 3.7 cm, 11.2 cm and so on. The screw and nut at the bottom of the page can be measured either across the object or use the lines with the double-ended arrow between them. The second column is much the same except the lines are angled, note that measurement for this column is in mm.

Use the same method with column 3 only write the size of each side and then add them for the total.

Measure the perimeter of these shapes to the nearest mm, write the side length on each side, then total answer in mm.

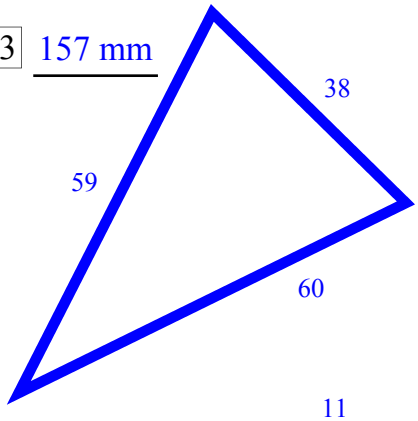
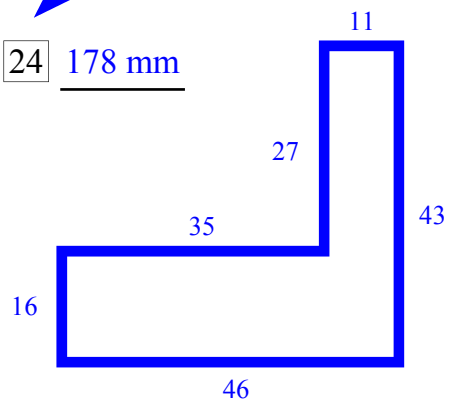
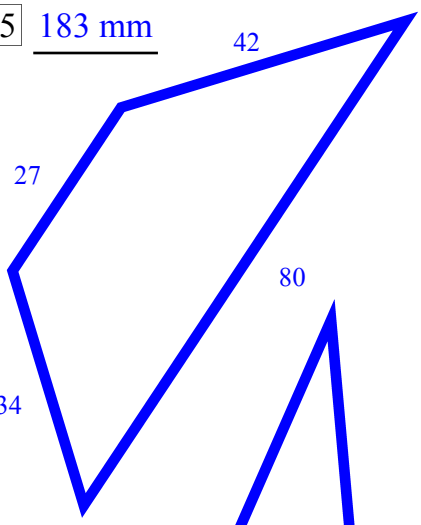
23 157 mm



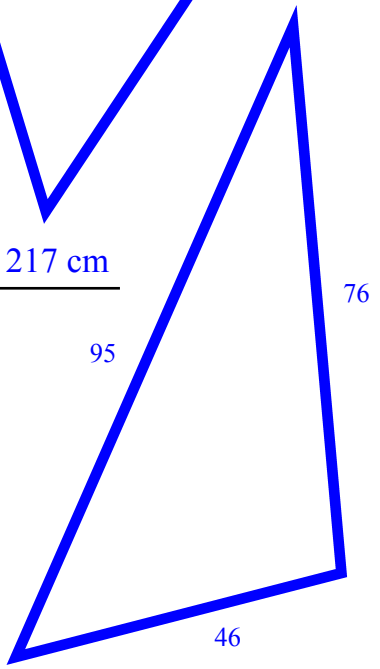
24 178 mm



25 183 mm



26 217 cm



Units of Measurement

When units of measurement are changed, multiply or divide by 10, 100, 1 000 or more. To change to a smaller unit multiply, to convert to a larger unit divide. Some students have difficulty with this, they think that if the unit is larger you must multiply. This isn't the case. Imagine you have 1 m or 100 cm, both are the same distance, there are more of the smaller unit, 1→100, so:

- changing to a smaller unit means - multiply
- changing to a larger unit means - divide

The number used to multiply or divide is the number of small units in the larger unit. For example 2 m to cm, there are 100 cm in a metre, changing to a smaller unit so multiply…so multiply by 100. As only 10, 100 or 1 000 are used to get the answer … move the decimal point. Multiply by 10 move the decimal place 1 position to the right, 100 move 2 positions and 1 000 move the decimal place 3 positions to the right.

Division is the same number of moves, only this time it's to the left. Divide by 10 and move the decimal place 1 position to the left, 100 move it 2 positions and 1 000 moves 3 positions to the left. A reminder is at the top of each column.

Column 1 starts with changing mm to cm. You should be able to talk it through to your-self….mm to cm is changing to a larger unit...that means division….there are 10 mm in a cm that means I divide by 10….divide by 10 means I move the decimal point 1 place to the left. That means 18 mm = 1.8 cm 113 mm = 11.3 cm and 0.9 mm = 0.09 cm. The next part of the column is the reverse, multiply by 10 means move the decimal place 1 position to the right. So 54 cm = 540 mm, 1.3 cm = 13 mm and 123 cm = 1 230 mm.

Column 2 deals with converting between cm and m. This time the change is by dividing or multiplying by 100. That means a 2 decimal place movement. For cm to m (divide by 100) 12 cm = 0.12 m, 106 cm = 1.06 m and 5.78 cm = 0.0578 m. Then the reverse, m to cm means multiplying by 100 or a 2 decimal place shift to the right: 3 m = 300 cm, 0.7 m = 70 cm and 10.05 m = 1 005 cm.

Column 3 is m to km, this involves multiplying or dividing by 1 000, or a 3 decimal place movement. That would mean 300 m = 0.3 km, 2 305 m = 2.305 km and 4.7 m = 0.0047 km. Then the reverse, changing km to m. That's 3 decimal places to the right: 1.2 km = 1 200m, 0.85 km = 850 m and 0.02 km = 20 m.

Further Units of Measurement

The processes are the same as on the previous sheet 'Units of Measurement' except that this time the conversions aren't in groups of units and multiplication/division. Its all jumbled so you need to know whether you divide or multiply and how many decimal places you shift the decimal point. There is also the inclusion of mm to m and the reverse. This is a 3 decimal place shift (× or ÷ by 1 000).

Perimeter of Shapes

The perimeter of a shape is the distance around the outside of the shape. The units of measurement are mm, cm, m and km. Shapes often have side lengths that are the same, rather than writing this distance out again a mark is put on the identical sides to show they are the same length. If there are a number of different pairs of sides that are the same length, 2 marks together will be used and so on, such as with a rectangle.

To answer columns 1 and 2 use the same method, this is:

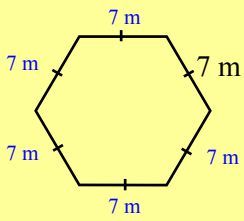
- Look at the side markings and write side lengths on every side it is up to you if you write the units as well
- The first line of working is the sum of the sides of the shape, write 'P =' then the sides separated by + signs. Note that to avoid missing sides don't jump around in the addition. Start on a side then move around the shape in a clockwise or anti-clockwise direction.
- If the sum is challenging to complete mentally, total the sum as you move through, look at the example below.
- The second line is the answer line, again write 'P =' then the answer, then the units, either mm, cm or m.

Column 3 introduces formulae used for squares and rectangles. These are:

- Squares: $P = 4l$ (which is 4 times the side length)
- Rectangles: $P = 2l + 2b$ (which is 2 times the length + 2 times the breadth)

The questions are in tables. With squares, multiply the side length by 4 and write the answer with units. The rectangles are completed in stages, l is given and you double it to get the value of $2l$, b is given and you double it to get the value of $2b$. Then add the values for $2l$ and $2b$ together to get the answer, write in the units (all of which are cm.)

Fill in all the side lengths to avoid missing them



P = 7 + 7 + 7 + 7 + 7 + 7

P = 42 m

Perimeter of Shapes

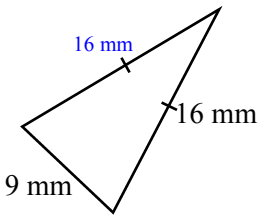
P = 28 m

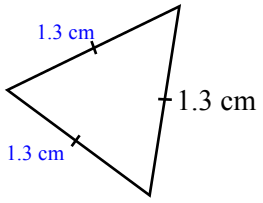
5



P = 16 + 16 + 9

P = 41 mm

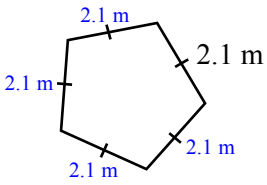
6



P = 1.3 + 1.3 + 1.3

P = 3.9 cm

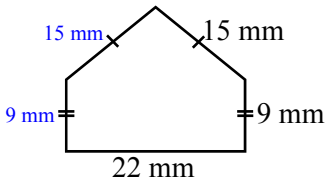
7



P = 2.1 + 2.1 + 2.1 + 2.1 + 2.1

P = 10.5 m

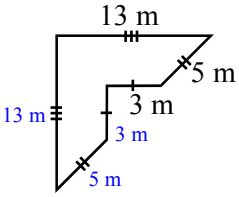
8



P = 22 + 9 + 15 + 15 + 9

P = 70 mm

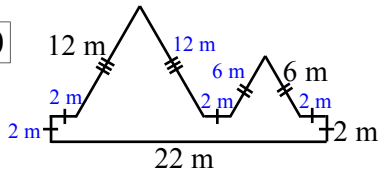
9



P = 5 + 13 + 13 + 5 + 3 + 3

P = 42 m

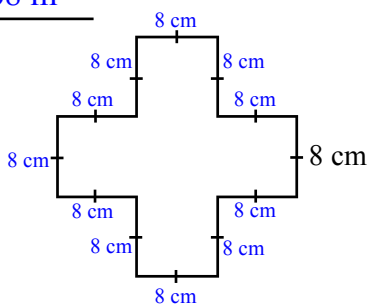
10



P = 22 + 2 + 2 + 12 + 12 + 2 + 6 + 6 + 2 + 2

P = 68 m

11



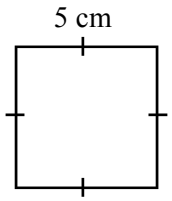
P = 8 × 12

P = 96 cm

Complete the tables, all measurements are in cm.

Perimeter Formula for Squares :

P = 4*l* where *l* = side length



P = 4*l*

= 4 × 5

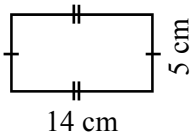
P = 20 cm

12

Length (*l*)	Perimeter (4*l*)	Length (*l*)	Perimeter (4*l*)
5	20 cm	15	60 cm
8	32 cm	11	44 cm
10	40 cm	14	56 cm
9	36 cm	30	120 cm
3	12 cm	50	200 cm
4	16 cm	80	320 cm
12	48 cm	55	220 cm
20	80 cm	42	168 cm

Perimeter Formula for Rectangles :

P = 2*l* + 2*b* where : *l* = length and *b* = breadth



P = 2*l* + 2*b*

= 2×14 + 2×5

P = 38 cm

13

Length (*l*)	2*l*	Breadth (*b*)	2*b*	Perimeter (2*l* + 2*b*)
14	28	5	10	38 cm

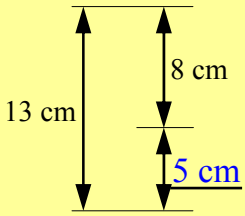
20	40	16	32	72 cm
7	14	19	38	52 cm
13	26	17	34	60 cm

Perimeter - Finding a Missing Side

Sometimes before the perimeter of a shape can be calculated the missing sides have to be found. The missing sides will either have side markings that indicate that they are the same size as another side or they will be found by adding or subtracting sides that you know the value of. Note that this applies due to all the angles being right angles, the corners are not marked but they are 90º.

In column 1 questions 1 - 5, two different ways are used to measure the same distance. This means that they must be equal. Use addition or subtraction to find the value. In the example below a distance is measured as 13 cm. The same distance is then broken up into to parts, one of those parts is 8 cm. Ask yourself, 'What number adds to 8 to give 13?', the answer is 5, so the missing length is 5 cm. From question 6, through the column, shapes are given and you use the same method to find the missing sides. The method is:

- If the shape has side markings write in all the sides that you know.
- Use the given lengths to then calculate the other side lengths



Columns 2 and 3 add one step to column 1, the perimeter is calculated. Use 2 lines of working, the first line being the addition of all the sides and the second line being the answer with the units (mm, cm, m etc). Writing the side lengths on all sides of the shape will help avoid mistakes. Some students like to miss this step because they know the value of the side and don't need to write it, the problem is that when they add the sides to get the perimeter they often forget to include them. A method to avoid this problem is to label every side with its measurement then look at the addition and check off the numbers against the numbers on the sides of the shape. If there are different numbers or there is too many or too few you have to find the problem. Note that if you add around the sides of the shape in the same way, clock-wise or an anti-clockwise direction, it makes it less confusing.

Be careful with question 19 it is different and may trick you.

Exact & Estimation - Circumference

The circumference of a circle is its perimeter, the distance around its outside. The way to measure circumference when you don't know how to calculate it is to place a mark on the circle roll it one revolution and see how far the mark has travelled. But you can use this formula:

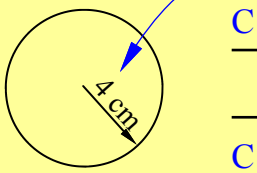
$$C = 2\pi r \text{ or } C = \pi d$$

Where: C = the circumference (length is same units as the radius/diameter)
π = Pi, it's a value on your calculator 3.14159….. Which is a bit more than 3!
r = the radius, the length from the centre to any point on the circumference
d = the diameter, the width of the circle.

Note that if life is complicated enough, just use $C = 2\pi r$ only, then remember to always use the radius. You don't have to remember both formulae. If given a diameter, halve it!

Column 1 starts with circles that have a radius shown, you will require a ruler for question 4. To find the circumference in terms of π, also called the exact length, use the value of r given in the circle. To find the estimate, use the exact circumference and substitute 3 for π.

Example



$C = 2\pi r$

$= 2\times\pi\times4$ ← Replace r with 4, (the radius of the circle)

$C = 8\pi$ cm ← $2 \times 4 = 8$, leave π as is. Write the units.

So the circumference is 8π cm. This is the exact length, to estimate the length without a calculator use $\pi = 3$. This is less than the actual value for π, but it gives a fairly accurate answer without too much calculation.

Estimate:

$C = 8\pi$ cm ← Rewrite the circumference from previous step

$\approx 8 \times 3$ ← Replace π with 3 and = with ≈

$C \approx 24$ cm ← Solve, use either ≈ or ≒ to indicate 'approximately'.

Column 2 uses diameters. You can either halve the diameter for the radius and solve as before, or use $C = \pi d$. So just multiply the diameter by 3 for an estimate of the circumference.

At the bottom of the page are four circles. Measure the diameter accurate to the nearest 0.5 cm, then calculate the exact circumference (in terms of π) and then an estimate, again using $\pi = 3$. Use the working out spaces in the third column to answer these.

Exact & Estimation - Circumference

Exact & Estimation - Circumference

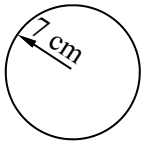
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the circumference in terms of π. Then using π = 3, estimate the circumference.

1 $C = 2\pi r$

$= 2 \times \pi \times 7$

$C = 14\pi$ cm

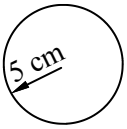


Estimate: $C = 14\pi$ cm

$\approx 14 \times 3$

$C \approx 42$ cm

2



$C = 2\pi r$

$= 2 \times \pi \times 5$

$C = 10\pi$ cm

Estimate: $C = 10\pi$ cm

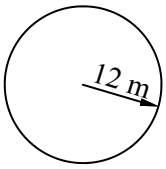
$\approx 10 \times 3$

$C \approx 30$ cm

3 $C = 2\pi r$

$= 2 \times \pi \times 12$

$C = 24\pi$ m

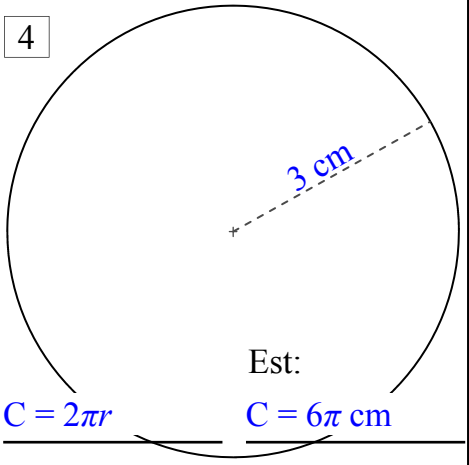


Estimate: $C = 24\pi$ cm

$\approx 24 \times 3$

$C \approx 72$ m

4



Est:

$C = 2\pi r$ | $C = 6\pi$ cm

$= 2 \times \pi \times 3$ | $\approx 6 \times 3$

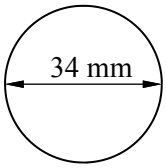
$C = 6\pi$ cm | $C \approx 18$ cm

Divide the diameter by 2 or use $C = \pi d$ to find the circumference & estimate.

5 $C = \pi d$

$= \pi \times 34$

$C = 34\pi$ mm

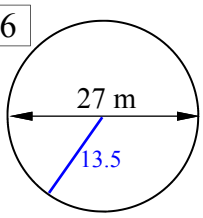


Estimate: $C = 34\pi$ mm

$\approx 34 \times 3$

$C \approx 102$ mm

6



$C = \pi d$

$= \pi \times 27$

$C = 27\pi$ m

Estimate: $C = 27\pi$ m

$\approx 27 \times 3$

$C \approx 81$ m

7

$C = \pi d$ | $C = 4\pi$ cm

$= \pi \times 4$ | $\approx 4 \times 3$

$C = 4\pi$ cm | $C \approx 12$ cm

8

$C = \pi d$ | $C = 12\pi$ cm

$= \pi \times 12$ | $\approx 12 \times 3$

$C = 12\pi$ cm | $C \approx 36$ cm

9

$C = \pi d$ | $C = 6.5\pi$ cm

$= \pi \times 6.5$ | $\approx 6.5 \times 3$

$C = 6.5\pi$ cm | $C \approx 19.5$ cm

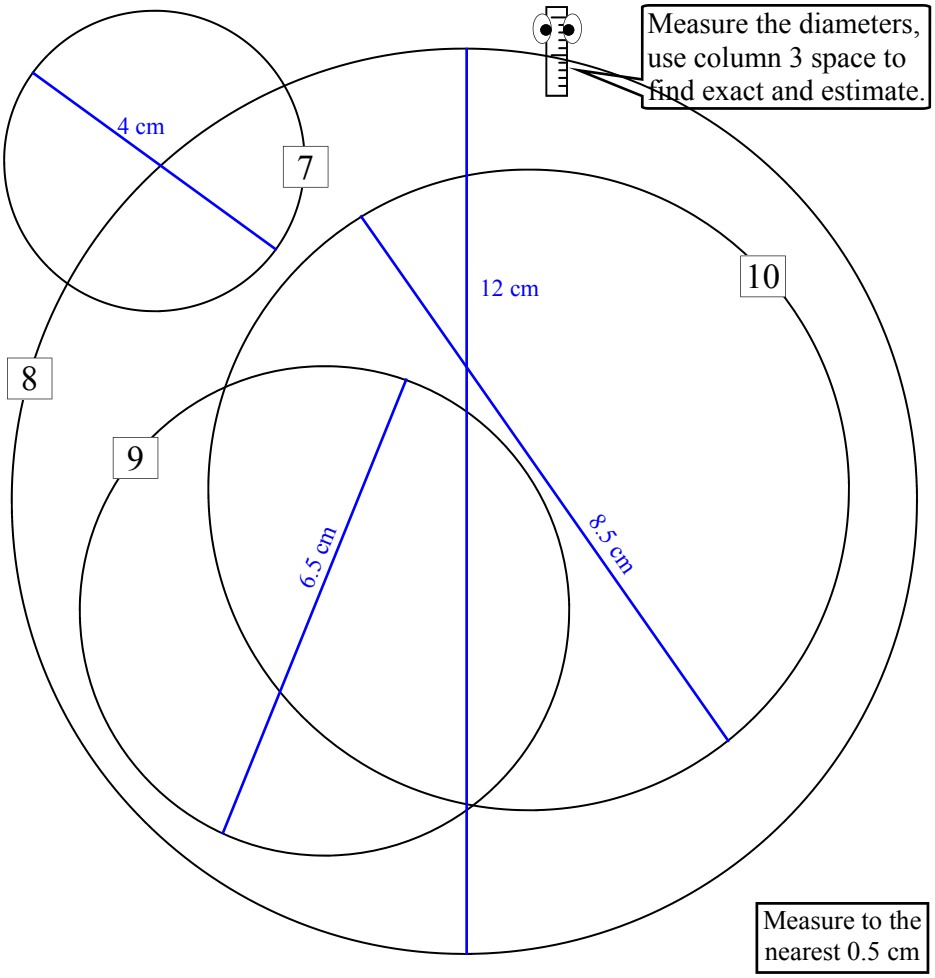
10

$C = \pi d$ | $C = 8.5\pi$ cm

$= \pi \times 8.5$ | $\approx 8.5 \times 3$

$C = 8.5\pi$ cm | $C \approx 25.5$ cm

Measure the diameters, use column 3 space to find exact and estimate.



Measure to the nearest 0.5 cm

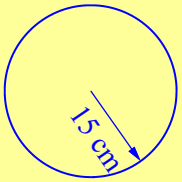
Circumference (Sheet 1)

The circumference of a circle is its perimeter, the distance around the outside of the circle. This distance is found by using this formula:

$$C = 2\pi r$$

Where: C = Circumference of circle
r = radius of the circle

Example



$C = 2\pi r$ ← Write the formula.

$= 2 \times \pi \times 15$ ← Show × signs and replace r with the radius (15 on diagram).

$C = 94.2$ cm (1 d.p.) ← Calculate, round and show units.

Calculator 2 × π × 1 5 = Answer on Screen 94.24777961

Round to 1 decimal place 94.2 cm (1 d.p.)

Column 1 uses the above process for all questions.

Column 2 gives you a diameter rather than a radius. So you can divide by the diameter by 2 to find the radius then use $C = 2\pi r$, but an easier way is to use:

$$C = \pi d$$

Where: C = Circumference of circle
d = diameter of the circle (note that $d = 2r$)

Column 3 are problem style questions using the circumference of a circle.

Circumference (Sheet 1)

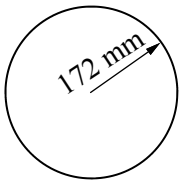
$C = 267$ km

6

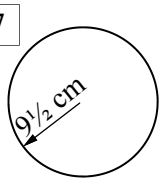
$C = 2\pi r$

$= 2 \times \pi \times 172$

$C = 1\,080.7$ mm



7



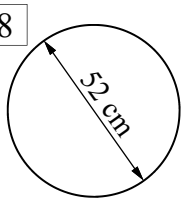
$C = 2\pi r$

$= 2 \times \pi \times 9.5$

$C = 59.7$ cm

These use diameter. Either divide by 2 for the radius *OR* use $C=\pi d$. Answer to 2 d.p.

8



$C = \pi d$

$= \pi \times 52$

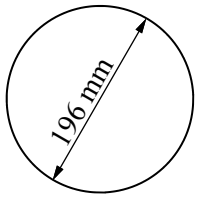
$C = 163.36$ cm

9

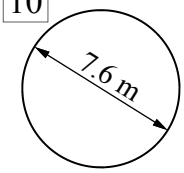
$C = \pi d$

$= \pi \times 196$

$C = 615.75$ mm



10



$C = \pi d$

$= \pi \times 7.6$

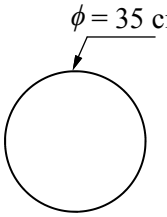
$C = 23.88$ m

11

$C = \pi d$

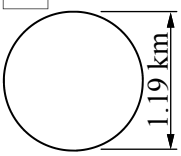
$= \pi \times 35$

$C = 109.96$ cm



* ϕ = 'phi' = d

12



$C = \pi d$

$= \pi \times 1.19$

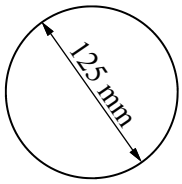
$C = 3.74$ km

13

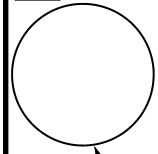
$C = \pi d$

$= \pi \times 125$

$C = 392.70$ mm



14



$C = \pi d$

$= \pi \times 7.89$

$C = 24.79$ m

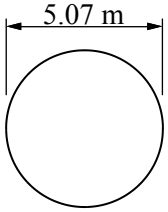
15

$\phi = 7.89$ m

$C = \pi d$

$= \pi \times 5.07$

$C = 15.93$ m



Now apply your skills to these problems. Answer to 2 d.p. where appropriate.

16 A car tyre has a diameter of 63 cm. Find its circumference. Give your answer in metres.

$C = \pi d$

$= \pi \times 0.63$

$C = 1.98$ m

17 How far does the tyre travel when it rotates 150 times?

Distance $= 150 \times 1.98$

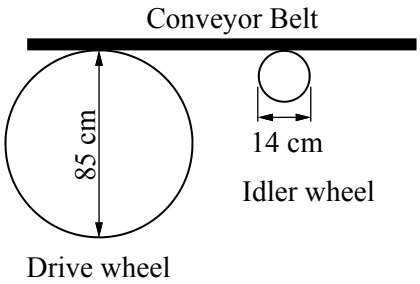
Distance $= 297$ m (296.88 m If 16 unrounded)

18 How many complete rotations of the tyre will occur if 1 km is travelled?

Rotations $= 1\,000 \div 1.98$

Rotations $= 505$

19 Calculate the amount of conveyor belt fed by 1 rotation of the drive wheel.



$C = \pi d$

$= \pi \times 85$

$C = 267.04$ cm

20 1 rotation of the idler wheel

$C = \pi d$

$= \pi \times 14$

$C = 43.98$ cm

21 Complete:

$$\frac{C_{(\text{Drive})}}{C_{(\text{Idler})}} = \frac{267.04}{43.98} = 6.07$$

Circumference (Sheet 2)

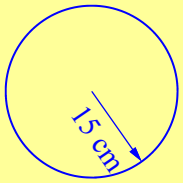
The circumference of a circle is its perimeter, the distance around the outside of the circle. This distance is found by using this formula:

$$C = 2\pi r$$

Where: C = Circumference of circle
r = radius of the circle

The usual process is to use your π key, but there are two common approximations for π. These are $\pi = 3.14$ (as a decimal) and $\pi = {}^{22}/_{7}$ (as a fraction).

Example - $\pi = 3.14$

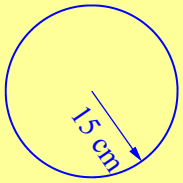


$C = 2\pi r$ ← Write the formula.

$= 2 \times 3.14 \times 15$ ← Show × signs and replace π with 3.14 and r with the radius .

$C = 94.2$ cm (1 d.p.) ← Calculate, round and show units.

Example - $\pi = {}^{22}/_{7}$



$C = 2\pi r$ ← Write the formula.

$= 2 \times {}^{22}/_{7} \times 15$ ← Show × signs and replace π with $^{22}/_{7}$ and r with the radius .

$C = 94.3$ cm (1 d.p.) ← Calculate, round and show units.

Column 1 uses the above process for all questions.

Column 2 gives you a diameter rather than a radius. Use:

$$C = \pi d$$

Where: C = Circumference of circle
d = diameter of the circle (note that $d = 2r$)

There are two tables at the base of the column, just write the answer with units, no working out required.

Column 3 finds the diameter (and later radius) given the circumference. If you divide the circumference by π then you find the diameter. If you halve this answer you get the radius.

$$C = \pi d$$
$$\div \pi \quad \div \pi$$
$$\frac{C}{\pi} = d$$
$$d = \frac{C}{\pi}$$

Circumference (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use $C=2\pi r$ with $\pi = 3.14$, to find the circumference. Round your answer to 1 decimal place.

Example

$C = 2\pi r$

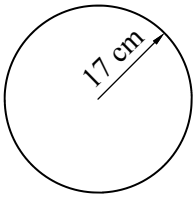
Write formula

$= 2 \times 3.14 \times 17$

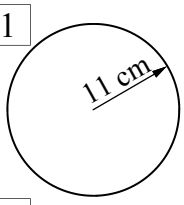
Substitute 3.14 and r

$C = 106.8$ cm

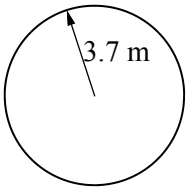
Answer 1 d.p., show units



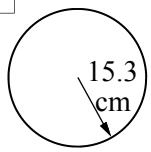
1



2

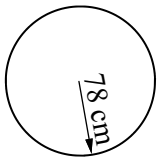


3

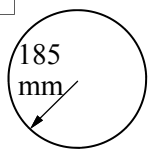


Now use $\pi = {}^{22}/_{7}$, to find the circumference. Round to the nearest whole number.

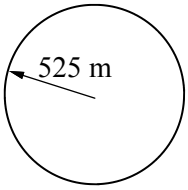
4



5

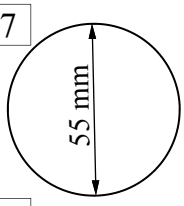


6

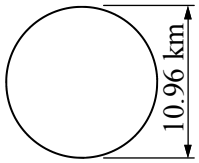


Now use $C = \pi d$ & $\pi = 3.14$, find the circumference and round to 1 decimal place.

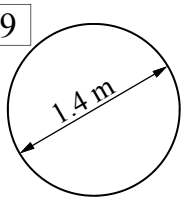
7



8



9



Now use $C = \pi d$ & $\pi = {}^{22}/_{7}$, to complete the table to 1 dp No working out required.

Q.	d	Circumference
10	23 cm	
11	83.2 m	
12	19.6 mm	
13	16.07 km	
14	208 m

Circumference (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use $C=2\pi r$ with $\pi = 3.14$, to find the circumference. Round your answer to 1 decimal place.

Example

$C = 2\pi r$

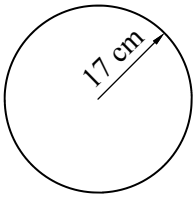
Write formula

$= 2 \times 3.14 \times 17$

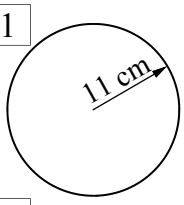
Substitute 3.14 and r

$C = 106.8$ cm

Answer 1 d.p., show units



1

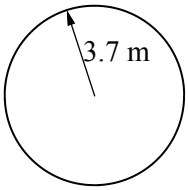


$C = 2\pi r$

$= 2 \times 3.14 \times 11$

$C = 69.1$ cm

2

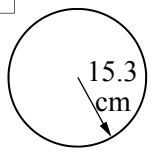


$C = 2\pi r$

$= 2 \times 3.14 \times 3.7$

$C = 23.2$ m

3



$C = 2\pi r$

$= 2 \times 3.14 \times 15.3$

$C = 96.1$ cm

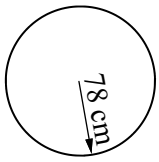
Now use $\pi = {}^{22}/_{7}$, to find the circumference. Round to the nearest whole number.

4

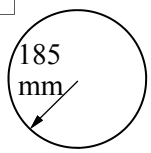
$C = 2\pi r$

$= 2 \times {}^{22}/_{7} \times 78$

$C = 490$ cm



5



$C = 2\pi r$

$= 2 \times {}^{22}/_{7} \times 185$

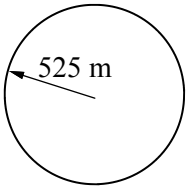
$C = 1\,163$ mm

6

$C = 2\pi r$

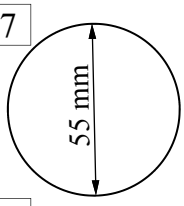
$= 2 \times {}^{22}/_{7} \times 525$

$C = 3\,300$ m



Now use $C = \pi d$ & $\pi = 3.14$, find the circumference and round to 1 decimal place.

7



$C = \pi d$

$= 3.14 \times 55$

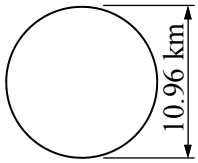
$C = 172.7$ mm

8

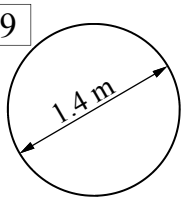
$C = \pi d$

$= 3.14 \times 10.96$

$C = 34.4$ km



9



$C = \pi d$

$= 3.14 \times 1.4$

$C = 4.4$ m

Now use $C = \pi d$ & $\pi = {}^{22}/_{7}$, to complete the table to 1 dp No working out required.

Q.	d	Circumference
10	23 cm	72.3 cm
11	83.2 m	261.5 m
12	19.6 mm	61.6 mm
13	16.07 km	50.5 km
14	208 m	653.7 m
15	485 km	1 524.3 km

Now use $C = \pi d$ & the π key on your calculator, to complete the table to 1 d.p.

Q.	d	Circumference
16	5.6 m	17.6 m
17	0.9 km	2.8 km
18	93 mm	292.2 mm

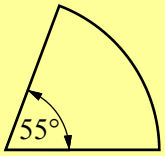
Fractions of a Circle and Arc Length

This sheet finds the length of an arc of a sector. The arc is the curved length which is a fraction of a whole circle's circumference. So in other words, this sheet deals with the circumference of a circle but multiplied by a fraction.

Column 1 starts with sectors (including quadrants and semi-circles) and finding the fraction of the circle that they represent. This requires you to identify the internal angle and write it 'over' 360°. That answers the question but the next step is to simplify the fraction. This can be done in your head by dividing by the LCM, or using a calculator.

Example

$\frac{55}{360} = \frac{11}{72}$ (÷ 5 above and below)



Calculator 5 5 $a^b/_c$ 3 6 0 =

Answer on Screen 11⌟72 But you write $\frac{11}{72}$

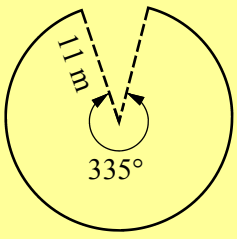
Column 2 relates the fraction to the arc length. The circumference of a circle is $C = 2\pi r$, but as these are sectors then the arc length is a fraction of the circumference (if the circle was whole).

$$l = \frac{\theta}{360} \times 2\pi r$$

Where:

l = the arc length (curved length)
θ = the internal angle of the sector
r = radius of sector

Example



$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{335}{360} \times 2 \times \pi \times 11$

$l = 64.3$ m (1 d.p.)

Column 3 asks you to find the perimeter of the sectors. So the method is just the same as above, but then add on the straight lengths as well. The straight lines are the radii, there are two of them. So work out the arc length, add two radii and you are done.

$$l = \frac{\theta}{360} \times 2\pi r + 2r$$

Fractions of a Circle and Arc Length

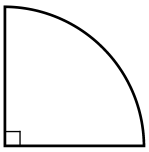
Fractions of a Circle and Arc Length

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

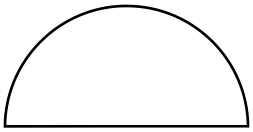
Calculate the fraction of a circle shown by these sectors, simplify if possible.

1



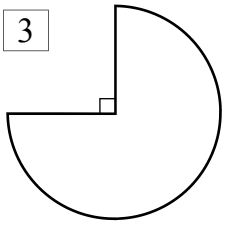
$\frac{90}{360} = \frac{1}{4}$

2



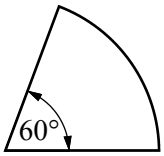
$\frac{180}{360} = \frac{1}{2}$

3



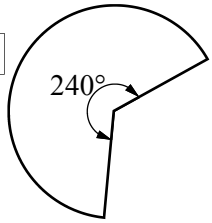
$\frac{270}{360} = \frac{3}{4}$

4



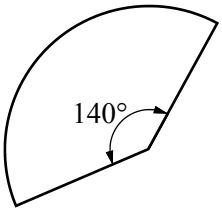
$\frac{60}{360} = \frac{1}{6}$

5



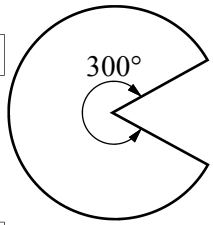
$\frac{240}{360} = \frac{1}{3}$

6



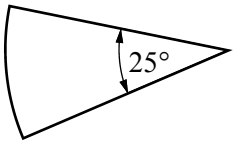
$\frac{140}{360} = \frac{7}{18}$

7



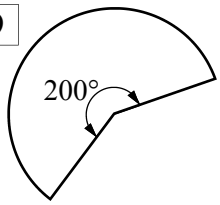
$\frac{300}{360} = \frac{5}{6}$

8



$\frac{25}{360} = \frac{5}{72}$

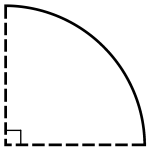
9



$\frac{200}{360} = \frac{5}{9}$

Find the fraction of a circle and multiply by $2\pi r$ to find the arc length 'l' to 1 d.p.

10

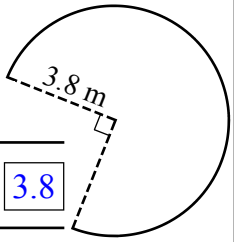


$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{90}{360} \times 2 \times \pi \times 43$

$l = 67.5$ cm

11

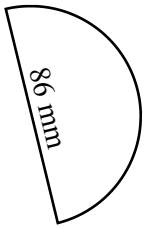


$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{270}{360} \times 2 \times \pi \times 3.8$

$l = 17.9$ m

12

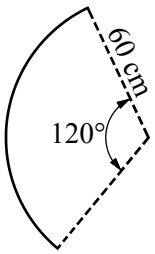


$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{180}{360} \times 2 \times \pi \times 86$

$l = 270.2$ mm

13

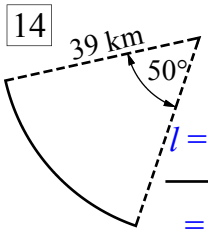


$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{120}{360} \times 2 \times \pi \times 60$

$l = 125.7$ cm

14



$l = \frac{\theta}{360} \times 2\pi r$

$= \frac{50}{360} \times 2 \times \pi \times 39$

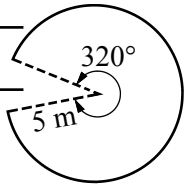
$l = 34$ km

15

$l = \frac{\theta}{360} \times 2\pi r$

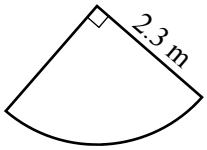
$= \frac{320}{360} \times 2 \times \pi \times 5$

$l = 27.9$ m



Now find the perimeter, to 1 d.p. Include the radii.

16

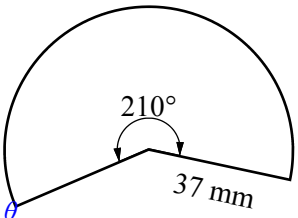


$l = \frac{\theta}{360} \times 2\pi r + 2r$

$= \frac{90}{360} \times 2 \times \pi \times 2.3 + 2 \times 2.3$

$l = 8.2$ m

17

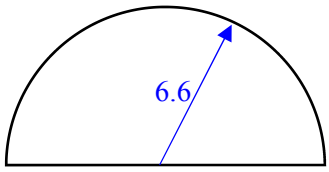


$l = \frac{\theta}{360} \times 2\pi r + 2r$

$= \frac{210}{360} \times 2 \times \pi \times 37 + 2 \times 37$

$l = 209.6$ mm

18

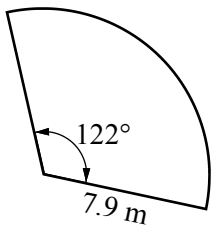


$l = \frac{\theta}{360} \times 2\pi r + d$

$= \frac{180}{360} \times 2 \times \pi \times 6.6 + 13.2$

$l = 33.9$ cm

19



$l = \frac{\theta}{360} \times 2\pi r + 2r$

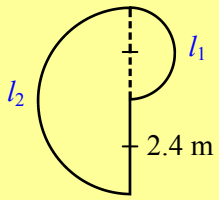
$= \frac{122}{360} \times 2 \times \pi \times 7.9 + 2 \times 7.9$

$l = 32.6$ m

Perimeter of Composite Shapes

This sheet shouldn't be attempted before the previous sheet on Arc Length is attempted. The circumference of a circle is found by $C = 2\pi r$ or $C = \pi d$. But with composite shapes parts of a circle are involved with other shapes/lengths, so you need to use fractions to find the arc length, then add that length to the other sides of the shape.

Example - Finding the perimeter to 1 d.p.



Label l_1 on the diagram and calculate the arc length.

$l_1 = {}^1/_2 \times \pi d$

$= {}^1/_2 \times \pi \times 2.4$

$l_1 = 3.8$ m

$l_2 = {}^1/_2 \times \pi d$

$= {}^1/_2 \times \pi \times 4.8$

$l_2 = 7.5$ m

Label l_2 on the diagram and calculate the arc length.

Add the three lengths. That is the two arc lengths and the 2.4 m straight length.

$P = 3.8 + 7.5 + 2.4$

$P = 13.7$ m

This sheet is answered by the above method, except sometimes quadrants are involved. So instead of using ${}^1/_2$ you will use ${}^1/_4$ to find the arc length.

Column 3 has the last two questions requiring an extra step, these require Pythagoras Theorem before solving.

Perimeter of Composite Shapes

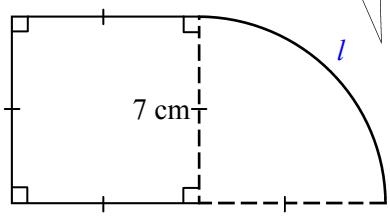
Perimeter of Composite Shapes

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the perimeter to 1 d.p.

1



$l = {}^1/_4 \times 2\pi r$

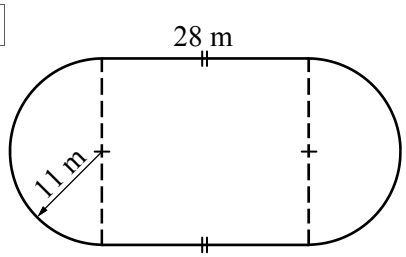
$= {}^1/_4 \times 2 \times \pi \times$ 7

$l =$ 11 cm (1 d.p.)

P = 11 + 4 × 7

P = 39 cm

2



$C = 2\pi r$

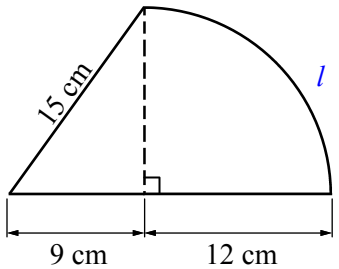
$= 2 \times \pi \times 11$

C = 69.1 m (1 d.p.)

P = 69.1 + 2 × 28

P = 125.1 m

3



$l = {}^1/_4 \times 2\pi r$

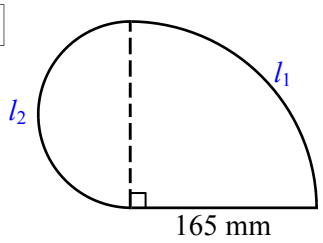
$= {}^1/_4 \times 2 \times \pi \times 12$

l = 18.8 cm (1 d.p.)

P = 18.8 + 15 + 9 + 12

P = 54.8 cm

4



$l_1 = {}^1/_4 \times 2\pi r$ $l_2 = {}^1/_2 \times 2\pi r$

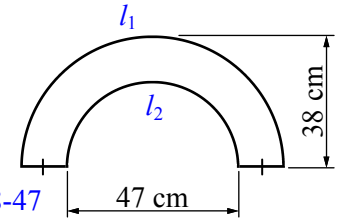
$= {}^1/_4 \times 2 \times \pi \times 165$ $= {}^1/_2 \times 2 \times \pi \times 82.5$

l_1 = 259.2 mm l_2 = 259.2 mm

P = 2 × 259.2 + 165

P = 683.4 mm

5



2×38-47 = 29

$l_1 = {}^1/_2 \times 2\pi r$ $l_2 = {}^1/_2 \times \pi d$

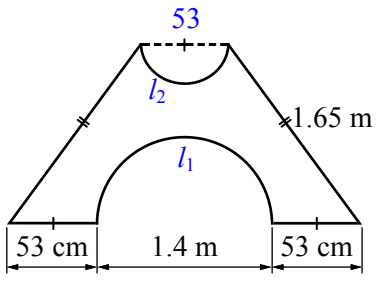
$= {}^1/_2 \times 2 \times \pi \times 38$ $= {}^1/_2 \times \pi \times 47$

l_1 = 119.4 cm l_2 = 73.8 cm

P = 119.4 + 73.8 + 29

P = 222.2 cm

6



$l_1 = {}^1/_2 \times \pi d$ $l_2 = {}^1/_2 \times \pi d$

$= {}^1/_2 \times \pi \times 1.4$ $= {}^1/_2 \times \pi \times 0.53$

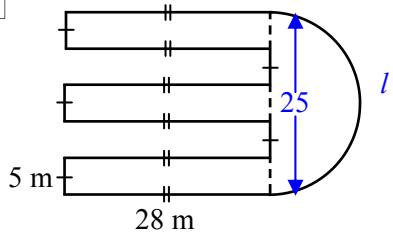
l_1 = 2.2 m (1 d.p) l_2 = 0.8 m (1 d.p)

P = 2×0.53 + 2.2 + 2×1.65 + 0.8

P = 7.4 m (1 d.p) or

P = 739.2 cm

7



$l = {}^1/_2 \times \pi d$

$= {}^1/_2 \times \pi \times 25$

l = 39.27 m

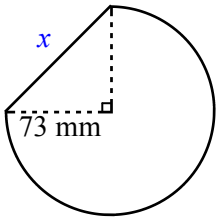
P = 39.27 + 3 × (5 + 2 × 28) + 10

P = 39.27 + 183 + 10

P = 232.27 m

Pythagoras required, round to 2 d.p.

8



$x^2 = 73^2 + 73^2$ $l = {}^3/_4 \times 2\pi r$

x^2 = 10 658 $= {}^3/_4 \times 2 \times \pi \times 73$

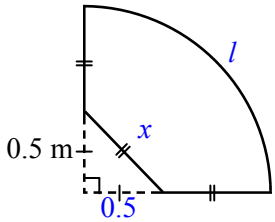
$x = \sqrt{10\,658}$ l = 344 mm

x = 103.24 mm

P = 103.24 + 344

P = 447.24 mm

9



$x^2 = 0.5^2 + 0.5^2$ r=0.5+0.71=1.21

$x^2 = 0.5$ $l = {}^1/_4 \times 2\pi r$

$x = \sqrt{0.5}$ $= {}^1/_4 \times 2 \times \pi \times 1.21$

x = 0.71 m l = 1.9 m

P = 1.9 + 3 × 0.71

P = 4.03 m

Perimeter Problems

These problems are an extension of the exercises covered earlier with an inclusion of cost. A common use of perimeter is in the calculation of cost of fences and walls. To calculate this cost calculate the perimeter first, then multiply the answer by the cost of the fence/wall by its unit cost, (the cost per metre).

In all the problems two lines of working are expected. The first line being the sum of the side lengths:
P = _ + _ + _ + etc

the second line being the total length and the units
P = _____ m (or cm).

Perimeter Problems

$P = 17 + 8 + 15 + 5 + 2 + 3$

$P = 50$ m

Area and Perimeter Problems

These are problem based questions based on circles or composite solids with circular elements. So before attempting this sheet ensure you have covered composite areas.

Column 1 are area questions, so use $A = \pi r^2$ to find the area, then apply other skills to solve the questions.

Column 2 are circumference questions, so use $C = \pi d$ *or* $C = 2\pi r$ to find the circumference or use fractions when arcs are involved.

As these questions require earlier exercises to be completed first, no examples have been included.

Area and Perimeter Problems

Use $A = \pi r^2$ to find the area and then apply your skills to answer these. Answer to 1 decimal place when needed.

A circular pool shown below in plan view has a diameter of 6 m. The pool fence encloses a 2.5 m wide paved area around the pool. Find:

1 The area occupied by the pool.

$A = \pi r^2$

$= \pi \times 3^2$

$A = 28.3 \text{ m}^2$

2 The area occupied by the tiles.

$A = \pi r^2$

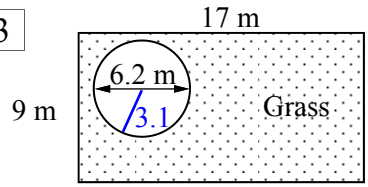
$= \pi \times 5.5^2$

$A = 95 \text{ m}^2$

$A = 95 - 28.3 = 66.7 \text{ m}^2$

Tom has built a 6.2 m diameter pergola in his backyard. The rest of his backyard is covered by grass. Calculate the percentage of his backyard that has to be mowed.

3



$A = \pi r^2$

$= \pi \times 3.1^2$

$A = 30.2 \text{ m}^2$

$A = lb$

$= 17 \times 9$

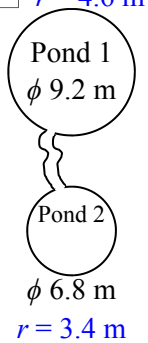
$A = 153 \text{ m}^2$

$\%\text{ Mowed} = \frac{30.2}{153} \times 100$

$\%\text{ Mowed} = 19.7\%$

Laura is constructing a wastewater system using two round settling ponds. Pond 1 is to have reeds covering 80% of its area, Pond 2 is to have 34% of its area covered with reeds. Calculate the amount of reeds (in m^2) required.

4



$r = 4.6$ m

$r = 3.4$ m

$A_1 = \pi r^2$

$= \pi \times 4.6^2$

$A_1 = 66.5 \text{ m}^2$

$A_2 = \pi r^2$

$= \pi \times 3.4^2$

$A_2 = 36.3 \text{ m}^2$

$\text{Pond 1} = 66.5 \times 0.80$

$\text{Pond 1} = 53.2 \text{ m}^2$

$\text{Pond 2} = 36.3 \times 0.34$

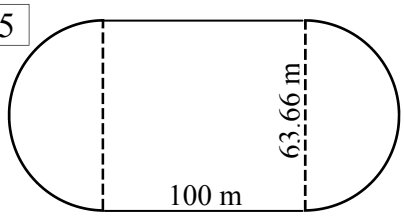
$\text{Pond 2} = 12.3 \text{ m}^2$

$\text{Total Reeds} = 53.2 + 12.3 = 65.5 \text{ m}^2$

Use $C = 2\pi r$ or $C = \pi d$ to find the circle's circumference then apply your skills to answer these. Answer to 1 decimal place.

Calculate the distance around the track field shown below.

5



$C = \pi d$

$= \pi \times 63.66$

$C = 200 \text{ m}$

$\text{Distance} = 200 + 2 \times 100$

$\text{Distance} = 400 \text{ m}$

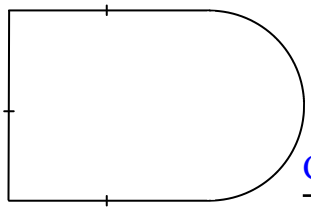
If Eve can run at an average speed of 3 m/s calculate the time, in minutes and seconds, that it would take her to complete one lap of the track above.

6 $\text{Time} = \frac{400}{3}$

$\text{Time} = 133.\dot{3} \text{ secs} = 2 \text{ m } 13 \text{ s}$

A tiger exhibit at the zoo is shown below. The curved length is a glass viewing wall costing \$1 450 per metre. While the remaining three walls are concrete and cost \$845 per metre. Find the cost of constructing the walls.

7



$l = \frac{1}{2}\pi d$

$= \frac{1}{2} \times \pi \times 11$

$l = 17.3 \text{ m}$

$\text{Cost}_{\text{GLASS}} = 17.3 \times 1\,450$

$\text{Cost}_{\text{GLASS}} = \$25\,085$

$\text{Cost}_{\text{CONCRETE}} = 11 \times 3 \times 845$

$\text{Cost}_{\text{CONCRETE}} = \$27\,885$

Jen's hamster 'Spartacus' runs in his 30 cm diameter exercise wheel. Jen has fitted a counter to the wheel and finds that Spartacus completed 800 revolutions one day, 560 the next and 725 on the third day. Find, in m, the:

8 Total distance Spartacus covers in three days.

$C = \pi d$

$= \pi \times 0.3$

$C = 0.9 \text{ m}$

$D = 2\,085 \times 0.9$

$D = 1\,876.5 \text{ m}$

Or 1 965.1 m (No rounding)

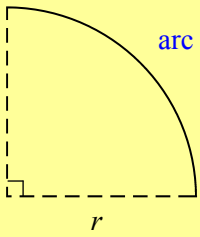
9 Average distance travelled per day.

$\text{Average Dist} = 1\,876.5 \div 3 = 625.5 \text{ m}$

Or No Rounding $\text{Average Dist} = 1\,965.1 \div 3 = 655 \text{ m}$

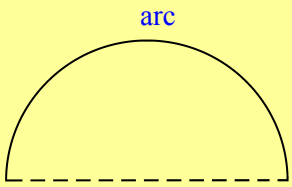
Further Perimeter Circles (Exact)

When finding the perimeter of a shape all the sides are added together. With the shapes in this worksheet an arc length is included, which has to be calculated in terms of π. This arc length will always be a fraction of a circle. For example:



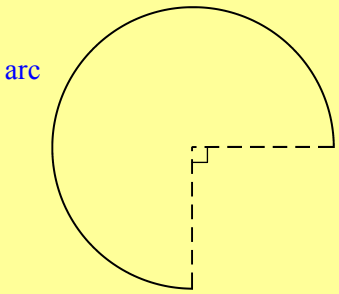
The arc length is:

$\frac{1}{4} \times 2\pi r$



The arc length is:

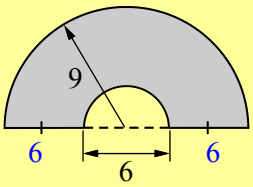
$\frac{1}{2} \times 2\pi r$ *or* $\frac{1}{2} \times \pi d$



The arc length is:

$\frac{3}{4} \times 2\pi r$

Example - Find the perimeter of the shape below



Because 18 - 6 = 12
shared equally = 6

$P = \frac{1}{2} \times 2\pi r + \frac{1}{2} \times \pi d + 2 \times 6$

Outside arc | Inside arc | Straight lengths

$= \frac{1}{2} \times 2 \times \pi \times 9 + \frac{1}{2} \times \pi \times 6 + 12$

Sub $r = 9$ | Sub $d = 6$ | $2 \times 6 = 12$

$= 9\pi + 3\pi + 12$

Solve each part

$P = 12\pi + 12$ units

Gather like terms and include 'units'

Column 1 starts with finding the perimeter of sectors, quadrants and semi-circles. These are all solved by finding the fraction of a circle shown and multiplying this by $2\pi r$. Then add the arc length with the other straight side lengths to get the perimeter.

Column 2 involve composite shapes and so include more sides in the calculation, watch for repetition to speed up your calculation remembering that two halves will make a whole circle. Note that Pythagoras Theorem is required at times.

Column 3 uses algebra-style questions, where letters are introduced rather than numbers. These may be more challenging.

Further Perimeter Circles (Exact)

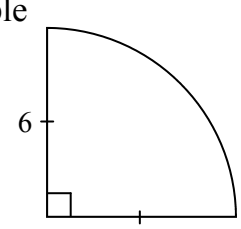
Further Perimeter Circles (Exact)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the perimeter in terms of π for these shapes.

Example

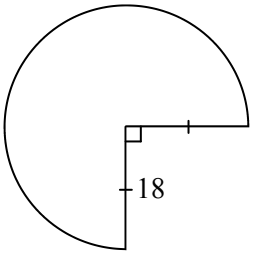


$P = \frac{1}{4}\times 2\pi r + 2r$

$= \frac{1}{4}\times 2\times\pi\times 6 + 2\times 6$

$P = 3\pi + 12$ units

1

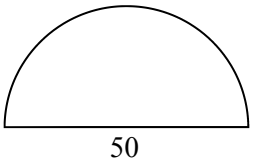


$P = \frac{3}{4}\times 2\pi r + 2r$

$= \frac{3}{4}\times 2\times\pi\times 18 + 2\times 18$

$P = 27\pi + 36$ units

2

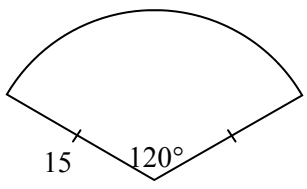


$P = \frac{1}{2}\times\pi d + d$

$= \frac{1}{2}\times\pi\times 50 + 50$

$P = 25\pi + 50$ units

3

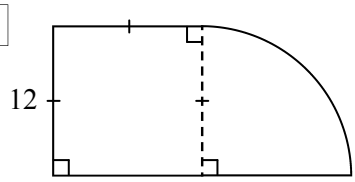


$P = \frac{1}{3}\times 2\times\pi\times r + 2\times r$

$= \frac{1}{3}\times 2\times\pi\times 15 + 2\times 15$

$P = 10\pi + 30$ units

4

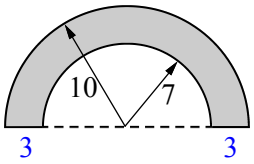


$P = \frac{1}{4}\times 2\pi r + 4r$

$= \frac{1}{4}\times 2\times\pi\times 12 + 4\times 12$

$P = 6\pi + 48$ units

5



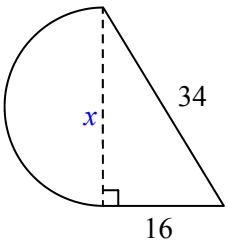
$P = \frac{1}{2}\times 2\pi R + \frac{1}{2}\times 2\pi r + 2\times 3$

$= \frac{1}{2}\times 2\times\pi\times 10 + \frac{1}{2}\times 2\times\pi\times 7 + 6$

$= 10\pi + 7\pi + 6$ units

$P = 17\pi + 6$ units

6



$x^2 = 34^2 - 16^2$

$x^2 = 900$

$x = \sqrt{900}$

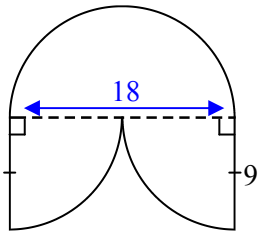
$x = 30$ units

$P = \frac{1}{2}\times\pi d + 16 + 34$

$= \frac{1}{2}\times\pi\times 30 + 50$

$P = 15\pi + 50$ units

7



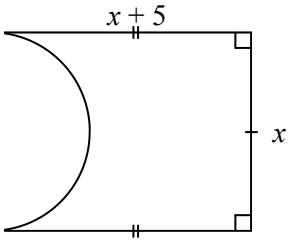
$P = \pi d + 2\times 9$

$= \pi\times 18 + 18$

$P = 18\pi + 18$ units

Keep finding the perimeter but this time using algebra.

8

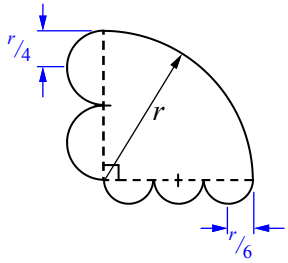


$P = \frac{1}{2}\times\pi d + 2(x + 5) + x$

$= \frac{1}{2}\times\pi\times x + 2x + 10 + x$

$P = \frac{1}{2}\pi x + 3x + 10$ units

9

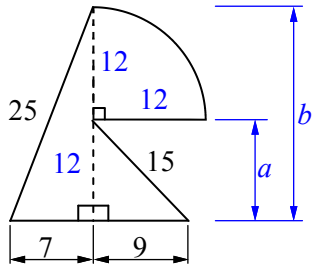


$P = \frac{1}{4}\times 2\pi r + 2\pi(\frac{r}{4}) + 1\frac{1}{2}\times 2\pi(\frac{r}{6})$

$= \frac{1}{2}\pi r + \frac{1}{2}\pi r + \frac{1}{2}\pi r$

$= \frac{3}{2}\pi r$ units or $1\frac{1}{2}\pi r$ units

10



$a^2 = 15^2 - 9^2$ | $b^2 = 25^2 - 7^2$

$a^2 = 144^2$ | $b^2 = 576^2$

$a = \sqrt{144}$ | $b = \sqrt{576}$

$a = 12$ units | $b = 24$ units

$P = \frac{1}{4}\times 2\pi r + 25 + 16 + 15 + r$

$= \frac{1}{4}\times 2\times\pi\times 12 + 56 + 12$

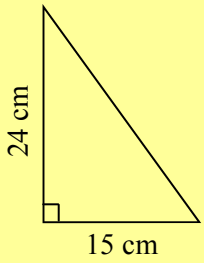
$P = 6\pi + 68$ units

Pythagoras - Area and Perimeter Applications

Perimeter is measurement of distance, the distance around a shape. So to find the perimeter of a triangle you add all the side lengths together. An example is at the top of column 1 of the worksheet.

The area of a triangle is found by $A = \frac{1}{2}bh$ which is 'a half times the base times the height'. Note that ½ = 0.5, it may be easier to type '0.5' into your calculator, also note that the 'base' isn't necessarily on the bottom of the triangle, due to rotation. Below is an example of finding the area of a triangle.

Example - Area of a Triangle



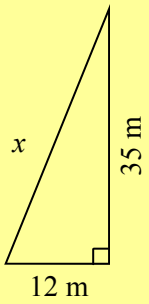
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 15 \times 24$

$A = 180 \text{ cm}^2$

Column 2 is all calculating the perimeter of a triangle. Note that you are given two sides only, but to calculate perimeter you need to know all three sides. So first calculate the unknown side using P.T., once you have calculated the side, add all three sides together. That gives you the perimeter. Remember that you may have subtraction or addition using Pythagoras, it depends if you are finding the length of the hypotenuse (addition or +) or finding a short side (subtraction or -). The first question reminds you of the process but there is also an example below.

Example - Using P.T. then finding the perimeter.



$x^2 = 35^2 + 12^2$

$x^2 = 1\,369$

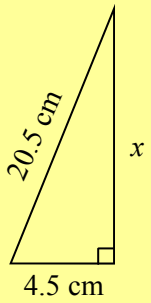
$x = \sqrt{1\,369}$

$x = 37 \text{ m}$

$P = 12 + 35 + 37 = 84 \text{ m}$

Column 3 deals with finding the area of a triangle. Again, like above you will need to use P.T. first to calculate the unknown side. Then use the area formula: $A = \frac{1}{2}bh$.

Example - Using P.T. then finding the area.



$x^2 = 20.5^2 - 4.5^2$

$x^2 = 400$

$x = \sqrt{400}$

$x = 20 \text{ cm}$

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 4.5 \times 20$

$A = 45 \text{ cm}^2$

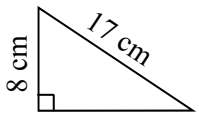
Pythagoras - Area and Perimeter Applications

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the perimeter for these triangles.

Example

Add all the sides

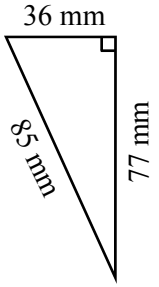


$P = 8 + 15 + 17$

$P = 40$ cm

Remember the units

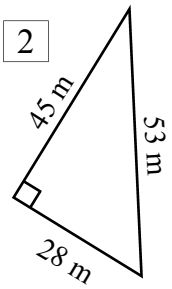
1



$P =$

$P =$ mm

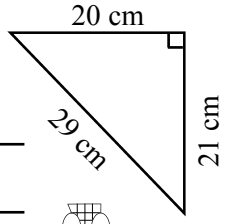
2



$P =$

$P =$

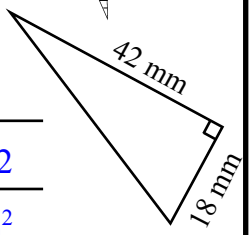
3



Now find the area.

Remember ½ = 0.5

4

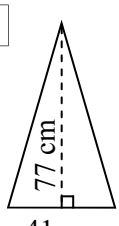


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 18 \times 42$

$A =$ mm^2

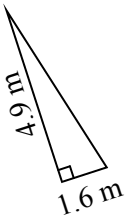
5



$A =$

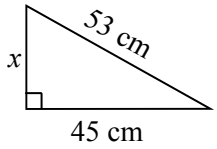
$A =$ cm^2

6



Calculate the missing side using Pythagoras Theorem then find the perimeter.

7



$x^2 =$

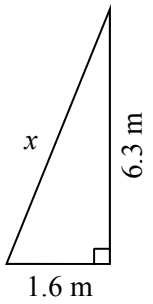
$x^2 =$

$x = \sqrt{}$

$x =$

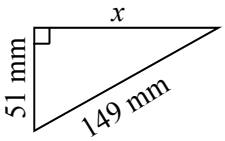
$P =$ + + = cm

8

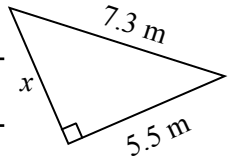


$P =$

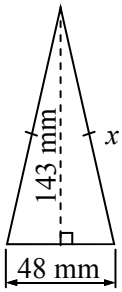
9



10

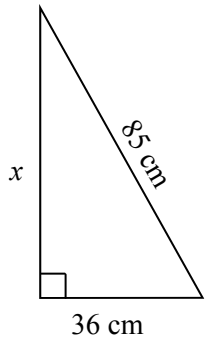


11



Now find the area. You need the base and the perpendicular height.

12



$x^2 =$

$x^2 =$

$x =$

$x =$

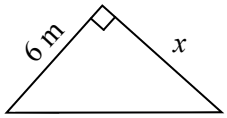
$A = \frac{1}{2}bh$

$= \quad \times \quad \times$

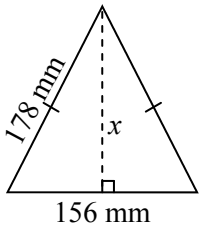
$A =$ cm^2

Area is measured in square units

13



14

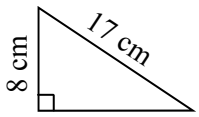


Pythagoras - Area and Perimeter Applications

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the perimeter for these triangles.

Example



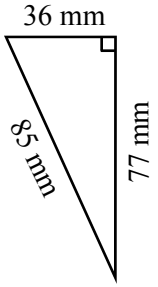
Add all the sides

$P = 8 + 15 + 17$

$P = 40$ cm

Remember the units

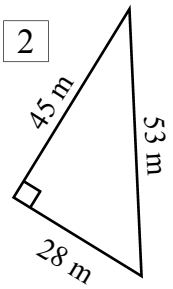
1



$P = 36 + 77 + 85$

$P = 198$ mm

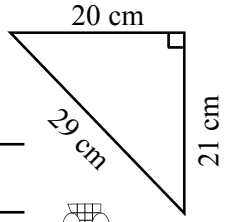
2



$P = 45 + 28 + 53$

$P = 126$ m

3



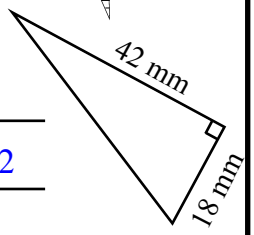
$P = 20 + 21 + 29$

$P = 70$ cm

Now find the area.

Remember ½ = 0.5

4

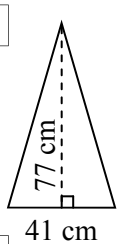


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 18 \times 42$

$A = 378$ mm^2

5

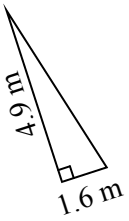


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 41 \times 77$

$A = 1\,578.5$ cm^2

6



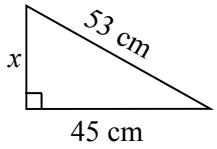
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 1.6 \times 4.9$

$A = 3.92$ m^2

Calculate the missing side using Pythagoras Theorem then find the perimeter.

7



$x^2 = 53^2 - 45^2$

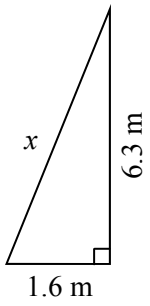
$x^2 = 784$

$x = \sqrt{784}$

$x = 28$ cm

$P = 28 + 45 + 53 = 126$ cm

8



$x^2 = 1.6^2 + 6.3^2$

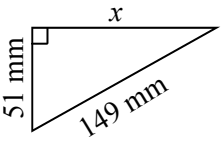
$x^2 = 42.25$

$x = \sqrt{42.25}$

$x = 6.5$ m

$P = 1.6 + 6.3 + 6.5 = 14.4$ m

9



$x^2 = 149^2 - 51^2$

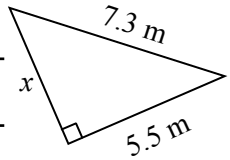
$x^2 = 19\,600$

$x = \sqrt{19\,600}$

$x = 140$ mm

$P = 51 + 140 + 149 = 340$ mm

10



$x^2 = 7.3^2 - 5.5^2$

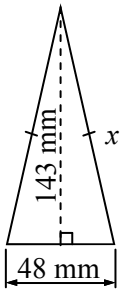
$x^2 = 23.04$

$x = \sqrt{23.04}$

$x = 4.8$ m

$P = 5.5 + 7.3 + 4.8 = 17.6$ m

11



$x^2 = 24^2 + 143^2$

$x^2 = 21\,025$

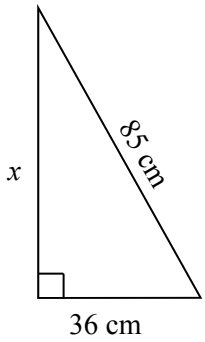
$x = \sqrt{21\,025}$

$x = 145$ mm

$P = 48 + 2 \times 145 = 338$ mm

Now find the area. You need the base and the perpendicular height.

12



$x^2 = 85^2 - 36^2$

$x^2 = 5\,929$

$x = \sqrt{5\,929}$

$x = 77$ cm

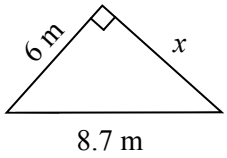
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 36 \times 77$

$A = 1\,386$ cm^2

Area is measured in square units

13



$x^2 = 8.7^2 - 6^2$

$x^2 = 39.69$

$x = \sqrt{39.69}$

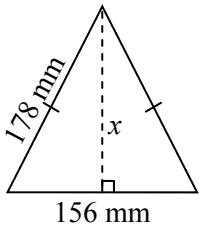
$x = 6.3$ m

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 6 \times 6.3$

$A = 18.9$ cm^2

14



$x^2 = 178^2 - 78^2$

$x^2 = 25\,600$

$x = \sqrt{25\,600}$

$x = 160$ mm

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 156 \times 160$

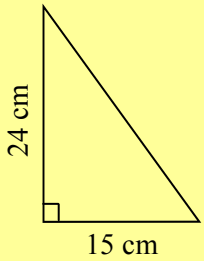
$A = 12\,480$ mm^2

Pythagoras - Further Area and Perimeter Applications

Perimeter is measurement of distance, the distance around a shape. So to find the perimeter of a triangle you add all the side lengths together. This sheet features problems which will require subtraction or some other calculation before applying Pythagoras Theorem. The questions can be challenging and so the previous 'Perimeter and Area' sheet should be attempted first.

The area of a triangle is found by $A = \frac{1}{2}bh$ which is 'a half times the base times the height'. Note that ½ = 0.5, it may be easier to type '0.5' into your calculator, also note that the 'base' isn't necessarily on the bottom of the triangle, due to rotation. Below is an example of finding the area of a triangle.

Example - Area of a Triangle



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 15 \times 24$

$A = 180 \text{ cm}^2$

Column 1 is calculating the perimeter of a shape. These are composite shapes which require you to calculate either two or three unknown lengths before you can find the perimeter.

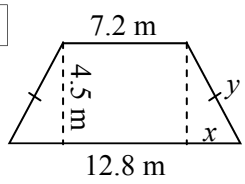
Column 2 and Column 3 are area questions, calculate all required sides first, then calculate the two areas individually and add them together. Question 6 is a subtraction question, with two identical triangles being removed from a rectangle to form the composite shape.

Pythagoras - Further Area and Perimeter Applications

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the missing side length(s) then find the perimeter in metres.

1



Find x first then use P.T. to find y

$x = \dfrac{\text{-}}{2}$ $\quad y^2 =$

$y^2 =$

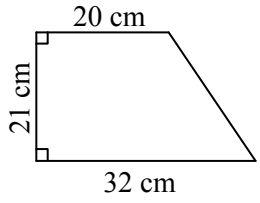
$x =$ m $\quad y = \sqrt{}$

$y =$

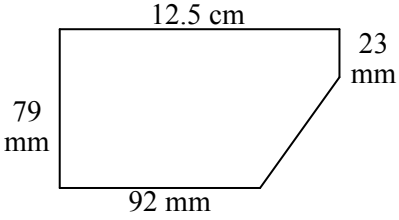
P = + + 2 ×

P = m

2

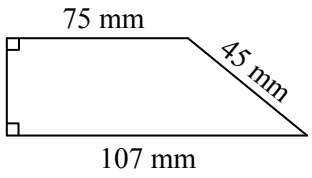


3



Now find the area. Answer to 1 d.p. when required.

4



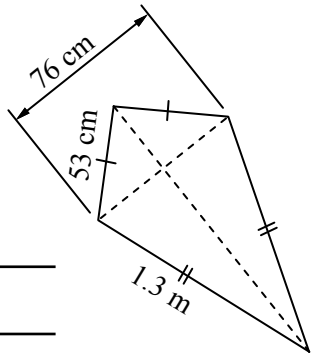
$A_1 = lb$ $\quad A_2 = \frac{1}{2}bh$

= $\quad$ =

$A_1 =$ mm^2 $\quad A_2 =$ mm^2

$A_T =$ + = mm^2

5



$A_1 =$ $\quad A_2 =$

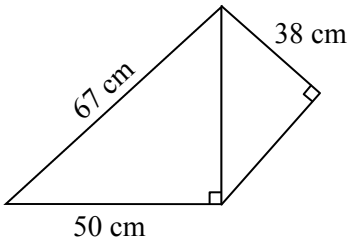
7

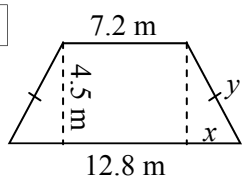


Pythagoras - Further Area and Perimeter Applications

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the missing side length(s) then find the perimeter in metres.

1



Find x first then use P.T. to find y

$x = \dfrac{12.8 - 7.2}{2}$

$x = 2.8$ m

$y^2 = 2.8^2 + 4.5^2$

$y^2 = 28.09$

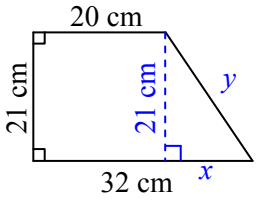
$y = \sqrt{28.09}$

$y = 5.3$ m

$P = 12.8 + 7.2 + 2 \times 5.3$

$P = 30.6$ m

2



$x = 32 - 20$

$x = 12$ cm

$y^2 = 12^2 + 21^2$

$y^2 = 585$

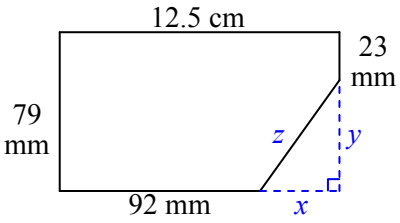
$y = \sqrt{585}$

$y = 24.2$ m

$P = 20 + 24.2 + 32 + 21$

$P = 97.2$ cm $= 0.972$ m

3



$x = 125 - 92$

$x = 33$ mm

$y = 79 - 23$

$y = 56$ mm

$z^2 = 33^2 + 56^2$

$z^2 = 4\,225$

$z = \sqrt{4\,225}$

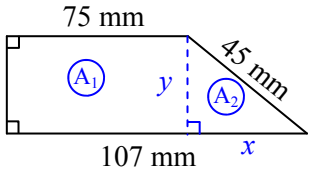
$z = 65$ mm

$P = 79 + 125 + 23 + 65 + 92$

$P = 384$ mm $= 0.384$ m

Now find the area. Answer to 1 d.p. when required.

4



$x = 107 - 75$

$x = 32$ mm

$y^2 = 45^2 - 32^2$

$y^2 = 1\,001$

$y = \sqrt{1\,001}$

$y = 31.6$ mm

$A_1 = lb$

$= 75 \times 31.6$

$A_1 = 2\,370$ mm^2

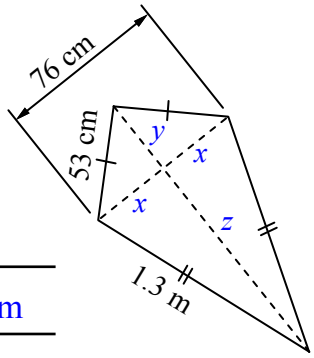
$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 32 \times 31.6$

$A_2 = 505.6$ mm^2

$A_T = 2\,370 + 505.6 = 2875.6$ mm^2

5



$2x = 76$

$x = 38$ cm

$y^2 = 53^2 - 38^2$

$y^2 = 1\,365$

$y = \sqrt{1\,365}$

$y = 36.9$ cm

$z^2 = 130^2 - 38^2$

$z^2 = 15\,456$

$z = \sqrt{15\,456}$

$z = 124.3$ cm

$A_1 = \frac{1}{2}bh$

$= \frac{1}{2} \times 76 \times 36.9$

$A_1 = 1\,402.2$ cm^2

$A_2 = \frac{1}{2}bh$

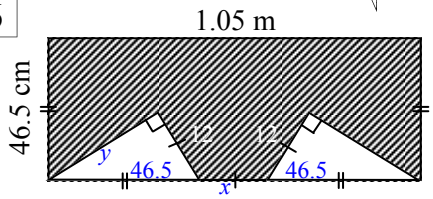
$= \frac{1}{2} \times 76 \times 124.3$

$A_2 = 4\,723.4$ cm^2

$A_T = 1402.2 + 4\,723.4 = 6\,125.6$ cm^2

Find the area, shaded area in Q6, to 1 d.p.

6



$x = 105 - 2 \times 46.5$

$x = 12$ cm

$y^2 = 46.5^2 - 12^2$

$y^2 = 2\,018.25$

$y = \sqrt{2\,018.5}$

$y = 44.9$ cm

$A_1 = lb$

$= 105 \times 46.5$

$A_1 = 4\,882.5$ cm^2

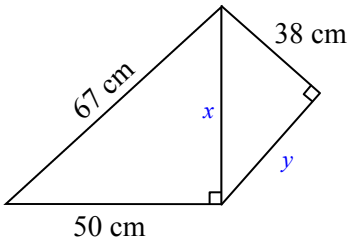
$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 44.9 \times 12$

$A_2 = 269.4$ cm^2

$A_S = 4\,882.5 - 2 \times 269.4 = 4343.7$ cm^2

7



$x^2 = 67^2 - 50^2$

$x^2 = 1\,989$

$x = \sqrt{1\,989}$

$x = 44.6$ cm

$y^2 = 44.6^2 - 38^2$

$y^2 = 545.16$

$y = \sqrt{545.16}$

$y = 23.3$ cm

$A_1 = \frac{1}{2}bh$

$= \frac{1}{2} \times 50 \times 44.6$

$A_1 = 1\,115$ cm^2

$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 38 \times 23.3$

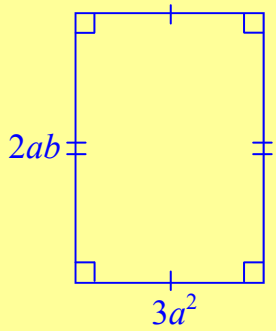
$A_2 = 442.7$ cm^2

$A_T = 1\,115 + 442.7 = 1\,557.7$ cm^2

Further Area and Perimeter - Algebraic Application

This sheet applies Algebraic skills to Area and Perimeter exercises. The skills to complete this worksheet are taught in the Algebra chapter (Chapter 5). This sheet is a sheet built up from the last columns of three algebra sheets, if you require a refresher on the skills required then you should refer to the Further Adding, Further Multiplying and Further Expanding worksheets. There is an example in column 1 for finding the perimeter, below are some examples for the second and third column.

Column 2 Example - Finding the Area



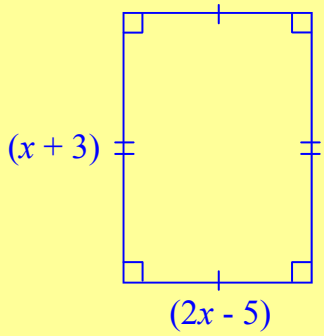
$A = lb$ ← Write the Area formula

$= 2ab \times 3a^2$ ← Substitute the side lengths

$A = 6a^3b$ units^2 ← Simplify, remember the units.

Column 3 Example - Finding the Area

This column requires you to use the 'foil' method to find the area.



$A = lb = (x + 3)(2x - 5)$ ← Write the Area formula and substitute

$= 2x^2 - 5x + 6x - 15$ ← Expand the expression using FOIL

$A = 2x^2 + x - 15$ units^2 ← Collect like terms, remember the units.

Further Area and Perimeter - Algebraic Application

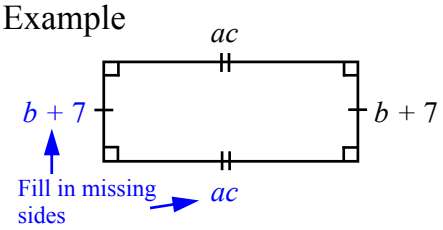
Further Area and Perimeter - Algebraic Application

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use your algebra skills to give an expression for the perimeter of the shapes below. Collect like terms.

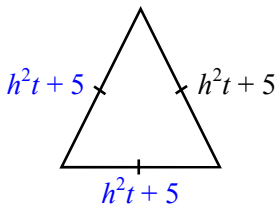
Example



$P = ac + ac + b + 7 + b + 7$

$P = 2ac + 2b + 14$ units

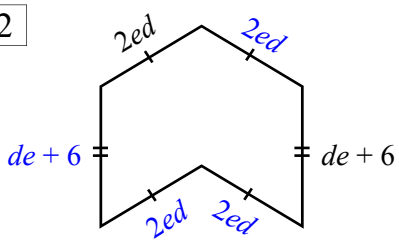
1



$P = h^2t + 5 + h^2t + 5 + h^2t + 5$

$P = 3h^2t + 15$ units

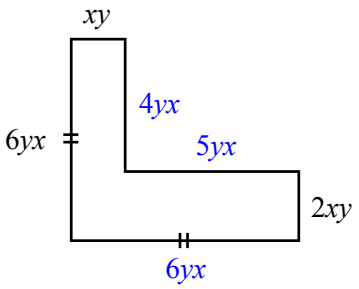
2



$P = 4 \times 2ed + de + 6 + de + 6$

$P = 10ed + 12$ units

3



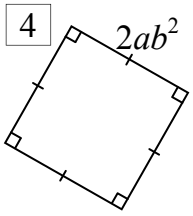
$P = xy + 4xy + 5xy + 2xy + 6xy$

$+ 6xy$

$P = 12xy$ units

Give an algebraic expression for the areas of these shapes.

4

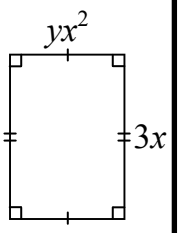


$A = l^2$

$= 2ab^2 \times 2ab^2$

$A = 4a^2b^4$ units^2

5

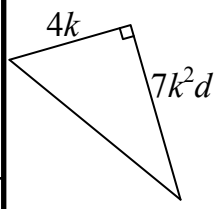


$A = lb$

$= 3x \times yx^2$

$A = 3yx^3$ units^2

6

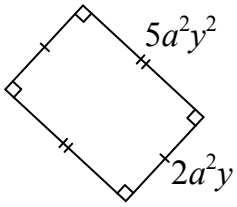


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 4k \times 7k^2d$

$A = 14k^3d$ units^2

7

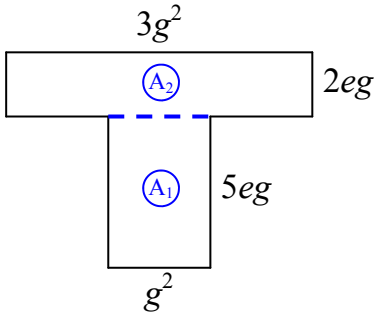


$A = lb$

$= 5a^2y^2 \times 2a^2y$

$A = 10a^4y^3$ units^2

8



$A_1 = lb$

$= 5eg \times g^2$

$A_1 = 5eg^2$ units^2

$A_2 = lb$

$= 2eg \times 3g^2$

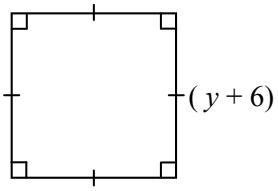
$A_2 = 6eg^2$ units^2

$A = 5eg^2 + 6eg^2$

$A = 11eg^2$ units^2

Find an expression for the area of these shapes, fully expand and simplify your answer.

9

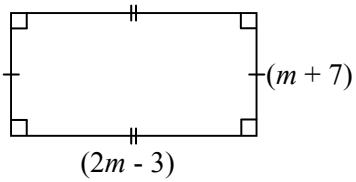


$A = l^2 = (y + 6)(y + 6)$

$= y^2 + 6y + 6y + 36$

$A = y^2 + 12y + 36$ units^2

10

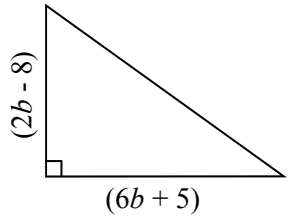


$A = lb = (m + 7)(2m - 3)$

$= 2m^2 - 3m + 14m - 21$

$A = 2m^2 + 11m - 21$ units^2

11



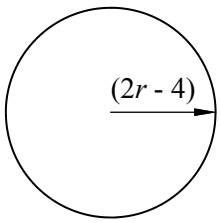
$A = \frac{1}{2}bh = \frac{1}{2} \times (2b - 8)(6b + 5)$

$= (b - 4)(6b + 5)$

$= 6b^2 + 5b - 24b - 20$

$A = 6b^2 - 19b - 20$ units^2

12



$A = \pi r^2 = \pi \times (2r - 4)(2r - 4)$

$= (2\pi r - 4\pi)(2r - 4)$

$= 4\pi r^2 - 8\pi r - 8\pi r + 16\pi$

$A = 4\pi r^2 - 16\pi r + 16\pi$ units^2

Perimeter/Area - Find a Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don't colour it in too dark (using a texta for example) so that you can still read it.

Completing Number Patterns

To complete number patterns either a "rule" is required which tells you how the number pattern is created, or, enough numbers (usually 4) are needed to determine the rule yourself. Once the rule has been found the last number is used to find the next one and so on.

In column 1 the rule is given, use the last number given and put it in the rule to get the first missing number. Then using the new number, put it in the rule and get the next missing value, and so on.

In column 2 you are asked to create the next pattern by building it with matchsticks. Then find the missing numbers to extend the pattern. Then write the rule in words as you were given in the first column.

Column 3 has number patterns, note how the numbers are changing and carry on the process for the unknown numbers in the boxes. The last few questions are more difficult and require two operations, for example multiplying by two an subtracting one.

Completing Number Patterns

Complete the patterns by finding the missing numbers

1 Start with 2, "add" 3

→ 2, 5, 8, ☐, ☐

2 Start with 21, "subtract" 3

→ 21, 18, 15, ☐, ☐

3 Start with 5, "add" 5

→ 5, 10, ☐, 20, ☐

4 Start with 5, "multiply by" 2

→ 5, 10, ☐, 40, ☐, ☐

5 Start with 80, "divide by" 2

→ 80, 40, ☐, ☐, ☐

6 Start with 25, "subtract" 5

→ 25, 20, ☐, ☐, ☐

7 Start with 2, "multiply by" 2 then add 1

→ 2, 5, 11, ☐, ☐, ☐

8 Start with 5, "multiply by" 3 then subtract 5

→ 5, 10, ☐, 70, ☐, ☐

9 Start with 6, "multiply by" 2 then subtract 4

→ 6, 8, ☐, ☐, ☐, ☐

10 Start with 3, "multiply by" 2 then add 1

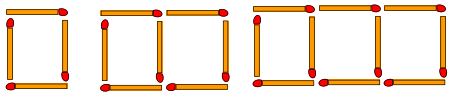
→ 3, 7, ☐, ☐, ☐, ☐

11 Start with 100, "divide by" 2 then add 2

→ 100, 52, ☐, ☐, ☐

Draw the next match-stick pattern then complete the numbers and pattern in words below it.

12

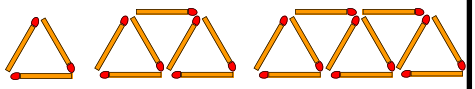


4th → pattern

4, 7, 10, ☐, ☐, ☐, ☐

Start with ☐ "add" ☐

13

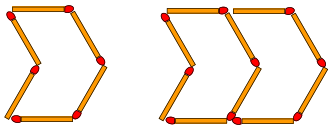


4th → pattern

3, 7, ☐, ☐, ☐, ☐

Start with ☐ ___ ☐

14



3rd → pattern

6, 10, ☐, ☐, ☐, ☐

___ ☐ ___ ☐

15

Writing Algebraic Expressions

An algebraic expression involves pronumerals (which are letters), like a, b, etc. Why use letters in mathematics? A letter can be used to represent different numbers, so it is a quick way to use the same 'formula' over and over.

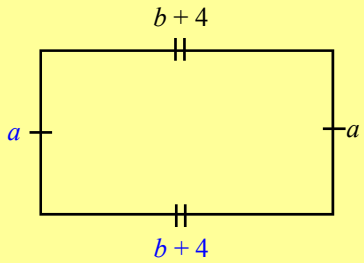
To write expressions in words there are several words that should be understood:
addition - increase, raise, sum of, plus, and add.
subtraction - decrease, reduce, subtract, minus and take away.
division - divide, over, find the quotient (answer after division).
multiplication - times, product of, multiply, lots of
squared - square of, multiplied by itself

In Column 1 write the algebraic expression that the sentence describes, this is sometimes not straight-forward. E.g. Subtract g^2 from the product of 9 and $m \rightarrow 9 \times m - g^2$
While g^2 is written first in the sentence, it is the last mathematical operation to be completed so it is written last in the expression.

Column 2 is the reverse of column 1, construct the sentences given the expression. Some will require order of operations to be considered so be careful.

Column 3 requires an expression for the perimeter of the shapes, write each side separated by a '+' sign, then add the numbers together to get a total but leave the letters as they are. Different letters are left with plus signs between them, you are about to learn how to add pronumerals, but for this exercise this is not required.

Example.



$P = b + 4 + a + b + 4 + a$
$= b + b + a + a + 8$ (leave your answer like this or simplify as below)
$= 2b + 2a + 8$

Writing Algebraic Expressions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Read the sentences and write algebraic expressions to describe them.

Example

Increase 15 by t squared

$15 + t^2$

1 The sum of g and 20

2 Decrease w by 29

3 Multiply 5 by d

4 From 15 subtract u

5 The sum of a, b and c

6 Raise 16 by r squared

7 Reduce b by 870

8 Subtract 38 from the sum of w and a

9 Reduce the quotient of 20 and q by 8

10 From the product of m and 9 subtract 6

This time write a sentence that matches the algebraic expressions below

Use words like: squared, times, increase, decrease, raise, reduce, sum of, subtract, product, plus, divide, multiply, minus and add.

11 $2 \times m$

12 $k + 5 - d$

* order of operations

13 $a + 2 \times b$*

14 $854 \div 3 \times f$

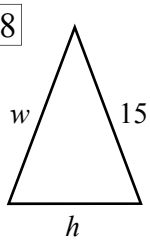
15 $9 + h \times c$

16 $a^2 + 25 - q$

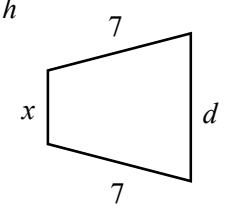
17 $x^2 - 3 \times a$

Construct an algebraic expression for the perimeter of the shapes below.

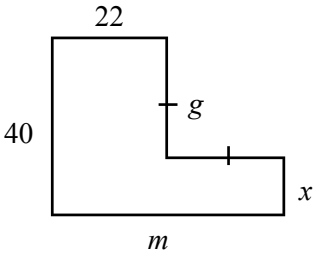
18



19

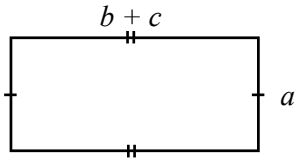


20

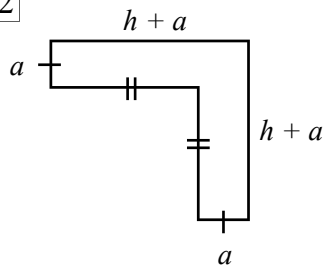


These two are harder

21



22



Writing Algebraic Expressions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Read the sentences and write algebraic expressions to describe them.

Example

Increase 15 by t squared

$15 + t^2$

1 The sum of g and 20

$g + 20$

2 Decrease w by 29

$w - 29$

3 Multiply 5 by d

$5 \times d$

4 From 15 subtract u

$15 - u$

5 The sum of a, b and c

$a + b + c$

6 Raise 16 by r squared

$16 + r^2$

7 Reduce b by 870

$b - 870$

8 Subtract 38 from the sum of w and a

$w + a - 38$

9 Reduce the quotient of 20 and q by 8

$20 \div q - 8$

10 From the product of m and 9 subtract 6

$m \times 9 - 6$

This time write a sentence that matches the algebraic expressions below

Use words like: squared, times, increase, decrease, raise, reduce, sum of, subtract, product, plus, divide, multiply, minus and add.

11 $2 \times m$

The product of 2 and m

12 $k + 5 - d$

From the sum of k and 5

subtract d

* order of operations

13 $a + 2 \times b$*

To the product of 2 and b add a

14 $854 \div 3 \times f$

Divide 854 by 3 then multiply

the quotient by f

15 $9 + h \times c$

To the product of h and c add 9

16 $a^2 + 25 - q$

From the sum of a squared and

25, subtract q

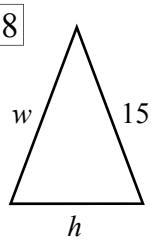
17 $x^2 - 3 \times a$

From x squared subtract the

product of 3 and a

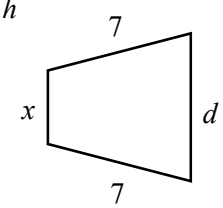
Construct an algebraic expression for the perimeter of the shapes below.

18



$P = w + h + 15$

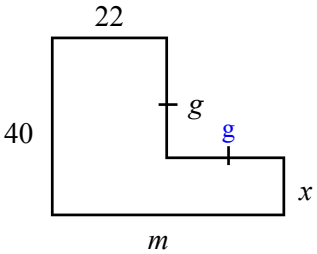
19



$P = x + d + 7 + 7$

$P = x + d + 14$

20

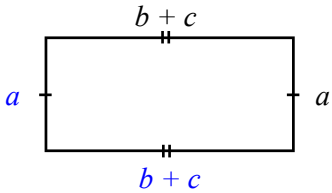


$P = 40 + 22 + g + g + x + m$

$P = 62 + 2g + x + m$

These two are harder

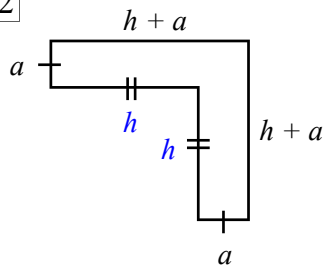
21



$P = a + b + c + a + b + c$

$P = 2a + 2b + 2c$

22



$P = a + h + a + h + a + a + h + h$

$P = 4a + 4h$

Algebraic Expressions - Adding and Subtracting

Think of algebra as being items. Standing at a street corner you may see trucks, cars and buses. If you see 3 trucks ($3t$) and 2 buses ($2b$) you can't add these together, so: $3t + 2b$ remains as $3t + 2b$. If you see 3 cars then 2 buses then 4 more cars, you have seen a total of 7 cars and 2 buses, or $3c + 2b + 4c = 7c + 2b$.

So 'like' terms (the same letter) can be added and subtracted but not different letters.

The same with numbers and terms. Numbers can be collected together and the letters can be collected together but letters can't be added/subtracted with numbers.
For example,

$3 + 4c + 4 + 5c - 2 \quad = 9c + 5 \quad (4c + 5c = 9c \quad \text{and} \quad 3 + 4 - 2 = 5)$

A common mistake is to write a '1' in front of a single letter, this isn't fully simplifying your answer.
For example,

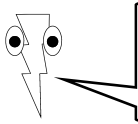
$5b - 7 + 2b - 6b \quad = b - 7$ (don't write this as $1b - 7$).

Just like numbers, when the same term is subtracted from itself it will give zero.
Example,

$5f + 2 - 3f - 2f = 2 \quad (\text{as } 5f - 3f - 2f = 0)$

Algebraic Expressions - Adding and Subtracting

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE



Simplify these, remember that you don't write a 1 in front of a letter, $1m = m$

1 $t + t$

2 $k + 2k$

3 $6m - 4m$

4 $12i + 3i$

5 $2j + 5j$

6 $16e - 9e$

7 $9x + 5x + 3x$

8 $12b + 9b + 4b$

9 $6n + 2n + n$

10 $t + 6t - 2t$

11 $3e + 5e - 4e$

12 $12r - 7r + 2r$

13 $11k - 7k - 4k$

14 $24h - 9h - 14h$

15 $2c + 5c + 7c$

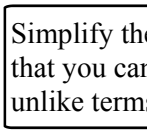
16 $u + 5u - 2u$

17 $6d - 3d - 2d$

18 $14q - 11q - 3q$

19 $8v - 2v - 3v$

20 $12s + 3s - 14s$



Simplify these, remember that you can't add/subtract unlike terms.

21 $a + g + a$

22 $2e + c + e$

23 $4h + 3h + 2d$

24 $10m - 3n - m$

25 $2c - 7q + 3c$

26 $9k + 3k + n$

27 $3e + 2f - f$

28 $m + p - m$

29 $4d - 2m + d$

30 $6m + 3b - 5m$

31 $2d + 3d - h$

32 $t + 5e - t$

33 $5e - 2e + q$

34 $3a - 2d - 2a$

35 $4c + 2b - b$

36 $6w + n - 6w$

37 $6n - 3n + 2d$

38 $2f + 3f + f - 2d$

39 $a + b + a + b$

40 $d + 3d + 3e$

Simplify these, remember that you can't add/subtract numbers and terms.

41 $2a + 3 + 2a$

42 $5e + 4 - 4e$

43 $10d - 3d - 6$

44 $3 + 4q + 2 - q$

45 $4y + 12 - 3y$

46 $4k + 2 + 5 - k$

47 $a + 2 + 2a - 1$

48 $2d - 5 + 4d$

49 $5 + 3e - 2 + e$

50 $t + 4 - t - 2$

51 $3v - 6 - 2v$

52 $10 + 2b - 5$

53 $a + 8 - a + 8$

54 $6x - 10 + 4x$

55 $9m + 6 - 8m$

56 $5 + b - 4 + b$

57 $2f - 10 - f$

58 $10 + k + 15$

59 $h + 3 + h + 1$

60 $y + 2y - 3 + y$

59	$h + 3 + h + 1$	$2h + 4$
60	$y + 2y - 3 + y$	$4y - 3$

Algebraic Expressions - Further Adding and Subtracting

To add and subtract terms they must be like. For example:
$5a + 2a = 7a$
$7bc - 6bc = bc$
$3ab + 2ba = 5ba$ (or $5ab$)

However unlike terms can't be added together:
$4c + 3a = 4c + 3a$
$7qm - 3q = 7qm - 3q$
$3ab - a - 3b = 3ab - a - 3b$

The order of the letters doesn't matter: $4bc = 4cb$, $5xqm = 5qxm = 5mqx$ so terms can be added when the letters are the same but in a different order.

The same applies to indexed terms, terms that have a power. Such as $3b^2$, $5d^2f$ and $2x^2y^2$. Terms with different powers can't be added or subtracted. But you can add/subtract these:
$a^2 + 3a^2 = 4a^2$
$5x^2y - 2yx^2 = 3x^2y$

But not these :
$a^2 + 2a = a^2 + 2a$,
$3e^2 - 3ed = 3e^2 - 3ed$
$5x^2y - 2xy^2 = 5x^2y - 2xy^2$

Remember that the order doesn't matter $3k^2mw^2 = 3mk^2w^2 = 3w^2mk^2$, so long as the powers are on the same letters the terms are like.

The final column requires the missing sides to be found and then the sides added together to get the perimeter. Follow the example at the top of the column.

Algebraic Expressions - Further Adding and Subtracting

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Collect like terms and simplify.

Example

$bx + b + 5 + 2xb + 3b + 7$

$= 3xb + 4b + 12$

1 $3a + 5t + 3 - a + 6 + 4t$

2 $12d + 2a + 16 - 5d - 9 + 3a$

3 $5 + a + b + 6 + 2ab + 3b$

4 $30ue + 15e - 5e - u$

5 $17 + 20as - 3 - 15sa - 3as$

6 $5 + 5m + 21 - 4m + 3ma$

Watch out for negatives

7 $4ux + 3xa - 7xu - 3ax$

8 $at - 2ta - 4at + 5 + a$

9 $-4kd - 13 - 5dk + 8 - kd$

10 $5tu + 4 - 12ut - t - 9$

11 $at - 5a - 11 - 5ta + 11a$

12 $-3mx - 18 + 4xm + 6 - mx$

Collect like terms, this time using powers. (^{2})

Example

$50 + a^2 + 3a + 17 - 2a + 3a^2$

$= 4a^2 - a + 67$

13 $17 + 2m^2 - m + m^2 + 14m$

14 $2h^2 - 8 - 3h^2 + 4 - 4h^2$

15 $9k^2 + 14k - 12 - 8k^2 - 7 - 6k$

16 $9r^2 + 5tr + 7 - 3r^2 - 16 - 2rt$

17 $13e - 5e^2 - 8e - 2e^2 + 3 - 4e$

18 $9fg^2 + 3f^2g + 3g^2f$

19 $10yt^2 + 5t^2y + 3y^2t$

20 $5a^2 + 3a^2t - 3a^2 - 2ta^2 - at^2$

21 $y^2 + 2xy^2 + 3y^2 - y^2x^2 - y^2x$

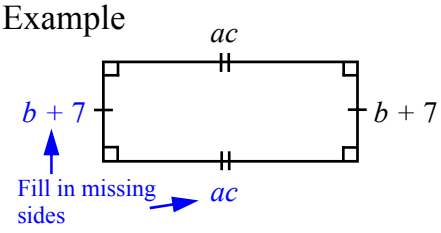
22 $-ab^2 + ba^2 - 5 + 2a^2 - 4a^2b$

23 $x^3y^2z - zy^3x^2 - x^2zy^3 + y^3zx^3$

24 $20t^2s^3 + s^2t^3 - 15s^3t^2 - 9t^3s^2$

Use your algebra skills to give an expression for the perimeter of the shapes below. Collect like terms.

Example



$P = ac + ac + b + 7 + b + 7$

$P = 2ac + 2b + 14$ units

Algebraic Expressions - Further Adding and Subtracting

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Collect like terms and simplify.

Example

$bx + b + 5 + 2xb + 3b + 7$

$= 3xb + 4b + 12$

1 $3a + 5t + 3 - a + 6 + 4t$

$= 2a + 9t + 9$

2 $12d + 2a + 16 - 5d - 9 + 3a$

$= 7d + 5a + 7$

3 $5 + a + b + 6 + 2ab + 3b$

$= 11 + a + 4b + 2ab$

4 $30ue + 15e - 5e - u$

$= 30ue + 10e - u$

5 $17 + 20as - 3 - 15sa - 3as$

$= 14 + 2as$

6 $5 + 5m + 21 - 4m + 3ma$

$= 26 + m + 3ma$

Watch out for negatives

7 $4ux + 3xa - 7xu - 3ax$

$= -3ux$

8 $at - 2ta - 4at + 5 + a$

$= -5at + 5 + a$

9 $-4kd - 13 - 5dk + 8 - kd$

$= -10kd - 5$

10 $5tu + 4 - 12ut - t - 9$

$= -8tu - 5 - t$

11 $at - 5a - 11 - 5ta + 11a$

$= -4at + 6a - 11$

12 $-3mx - 18 + 4xm + 6 - mx$

$= -12$

Collect like terms, this time using powers. (^{2})

Example

$50 + a^2 + 3a + 17 - 2a + 3a^2$

$= 4a^2 - a + 67$

13 $17 + 2m^2 - m + m^2 + 14m$

$= 17 + 3m^2 + 13m$

14 $2h^2 - 8 - 3h^2 + 4 - 4h^2$

$= -5h^2 - 4$

15 $9k^2 + 14k - 12 - 8k^2 - 7 - 6k$

$= k^2 + 8k - 19$

16 $9r^2 + 5tr + 7 - 3r^2 - 16 - 2rt$

$= 6r^2 + 3tr - 9$

17 $13e - 5e^2 - 8e - 2e^2 + 3 - 4e$

$= -7e^2 + e + 3$

18 $9fg^2 + 3f^2g + 3g^2f$

$= 12fg^2 + 3f^2g$

19 $10yt^2 + 5t^2y + 3y^2t$

$= 15yt^2 + 3y^2t$

20 $5a^2 + 3a^2t - 3a^2 - 2ta^2 - at^2$

$= 2a^2 + a^2t - 3a^2 - at^2$

21 $y^2 + 2xy^2 + 3y^2 - y^2x^2 - y^2x$

$= 4y^2 + xy^2 - y^2x^2$

22 $-ab^2 + ba^2 - 5 + 2a^2 - 4a^2b$

$= -ab^2 - 3ba^2 - 5 - 2a^2$

23 $x^3y^2z - zy^3x^2 - x^2zy^3 + y^3zx^3$

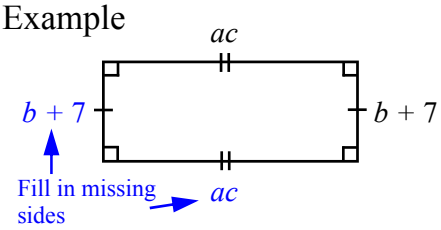
$= x^3y^2z - 2x^2zy^3 + y^3zx^3$

24 $20t^2s^3 + s^2t^3 - 15s^3t^2 - 9t^3s^2$

$= 5t^2s^3 - 8t^3s^2$

Use your algebra skills to give an expression for the perimeter of the shapes below. Collect like terms.

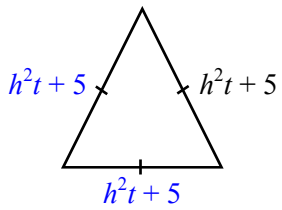
Example



$P = ac + ac + b + 7 + b + 7$

$P = 2ac + 2b + 14$ units

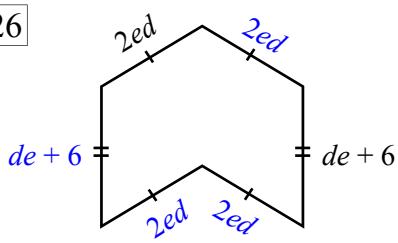
25



$P = h^2t + 5 + h^2t + 5 + h^2t + 5$

$P = 3h^2t + 15$ units

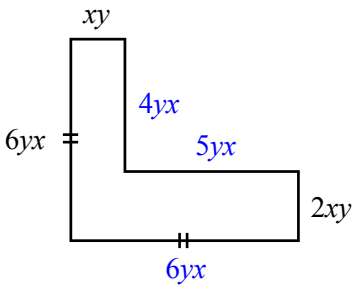
26



$P = 4 \times 2ed + de + 6 + de + 6$

$P = 10ed + 12$ units

27



$P = xy + 4xy + 5xy + 2xy + 6xy$

$+ 6xy$

$P = 12xy$ units

Multiplying Algebraic Terms

We show multiplication between numbers and pronumerals as the number first then the letter. For example, $2 \times a = 2a$, $5 \times d = 5d$ and $4 \times a \times d = 4ad$ (or $4da$).

When several numbers and letters are mixed up, calculate the product of the numbers first, then the letters. For example, $5e \times 2g = 10eg$. Note that when the same letter is featured twice a squared term will result. E.g. $3q \times 5q = 15q^2$. A letter times itself is that letter squared. ($a \times a = a^2$, $c \times c = c^2$ etc.)

Column 1 starts with multiplications as above, Q. 9 features a times table, multiply just as you would with a normal number times table, only the answers will include algebraic terms. From Q.15 negative numbers are involved. When you multiply negative numbers …..

Negative × Positive = Negative (different signs = negative)
Positive × Negative = Negative (different signs = negative)
Negative × Negative = Positive (same signs = Positive)

Remember that three negatives swap the sign back to negative again.

Negative × Negative × Negative = Positive × Negative = Negative

Column 2 builds on the previous column. This time an addition or subtraction are included and you have to consider order of operations principles. Remember to do the × before the + or -. There is an example at the top of the column.

Column 3 is the same as the first two columns, except that it involves shapes. To find the area of squares and rectangles you multiply the sides. So these are multiplication questions like Column 1. Remember that area is measured in square units, as there are no units given you write 'units^2' in the final answer. The last two questions are composite areas, so these questions are much like Column 2.

26 $(-y) \times (-y) \times (-y)$ $-y^3$

Addition & subtraction now involved. Simplify these.

Example $3am \times 2m - a \times 2m^2$

$= 6am^2 - 2am^2$

$= 4am^2$

27 $7e \times 2 - 4 \times 3e$

$=$ $14e$ $-$ $12e$

$= 2e$

28 $p \times 4a + 5a \times 2p$

$=$ $4ap$ $+$ $10ap$

$= 14ap$

29 $3ab \times 3a - 8a^2 \times (-b)$

$= 9a^2b - (-8a^2b)$

$= 17a^2b$

30 $10k - 5k \times 2 + 7$

$= 10k - 10k + 7$

$= 7$

31 $-2g \times ag + 3a \times 5g^2$

$= -2ag^2 + 15ag^2$

$= 13ag^2$

32 $6ac \times 2 - 3a \times (-4c)$

$= 12ac - (-12ac)$

$= 24ac$

33 $6em - 7e \times 2m + 8e$

$= 6em - 14em + 8e$

$= -8em + 8e$

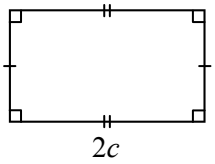
34 $3 \times b - b \times (-3) + 3 \times (-b)$

$= 3b - (-3b) + (-3b)$

$= 3b$

Find the area of these shapes.

Example

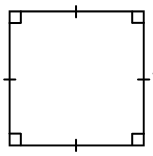


$A = lb$

$= 3q \times 2c$

$A = 6qc$ units^2

35

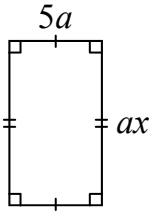


$A = l^2$

$=$ $7x$ $\times$ $7x$

$A =$ $49x^2$ units^2

36

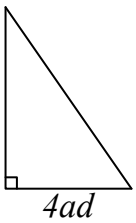


$A = lb$

$=$ $5a$ $\times$ ax

$A =$ $5a^2x$ units^2

37

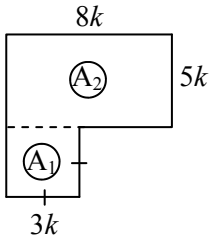


$A = \frac{1}{2}bh$

$=$ $\frac{1}{2}$ $\times$ $4ad$ $\times$ de

$A =$ $2ad^2e$ units^2

38



$A_1 = l^2$

$= (3k)^2$

$A_1 = 9k^2$ units^2

$A_2 = lb$

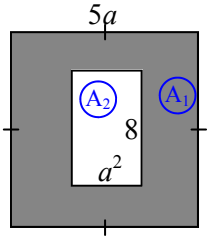
$= 8k \times 5k$

$A_2 = 40k^2$ units^2

$A =$ $9k^2$ $+$ $40k^2$

$A = 40k^2$ units^2

39 *Shaded Area



$A_1 = l^2$

$= (5a)^2$

$A_1 = 25a^2$ units^2

$A_2 = lb$

$= 8 \times a^2$

$A_2 = 8a^2$ units^2

$A = 25a^2 - 8a^2$

$A_2 = 17a^2$ units^2

Multiplying Algebraic Terms - Powers

When you multiply algebraic terms you write the terms next to each other.
Example $t \times a \times g = tag$

But when letters are the same, powers are involved.
Example $t \times g \times t = tgt$ but this is equal to t^2g or gt^2 Both answers are correct.

There are 2 t's above and that results in a power of 2. So by counting the number of terms the power is found.
Example $t \times t \times t \times t \times t \times t = t^6$ There are six t's and the power is 6. EASY!

The above can be rewritten as $t \times t \times t \times t \times t \times t = t^2 \times t^2 \times t^2 = t^6$
Notice that when you add the 2, 2 and 2 it equals 6. So when you multiply terms with powers you add the powers. You just have to remember that when there is no power it is as if there is a '1' there.

Examples

$t^2 \times t^5 = t^7$ (as 2 + 5 = 7)
$t^6 \times t = t^7$ (as 6 + 1 = 7)
$e^3n^2 \times en^5t = e^4n^7t$ (e: 3 + 1 = 4 n: 2 + 5 = 7 t: no change)

When numbers are involved, multiply the numbers …. Don't add them.

Examples
$2a^2b^6 \times a^3b = 2a^5b^7$ (2: no change a: 2 + 3 = 5 b: 6 + 1 = 7)
$5a^7q^3 \times 2aq^2w = 10a^8q^5w$ (5 × 2 =10 a: 7 + 1 = 8 q: 3 + 2 = 5 w: no change)

Column 1 starts with multiplying single terms together without powers. So count each term as 1 to find the power to use. Q. 11-16 are expansions, this is the opposite to the questions above, in other words …. Put in × signs between the terms. Q.17 asks you to join the dots together for matching pairs. The pairs are in opposite columns.

Column 2 has multiplications which involve powers, remember to add the powers on matching terms, and no power means 'the power of 1'. There is also a multiplication table to fill in as well as negative numbers at the base of the column. Remember the properties of multiplying negatives. These are:

- × - = +	- × + = -	+ × - = -
Same sign = +	Different sign = -	Different sign = -

Column 3 applies what you have learned about multiplying terms and applies it to area Calculation. So these are exactly the same as Column 2 except that you are working out an area so write the formula, substitute, then answer. The answer should have units^2 after it.

$A = 5eg^3 + 6eg^3$

$A = 11eg^3$ units^2

Dividing Algebraic Terms

Division can be shown with a '÷' or a vinculum. A vinculum is a horizontal line that separates the numerator (top part of a fraction) from the denominator (bottom part). So you have to know both ways that a division can be written.

Example

If terms are separated then the ÷ only applies to the term after it.

Brackets gather the terms and so both terms become the denominator

$a \div b = \frac{a}{b}$ $\quad 2 \div ab = \frac{2}{ab}$ $\quad 2 \div a \times b = \frac{2b}{a}$ $\quad 2 \div (a \times b) = \frac{2}{ab}$

The opposite process is covered further down Column 1, it also requires you to complete an expansion, so all numbers and pronumerals are separated by × signs.

Example

If a pronumeral has a power on it, then remove the power and expand.

$\frac{a}{b} = a \div b$ $\quad \frac{2a}{b} = 2 \times a \div b$ $\quad \frac{5qv^2}{2m} = 5 \times q \times v \times v \div (2 \times m)$

Brackets are needed to group the $2 \times m$.

Simplifying algebraic expressions means reducing the expression to its most simplest form. The column starts with the pronumerals being ignored (as they can't be simplified) and concentrating solely on the numbers. An example is at the top of the column. You have to find the HCF (highest common factor) and divide both top and bottom numbers by the HCF. You don't write '1' except in the top line if there are no pronumerals in that line.

The second part of Column 2 allows the pronumerals to be simplified but not the numbers. So the numbers stay the same and the letters are cancelled top and bottom. There are two Examples above Q. 26. Note that squared terms have the power removed but the letter stays.

Column 3 brings the top operations of Column 2 together. So you have to simplify both the numbers and the pronumerals in the questions. Examples are at the top of the column, remember to simplify the numbers first, then cancel the pronumerals.

Dividing Algebraic Terms

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Write these expressions without the ÷ sign.

1 $e \div 4 = \frac{\square}{\square}$

2 $d \div j = \frac{\square}{\square}$

3 $5 \div k = \frac{\square}{\square}$

4 $q \div k^2 = \frac{\square}{\square}$

5 $b^3 \div f = \frac{\square}{\square}$

6 $c \div 2i = \frac{\square}{\square}$

7 $wm \div t \times 5 = \frac{\square}{\square}$

8 $wm \div 5t = \frac{\square}{\square}$

9 $wm \div (t \times 5) = \frac{\square}{\square}$

10 $5 \times t \div 7 \times a = \frac{\square}{\square}$

Now write using ÷ signs, then expand your answer.

Example

$\frac{5y}{3x} = 5y \div 3x = 5 \times y \div (3 \times x)$ *expanded*

11 $\frac{2w}{y} = \_\_\_\_ = \_\_\_\_$ *expanded*

12 $\frac{d}{nb} = \_\_\_\_ = \_\_\_\_$ *expanded*

13 $\frac{3}{5a^2} = \_\_\_\_ = \_\_\_\_$ *expanded*

14 $\frac{2vc}{9m^2} = \_\_\_\_$

$= \_\_\_\_$ *expanded*

15 $\frac{7c^2b}{8yw^2} = \_\_\_\_$

$= \_\_\_\_$ *expanded*

The numbers in these questions can be simplified.

Example $\frac{\overset{1}{\cancel{5}}f}{\underset{2}{\cancel{10}}e} = \frac{f}{2e}$ ($\div 5$, $\div 5$)

16 $\frac{6k}{8m} = \frac{\square}{\square}$

17 $\frac{9c}{6} = \frac{\square}{\square}$

18 $\frac{10}{12x} = \frac{\square}{\square}$

19 $\frac{4t}{8} = \frac{\square}{\square}$

20 $\frac{9w}{15ay} = \frac{\square}{\square}$

21 $\frac{6tu^2}{3} = \frac{\square}{\square}$

22 $\frac{5r^2}{25d} = \frac{\square}{\square}$

23 $\frac{12e^2}{18h} = \frac{\square}{\square}$

24 $\frac{8xy^2}{2} = \frac{\square}{\square}$

25 $\frac{12kd}{15z} = \frac{\square}{\square}$

Numbers can't simplify, this time it's the pronumerals.

Examples

$\frac{3\cancel{f}}{7e\cancel{f}} = \frac{3}{7e}$ $\qquad \frac{5\cancel{a}b^{\cancel{2}\,1}}{9\cancel{a}\cancel{b}} = \frac{5b}{9}$

26 $\frac{4m}{5m} = \frac{\square}{\square}$

27 $\frac{3c}{7ec} = \frac{\square}{\square}$

28 $\frac{2d^2}{d} = \frac{\square}{\square}$

29 $\frac{9fg}{7g^2} = \frac{\square}{\square}$

30 $\frac{t}{3t} = \frac{\square}{\square}$

31 $\frac{6q^2y}{11q} = \frac{\square}{\square}$

32 $\frac{abc}{ab^2c} = \frac{\square}{\square}$

33 $\frac{x^2}{5x} = \frac{\square}{\square}$

34 $\frac{8a^2n}{n^2a} = \frac{\square}{\square}$

35 $\frac{x^2y^2}{xw} = \frac{\square}{\square}$

Watch for both numbers and pronumerals in these. Simplify.

Examples

$\frac{\overset{1}{\cancel{3}}\cancel{f}g}{\underset{3}{\cancel{9}}e\cancel{f}} = \frac{g}{3e}$ $\qquad \frac{\overset{5}{\cancel{20}}\cancel{v}r^{\cancel{2}\,1}}{\underset{1}{\cancel{4}}\cancel{v}\cancel{r}} = 5r$

36 $\frac{4t}{6t} = \frac{\square}{\square}$

37 $\frac{10k}{2kn} = \frac{\square}{\square}$

38 $\frac{3ab}{12b} = \frac{\square}{\square}$

39 $\frac{15h}{5h^2} = \frac{\square}{\square}$

40 $\frac{4a^2v}{6v^2} = \frac{\square}{\square}$

41 $\frac{8abc}{2ab} = \frac{\square}{\square}$

42 $\frac{3a}{6a^2} = \frac{\square}{\square}$

43 $\frac{24xy}{36x} = \frac{\square}{\square}$

44 $20by^2 \div 4y = \frac{\square}{\square}$

45 $\frac{15c}{9vc^2} = \frac{\square}{\square}$

46 $\frac{10bx}{16ab} = \frac{\square}{\square}$

47 $\frac{6q^2}{2dq} = \frac{\square}{\square}$

48 $\frac{18a^2}{12ab} = \frac{\square}{\square}$

49 $5xt \div 25x^2 = \frac{\square}{\square}$

50 $\frac{6e^2c}{2ec} = \frac{\square}{\square}$

51 $\frac{8cv^2}{18v} = \frac{\square}{\square}$

52 $6xy^2z \div 14x^2yz = \frac{\square}{\square}$

53 $8a^2b \div 16ab^2c = \frac{\square}{\square}$

Dividing Algebraic Terms

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Write these expressions without the ÷ sign.

1 $e \div 4 = \frac{e}{4}$

2 $d \div j = \frac{d}{j}$

3 $5 \div k = \frac{5}{k}$

4 $q \div k^2 = \frac{q}{k^2}$

5 $b^3 \div f = \frac{b^3}{f}$

6 $c \div 2i = \frac{c}{2i}$

7 $wm \div t \times 5 = \frac{5wm}{t}$

8 $wm \div 5t = \frac{wm}{5t}$

9 $wm \div (t \times 5) = \frac{wm}{5t}$

10 $5 \times t \div 7 \times a = \frac{5ta}{7}$

Now write using ÷ signs, then expand your answer.

Example

$\frac{5y}{3x} = 5y \div 3x = 5 \times y \div (3 \times x)$ *expanded*

11 $\frac{2w}{y} = 2w \div y = 2 \times w \div y$ *expanded*

12 $\frac{d}{nb} = d \div nb = d \div (n \times b)$ *expanded*

13 $\frac{3}{5a^2} = 3 \div 5a^2 = 3 \div (5 \times a \times a)$ *expanded*

14 $\frac{2vc}{9m^2} = 2vc \div 9m^2 = 2 \times v \times c \div (9 \times m \times m)$ *expanded*

15 $\frac{7c^2b}{8yw^2} = 7c^2b \div 8yw^2 = 7 \times c \times c \times b \div (8 \times y \times w \times w)$ *expanded*

Numbers in these questions can be simplified. Letters stay as is.

Example $\frac{\overset{1}{\cancel{5}f}}{\underset{2}{\cancel{10}e}} \overset{\div 5}{\underset{\div 5}{=}} \frac{f}{2e}$

16 $\frac{6k}{8m} = \frac{3k}{4m}$

17 $\frac{9c}{6} = \frac{3c}{2}$

18 $\frac{10}{12x} = \frac{5}{6x}$

19 $\frac{4t}{8} = \frac{t}{2}$

20 $\frac{9w}{15ay} = \frac{3w}{5ay}$

21 $\frac{6tu^2}{3} = 2tu^2$

22 $\frac{5r^2}{25d} = \frac{r^2}{5d}$

23 $\frac{12e^2}{18h} = \frac{2e^2}{3h}$

24 $\frac{8xy^2}{2} = 4xy^2$

25 $\frac{12kd}{15z} = \frac{4kd}{5z}$

Numbers can't simplify, this time it's the pronumerals.

Examples

$\frac{3\cancel{f}}{7e\cancel{f}} = \frac{3}{7e}$ $\qquad \frac{5\cancel{ab}^{1}}{9\cancel{ab}} = \frac{5b}{9}$

26 $\frac{4m}{5m} = \frac{4}{5}$

27 $\frac{3c}{7ec} = \frac{3}{7e}$

28 $\frac{2d^2}{d} = 2d$

29 $\frac{9fg}{7g^2} = \frac{9f}{7g}$

30 $\frac{t}{3t} = \frac{1}{3}$

31 $\frac{6q^2y}{11q} = \frac{6qy}{11}$

32 $\frac{abc}{ab^2c} = \frac{1}{b}$

33 $\frac{x^2}{5x} = \frac{x}{5}$

34 $\frac{8a^2n}{n^2a} = \frac{8a}{n}$

35 $\frac{x^2y^2}{xw} = \frac{xy^2}{w}$

Watch for both numbers and pronumerals in these. Simplify.

Examples

$\frac{\overset{1}{\cancel{3}fg}}{\underset{3}{\cancel{9}ef}} = \frac{g}{3e}$ $\qquad \frac{\overset{5}{\cancel{20}}vr^{\overset{1}{\cancel{2}}}}{\underset{1}{\cancel{4}}\cancel{xv}} = 5r$

36 $\frac{4t}{6t} = \frac{2}{3}$

37 $\frac{10k}{2kn} = \frac{5}{n}$

38 $\frac{3ab}{12b} = \frac{a}{4}$

39 $\frac{15h}{5h^2} = \frac{3}{h}$

40 $\frac{4a^2v}{6v^2} = \frac{2a^2}{3v}$

41 $\frac{8abc}{2ab} = 4c$

42 $\frac{3a}{6a^2} = \frac{1}{2a}$

43 $\frac{24xy}{36x} = \frac{2y}{3}$

44 $20by^2 \div 4y = 5by$

45 $\frac{15c}{9vc^2} = \frac{5}{3vc}$

46 $\frac{10bx}{16ab} = \frac{5x}{8a}$

47 $\frac{6q^2}{2dq} = \frac{3q}{d}$

48 $\frac{18a^2}{12ab} = \frac{3a}{2b}$

49 $5xt \div 25x^2 = \frac{t}{5x}$

50 $\frac{6e^2c}{2ec} = 3e$

51 $\frac{8cv^2}{18v} = \frac{4cv}{9}$

52 $6xy^2z \div 14x^2yz = \frac{3y}{7x}$

53 $8a^2b \div 16ab^2c = \frac{a}{2bc}$

Further Dividing Algebraic Terms - With Powers

This sheet, particularly the middle and last columns are difficult in concept for some students. When you multiply like terms with powers, you add the powers. Division is the opposite to multiplication, so as you would expect, when you divide like terms with powers then you subtract the powers.

$$a^x \div a^n = a^{x-n} \qquad or \qquad \frac{a^x}{a^n} = a^{x-n}$$

How do you apply the above? Here are some examples.

$$\frac{a^7}{a^2} = a^5 \qquad k^9 \div k^4 = k^5 \qquad \frac{a^2}{a^5} = \frac{1}{a^3}$$

When there is more than one pronumeral, then they are cancelled against the same pronumeral. Examples.

$$\frac{cn^7}{n^2} = cn^5 \qquad a^3b^9 \div a^2b^7 = ab^2 \qquad \frac{x^3ya^2}{x^5a^9} = \frac{y}{x^2a^7}$$

Also numbers can be included. While you subtract powers, when the coefficients (numbers) are divided, they are divided … not subtracted. Examples.

$$\frac{4n^7}{2n^2} = 2n^5 \qquad 6a^3b^9 \div 12a^2b^7 = \frac{ab^2}{2} \qquad \frac{16x^3y}{-4xy^9} = \frac{-4x^2}{y^8}$$

Column 1 starts with expanding expressions and cancelling like terms. This is another way of approaching the question. So expand both the numerator and denominator (top and bottom) and then strike out matching term, terms that are in both the top and bottom rows, one for one. What is left is the answer, if you have nothing left then write '1'.

From Q. 5 apply the index law outlined above, by subtracting the powers. There are no coefficients (numbers) in these questions just pronumerals (letters).

Column 2 introduces coefficients and then negative coefficients. So remember to divide the numbers and subtract the powers.

Column 3 reverses the process and asks you to place the answer in the box that makes the statement true. These can be very challenging so concentrate when you attempt these. The final part of the column is the same as column 2 only with more terms.

Further Dividing Algebraic Terms - With Powers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Show the expansion then strike out the letters to simplify.

Example

$\frac{e^5}{e^2} = \frac{\cancel{e} \times \cancel{e} \times e \times e \times e}{\cancel{e} \times \cancel{e}} = e^3$

1 $\frac{k^4}{k} = \frac{\quad}{\quad} =$ ____

2 $\frac{a^5}{a^4} = \frac{\quad}{\quad} =$ ____

3 $\frac{x^2}{x^4} = \frac{\quad}{\quad} = \frac{\quad}{\quad}$

4 $\frac{c^2a^3}{ca} = \frac{\quad}{\quad} =$ ____

When you divide (÷), subtract the powers. Simplify these.

Examples

$n^7 \div n^4 = n^{7-4}$
$= n^3$

$\frac{an^5}{a^6n^2} = \frac{n^3}{a^5}$

5 $\frac{k^4}{k^2} =$ ____ 6 $\frac{a^5}{a^4} =$ ____

7 $b^5 \div b^2 =$ ____

8 $\frac{v^2}{v^7} = \frac{\quad}{\quad}$ 9 $\frac{d^3}{d^{10}} = \frac{\quad}{\quad}$

10 $h^2 \div h^8 = \frac{\quad}{\quad}$ 11 $i^5 \div i^9 = \frac{\quad}{\quad}$

12 $\frac{r^6}{r^5} =$ ____ 13 $\frac{m^3}{m^9} = \frac{\quad}{\quad}$

14 $\frac{e^5t^2}{e^2t} =$ ____ 15 $\frac{a^2b^4}{ab^7} = \frac{\quad}{\quad}$

16 $\frac{xy^3}{x^2y^4} = \frac{\quad}{\quad}$ 17 $\frac{c^3k^2}{k^7c} = \frac{\quad}{\quad}$

18 $\frac{hu^2c}{hc^2} = \frac{\quad}{\quad}$ 19 $\frac{z^2x^2}{z^3kx^5} = \frac{\quad}{\quad}$

20 $\frac{d^3y^3}{ay^2} = \frac{\quad}{\quad}$ 21 $\frac{xy^2z}{xyz} =$ ____

22 $q^4tp^2 \div q^7p = \frac{\quad}{\quad}$

These include numbers. Simplify these.

Examples

$8n^7 \div 2n^4$
$= 4n^3$

$\frac{6an^5}{14a^6n^2} = \frac{3n^3}{7a^5}$

23 $\frac{4y^3}{y^2} =$ ____ 24 $\frac{6}{2a^2} = \frac{\quad}{\quad}$

25 $2w^2 \div 4w^5 = \frac{\quad}{\quad}$

26 $\frac{10n^4}{5n} =$ ____ 27 $\frac{3xm}{9m^2} = \frac{\quad}{\quad}$

28 $8t^2 \div 12st^2 = \frac{\quad}{\quad}$

29 $16j^5p^2 \div 4j^4 =$ ____

30 $\frac{5c^6}{20nc^2} = \frac{\quad}{\quad}$ 31 $\frac{18ey}{12a^2} = \frac{\quad}{\quad}$

32 $\frac{5r^3x}{5r^3} =$ ____ 33 $\frac{35k}{20k^2} = \frac{\quad}{\quad}$

Watch for negatives. Simplify these.

34 $\frac{-6r^3d^2}{3r^2d^3} = \frac{\quad}{\quad}$

35 $9a^3y^5 \div 3y^2a =$ ____

36 $\frac{-2x^5y}{12x^6y} = \frac{\quad}{\quad}$

37 $2u^2v^4x \div (-14v^6ux^2) = \frac{\quad}{\quad}$

38 $-12q^2d^4 \div (-dq^2) =$ ____

39 $-a^5x^3j \div 2a^6ux^3 = \frac{\quad}{\quad}$

40 $15b^5e^3t \div (-45bt^3) = \frac{\quad}{\quad}$

41 $\frac{-50p^2m^7}{-35e^2m^4p} = \frac{\quad}{\quad}$

42 $\frac{2a^3bc^4}{-8a^6b^2c^3} = \frac{\quad}{\quad}$

Find the term that goes into the box.

43 $\frac{2c^3}{\quad} = 2c$ 44 $\frac{w^4}{\quad} = \frac{w^3}{m}$

45 $\frac{\quad}{3a} = 4$ 46 $\frac{4e^5}{\quad} = \frac{e^3}{2}$

47 $\frac{\quad}{\quad} \div 2k = 3k$

48 $6a^2b \div \frac{\quad}{\quad} = 3ab$

49 $\frac{\quad}{\quad} \div y = \frac{3x}{y}$

50 $\frac{\quad}{2j^3} = \frac{7}{j}$

51 $\frac{5ux}{\quad} = \frac{1}{2w}$

52 $\frac{\quad}{\quad} \div 4v^2y = \frac{-5y^3}{2v}$

53 $\frac{\quad}{-2hg^3} = \frac{h}{g}$

54 $16x^3k \div \frac{\quad}{\quad} = \frac{-8}{3x}$

55 $\frac{\quad}{\quad} \div 2y^2 = 9x$

56 $\frac{-8ka^3}{\quad} = \frac{2k}{a^3}$

57 $\frac{\quad}{\quad} \div 4ey^4 = \frac{-1}{y^2}$

These are larger, but the same process applies. Simplify.

58 $\frac{12c^8y^3d^2}{28kdy^5c^5} = \frac{\quad}{\quad}$

59 $\frac{54t^5b^3a}{36b^2t^3w} = \frac{\quad}{\quad}$

60 $\frac{-q^2e^3y^7}{-3b^2q^6ye^5} = \frac{\quad}{\quad}$

61 $\frac{-18fdh^3}{14hd^4} = \frac{\quad}{\quad}$

Further Dividing Algebraic Terms - With Powers

38 $-12q^2d^4 \div (-dq^2) = 12d^3$

39 $-a^5x^3j \div 2a^6ux^3 = \frac{-j}{2au}$

40 $15b^5e^3t \div (-45bt^3) = \frac{-b^4e^3}{3t^2}$

41 $\frac{-50p^2m^7}{-35e^2m^4p} = \frac{10pm^3}{7e^2}$

42 $\frac{2a^3bc^4}{-8a^6b^2c^3} = \frac{-c}{4a^3b}$

Find the term that goes into the box.

43 $\frac{2c^3}{c^2} = 2c$

44 $\frac{w^4}{wm} = \frac{w^3}{m}$

45 $\frac{12a}{3a} = 4$

46 $\frac{4e^5}{8e^2} = \frac{e^3}{2}$

47 $6k^2 \div 2k = 3k$

48 $6a^2b \div 2a = 3ab$

49 $3x \div y = \frac{3x}{y}$

50 $\frac{14j^2}{2j^3} = \frac{7}{j}$

51 $\frac{5ux}{10uxw} = \frac{1}{2w}$

52 $-10vy^4 \div 4v^2y = \frac{-5y^3}{2v}$

53 $\frac{-2h^2g^2}{-2hg^3} = \frac{h}{g}$

54 $16x^3k \div -6x^4k = \frac{-8}{3x}$

55 $18xy^2 \div 2y^2 = 9x$

56 $\frac{-8ka^3}{-4a^6} = \frac{2k}{a^3}$

57 $-4ey^2 \div 4ey^4 = \frac{-1}{y^2}$

These are larger, but the same process applies. Simplify.

58 $\frac{12c^8y^3d^2}{28kdy^5c^5} = \frac{3c^3d}{7ky^2}$

59 $\frac{54t^5b^3a}{36b^2t^3w} = \frac{3t^2ba}{2w}$

60 $\frac{-q^2e^3y^7}{-3b^2q^6ye^5} = \frac{y^6}{3q^4e^2}$

61 $\frac{-18fdh^3}{14hd^4} = \frac{-9fh^2}{7d^3}$

Multiplying and Dividing Algebraic Terms - With Powers

When you multiply indices you add the powers. When you divide indices you subtract the powers. Here are some examples.

Multiplication:

$r^2 \times r^3 = r^5$

Add the powers
2 + 3 = 5

$e^2 \times e = e^3$

If there is no power on a letter, it is '1'.
2 + 1 = 3

$e^2r^3 \times er^4 = e^3r^7$

Two or more letters are answered in the same way.

$2e^2r^3 \times 3r^4e = 6e^3r^7$

Coefficients (numbers) are still multiplied, not added.
2 × 3 = 6

Division:

$r^5 \div r^2 = r^3$

Subtract the powers
5 - 2 = 3

$e^2 \div e = e$

If there is no power on a letter, it is '1'.
2 - 1 = 1

$\frac{e^4r^3}{e^2r} = e^2r^2$

Questions can use the 'over' bar called a vinculum

$\frac{e^2r^3}{e^9r^7} = \frac{1}{e^7r^4}$

Subtract the highest from the lowest, so letters can be removed from the top line, leaving a numerator of 1.

$10e^8 \div 5e^2 = 2e^6$

Coefficients (numbers) are still divided, not subtracted.
10 ÷ 5 = 2

$\frac{2e^2r^3}{8e^9r^7} = \frac{1}{4e^7r^4}$

Denominators can be larger than numerators

$\frac{8e^2r^3}{2e^9r^7} = \frac{4}{e^7r^4}$

Numerators can be larger than denominators

Column 1 starts with multiplications and divisions that have no powers greater than 2, so this has already been experienced with previous sheets. These are two stage questions. First multiply the top row and bottom row. Then divide.

Column 2 then introduces multiplication involving powers. Remember to add the powers but multiply coefficients (if there are any). Q. 23 reminds you of showing indices in expanded form, separate the term and place '×' signs between each pronumeral/coefficient. Q. 28 introduces division, remember to subtract powers but still divide coefficients.

Column 3 from Q. 41 blends multiplication with division. Complete the multiplication first by multiplying across the top row, then the bottom. Write the answer in the first boxes, then divide for the final answer.

Multiplying and Dividing Algebraic Terms - With Powers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Multiply, then divide these.

Example $\dfrac{4n \times 3}{2n} = \dfrac{\overset{6}{\cancel{12}}\cancel{n}}{\underset{1}{\cancel{2}}\cancel{n}} = 6$

1 $\dfrac{5k \times 4}{2} = \dfrac{\quad}{\quad} = \quad$

2 $\dfrac{4 \times a}{2a \times 2} = \dfrac{\quad}{\quad} = \quad$

3 $\dfrac{n \times m}{2 \times m} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

4 $\dfrac{e \times 9}{e \times e} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

5 $\dfrac{x \times 9 \times b}{x \times 3} = \dfrac{\quad}{\quad} = \quad$

6 $\dfrac{2e \times 6k}{e \times 8} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

7 $\dfrac{5t \times 4t}{g \times 2t} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

8 $\dfrac{4d \times 8n}{2n \times 2d} = \dfrac{\quad}{\quad} = \quad$

9 $\dfrac{t \times 3t \times h}{h \times 2h \times t} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

10 $\dfrac{5n \times 4b \times 3b}{2b \times 6n} = \dfrac{\quad}{\quad}$

$= \quad$

11 $\dfrac{2e \times y \times 3h}{4h \times 2e} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

When you multiply you add powers. Multiply these.

Examples $am^3 \times a^2m^2 = a^3m^5$

$m^3 \times m^2 = m^5$ $\quad 2m^3 \times 3m^2 = 6m^5$

12 $d^3 \times d^5 = \quad$

13 $w^3 \times w^7 \times w^2 = \quad$

14 $f^3 \times f^5 \times f^3 = \quad$

15 $c \times a^3 \times c^2 \times a^5 = \quad$

16 $2e^2 \times 4e^4 = \quad$

17 $3r^3 \times 5r^4 = \quad$

18 $ab^3 \times a^2b^4 = \quad$

19 $x^2yz^3 \times x^5y^2z = \quad$

20 $2uv \times 5vu^2 = \quad$

21 $3y^3b^2 \times 6b^4y = \quad$

22 $5ac^3 \times 2a^4b^4 = \quad$

Expand these terms.

Example x^3: $x \times x \times x$

23 a^5: $\quad$

24 k^4: $\quad$

25 $4n^4$: $\quad$

26 $\dfrac{qe^3}{a^2} = \dfrac{\quad}{\quad}$

27 $\dfrac{2nt^2}{3n^4} = \dfrac{\quad}{\quad}$

When you divide you subtract powers. Complete these.

Examples

$m^3 \div m^2 = m$ $\quad \dfrac{8m^7}{2m^5} = 4m^2$

28 $a^8 \div a^2 = \quad$

29 $e^6 \div e^5 = \quad$

30 $k^6 \div k^3 \div k^2 = \quad$

31 $c^3x^6 \div c^2x^3 = \quad$

32 $n^2m^3 \div m^2n^2 = \quad$

33 $\dfrac{e^7v^2}{e^6v^7} = \dfrac{\quad}{\quad}$ $\quad$ 34 $\dfrac{y^2z^3}{z^5} = \dfrac{\quad}{\quad}$

35 $\dfrac{6m^5}{3m^2} = \quad$ $\quad$ 36 $\dfrac{12a^3}{4a^5} = \dfrac{\quad}{\quad}$

37 $\dfrac{2x}{8x^3} = \dfrac{\quad}{\quad}$ $\quad$ 38 $\dfrac{14n^7}{6n^3} = \dfrac{\quad}{\quad}$

39 $\dfrac{9e^2t^5}{3et^3} = \quad$ $\quad$ 40 $\dfrac{4xp^3}{2x^4p} = \dfrac{\quad}{\quad}$

Multiply first, then divide for the answer.

41 $\dfrac{v^5 \times v^7}{v^3 \times v^6} = \dfrac{\quad}{\quad} = \quad$

42 $\dfrac{w^2 \times w^4}{w \times w^3} = \dfrac{\quad}{\quad} = \quad$

43 $\dfrac{r^5 \times r}{r^3 \times r^4} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

44 $\dfrac{3q^2 \times 2q^5}{2q \times q^4} = \dfrac{\quad}{\quad} = \quad$

45 $\dfrac{5ay \times 2y^3}{4a^3y \times ay^4} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

46 $\dfrac{2ge^3 \times g^4e^2}{5g^6 \times 4e^4} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

47 $\dfrac{3b^2t \times 4v}{2t^3v \times 3vb^3} = \dfrac{\quad}{\quad} = \dfrac{\quad}{\quad}$

48 $\dfrac{2abc \times 8b^3c}{4ac^2 \times b^4} = \dfrac{\quad}{\quad} = \quad$

Multiplying and Dividing Algebraic Terms - With Powers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Multiply, then divide these.

Example $\frac{4n \times 3}{2n} = \frac{12n}{2n} = 6$

1 $\frac{5k \times 4}{2} = \frac{20k}{2} = 10k$

2 $\frac{4 \times a}{2a \times 2} = \frac{4a}{4a} = 1$

3 $\frac{n \times m}{2 \times m} = \frac{nm}{2m} = \frac{n}{2}$

4 $\frac{e \times 9}{e \times e} = \frac{9e}{e^2} = \frac{9}{e}$

5 $\frac{x \times 9 \times b}{x \times 3} = \frac{9xb}{3x} = 3b$

6 $\frac{2e \times 6k}{e \times 8} = \frac{12ek}{8e} = \frac{3k}{2}$

7 $\frac{5t \times 4t}{g \times 2t} = \frac{20t^2}{2gt} = \frac{10t}{g}$

8 $\frac{4d \times 8n}{2n \times 2d} = \frac{32dn}{4dn} = 8$

9 $\frac{t \times 3t \times h}{h \times 2h \times t} = \frac{3t^2h}{2th^2} = \frac{3t}{2h}$

10 $\frac{5n \times 4b \times 3b}{2b \times 6n} = \frac{60nb^2}{12nb} = 5b$

11 $\frac{2e \times y \times 3h}{4h \times 2e} = \frac{6eyh}{8eh} = \frac{3y}{4}$

When you multiply you add powers. Multiply these.

Examples $am^3 \times a^2m^2 = a^3m^5$

$m^3 \times m^2 = m^5$ $2m^3 \times 3m^2 = 6m^5$

12 $d^3 \times d^5 = d^8$

13 $w^3 \times w^7 \times w^2 = w^{12}$

14 $f^3 \times f^5 \times f^3 = f^{11}$

15 $c \times a^3 \times c^2 \times a^5 = c^3a^8$

16 $2e^2 \times 4e^4 = 8e^6$

17 $3r^3 \times 5r^4 = 15r^7$

18 $ab^3 \times a^2b^4 = a^3b^7$

19 $x^2yz^3 \times x^5y^2z = x^7y^3z^4$

20 $2uv \times 5vu^2 = 10u^3v^2$

21 $3y^3b^2 \times 6b^4y = 18y^4b^6$

22 $5ac^3 \times 2a^4b^4 = 10a^5b^4c^3$

Expand these terms.

Example x^3: $x \times x \times x$

23 a^5: $a \times a \times a \times a \times a$

24 k^4: $k \times k \times k \times k$

25 $4n^4$: $4 \times n \times n \times n \times n$

26 $\frac{qe^3}{a^2} = \frac{q \times e \times e \times e}{a \times a}$

27 $\frac{2nt^2}{3n^4} = \frac{2 \times n \times t \times t}{3 \times n \times n \times n \times n}$

When you divide you subtract powers. Complete these.

Examples $m^3 \div m^2 = m$ $\frac{8m^7}{2m^5} = 4m^2$

28 $a^8 \div a^2 = a^6$

29 $e^6 \div e^5 = e$

30 $k^6 \div k^3 \div k^2 = k$

31 $c^3x^6 \div c^2x^3 = cx^3$

32 $n^2m^3 \div m^2n^2 = m$

33 $\frac{e^7v^2}{e^6v^7} = \frac{e}{v^5}$

34 $\frac{y^2z^3}{z^5} = \frac{y^2}{z^2}$

35 $\frac{6m^5}{3m^2} = 2m^3$

36 $\frac{12a^3}{4a^5} = \frac{3}{a^2}$

37 $\frac{2x}{8x^3} = \frac{1}{4x^2}$

38 $\frac{14n^7}{6n^3} = \frac{7n^4}{3}$

39 $\frac{9e^2t^5}{3et^3} = 3et^2$

40 $\frac{4xp^3}{2x^4p} = \frac{2p^2}{x^3}$

Multiply first, then divide for the answer.

41 $\frac{v^5 \times v^7}{v^3 \times v^6} = \frac{v^{12}}{v^9} = v^3$

42 $\frac{w^2 \times w^4}{w \times w^3} = \frac{w^6}{w^4} = w^2$

43 $\frac{r^5 \times r}{r^3 \times r^4} = \frac{r^6}{r^7} = \frac{1}{r}$

44 $\frac{3q^2 \times 2q^5}{2q \times q^4} = \frac{6q^7}{2q^5} = 3q^2$

45 $\frac{5ay \times 2y^3}{4a^3y \times ay^4} = \frac{10ay^4}{4a^4y^5} = \frac{5}{2a^3y}$

46 $\frac{2ge^3 \times g^4e^2}{5g^6 \times 4e^4} = \frac{2g^5e^5}{20g^6e^4} = \frac{e}{10g}$

47 $\frac{3b^2t \times 4v}{2t^3v \times 3vb^3} = \frac{12b^2tv}{6b^3t^3v^2} = \frac{2}{bt^2v}$

48 $\frac{2abc \times 8b^3c}{4ac^2 \times b^4} = \frac{16ab^4c^2}{4ab^4c^2} = 4$

Adding and Subtracting Algebraic Fractions

Just like with number fractions, when algebraic fractions are added/subtracted, the denominators (bottom number/term) must be the same.

Column 1 starts with fractions that have the same denominator. So the denominator stays the same in the answer and the operation is applied only to the numerator (top number/term).

Example $\frac{c}{11} + \frac{8c}{11} = \frac{9c}{11}$

The denominator is 11 in both fractions, so the answer is found by adding straight across the top.
DON'T ADD THE DOMINATORS IT STAYS AS 11.

From Q. 7 the answers can be simplified. So the same working as above but then the answer has to be simplified by dividing through by the HCF (Highest Common Factor).

Example $\frac{2k}{9} + \frac{4k}{9} = \frac{6k}{9} = \frac{2k}{3}$

Divide both the top and bottom numbers by 3

Column 2 starts with reminding you about equivalent fractions. These are fractions of equal value but one has been multiplied or divided by a number.

Example $\frac{2k}{5} = \frac{\square}{10}$ (×2 top, ×2 bottom)

Look at the denominators and ask yourself: "What do you multiply 5 by to get 10?" .... The answer is 2.
So multiply the top term by 2, you get $4k$.

$\frac{2k}{5} = \frac{4k}{10}$ (×2 top, ×2 bottom)

The rest of column 2 applies your equivalent fraction skills. The fractions to be added have different denominators, So you have to change the denominators to match each other, again by equivalent fraction methods. Then add/subtract the fractions as they then have the same denominator. The good news is that the LCM (lowest common multiple) has been found for you, it is already written for you in the second row. So look at the denominators and find what number you need to multiply by.

Example $\frac{3a}{4} - \frac{2a}{5}$

Look at the denominators and ask yourself:
"What is the smallest number that both 4 and 5 go in to?"
The answer is 20.

$= \frac{\square}{20} - \frac{\square}{20}$ (×5 left, ×4 right)

Left Fraction: You have to multiply 4 by 5 to get 20.
Right Fraction: You have to multiply 5 by 4 to get 20.

$= \frac{15a}{20} - \frac{8a}{20} = \frac{7a}{20}$

Once you have the fractions with matching denominators perform the operation on the numerators.

Column 3 is the same except you have to find the LCM yourself, so they are a little harder.

Adding and Subtracting Algebraic Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Work on the top row only. These all have the same denominator.

1 $\frac{3x}{10} + \frac{4x}{10} = \frac{\square}{10}$

2 $\frac{5a}{8} - \frac{2a}{8} = \frac{\square}{\square}$

3 $\frac{4c}{7} + \frac{2c}{7} - \frac{c}{7} = \frac{\square}{\square}$

4 $\frac{3x}{16} + \frac{5x}{16} + \frac{7x}{16} = \frac{\square}{\square}$

5 $\frac{9e}{11} - \frac{4e}{11} - \frac{e}{11} = \frac{\square}{\square}$

6 $\frac{5}{3k} - \frac{2}{3k} + \frac{4}{3k} = \frac{\square}{\square}$

Same denominator still, but the answer can be simplified.

Example

$\frac{5x}{10} + \frac{3x}{10} = \frac{8x}{10} = \frac{4x}{5}$ (÷ 2 above, ÷ 2 below)

7 $\frac{a}{8} + \frac{a}{8} = \frac{\square}{\square} = \frac{\square}{\square}$

8 $\frac{3n}{4} + \frac{n}{4} = \frac{\square}{\square} = \frac{\square}{\square}$

9 $\frac{8}{9x} - \frac{2}{9x} = \frac{\square}{\square} = \frac{\square}{\square}$

10 $\frac{3c}{2} + \frac{5c}{2} = \frac{\square}{\square} = \frac{\square}{\square}$

11 $\frac{11h}{18} - \frac{h}{18} = \frac{\square}{\square} = \frac{\square}{\square}$

12 $\frac{11}{3x} - \frac{2}{3x} = \frac{\square}{\square} = \frac{\square}{\square}$

13 $\frac{5y}{12} + \frac{3y}{12} = \frac{\square}{\square} = \frac{\square}{\square}$

14 $\frac{13a}{18} - \frac{4a}{18} = \frac{\square}{\square} = \frac{\square}{\square}$

Complete these equivalent algebraic fractions.

15 $\frac{3c}{5} = \frac{\square}{10}$

16 $\frac{k}{3} = \frac{\square}{9}$

17 $\frac{v}{2} = \frac{\square}{16}$

18 $\frac{3e}{4} = \frac{\square}{12}$

19 $\frac{7a}{8} = \frac{\square}{24}$

20 $\frac{5n}{6} = \frac{\square}{42}$

Use equivalent fractions to solve these questions which have different denominators.

21 $\frac{a}{4} + \frac{a}{2} = \frac{a}{4} + \frac{\square}{4} = \frac{\square}{\square}$

22 $\frac{r}{3} + \frac{r}{4} = \frac{\square}{12} + \frac{\square}{12} = \frac{\square}{\square}$

23 $\frac{5t}{6} - \frac{2t}{3} = \frac{\square}{6} - \frac{\square}{6} = \frac{\square}{\square}$

24 $\frac{m}{4} + \frac{5m}{6} = \frac{\square}{12} + \frac{\square}{12} = \frac{\square}{\square}$

25 $\frac{3b}{5} - \frac{b}{2} = \frac{\square}{10} - \frac{\square}{10} = \frac{\square}{\square}$

26 $\frac{3a}{4} - \frac{2a}{5} + \frac{3a}{10} = \frac{\square}{20} - \frac{\square}{20} + \frac{\square}{20} = \frac{\square}{\square}$

27 $\frac{7q}{12} - \frac{q}{3} = \frac{\square}{12} - \frac{\square}{12} = \frac{\square}{\square} = \frac{\square}{\square}$ Simplify

28 $\frac{g}{5} + \frac{2g}{3} - \frac{g}{6} = \frac{\square}{30} + \frac{\square}{30} - \frac{\square}{30} = \frac{\square}{\square} = \frac{\square}{\square}$

Find the (LCM) lowest common multiple and then simplify.

29 $\frac{5t}{6} - \frac{t}{2}$ Simplify

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

30 $\frac{4d}{5} + \frac{7d}{10}$ Simplify

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

31 $\frac{n}{2} + \frac{5n}{12}$

$= \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

32 $\frac{5c}{8} - \frac{c}{3}$

$= \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

33 $\frac{2q}{3} + \frac{q}{2} - \frac{3q}{4}$

$= \frac{\square}{\square} + \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

34 $\frac{7e}{9} - \frac{e}{2} + \frac{5e}{6}$

$= \frac{\square}{\square} - \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

35 $\frac{4v}{5} + \frac{v}{4} - \frac{3v}{10}$

$= \frac{\square}{\square} + \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

36 $\frac{3p}{4} - \frac{2p}{3} + \frac{p}{6}$

$= \frac{\square}{\square} - \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

37 $\frac{y}{3} - \frac{5y}{6} + \frac{4y}{7}$

$= \frac{\square}{\square} - \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square} = \frac{\square}{\square}$

Adding and Subtracting Algebraic Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Work on the top row only. These all have the same denominator.

1 $\frac{3x}{10} + \frac{4x}{10} = \frac{7x}{10}$

2 $\frac{5a}{8} - \frac{2a}{8} = \frac{3a}{8}$

3 $\frac{4c}{7} + \frac{2c}{7} - \frac{c}{7} = \frac{5c}{7}$

4 $\frac{3x}{16} + \frac{5x}{16} + \frac{7x}{16} = \frac{15x}{16}$

5 $\frac{9e}{11} - \frac{4e}{11} - \frac{e}{11} = \frac{4e}{11}$

6 $\frac{5}{3k} - \frac{2}{3k} + \frac{4}{3k} = \frac{7}{3k}$

Same denominator still, but the answer can be simplified.

Example

$\frac{5x}{10} + \frac{3x}{10} = \frac{8x}{10} = \frac{4x}{5}$ (÷ 2 above, ÷ 2 below)

7 $\frac{a}{8} + \frac{a}{8} = \frac{2a}{8} = \frac{a}{4}$

8 $\frac{3n}{4} + \frac{n}{4} = \frac{4n}{4} = n$

9 $\frac{8}{9x} - \frac{2}{9x} = \frac{6}{9x} = \frac{2}{3x}$

10 $\frac{3c}{2} + \frac{5c}{2} = \frac{8c}{2} = 4c$

11 $\frac{11h}{18} - \frac{h}{18} = \frac{10h}{18} = \frac{5h}{9}$

12 $\frac{11}{3x} - \frac{2}{3x} = \frac{9}{3x} = \frac{3}{x}$

13 $\frac{5y}{12} + \frac{3y}{12} = \frac{8y}{12} = \frac{2y}{3}$

14 $\frac{13a}{18} - \frac{4a}{18} = \frac{9a}{18} = \frac{a}{2}$

Complete these equivalent algebraic fractions.

15 $\frac{3c}{5} = \frac{6c}{10}$

16 $\frac{k}{3} = \frac{3k}{9}$

17 $\frac{v}{2} = \frac{8v}{16}$

18 $\frac{3e}{4} = \frac{9e}{12}$

19 $\frac{7a}{8} = \frac{21a}{24}$

20 $\frac{5n}{6} = \frac{35n}{42}$

Use equivalent fractions to solve these questions which have different denominators.

21 $\frac{a}{4} + \frac{a}{2} = \frac{a}{4} + \frac{2a}{4} = \frac{3a}{4}$

22 $\frac{r}{3} + \frac{r}{4} = \frac{4r}{12} + \frac{3r}{12} = \frac{7r}{12}$

23 $\frac{5t}{6} - \frac{2t}{3} = \frac{5t}{6} - \frac{4t}{6} = \frac{t}{6}$

24 $\frac{m}{4} + \frac{5m}{6} = \frac{3m}{12} + \frac{10m}{12} = \frac{13m}{12}$

25 $\frac{3b}{5} - \frac{b}{2} = \frac{6b}{10} - \frac{5b}{10} = \frac{b}{10}$

26 $\frac{3a}{4} - \frac{2a}{5} + \frac{3a}{10} = \frac{15a}{20} - \frac{8a}{20} + \frac{6a}{20} = \frac{13a}{20}$

27 $\frac{7q}{12} - \frac{q}{3} = \frac{7q}{12} - \frac{4q}{12} = \frac{3q}{12} = \frac{q}{4}$ Simplify

28 $\frac{g}{5} + \frac{2g}{3} - \frac{g}{6} = \frac{6g}{30} + \frac{20g}{30} - \frac{5g}{30} = \frac{21g}{30} = \frac{7g}{10}$

Find the (LCM) lowest common multiple and then simplify.

29 $\frac{5t}{6} - \frac{t}{2}$ Simplify

$= \frac{5t}{6} - \frac{3t}{6} = \frac{2t}{6} = \frac{t}{3}$

30 $\frac{4d}{5} + \frac{7d}{10}$ Simplify

$= \frac{8d}{10} + \frac{7d}{10} = \frac{15d}{10} = \frac{3d}{2}$

31 $\frac{n}{2} + \frac{5n}{12}$

$= \frac{6n}{12} + \frac{5n}{12} = \frac{11n}{12}$

32 $\frac{5c}{8} - \frac{c}{3}$

$= \frac{15c}{24} - \frac{8c}{24} = \frac{7c}{24}$

33 $\frac{2q}{3} + \frac{q}{2} - \frac{3q}{4}$

$= \frac{8q}{12} + \frac{6q}{12} - \frac{9q}{12} = \frac{5q}{12}$

34 $\frac{7e}{9} - \frac{e}{2} + \frac{5e}{6}$

$= \frac{14e}{18} - \frac{9e}{18} + \frac{15e}{18} = \frac{20e}{18} = \frac{10e}{9}$

35 $\frac{4v}{5} + \frac{v}{4} - \frac{3v}{10}$

$= + \frac{5v}{20} - \frac{6v}{20} = \frac{15v}{20} = \frac{3v}{4}$

36 $\frac{3p}{4} - \frac{2p}{3} + \frac{p}{6}$

$= \frac{9p}{12} - \frac{8p}{12} + \frac{2p}{12} = \frac{3p}{12} = \frac{p}{4}$

37 $\frac{y}{3} - \frac{5y}{6} + \frac{4y}{7}$

$= \frac{14y}{42} - \frac{35y}{42} + \frac{24y}{42} = \frac{3y}{42} = \frac{y}{14}$

Multiplying & Dividing Algebraic Fractions

When you multiply algebraic fractions the denominators don't have to be the same. Just multiply straight across the top and straight across the bottom.

Examples

$$\frac{p}{2} \times \frac{m}{3} = \frac{pm}{6} \qquad p \times m = pm \qquad 2 \times 3 = 6$$

$$\frac{3t}{5n} \times \frac{2x}{7} = \frac{6tx}{35n} \qquad 3t \times 2x = 6tx \qquad 5n \times 7 = 35n$$

From Q. 7 in Column 1 the answer will be able to be simplified. So look at the numbers … can they be simplified? Then look at the pronumerals that are common on the top and bottom, if they can be cancelled.

Examples

$$\frac{qp}{2} \times \frac{p}{q} = \frac{qp^2}{2q} = \frac{p^2}{2}$$

$$\frac{3t}{5x} \times \frac{2x}{6} = \frac{6tx}{30x} = \frac{t}{5}$$

Column 2 introduces the reciprocal. These are when the number/fraction/term are turned upside-down (inverted). So write the denominator as the numerator, and the opposite. The only tricky thing is whole numbers and '^{1}/' fractions. A whole number turns into '^{1}/' the number. While '^{1}/' turns into a whole number.

Q. 21 introduces division. Algebraic fractions are solved similarly to normal fractions, division isn't used to solve them. Instead the reciprocal is found for the term behind the ÷ sign and the ÷ sign is replace by a × sign. So these are essentially the same as multiplication, except with an 'inverted twist.' There is an example above Q. 21.

The final column increases the number of terms to three. Remember that you find the reciprocal only for the term behind the ÷ sign, the other terms are unchanged. There is an example at the top of the column.

Multiplying & Dividing Algebraic Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Multiply these algebraic fractions. Watch for powers.

Example $\frac{a}{3} \times \frac{2n}{5} = \frac{2an}{15}$

1 $\frac{x}{2} \times \frac{y}{3} =$

2 $\frac{e}{5} \times \frac{k}{y} =$

3 $\frac{n}{2} \times \frac{n}{3} =$

4 $\frac{3p}{5} \times \frac{4p}{7} =$

5 $\frac{e}{2} \times \frac{t}{3} \times \frac{5e}{4} =$

6 $\frac{2}{k} \times \frac{m}{3} \times \frac{4m}{5} =$

These can be simplified. Look for letters to cancel and numbers that divide through.

Example $\frac{2a}{5} \times \frac{3n}{4} \overset{\div 2}{=} \frac{\cancel{6}an}{\cancel{20}} = \frac{3an}{10}$

7 $\frac{m}{2} \times \frac{x}{m} = = $ Simplify

8 $\frac{a}{3} \times \frac{6}{a} = = $

9 $\frac{2c}{3} \times \frac{x}{4} = = $

10 $\frac{ux}{2} \times \frac{x}{u} = = $

11 $\frac{5n}{px} \times \frac{2}{nx} = = $

12 $\frac{3}{k} \times \frac{2}{k} \times \frac{ak}{2} = = $

13 $\frac{3f}{2} \times 4 \times \frac{h}{6f} = = $

14 $\frac{2a}{b} \times \frac{b}{2c} \times \frac{2c}{a} = = $

Find the reciprocal for these. Invert the fractions. *(invert = turn upside-down)*

15 $\frac{x}{2} \rightarrow$

16 $\frac{3}{y} \rightarrow$

17 $\frac{1}{3} \rightarrow$

18 $5 \rightarrow$

19 $\frac{a}{b} \rightarrow$

20 $\frac{c}{2e} \rightarrow$

Divide these by finding the reciprocal and multiplying.

Example $\frac{c}{2} \div \frac{3}{v} = \frac{c}{2} \times \frac{v}{3} = \frac{cv}{6}$ ($\div \rightarrow \times$, reciprocal)

21 $\frac{a}{c} \div \frac{d}{b} = \times = $

22 $\frac{2}{u} \div \frac{u}{2} = \times = $

23 $\frac{d}{3} \div \frac{4}{d} = \times = $

24 $\frac{y}{3} \div \frac{1}{2} = \times = $

25 $\frac{2n}{3} \div \frac{5}{x} = \times = $

26 $\frac{3c}{m} \div 5 = \times = $

27 $\frac{4k}{3} \div \frac{8}{3} = \times = = $ Simplify

28 $\frac{6y}{5} \div \frac{3}{4g} = \times = = $ Simplify

These have both ÷ and × in them. Only invert the term behind the ÷ sign and change the sign to ×.

Example

$\frac{a}{3} \times \frac{n}{5} \div \frac{a}{2}$

$= \frac{a}{3} \times \frac{n}{5} \times \frac{2}{a} = \frac{2an}{15a} = \frac{2n}{15}$ Simplify

($\div \rightarrow \times$, reciprocal)

29 $\frac{k}{3} \div \frac{2}{3} \times \frac{4}{k}$

$= \times \times = = $

30 $\frac{4}{e} \times \frac{2e}{3} \div \frac{1}{e}$

$= \times \times = = $

31 $\frac{ch}{2} \div \frac{1}{2} \times \frac{a}{h}$

$= \times \times = = $

32 $\frac{2v}{5} \times \frac{3}{2} \div \frac{v^2}{3}$

$= \times \times = = $

33 $\frac{1}{d} \times \frac{3d}{4} \div \frac{1}{d}$

$= \times \times = = $

34 $\frac{q}{p} \times \frac{aq}{2p} \div \frac{4q}{5p}$

$= \times \times = = $

35 $\frac{3}{10} \div \frac{v}{t} \times \frac{4t}{k}$

$= \times \times = = $

Multiplying & Dividing Algebraic Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Multiply these algebraic fractions. Watch for powers.

Example $\frac{a}{3} \times \frac{2n}{5} = \frac{2an}{15}$

1 $\frac{x}{2} \times \frac{y}{3} = \frac{xy}{6}$

2 $\frac{e}{5} \times \frac{k}{y} = \frac{ek}{5y}$

3 $\frac{n}{2} \times \frac{n}{3} = \frac{n^2}{6}$

4 $\frac{3p}{5} \times \frac{4p}{7} = \frac{12p^2}{35}$

5 $\frac{e}{2} \times \frac{t}{3} \times \frac{5e}{4} = \frac{5e^2t}{24}$

6 $\frac{2}{k} \times \frac{m}{3} \times \frac{4m}{5} = \frac{8m^2}{15k}$

These can be simplified. Look for letters to cancel and numbers that divide through.

Example $\frac{2a}{5} \times \frac{3n}{4} = \frac{\overset{\div 2}{\cancel{6}an}}{\underset{\div 2}{\cancel{20}}} = \frac{3an}{10}$

7 $\frac{m}{2} \times \frac{x}{m} = \frac{mx}{2m} = \frac{x}{2}$ Simplify

8 $\frac{a}{3} \times \frac{6}{a} = \frac{6a}{3a} = 2$

9 $\frac{2c}{3} \times \frac{x}{4} = \frac{2cx}{12} = \frac{cx}{6}$

10 $\frac{ux}{2} \times \frac{x}{u} = \frac{ux^2}{2u} = \frac{x^2}{2}$

11 $\frac{5n}{px} \times \frac{2}{nx} = \frac{10n}{pnx^2} = \frac{10}{px^2}$

12 $\frac{3}{k} \times \frac{2}{k} \times \frac{ak}{2} = \frac{6ak}{2k^2} = \frac{3a}{k}$

13 $\frac{3f}{2} \times 4 \times \frac{h}{6f} = \frac{12fh}{12f} = h$

14 $\frac{2a}{b} \times \frac{b}{2c} \times \frac{2c}{a} = \frac{4abc}{2abc} = 2$

Find the reciprocal for these. Invert the fractions. *(invert = turn upside-down)*

15 $\frac{x}{2} \rightarrow \frac{2}{x}$

16 $\frac{3}{y} \rightarrow \frac{y}{3}$

17 $\frac{1}{3} \rightarrow 3$

18 $5 \rightarrow \frac{1}{5}$

19 $\frac{a}{b} \rightarrow \frac{b}{a}$

20 $\frac{c}{2e} \rightarrow \frac{2e}{c}$

Divide these by finding the reciprocal and multiplying.

Example $\frac{c}{2} \div \frac{3}{v} = \frac{c}{2} \times \frac{v}{3} = \frac{cv}{6}$ ($\div \rightarrow \times$, reciprocal)

21 $\frac{a}{c} \div \frac{d}{b} = \frac{a}{c} \times \frac{b}{d} = \frac{ab}{cd}$

22 $\frac{2}{u} \div \frac{u}{2} = \frac{2}{u} \times \frac{2}{u} = \frac{4}{u^2}$

23 $\frac{d}{3} \div \frac{4}{d} = \frac{d}{3} \times \frac{d}{4} = \frac{d^2}{12}$

24 $\frac{y}{3} \div \frac{1}{2} = \frac{y}{3} \times 2 = \frac{2y}{3}$

25 $\frac{2n}{3} \div \frac{5}{x} = \frac{2n}{3} \times \frac{x}{5} = \frac{2nx}{15}$

26 $\frac{3c}{m} \div 5 = \frac{3c}{m} \times \frac{1}{5} = \frac{3c}{5m}$

27 $\frac{4k}{3} \div \frac{8}{3} = \frac{4k}{3} \times \frac{3}{8} = \frac{12k}{24} = \frac{k}{2}$ Simplify

28 $\frac{6y}{5} \div \frac{3}{4g} = \frac{6y}{5} \times \frac{4g}{3} = \frac{24yg}{15} = \frac{8yg}{5}$ Simplify

These have both ÷ and × in them. Only invert the term behind the ÷ sign and change the sign to ×.

Example

$\frac{a}{3} \times \frac{n}{5} \div \frac{a}{2} = \frac{a}{3} \times \frac{n}{5} \times \frac{2}{a} = \frac{2an}{15a} = \frac{2n}{15}$ Simplify

($\div \rightarrow \times$, reciprocal)

29 $\frac{k}{3} \div \frac{2}{3} \times \frac{4}{k} = \frac{k}{3} \times \frac{3}{2} \times \frac{4}{k} = \frac{12k}{6k} = 2$

30 $\frac{4}{e} \times \frac{2e}{3} \div \frac{1}{e} = \frac{4}{e} \times \frac{2e}{3} \times e = \frac{8e^2}{3e} = \frac{8e}{3}$

31 $\frac{ch}{2} \div \frac{1}{2} \times \frac{a}{h} = \frac{ch}{2} \times 2 \times \frac{h}{a} = \frac{2ch^2}{2a} = \frac{ch^2}{a}$

32 $\frac{2v}{5} \times \frac{3}{2} \div \frac{v^2}{3} = \frac{2v}{5} \times \frac{3}{2} \times \frac{3}{v^2} = \frac{18v}{10v^2} = \frac{9}{5v}$

33 $\frac{1}{d} \times \frac{3d}{4} \div \frac{1}{d} = \frac{1}{d} \times \frac{3d}{4} \times d = \frac{3d^2}{4d} = \frac{3d}{4}$

34 $\frac{q}{p} \times \frac{aq}{2p} \div \frac{4q}{5p} = \frac{q}{p} \times \frac{aq}{2p} \times \frac{5p}{4q} = \frac{5paq^2}{8p^2q} = \frac{5aq}{8p}$

35 $\frac{3}{10} \div \frac{v}{t} \times \frac{4t}{k} = \frac{3}{10} \times \frac{t}{v} \times \frac{4t}{k} = \frac{12t^2}{10vk} = \frac{6t^2}{5vk}$

Expanding and Collecting Like Terms

Expanding and 'Removing the brackets' are the same process. This involves multiplying the outside term with the inside terms. Here are two examples.

Outside term multiplied by first term inside — Outside term multiplied by second term inside

$3(x + 2) = 3(x + 2) + 3(x + 2)$

$= 3x + 6$

Outside term multiplied by first term inside — Outside term multiplied by second term inside

$4(n + 5) = 4(n + 5) + 4(n + 5)$

$= 4n + 20$

If the sign in the brackets is a '-' then this changes the answer. Examples.

$5(y - 3) = 5y - 15$ $\qquad$ $2(6 - k) = 12 - 2k$ $\qquad$ $a(a - b) = a^2 - ab$

Column 1 starts with completing expansions using a manual method. By repeating additions of the bracketed expression the answer can be achieved without multiplying, this process is for increasing understanding it shouldn't be used to solve questions. Q. 6 outlines the use of multiplication and asks you to show the working out.

Column 2 is multiplication without working out, so they are quick. But watch out for 'powers' on some terms. The column then introduces negative outside terms, which have the effect of swapping the sign. There are examples at the start of the questions.

Column 3 extends the expansion process by including 'collecting like terms'. Performing a double expansion then gathering terms that can be added/subtracted. There is an example at the top of the column. Remember to watch for negatives, especially in front of the second bracketed expression, which changes the sign and subsequently your answer.

Expanding and Collecting Like Terms

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Expand these questions in steps, collecting like terms to get your answer.

Example

$3(x + 3) = (x+3) + (x+3) + (x+3)$

$= 3x + 9$

1 $2(y + 5) = (\quad) + (\quad)$

$= \quad$

2 $2(e + 7) = (\quad) + (\quad)$

$= \quad$

3 $3(m + k)$

$= (\quad) + (\quad) + (\quad)$

$= \quad$

4 $3(r - 4)$

$= (\quad) + (\quad) + (\quad)$

$= \quad$

5 $3(3x - 8)$

$= (\quad) + (\quad) + (\quad)$

$= \quad$

Expand these questions using multiplication. Hula!

Example

$3(x - 12) = 3 \times x \; - \; 3 \times 12$

$= 3x - 36$

6 $5(j + 3) = 5 \times \square + 5 \times \square$

$= \quad$

7 $7(n - 9) = 7 \times \square - 7 \times \square$

$= \quad$

8 $k(5 - t) = \quad$

$= \quad$

9 $a(a + b) = \quad$

$= \quad$

10 $2x(x + 5) = \quad$

$= \quad$

Expand these, no working out is required.

Examples $4(x - 3) = 4x - 12$

$5(2x + 4) = 10x + 20$

$2a(x + 5a) = 2ax + 10a^2$

11 $4(e + 7) = \quad$

12 $5(n + 2) = \quad$

13 $3(d - 5) = \quad$

14 $a(n + 10) = \quad$

15 $k(k - m) = \quad$

16 $3(14 - e) = \quad$

17 $8(3c + 2d) = \quad$

18 $4n(n - 6) = \quad$

19 $xy(x + y) = \quad$

20 $5t(3t - n) = \quad$

21 $9x(5x - 2xy) = \quad$

Negatives change the sign, expand the following.

Examples $-(x - 4) = -x + 4$

$-7(y + 2) = -7y - 14$

22 $-5(t + 2) = \quad$

23 $-2(m - 7) = \quad$

24 $-(k - j) = \quad$

25 $-3x(2 + x) = \quad$

26 $-a(2a + ab) = \quad$

27 $-c^2(m + c) = \quad$

28 $-6(7y - 4h) = \quad$

29 $-2uv(2u - v^3) = \quad$

30 $-5(2d - dr^2) = \quad$

31 $-4(a - b - c^2) = \quad$

32 $-ax(x^2a - 2x) = \quad$

Expand then collect like terms. Watch for negatives.

Example

$2(y + 7) + 4(y - 3)$

$= 2y + 14 + 4y - 12 = 6y + 2$

33 $9(h + 8) + 7h$

$= \quad + 7h = \quad$

34 $5(3c - 4) - 13$

$= \quad = \quad$

35 $3(x + 2) + 4(x + 5)$

$= \quad = \quad$

36 $4(n + 7) + 2(n - 3)$

$= \quad = \quad$

37 $5(k - 2) + 7(k + 9)$

$= \quad = \quad$

38 $v(v + t) + v(v - t)$

$= \quad = \quad$

39 $6(m + 3) + 5(m - 7)$

$= \quad = \quad$

40 $2(e + 6) - 4(e + 4)$

$= \quad = \quad$

41 $a(b + 2c) + a(4b + c)$

$= \quad$

$= \quad$

42 $2(b + 4) - 3(b - 6)$

$= \quad = \quad$

43 $8(5 - c) - 2(c - 6)$

$= \quad = \quad$

44 $2y(3x - 4) - y(3x + 5)$

$= \quad$

$= \quad$

Expanding and Collecting Like Terms

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Expand these questions in steps, collecting like terms to get your answer.

Example

$3(x + 3) = (x+3) + (x+3) + (x+3)$

$= 3x + 9$

1 $2(y + 5) = (\ y + 5\ ) + (\ y + 5\ )$

$= 2y + 10$

2 $2(e + 7) = (\ e + 7\ ) + (\ e + 7\ )$

$= 2e + 14$

3 $3(m + k)$

$= (\ m + k\ ) + (\ m + k\ ) + (\ m + k\ )$

$= 3m + 3k$

4 $3(r - 4)$

$= (\ r - 4\ ) + (\ r - 4\ ) + (\ r - 4\ )$

$= 3r - 12$

5 $3(3x - 8)$

$= (3x - 8) + (3x - 8) + (3x - 8)$

$= 9x - 24$

Expand these questions using multiplication. Hula!

Example

$3(x - 12) = 3 \times x - 3 \times 12$

$= 3x - 36$

6 $5(j + 3) = 5 \times \boxed{j} + 5 \times \boxed{3}$

$= 5j + 15$

7 $7(n - 9) = 7 \times \boxed{n} - 7 \times \boxed{9}$

$= 7n - 63$

8 $k(5 - t) = k \times 5 - k \times t$

$= 5k - kt$

9 $a(a + b) = a \times a + a \times b$

$= a^2 + ab$

10 $2x(x + 5) = 2x \times x + 2x \times 5$

$= 2x^2 + 10x$

Expand these, no working out is required.

Examples $4(x - 3) = 4x - 12$

$5(2x + 4) = 10x + 20$

$2a(x + 5a) = 2ax + 10a^2$

11 $4(e + 7) = 4e + 28$

12 $5(n + 2) = 5n + 10$

13 $3(d - 5) = 3d - 15$

14 $a(n + 10) = an + 10a$

15 $k(k - m) = k^2 - km$

16 $3(14 - e) = 42 - 3e$

17 $8(3c + 2d) = 24c + 16d$

18 $4n(n - 6) = 4n^2 - 24n$

19 $xy(x + y) = x^2y + xy^2$

20 $5t(3t - n) = 15t^2 - 5tn$

21 $9x(5x - 2xy) = 45x^2 - 18x^2y$

Negatives change the sign, expand the following.

Examples $-(x - 4) = -x + 4$

$-7(y + 2) = -7y - 14$

22 $-5(t + 2) = -5t - 10$

23 $-2(m - 7) = -2m + 14$

24 $-(k - j) = -k + j$

25 $-3x(2 + x) = -6x - 3x^2$

26 $-a(2a + ab) = -2a^2 - a^2b$

27 $-c^2(m + c) = -c^2m - c^3$

28 $-6(7y - 4h) = -42y + 24h$

29 $-2uv(2u - v^3) = -4u^2v + 2uv^4$

30 $-5(2d - dr^2) = -10d + 5dr^2$

31 $-4(a - b - c^2) = -4a + 4b + 4c^2$

32 $-ax(x^2a - 2x) = -a^2x^3 + 2x^2a$

Expand then collect like terms. Watch for negatives.

Example

$2(y + 7) + 4(y - 3)$

$= 2y + 14 + 4y - 12 = 6y + 2$

33 $9(h + 8) + 7h$

$= 9h + 72 + 7h = 16h + 72$

34 $5(3c - 4) - 13$

$= 15c - 20 - 13 = 15c - 33$

35 $3(x + 2) + 4(x + 5)$

$= 3x + 6 + 4x + 20 = 7x + 26$

36 $4(n + 7) + 2(n - 3)$

$= 4n + 28 + 2n - 6 = 6n + 22$

37 $5(k - 2) + 7(k + 9)$

$= 5k - 10 + 7k + 63 = 12k + 53$

38 $v(v + t) + v(v - t)$

$= v^2 + vt + v^2 - vt = 2v^2$

39 $6(m + 3) + 5(m - 7)$

$= 6m + 18 + 5m - 35 = 11m - 17$

40 $2(e + 6) - 4(e + 4)$

$= 2e + 12 - 4e - 16 = -2e - 4$

41 $a(b + 2c) + a(4b + c)$

$= ab + 2ac + 4ab + ac$

$= 5ab + 3ac$

42 $2(b + 4) - 3(b - 6)$

$= 2b + 8 - 3b + 18 = -b + 26$

43 $8(5 - c) - 2(c - 6)$

$= 40 - 8c - 2c + 12 = -10c + 52$

44 $2y(3x - 4) - y(3x + 5)$

$= 6xy - 8y - 3xy - 5y$

$= 3xy - 13y$

Further Expanding

Expanding binomial expressions is remembered best by the word FOIL. This stands for:

F - The front terms are multiplied first

FRONT

$(y + 2)(y + 3) = y^2$

O - The two outside terms are then multiplied

OUTSIDE

$(y + 2)(y + 3) = 3y$

I - The two inside terms are then multiplied

INSIDE

$(y + 2)(y + 3) = 2y$

L - The last two terms in each pair of brackets are multiplied

LAST

$(y + 2)(y + 3) = 6$

So $(y + 2)(y + 3) = y^2 + 3y + 2y + 6$ (then gathering like terms) $= y^2 + 5y + 6$

So when you are working out a question, the process looks like this:

$(a - 2)(a + 3)$

$= a^2 + 3a - 2a - 6$

$= a^2 + a - 6$

Watch out for negative terms and the effect on the sign in the expansion. Column 3 relates expansions to area of a shape. The last two questions involve multiplying by an additional fraction/constant, you can apply this after the expansion or to one of the bracketed expressions. See how you go.

Further Expanding

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Expand these questions using FOIL, then collecting like terms to get your answer.

Example $(x + 2)(x + 5)$

$= x^2 + 5x + 2x + 10$

$= x^2 + 7x + 10$

1 $(y + 3)(y + 5)$

2 $(m + 6)(m + 4)$

3 $(e + 2)(e - 4)$

4 $(w - 5)(w + 7)$

5 $(d - 2x)(d + x)$

6 $(3k + 2)(k - 2)$

7 $(4x - 3)(4x - 8)$

8 $(3c - k)(5c + 2k)$

Rewrite squared expressions, expand and collect like terms.

Example $(x + 2)^2$

$= (x + 2)(x + 2)$

Rewrite the expression without the ^{2}.

$= x^2 + 2x + 2x + 4$

Expand using FOIL.

$= x^2 + 4x + 4$

Collect like terms.

9 $(b + 4)^2$

10 $(h - 6)^2$

11 $(u + 3x)^2$

12 $(3a + 9)^2$

13 $(11 - 5q)^2$

14 $(6f - 2g)^2$

Find an expression for the area of these shapes, fully expand and simplify your answer.

Further Expanding

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Expand these questions using FOIL, then collecting like terms to get your answer.

Example $(x + 2)(x + 5)$

$= x^2 + 5x + 2x + 10$

$= x^2 + 7x + 10$

1 $(y + 3)(y + 5)$

$= y^2 + 5y + 3y + 15$

$= y^2 + 8y + 15$

2 $(m + 6)(m + 4)$

$= m^2 + 4m + 6m + 24$

$= m^2 + 10m + 24$

3 $(e + 2)(e - 4)$

$= e^2 - 4e + 2e - 8$

$= e^2 - 2e - 8$

4 $(w - 5)(w + 7)$

$= w^2 + 7w - 5w - 35$

$= w^2 + 2w - 35$

5 $(d - 2x)(d + x)$

$= d^2 + dx - 2xd - 2x^2$

$= d^2 - dx - 2x^2$

6 $(3k + 2)(k - 2)$

$= 3k^2 - 6k + 2k - 4$

$= 3k^2 - 4k - 4$

7 $(4x - 3)(4x - 8)$

$= 16x^2 - 32x - 12x + 24$

$= 16x^2 - 44x + 24$

8 $(3c - k)(5c + 2k)$

$= 15c^2 + 6ck - 5ck - 2k^2$

$= 15c^2 + ck - 2k^2$

Rewrite squared expressions, expand and collect like terms.

Example $(x + 2)^2$

$= (x + 2)(x + 2)$

Rewrite the expression without the ^{2}.

$= x^2 + 2x + 2x + 4$

Expand using FOIL.

$= x^2 + 4x + 4$

Collect like terms.

9 $(b + 4)^2$

$= (b + 4)(b + 4)$

$= b^2 + 4b + 4b + 16$

$= b^2 + 8b + 16$

10 $(h - 6)^2$

$= (h - 6)(h - 6)$

$= h^2 - 6h - 6h + 36$

$= h^2 - 12h + 36$

11 $(u + 3x)^2$

$= (u + 3x)(u + 3x)$

$= u^2 + 3ux + 3ux + 9x^2$

$= u^2 + 6ux + 9x^2$

12 $(3a + 9)^2$

$= (3a + 9)(3a + 9)$

$= 9a^2 + 27a + 27a + 81$

$= 9a^2 + 54a + 81$

13 $(11 - 5q)^2$

$= (11 - 5q)(11 - 5q)$

$= 121 - 55q - 55q + 25q^2$

$= 121 - 110q + 25q^2$

14 $(6f - 2g)^2$

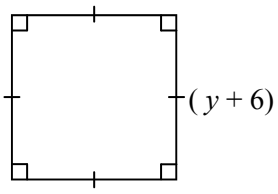
$= (6f - 2g)(6f - 2g)$

$= 36f^2 - 12fg - 12fg + 4g^2$

$= 36f^2 - 24fg + 4g^2$

Find an expression for the area of these shapes, fully expand and simplify your answer.

15

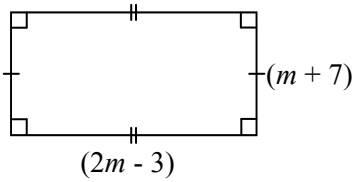


$A = l^2 = (y + 6)(y + 6)$

$= y^2 + 6y + 6y + 36$

$A = y^2 + 12y + 36$ units^2

16

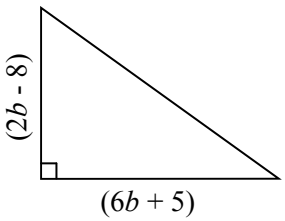


$A = lb = (m + 7)(2m - 3)$

$= 2m^2 - 3m + 14m - 21$

$A = 2m^2 + 11m - 21$ units^2

17



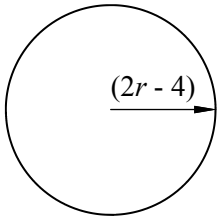
$A = \frac{1}{2}bh = \frac{1}{2} \times (2b - 8)(6b + 5)$

$= (b - 4)(6b + 5)$

$= 6b^2 + 5b - 24b - 20$

$A = 6b^2 - 19b - 20$ units^2

18



$A = \pi r^2 = \pi \times (2r - 4)(2r - 4)$

$= (2\pi r - 4\pi)(2r - 4)$

$= 4\pi r^2 - 8\pi r - 8\pi r + 16\pi$

$A = 4\pi r^2 - 16\pi r + 16\pi$ units^2

Factorising Algebraic Expressions

Factorising is the opposite to expanding. So you are showing an expression using brackets. To factorise an expression you have to take the HCF outside the brackets. The HCF is the highest common factor.

Examples - Finding the HCF of two terms

$2, 4x$ HCF = 2 $8x, 6x$ HCF = $2x$ $2x^2, 4x$ HCF = $2x$

Examples - Factorising an Expression

$2x + 12 = 2(x + 6)$ $kx - 5x = x(k - 5)$ $4x - 6x^2 = 2x(2 - 3x)$

Column 1 starts with a brief section on finding the HCF. Look at the numbers first, then look if there are any common letters. Then factorising starts, but the HCF has been found for you and is shown outside the brackets, so you have to just find what is inside the brackets. From Q. 15 you are only given the sign inside the brackets, you have to find all three boxes. The outside term is only a number or single pronumeral. From Q. 21 the outside term is a term with two pronumerals (letters) or a coefficient and a pronumeral (number and a letter).

Column 2 is still factorising but without assistance, further down the column are questions with a negative first term. When you factorise the first term inside the brackets should always be positive, so look at the example before Q. 40 and remember how the sign change affects the sign in front of the second term in the brackets.

Column 3 relates factorising to perimeter. There is an example at the top of the column.

Factorising Algebraic Expressions

ALTITUDE

VOLUME & CAPACITY

Centicube Volumes

Volume is a measure of the amount of space an object occupies. The units used in measuring volume are cubic units: mm^3, cm^3 and m^3. The solids on this sheet are all constructed from centicubes (each 1 cm^3). This allows the volume to be found by counting the cubes with the volume being the total number of cubes (in cm^3).

The first 2 columns ask you to count the cubes, you have to accept that the cubes that you can't see, due to cubes being in front, are still there. A cube must be on top of another cube to be above the first layer. When you write the volume you must include the units (cm^3).

Column 3 introduces the Volume formula : $V = Ah$. This applies to any shape with a uniform cross-section, (this means the blue area is the same throughout the height of the shape). Count the number of squares that make up the blue area (A) and multiply this by the number of red squares that make up the height (h), this will give you the volume in cm^3.

Don't let the word 'height' confuse you. You may feel that height must go up and down but the word height is used to describe the direction of the uniform cross-section. When you think about it if you turn the page sideways it will be up and down, so the answer will be the same.

Centicube Volumes

Find the area of the front face then multiply it by the height (the distance the shape goes back into the page).

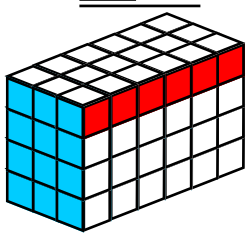
21 Face Area (A) = 12 cm^2

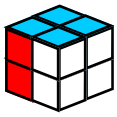
Shape height (h) = 6 cm

A × h = 72 cm^3



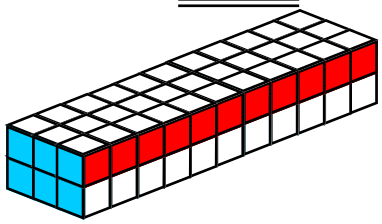
22 A = 4 cm^2 h = 2 cm

V = Ah = 8 cm^3



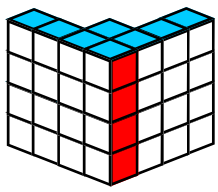
23 A = 6 cm^2 h = 11 cm

V = Ah = 66 cm^3



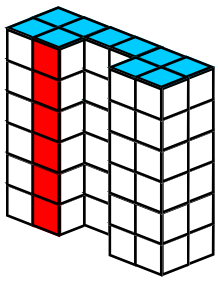
24 A = 8 cm^2 h = 4 cm

V = Ah = 32 cm^3



25 A = 10 cm^2 h = 6 cm

V = Ah = 60 cm^3

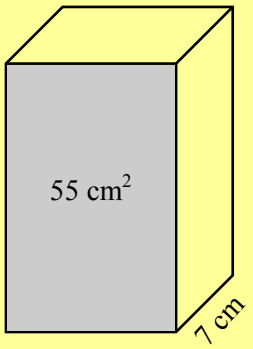


Volume, Area and Height - Volume of a Prism

When a solid has a uniform cross section (same shape throughout the height of the solid) then it is a prism. The formula V = *Ah* can be used to obtain the volume of the solid. The area will be given in square units (mm^2, cm^2, m^2) and the height of the solid will be given in mm, cm and m. Multiply the two together to get your answer. The answers will be in cubic units mm^3, cm^3, m^3.

The first columns uses the same method as shown in the example below, this is: writing the formula (V = *Ah*), substituting the values (for *A* and *h*), with an '=' sign before them and a '×' sign between them, then the answer with the appropriate cubic units after it.

Example



V = A*h*

= 55 × 7

V = 385 cm^3 ← Volume is measured in cubic units

Column 2 is the same as column 1 except that the height unit doesn't match the area unit. So you need to change the height to same units as the area. Then solve as before.

Column 3 applies your skills to a duck pond, the ducks are getting their bills all muddy when they dive down, it's time to give them a little more depth.

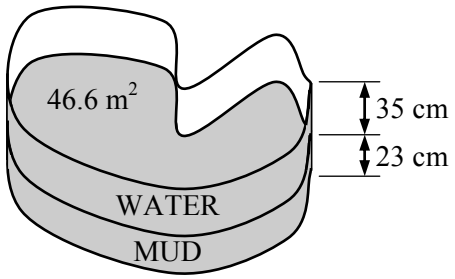
Apply your volume skills to these questions. The bill for this job is too much to wear!

A council duck pond has to have the mud build-up removed. It has to be drained, excavated and refilled.



18 Find the mud volume in m³.

19 Find the water volume in m³.

20 Mud excavation/removal costs $712 per m³ (or part m³). Find the cost for mud removal.

21 Find the volume of water in the mud cleared pond in m³.

22 Find the percentage increase for the volume of water. (1 d.p)

$$\% \text{ Increase} = \frac{H_2O\ Vol_{NEW}}{H_2O\ Vol_{OLD}} \times 100 - 100$$

$$= \frac{\square}{\square} \times 100 - 100$$

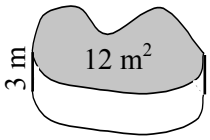
% Increase = _____

Volume, Area and Height - Volume of a Prism

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Multiply the area by the height to find the volume

1

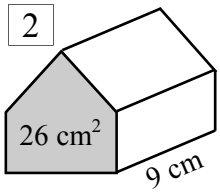


$V = Ah$

$= 12 \times 3$

$V = 36$ m³

2

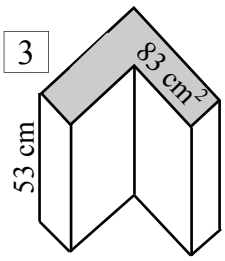


$V = Ah$

$= 26 \times 9$

$V = 234$ cm³

3

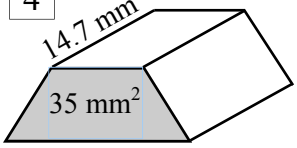


$V = Ah$

$= 83 \times 53$

$V = 4\,399$ cm³

4

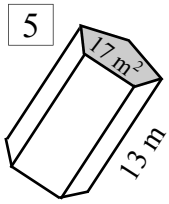


$V = Ah$

$= 35 \times 14.7$

$V = 514.5$ mm³

5

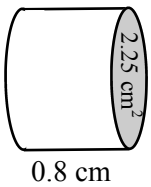


$V = Ah$

$= 17 \times 13$

$V = 221$ m³

6

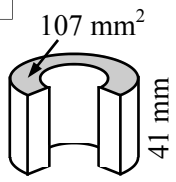


$V = Ah$

$= 2.25 \times 0.8$

$V = 1.8$ cm³

7

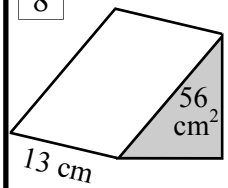


$V = Ah$

$= 107 \times 41$

$V = 4\,387$ mm³

8

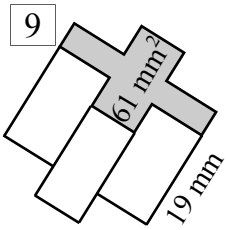


$V = Ah$

$= 56 \times 13$

$V = 728$ cm³

9



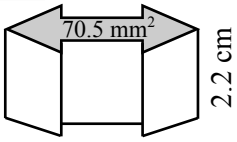
$V = Ah$

$= 61 \times 19$

$V = 1\,159$ mm³

Change the height unit to match the area units. Then multiply for the volume. Round to 2 d.p.

10

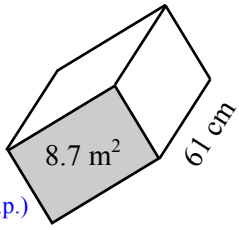


$V = Ah$

$= 70.5 \times 22$

$V = 1\,551$ mm³

11

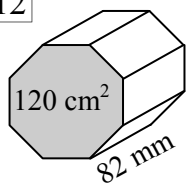


$V = Ah$

$= 8.7 \times 0.61$

$V = 5.31$ m³ (2 d.p.)

12

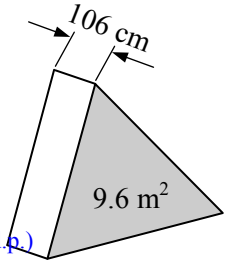


$V = Ah$

$= 120 \times 8.2$

$V = 984$ cm³

13

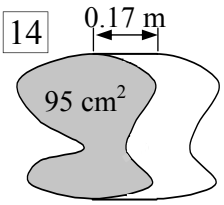


$V = Ah$

$= 9.6 \times 1.06$

$V = 10.18$ m³ (2 d.p.)

14

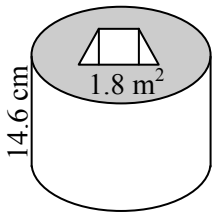


$V = Ah$

$= 95 \times 17$

$V = 1\,615$ cm³

15

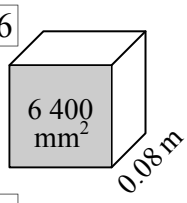


$V = Ah$

$= 1.8 \times 0.146$

$V = 0.26$ m³

16

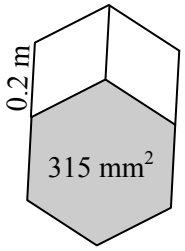


$V = Ah$

$= 6\,400 \times 80$

$V = 512\,000$ mm³

17



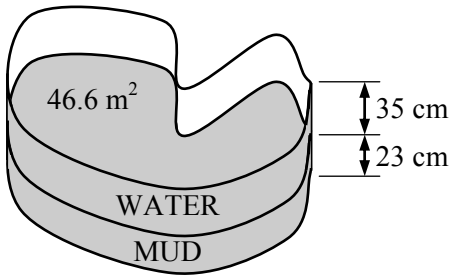
$V = Ah$

$= 315 \times 200$

$V = 63\,000$ mm³

Apply your volume skills to these questions. The bill for this job is too much to wear!

A council duck pond has to have the mud build-up removed. It has to be drained, excavated and refilled.



18 Find the mud volume in m³.

$V = Ah$

$= 46.6 \times 0.23$

$V = 10.718$ m³

19 Find the water volume in m³.

$V = Ah$

$= 46.6 \times 0.35$

$V = 16.31$ m³

20 Mud excavation/removal costs \$712 per m³ (or part m³). Find the cost for mud removal.

Cost $= 11 \times 712$

Cost $=$ \$7 832

21 Find the volume of water in the mud cleared pond in m³.

$V = Ah$

$= 46.6 \times 0.58$

$V = 27.028$ m³

22 Find the percentage increase for the volume of water. (1 d.p)

$$\%\ \text{Increase} = \frac{H_2O\ Vol_{NEW}}{H_2O\ Vol_{OLD}} \times 100 - 100$$

$$= \frac{27.028}{16.31} \times 100 - 100$$

% Increase $=$ 65.7% (1 d.p.)

Volume of Cubes and Rectangular Prisms (Sheet 1)

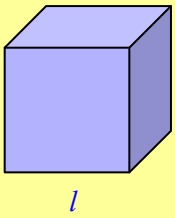
This sheet deals with cubes and rectangular prisms. Sheet 2 is harder and includes changing units and finding lengths given volume.

Rectangular prisms are the most common form of packaging, from shipping containers to match boxes they are everywhere. To calculate their volume you multiply the 3 sides together, in any order. Because we have V = Ah as the standard formula for volume for a prism with the Area being a rectangle, we can replace the A with $l \times b$. So we have V = $l \times b \times h$, or V = lbh.

As a cube has all lengths the same it is like the formula V = $l \times b \times h$ is changed to V = $l \times l \times l$, which can be simplified to V = l^3. Sometimes this is written as V = s^3, where s is the side length. It is the same thing, just a different way of writing it.

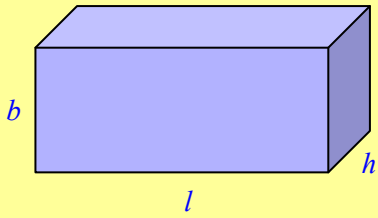
Cubes

$V = l^3$



Rectangular Prisms

$V = lbh$

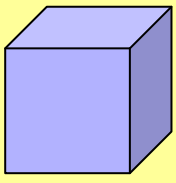


Example

$V = l^3$

$= 18^3$

$V = 5\,832\ cm^3$

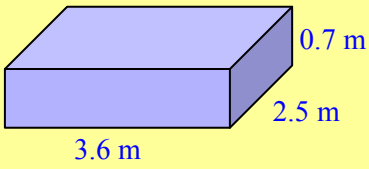


Example

$V = lbh$

$= 3.6 \times 2.5 \times 0.7$

$V = 6.3\ m^3$



Volume is measured in cubic units, that means that your answer should have a ^{3} above the unit when written in the answer. So mm^3, cm^3 and m^3.

Volume of Cubes and Rectangular Prisms (Sheet 1)

$V = 1\,748$ mm^3

Now apply your skills to these. Round to 1 d.p. if required.

15 Ron is hiring a storage unit. It has sides 8 m, 7.3 m and 5.7 m. Find its volume to the nearest m^3.

$V = lbh$

$= 8 \times 7.3 \times 5.7$

$V = 333$ m^3 (nearest m^3)

16 If storage costs \$0.60/m^3 per mth, how much should Ron expect to pay for the storage unit per month?

Cost $= 333 \times 0.60$

Cost = \$199.80 per month

17 Lilly's favorite glass is shaped like a rectangular prism. It is 12 cm tall with both sides 7 cm. Find its volume.

$V = lbh$

$= 12 \times 7 \times 7$

$V = 588$ cm^3

18 Lilly's drops 5 ice cubes in the empty glass. Each cube has a side length of 1.8 cm. Find volume of ice.

$V = l^3$

$= 1.8^3$

$V = 5.832$ cm^3

Total $= 5 \times 5.832 = 29.16$ cm^3

19 Find the amount of drink that can be added to the glass, in cm^3.

$588 - 29.16 = 558.84$ cm^3

20 Calculate the volume of ice as a percentage of the glass volume.

$$\% \text{ Ice} = \frac{29.16}{588} \times 100$$

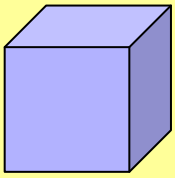
% Ice = 4.96% (2 d.p.)

Volume of Cubes and Rectangular Prisms (Sheet 2)

This sheet deals with cubes and rectangular prisms. Sheet 2 is more challenging than Sheet 1 as it includes changing units and finding lengths given volume.

Cubes

$V = l^3$



Rectangular Prisms

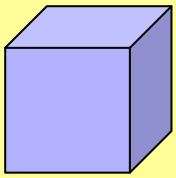
$V = lbh$

Example

$V = l^3$

$= 18^3$

$V = 5\,832\ cm^3$

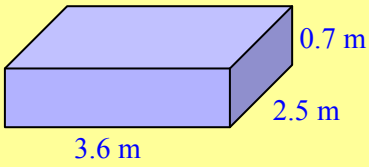


Example

$V = lbh$

$= 3.6 \times 2.5 \times 0.7$

$V = 6.3\ m^3$



Volume is measured in cubic units, that means that your answer should have a ^{3} above the unit when written in the answer. So mm^3, cm^3 and m^3.

Column 1 involves finding the volume for cubes. So use the method shown above (left), note that Q.6 and Q.7 require units to be changed first before the calculation.

Column 2 also is about cubes but you are given the volume. This time you are required to find the side length of the cube. To do this, cube root the volume, this will give you the side length. Column 2 then introduces rectangular prisms, solve these using the method above (right). Watch for units not matching, make sure you change the units to a common unit before solving.

Column 3 ends with the volume of a rectangular prism being given. You have to find the height given two other side lengths. The process is solved by multiplying the two sides you are given to find the face area. As $V = Ah$ for a prism, $h = {}^{V}/_{A}$. So divide the volume by the area to find the height.

$A = 85 \times 32$

$= 312\,800 \div 2\,720$

$A = 2\,720$ cm^3

$h = 115$ cm

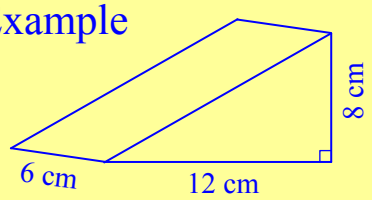
Volume of Triangular Prisms

There are two ways of calculating the volume of a triangular prism. You can calculate the Triangular face area and multiply by the height of the solid, or you can treat the prism as being half of a rectangular prism of the same size.

Area then Volume Method

$A = \frac{1}{2}bh$ then $V = Ah$

Example



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 12 \times 8$

$A = 48 \text{ cm}^2$

This is area so it is measured in square units

$V = Ah$

$= 48 \times 6$

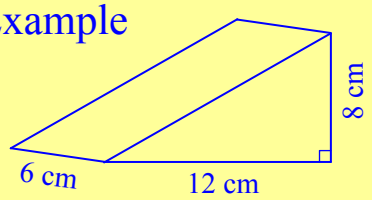
$V = 288 \text{ cm}^3$

This is volume so it is measured in cubic units

Volume Method

$V = \frac{1}{2}lbh$

Example



$V = \frac{1}{2}lbh$

$= \frac{1}{2} \times 8 \times 12 \times 6$

$V = 288 \text{ m}^3$

This is volume so it is measured in cubic units

The second method finds the answer in one step so it is quicker. But the first method is essential to learn as it is a method that will be used regularly with prisms.

Column 1 starts with a reminder about the method of finding the area of a triangle. The remainder of the column is using the above left method. It may be that you prefer the second method, but apply the area then volume process regardless, it is a skill you will need.

Column 2 is the method shown above right. So it is quicker as it is solved using one formula/ substitution.

Column 3 can be solved using either method and are worded questions. Watch that all units are the same when finding the volume.

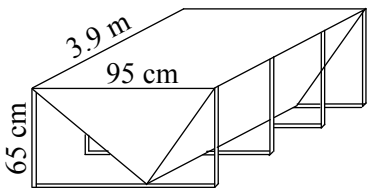
$V = 6\,160 \text{ m}^3$

16 If the coal has a density of 845 kg/m^3. Find the mass of the coal in T. (1 T = 1 000 kg).

Mass = $6\,160 \times 0.845$

Mass = 5 205.5 T

17 A steel cow-feeding trough, is shown below, find its volume in m^3 to 2 d.p.



$V = \frac{1}{2}lbh$

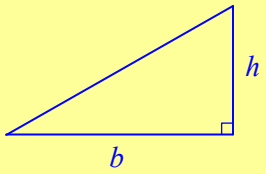
$= \frac{1}{2} \times 0.65 \times 0.95 \times 3.9$

$V = 1.20 \text{ m}^3$ (2 d.p.)

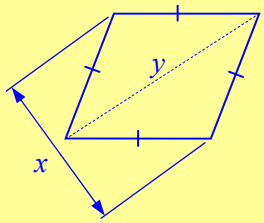
Volume of Various Prisms

Finding the volume of a prism is found by finding the area of the uniform cross section and multiplying it by the height of the solid. This sheet deals with non-circular prisms. The face that requires the area calculation is always the front face with this sheet, the formula used will be one of the following:

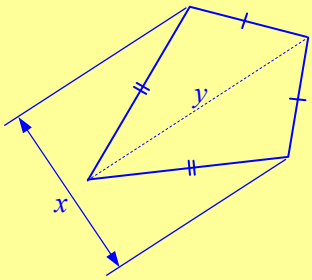
Triangle $A = \frac{1}{2}bh$



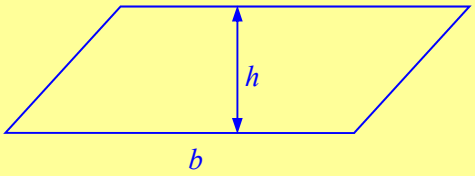
Rhombus $A = \frac{1}{2}xy$



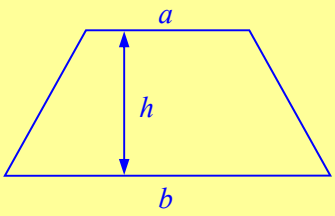
Kite $A = \frac{1}{2}xy$

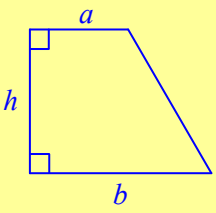


Parallelogram $A = bh$

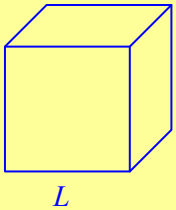


Trapezium $A = \frac{1}{2}(a + b)h$

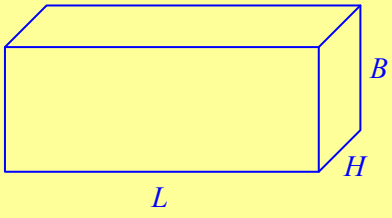




Cubes $V = l^3$

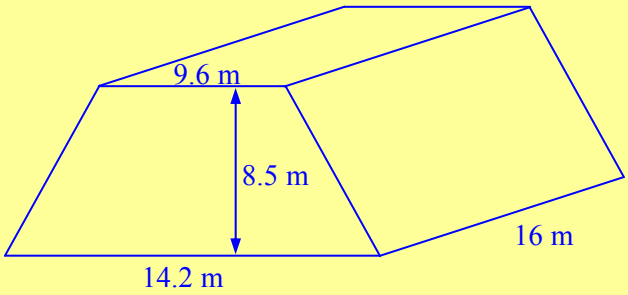


Rectangular Prisms $V = lbh$



Cubes, rectangular prisms and triangular prisms can be solved using their specific formulae. However the other solids require you to first calculate the area of the front face then use this answer to find the volume. An example for a trapezoidal prism (prism with a trapezium as its uniform cross section) is shown below.

Example - Find the volume.



$A = \frac{1}{2}(a + b) \times h$

$= \frac{1}{2} \times (9.6 + 14.2) \times 8.5$

$A = 101.15 \text{ m}^2$

This is the **area** of the front face so it is measured in square units.

$V = Ah$

$= 101.15 \times 16$

$V = 1\,618.4 \text{ m}^3$

This is volume so it is measured in cubic units

Estimation/Terms of π - Volume of Cylinders

While mostly a calculator will be used to calculate the volume of a cylinder, it may be that you are asked to express the volume 'in terms of π' or the 'exact volume'. Both of these requests mean that π is left in the answer.

Being able to estimate volume is a valuable skill, because you can get a rough idea of the answer without a calculator, or before using a calculator. It also is a good 'self-check' mechanism in case you make a mistake using the calculator.

Column 1 has three cylinders in the column. The procedure is the same as the example at the top of the column. Use the Volume formula:

$$V = \pi r^2 h$$

Where: V = the volume of the prism
r = the radius of the circular face
h = the height of the cylinder

This will give an answer in terms of π, in other words, the exact volume.

The second step is to make an estimate, write the volume out again but then substitute the value of 3 for π. Multiply the two numbers and you have your estimate.

Because π is 3.14159..... It is more than 3, so when you use 3 as an estimate the answer will always be slightly less than the answer achieved by using a calculator.

Columns 2 and 3 use the diagrams at the base of the page. Measure the diameter, halve it for the radius, then measure the height. Record these lengths in the spaces provided on each cylinder. Once you have done that solve the same way as Column 1.

Estimation/Terms of π - Volume of Cylinders

Volume of Cylinders

The standard formula for a prism is V = Ah.

Where: V = the volume of the prism
A = the uniform cross sectional area
h = the height of the prism

But with cylinders the cross sectional area is a circle, which has an area of πr^2. So if you replace A with πr^2 you have:

The formula for a cylinder is V = $\pi r^2 h$.

Where: V = the volume of the prism
r = the radius of the circular face
h = the height of the cylinder

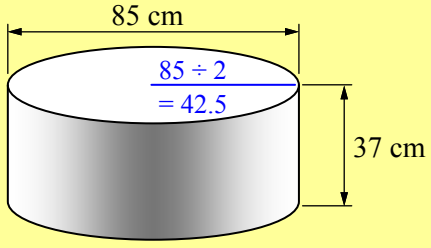
Column 1 starts with an example showing the formula line, substitution and then answer. Make sure you show cubic units. Eg. mm^3, cm^3 and m^3.

Column 2 has an extra step, you are given the diameter of the circle. So before you start, divide the diameter by 2 to get the radius and then use the formula as you did in column 1.

Column 3 applies what you have learned to some worded problems. There is also a table at the bottom of the column, no working required, just answers.

Below is an example of finding the volume when given the cylinder height and diameter.

Example - Find the volume to 1 decimal place.



r = 42.5 cm

$V = \pi r^2 h$ ← Write the formula

$= \pi \times 42.5^2 \times 37$ ← Substitute r and h

$V = 209\ 956.6\ cm^3$ ← Solve showing cubic units

Volume of Cylinders - Different Units, finding *r* and *h*.

Imagine you require a container to hold a specific amount but it must also be a specific height. Finding the radius required needs the formula to be rearranged, that is what this sheet deals with.

Column 1 starts with asking you to rearrange the question given the steps. Then the new rearranged formula is used to find the height of cylinders given the volume and radius (or diameter).

Column 2 is a break away from rearranging/use of formulae. It is finding the volume but the answer is required in cm^3, while the dimensions are in various units. So change the units to cm and solve. The last question in the column requires you to rearrange $C=2\pi r$ first, then use the volume formula.

Column 3 gives you the height and the volume and asks you to rearrange the volume formula to find the radius. Then apply to solve for *r*.

2 8 2 ÷ (π × 1 0) =

Then press $\sqrt{\ }$ =

$r = \sqrt{\frac{V}{\pi h}} = \sqrt{\frac{282}{\pi \times 10}}$

$r = 3$ cm

15 $V = 905$ cm^3, $h = 8$ cm.

$r = \sqrt{\frac{V}{\pi h}} = \sqrt{\frac{905}{\pi \times 8}}$

$r = 6$ cm

16 $V = 28.1$ m^3, $h = 3.5$ m.

$r = \sqrt{\frac{V}{\pi h}} = \sqrt{\frac{28.1}{\pi \times 3.5}}$

$r = 1.6$ m

17 $V = 29\,050$ mm^3, $h = 32$ mm.

$r = \sqrt{\frac{V}{\pi h}} = \sqrt{\frac{29\,050}{\pi \times 32}}$

$r = 5.4$ mm

18 $V = 7\,581$ cm^3, $h = 15.2$ cm.

$r = \sqrt{\frac{V}{\pi h}} = \sqrt{\frac{7\,581}{\pi \times 15.2}}$

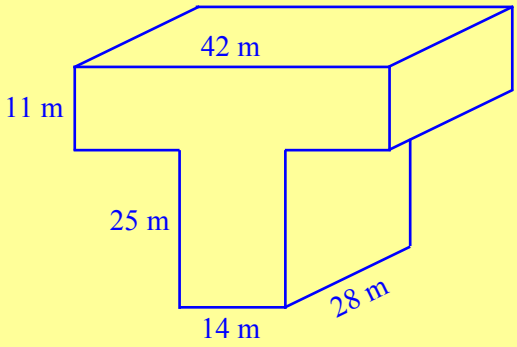
$r = 12.6$ cm

Finding Area and Volume - Composite Shapes

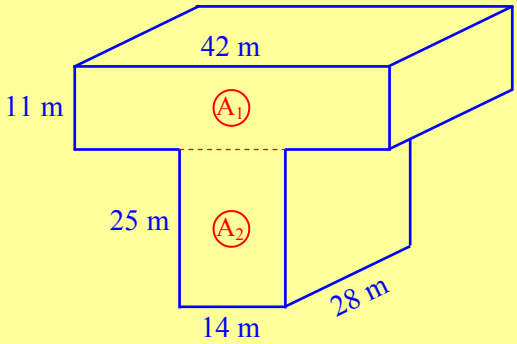
The volume of a prism is found using the formula $V = Ah$. So if you know how to find the area, you only have to multiply by the height to get the volume.

This sheet has two columns, the left column are questions finding the area. The right column are questions finding the volume. But the columns are related because the questions match in layout, for example, Question 1 is a composite shape made from two rectangles, Question 5 is a composite solid made from two rectangular prisms. The method of solving is exactly the same in both questions, the only difference is the extra step in finding the volume. Below is an example.

Example - Find the volume of the shape below.



STEP 1 Here is the solid, find its volume.



STEP 2 Break the front face up into two rectangles. Label the rectangles A_1 and A_2.

$A_1 = lb$

$= 11 \times 42$

$A_1 = 462 \text{ m}^2$

$A_2 = lb$

$= 14 \times 25$

$A_2 = 350 \text{ m}^2$

STEP 3 Calculate the two separate areas. As this is area, the units are square units.

$A = A_1 + A_2 = 462 + 350 = 812 \text{ m}^2$

STEP 4 Add the two areas to get the total area of the front face.

$V = Ah = 812 \times 28 = 22\,736 \text{ m}^3$

STEP 5 Multiply the area by the height to get the volume. Volume is in cubic units.

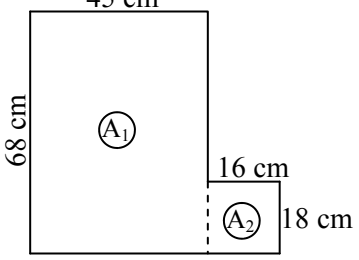
Calculate the area of these shapes by breaking them up into parts first. All angles are right angles, remember to use square units, e.g. cm^2.

1



$A_1 = lb$

$= 68 \times 45$

$A_1 = 3\,060 \text{ cm}^2$

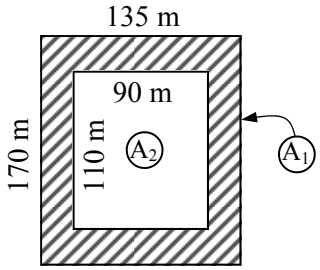
$A_2 = lb$

$= 16 \times 18$

$A_2 = 288 \text{ cm}^2$

$A = A_1 + A_2 = 3\,060 + 288 = 3\,348 \text{ cm}^2$

2 Find the shaded area



$A_1 = lb$

$= 170 \times 135$

$A_1 = 22\,950 \text{ m}^2$

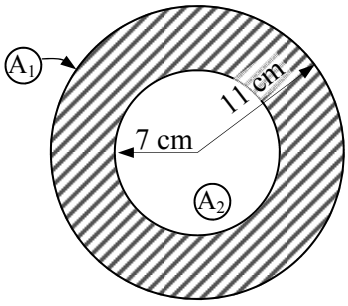
$A_2 = lb$

$= 110 \times 90$

$A_2 = 9\,900 \text{ m}^2$

$A = A_1 - A_2 = 22\,950 - 9\,900 = 13\,050 \text{ m}^2$

3 Shaded area, to 2 d.p.



$A_1 = \pi r^2$

$= \pi \times 11^2$

$A_1 = 380.13 \text{ cm}^2$ (2 d.p.)

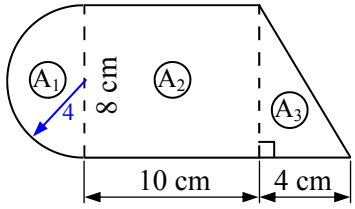
$A_2 = \pi r^2$

$= \pi \times 7^2$

$A_2 = 153.94 \text{ cm}^2$ (2 d.p.)

$A = A_1 - A_2 = 380.13 - 153.94 = 226.19 \text{ cm}^2$

4 Round to 2 d.p.



$A_1 = \pi r^2 \div 2$

$= \pi \times 4^2 \div 2$

$A_1 = 25.13 \text{ cm}^2$ (2 d.p.)

$A_2 = lb$

$= 10 \times 8$

$A_2 = 80 \text{ cm}^2$

$A_3 = \frac{1}{2}bh$

$= \frac{1}{2} \times 4 \times 8$

$A_3 = 16 \text{ cm}^2$

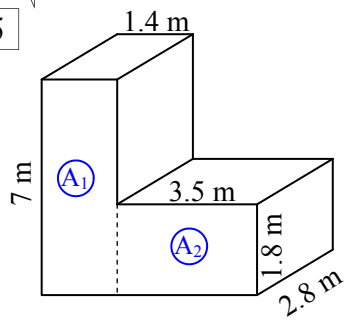
$A = A_1 + A_2 + A_3$

$= 25.13 + 80 + 16$

$A = 121.13 \text{ cm}^2$

Now apply your skills to find the volume. Use the same method as in the left column, except add one more line V=AH to find the volume.

5



$A_1 = lb$

$= 7 \times 1.4$

$A_1 = 9.8 \text{ m}^2$

$A_2 = lb$

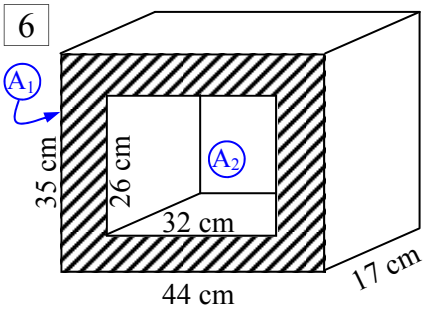
$= 3.5 \times 1.8$

$A_2 = 6.3 \text{ m}^2$

$A = A_1 + A_2 = 9.8 + 6.3 = 16.1 \text{ m}^2$

$V = Ah = 16.1 \times 2.8 = 45.08 \text{ m}^3$

6



$A_1 = lb$

$= 35 \times 44$

$A_1 = 1\,540 \text{ cm}^2$

$A_2 = lb$

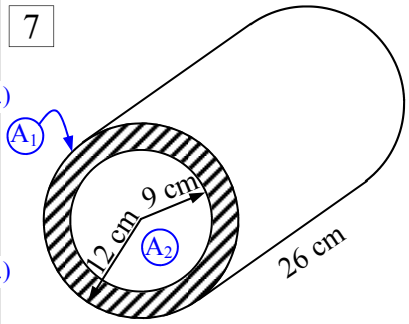
$= 32 \times 26$

$A_2 = 832 \text{ cm}^2$

$A = A_1 - A_2 = 1\,540 - 832 = 708 \text{ cm}^2$

$V = Ah = 708 \times 17 = 12\,036 \text{ cm}^3$

7



$A_1 = \pi r^2$

$= \pi \times 12^2$

$A_1 = 452.39 \text{ cm}^2$ (2 d.p.)

$A_2 = \pi r^2$

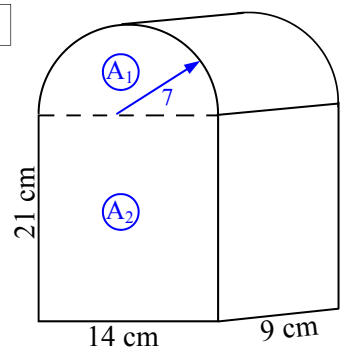
$= \pi \times 9^2$

$A_2 = 254.47 \text{ cm}^2$ (2 d.p.)

$A = A_1 - A_2 = 452.39 - 254.47 = 197.92 \text{ cm}^2$

$V = Ah = 197.92 \times 26 = 5\,145.92 \text{ cm}^3$

8



$A_1 = \pi r^2$

$= \pi \times 7^2$

$A_1 = 153.94 \text{ cm}^2$ (2 d.p.)

$A_2 = lb$

$= 21 \times 14$

$A_2 = 294 \text{ cm}^2$

$A = A_1 + A_2 = 153.94 + 294 = 447.94 \text{ cm}^2$

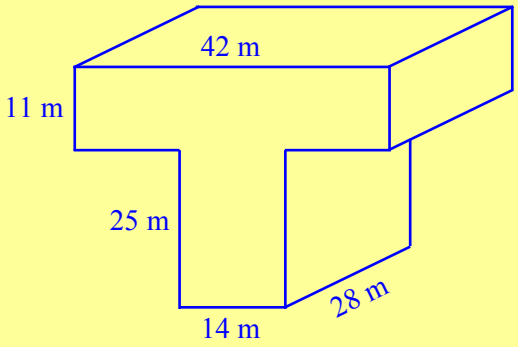
$V = Ah = 447.94 \times 9 = 4\,031.46 \text{ cm}^3$

Volume of Composite Solids - Prisms - Non Circular

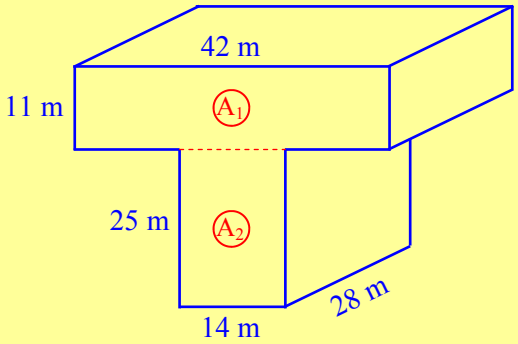
Composite solids are solids built from common solids being added together, or subtracted from each other, to form a new solid. The solids on the first worksheet are all prisms, that means that the front face is the same all through the solid. Because of the uniform cross sectional area these questions can be solved by finding the front face area then multiplying by the height of the solid.

The volume can also be found by finding volumes separately and then adding them together. The two different methods of calculating volume are shown below.

Volume by Finding Area First



STEP 1 Here is the solid, find its volume.



STEP 2 Break the front face up into two rectangles. Label the rectangles A_1 and A_2.

$A_1 = lb$

$= 11 \times 42$

$A_1 = 462 \text{ m}^2$

$A_2 = lb$

$= 14 \times 25$

$A_2 = 350 \text{ m}^2$

STEP 3 Calculate the two separate areas. As this is area, the units are square units.

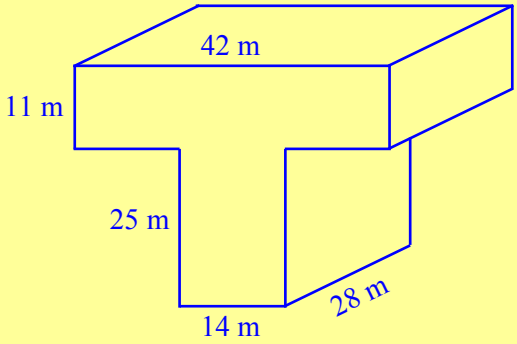
$A = A_1 + A_2 = 462 + 350 = 812 \text{ m}^2$

STEP 4 Add the two areas to get the total area of the front face.

$V = Ah = 812 \times 28 = 22\,736 \text{ m}^3$

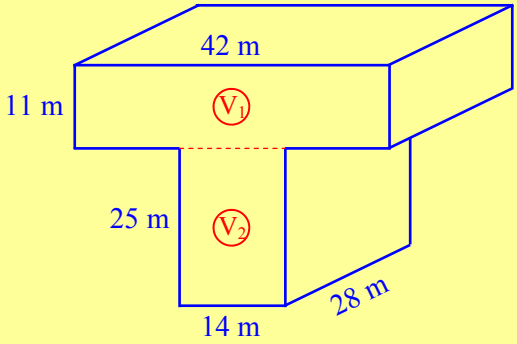
STEP 5 Multiply the area by the height to get the volume. Volume is in cubic units.

Volume by adding Individual Volumes



STEP 1

Here is the solid, find its volume.



STEP 2

Break the front face up into two rectangular prisms. Label them V_1 and V_2.

$V_1 = lbh$

$= 11 \times 42 \times 28$

$V_1 = 12\,936\ m^2$

$V_2 = lbh$

$= 14 \times 25 \times 28$

$V_2 = 9\,800\ m^2$

STEP 3

Calculate the two separate volumes. As this is volume, the units are cubic units.

$V = V_1 + V_2 = 12\,936 + 9\,800 = 22\,736\ m^2$

STEP 4

Add the two volumes to get the total volume.

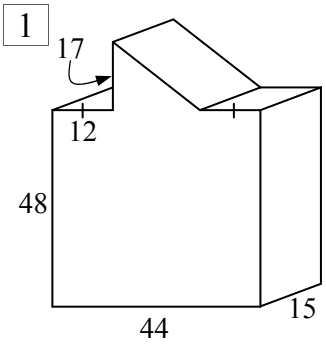
1



$A_1 = \frac{1}{2}bh$

$= \frac{1}{2} \times 20 \times 17$

$A_1 = 170 \text{ cm}^2$

$A_2 = lb$

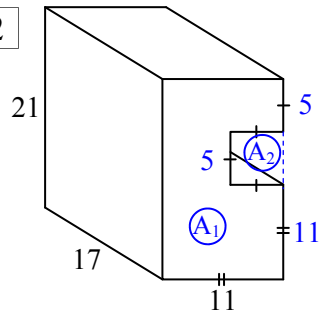
$= 48 \times 44$

$A_2 = 2\,112 \text{ cm}^2$

$A = A_1 + A_2 = 170 + 2\,112 = 2\,282 \text{ cm}^2$

$V = Ah = 2\,282 \times 15 = 34\,230 \text{ cm}^3$

2



$A_1 = lb$

$= 11 \times 21$

$A_1 = 231 \text{ cm}^2$

$A_2 = l^2$

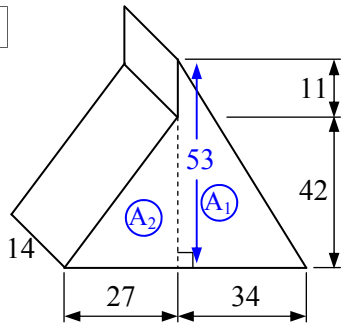
$= 5^2$

$A_2 = 25 \text{ cm}^2$

$A = A_1 - A_2 = 231 - 25 = 206 \text{ cm}^2$

$V = Ah = 206 \times 17 = 3\,502 \text{ cm}^3$

3



$A_1 = \frac{1}{2}bh$

$= \frac{1}{2} \times 34 \times 53$

$A_1 = 901 \text{ cm}^2$

$A_2 = \frac{1}{2}bh$

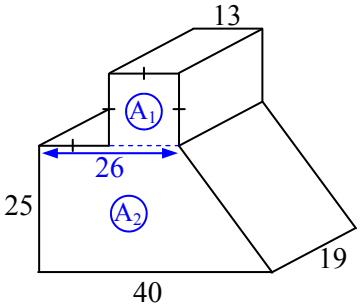
$= \frac{1}{2} \times 27 \times 42$

$A_2 = 567 \text{ cm}^2$

$A = A_1 + A_2 = 901 + 567 = 1\,468 \text{ cm}^2$

$V = Ah = 1\,468 \times 14 = 20\,552 \text{ cm}^3$

4



$A_1 = l^2$

$= 13^2$

$A_1 = 169 \text{ cm}^2$

$A_2 = \frac{1}{2}(a + b)\,h$

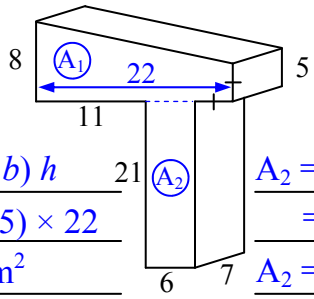
$= \frac{1}{2} \times (40 + 26) \times 25$

$A_2 = 825 \text{ cm}^2$

$A = A_1 + A_2 = 169 + 825 = 994 \text{ cm}^2$

$V = Ah = 994 \times 19 = 18\,886 \text{ cm}^3$

5



$A_1 = \frac{1}{2}(a + b)\,h$

$= \frac{1}{2} \times (8 + 5) \times 22$

$A_1 = 143 \text{ cm}^2$

$A_2 = lb$

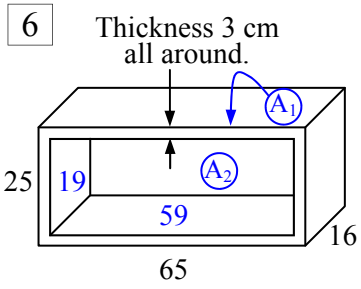
$= 6 \times 21$

$A_2 = 126 \text{ cm}^2$

$A = A_1 + A_2 = 143 + 126 = 269 \text{ cm}^2$

$V = Ah = 269 \times 7 = 1\,883 \text{ cm}^3$

6



$A_1 = lb$

$= 65 \times 25$

$A_1 = 1\,625 \text{ cm}^2$

$A_2 = lb$

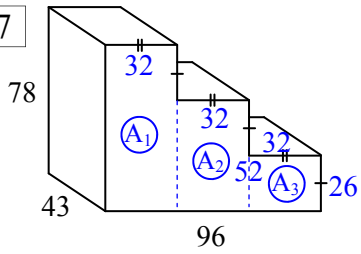
$= 59 \times 19$

$A_2 = 1\,121 \text{ cm}^2$

$A = A_1 - A_2 = 1\,625 - 1\,121 = 504 \text{ cm}^2$

$V = Ah = 504 \times 16 = 8\,064 \text{ cm}^3$

7



$A_1 = lb$

$= 32 \times 26$

$A_1 = 832 \text{ cm}^2$

$A_2 = lb$

$= 32 \times 52$

$A_2 = 1\,664 \text{ cm}^2$

$A_3 = lb$

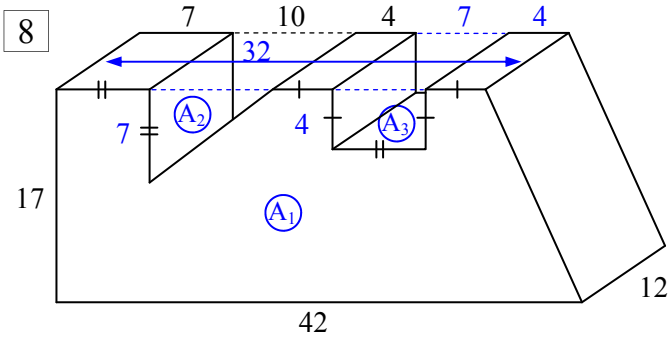
$= 32 \times 78$

$A_3 = 2\,496 \text{ cm}^2$

$A = A_1 + A_2 + A_3 = 832 + 1\,664 + 2\,496 = 4\,992 \text{ cm}^2$

$V = Ah = 4\,992 \times 43 = 214\,656 \text{ cm}^3$

8



$A_1 = \frac{1}{2}(a + b)\,h$

$= \frac{1}{2} \times (32 + 42) \times 17$

$A_1 = 629 \text{ cm}^2$

$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 7 \times 10$

$A_2 = 35 \text{ cm}^2$

$A_3 = lb$

$= 4 \times 7$

$A_3 = 28 \text{ cm}^2$

$A = A_1 - A_2 - A_3 = 629 - 35 - 28 = 566 \text{ cm}^2$

$V = Ah = 566 \times 12 = 6\,792 \text{ cm}^3$

Volume of Composite Solids - Circles

Composite solids are solids that are made by combining two or more solids. To calculate the total volume, separate them into the two volumes (except question 4 - which has 3 solids) and calculate them individually. Then add them together, or subtract them.

Column 1 of the worksheet is answered by adding the volumes together. So calculate the individual volumes and sum them.

Question 1 starts you off with the formulae written and the solid's parts being labeled with V_1 and V_2. Make sure you label each solid. Then the volumes as individual volumes are calculated. Then the last stage is adding the two together. So if you can work out the volume of a cylinder then you just do this twice. Add them and you are done.

Remember to look for when you are given a radius or a diameter, it also may be that you need to calculate some lengths by adding sides together.

Column 2 is also answered by calculating individual volumes but instead of addition use subtraction. It is like a hole has been 'punched' through the solids and because these holes have been removed from the solid, subtraction is used.

Question 5 starts with a rectangular block which has two holes drilled through it. So calculate the volume of the block as if the holes weren't there. Then calculate the volume of one cylindrical hole. The volume will be found by subtracting two 'hole' volumes from the rectangular prism.

You will notice that all of these questions are prisms except the first two questions. Another method of calculating volume is to find the **AREA** of the front face of the prism, then use $\mathbf{V = A}\boldsymbol{h}$ to find the volume. Both methods will result in the same answer.

$V_2 = 7\,238.2 \text{ cm}^3$

$V = 15\,393.8 - 7\,238.2$

$V = 8\,155.6 \text{ cm}^3$

Converting between Volume and Capacity

When you calculate the volume within a solid it's measured in cubic units such as mm^3, cm^3, or m^3. These units are used usually to define empty space such as storage space, shipping containers or packaging, usually when they are to be filled with solid material. Capacity is measured in millilitres (mL), litres (L), kilolitres (kL) and Megalitres (ML). Each unit is 1 000 times larger than the unit before it. While capacity is usually associated with liquids it is also used with air. For example the space inside a car will have its capacity measured in litres.

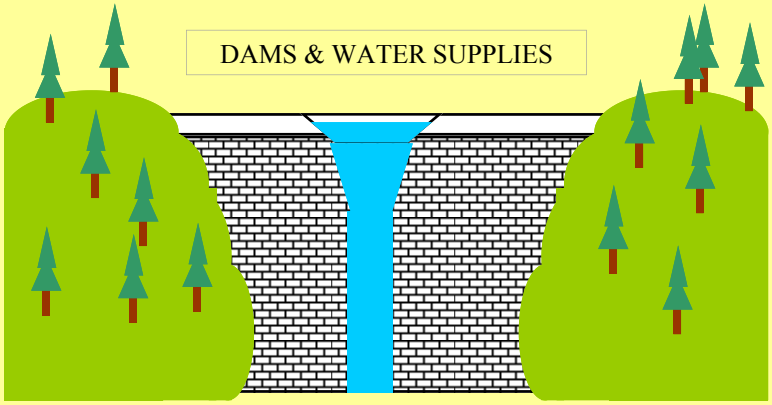
Column 1 starts with comparing mL and cm^3. They are the same, so a measurement in mL, say 5.72 mL is the same in cm^3, 5.72 cm^3. So rewrite the number and change to the other unit. From question 7 you are asked to convert cm^3 to L. As 1 cm^3 is 1 mL, and there are 1 000 mL in a L, then 1 cm^3 must be $^1/_{1000}$ of a L. So divide by 1 000 or move the decimal point 3 places to the left to get your answer. Remember that litres is written with an upper case L.

A common object where both capacity and volume are used is with car motors. The size of the engine could be given in c.c. (cubic centimetres) which is an accepted way of writing cm^3, or litres (L). For example a 1 800 c.c. engine could also be described as a 1.8 L engine.

Column 2 starts with the reverse, converting from L to cm^3. This time you multiply by 1 000 or move the decimal point 3 places to the right. The last 6 questions involve the conversion between kL and m^3. Just as with mL and cm^3, they are identical so 1 kilolitre (1 000 L) = 1 cubic metre (m^3). Just rewrite the number and change the unit.

Column 3 asks you first to convert from m^3 to L. Remember that $1m^3$ = 1 kL which is 1 000 L. So multiply by 1 000 or move the decimal point 3 places to the right. The next section of the column reverses the process, converting L to m^3. Reverse the process by dividing by 1 000 or moving the decimal place 3 places to the left.

This sheet doesn't deal with Megalitres (ML) as they are rarely used. But there are times when their use is essential when dealing with large capacities, can you think of where ML would be used?



Converting between Volume and Capacity

Change the units from mL to cm^3 or the reverse

Example

73 mL = 73 cm^3

1. 350 mL = _____
2. 105 mL = _____
3. 56.3 cm^3 = _____
4. 850 mL = _____
5. 2.43 cm^3 = _____
6. 600 cm^3 = _____

Convert these volumes in cm^3 (c.c.) to litres

850 cm^3 = 0.85 L (3 places left)

7. 1 000 cm^3 = _____
8. 800 cm^3 = _____
9. 450 cm^3 = _____
10. 2 100 cm^3 = _____
11. 1 700 cm^3 = _____
12. 750 cm^3 = _____
13. 1 250 cm^3 = _____
14. 5 000 cm^3 = _____
15. 85 cm^3 = _____
16. 4 302 cm^3 = _____
17. 120.4 cm^3 = _____
18. 333 cm^3 = _____
19. 2 006 cm^3 = _____
20. 500 cm^3 = _____
21. 25.1 cm^3 = _____
22. 1 007 cm^3 = _____
23. 10 cm^3 = _____

Now reverse, change these from L to cm^3

4.3 L = 4 300 cm^3 (3 places right)

24. 2 L = _____
25. 0.5 L = _____
26. 3.1 L = _____
27. 0.2 L = _____
28. 3.5 L = _____
29. 1.75 L = _____
30. 0.04 L = _____
31. 4.03 L = _____
32. 0.05 L = _____
33. 0.01 L = _____
34. 0.2063 L = _____
35. 2.02 L = _____
36. 0.25 L = _____
37. 4.06 L = _____
38. 0.96 L = _____
39. 3.007 L = _____
40. 4.55 L = _____

Change the units from kL to m^3 or the reverse

Example

2.9 m^3 = 2.9 kL

41. 7 m^3 = _____
42. 3.84 kL = _____
43. 43 kL = _____
44. 0.3 m^3 = _____
45. 204 m^3 = _____
46. 7.06 kL = _____

Change these volumes from m^3 to litres.

2.53 m^3 = 2 530 L (3 places right)

47. 7.2 m^3 = _____
48. 0.5 m^3 = _____
49. 3.7 m^3 = _____
50. 0.25 m^3 = _____
51. 16.403 m^3 = _____
52. 0.02 m^3 = _____
53. 5.62 m^3 = _____
54. 1.01 m^3 = _____
55. 7.9035 m^3 = _____
56. 18.006 m^3 = _____
57. 105.12 m^3 = _____

Now change these from litres to cubic metres

2 650 L = 2.65 m^3 (3 places left)

58. 2 000 L = _____
59. 1 700 L = _____
60. 800 L = _____
61. 3 075 L = _____
62. 175 L = _____
63. 422 L = _____
64. 9.06 L = _____
65. 45.6 L = _____
66. 115 L = _____
67. 2 L = _____
68. 500.5 L = _____
69. 3 000.6 L = _____

Converting between Volume and Capacity

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Change the units from mL to cm^3 or the reverse

Example

73 mL = 73 cm^3

1. 350 mL = 350 cm^3
2. 105 mL = 105 cm^3
3. 56.3 cm^3 = 56.3 mL
4. 850 mL = 850 cm^3
5. 2.43 cm^3 = 2.43 mL
6. 600 cm^3 = 600 mL

Convert these volumes in cm^3 (c.c.) to litres

850 cm^3 = 0.85 L (3 places left)

7. 1 000 cm^3 = 1 L
8. 800 cm^3 = 0.8 L
9. 450 cm^3 = 0.45 L
10. 2 100 cm^3 = 2.1 L
11. 1 700 cm^3 = 1.7 L
12. 750 cm^3 = 0.75 L
13. 1 250 cm^3 = 1.25 L
14. 5 000 cm^3 = 5 L
15. 85 cm^3 = 0.085 L
16. 4 302 cm^3 = 4.302 L
17. 120.4 cm^3 = 0.1204 L
18. 333 cm^3 = 0.333 L
19. 2 006 cm^3 = 2.006 L
20. 500 cm^3 = 0.5 L
21. 25.1 cm^3 = 0.0251 L
22. 1 007 cm^3 = 1.007 L
23. 10 cm^3 = 0.01 L

Now reverse, change these from L to cm^3

4.3 L = 4 300 cm^3 (3 places right)

24. 2 L = 2 000 cm^3
25. 0.5 L = 500 cm^3
26. 3.1 L = 3 100 cm^3
27. 0.2 L = 200 cm^3
28. 3.5 L = 3 500 cm^3
29. 1.75 L = 1 750 cm^3
30. 0.04 L = 40 cm^3
31. 4.03 L = 4 030 cm^3
32. 0.05 L = 50 cm^3
33. 0.01 L = 10 cm^3
34. 0.2063 L = 206.3 cm^3
35. 2.02 L = 2 020 cm^3
36. 0.25 L = 250 cm^3
37. 4.06 L = 4 060 cm^3
38. 0.96 L = 960 cm^3
39. 3.007 L = 3 007 cm^3
40. 4.55 L = 4 550 cm^3

Change the units from kL to m^3 or the reverse

Example

2.9 m^3 = 2.9 kL

41. 7 m^3 = 7 kL
42. 3.84 kL = 3.84 m^3
43. 43 kL = 43 m^3
44. 0.3 m^3 = 0.3 kL
45. 204 m^3 = 204 kL
46. 7.06 kL = 7.06 m^3

Change these volumes from m^3 to litres.

2.53 m^3 = 2 530 L (3 places right)

47. 7.2 m^3 = 7 200 L
48. 0.5 m^3 = 500 L
49. 3.7 m^3 = 3 700 L
50. 0.25 m^3 = 250 L
51. 16.403 m^3 = 16 403 L
52. 0.02 m^3 = 20 L
53. 5.62 m^3 = 5 620 L
54. 1.01 m^3 = 1 010 L
55. 7.9035 m^3 = 7 903.5 L
56. 18.006 m^3 = 18 006 L
57. 105.12 m^3 = 105 120 L

Now change these from litres to cubic metres

2 650 L = 2.65 m^3 (3 places left)

58. 2 000 L = 2 m^3
59. 1 700 L = 1.7 m^3
60. 800 L = 0.8 m^3
61. 3 075 L = 3.075 m^3
62. 175 L = 0.175 m^3
63. 422 L = 0.422 m^3
64. 9.06 L = 9 060 m^3
65. 45.6 L = 0.0456 m^3
66. 115 L = 0.115 m^3
67. 2 L = 0.002 m^3
68. 500.5 L = 0.5005 m^3
69. 3 000.6 L = 3.0006 m^3

Units of Capacity

Capacity is another way of expressing volume. Rather than using length measurements, capacity is expressed using measurements normally associated with liquids. Usually mL, L and kL. This sheet deals with the changing of units between these three. As with length, (mm, m and km), capacity units are × 1 000 apart (cm is the exception with length). So you multiply by 1 000, or as hopefully you know, you move the decimal point 3 places to the right (multiplying) and to the left (dividing).

Column 1 deals with changing from a smaller unit to a larger unit. With these you divide by 1 000. So move the decimal point 3 places to the left with these, remember to write the new unit after your answer, it will be the unit inside the brackets. Watch that you don't have unnecessary zeros in your answers when decimal points are involved.

Column 2 is the reverse, this time moving to a smaller unit so you have more of them, so you are multiplying by 1 000. Move the decimal point 3 places to the right to make the number larger. Again remember to write the new units after the number.

Column 3 asks you to find the volume of the prisms, the answer will be in cubic units, either cm^3 or m^3. Convert these to either mL (if cm^3) or kL (if m^3), rewrite the number and change the units. Then rewrite the answer in litres (L), using your skills from the previous 2 columns. Capacity is volume, so you still write 'V =' in your answer.

Note that L is the symbol for litres, it is a capital letter, this may seem unusual but many metric units use capital letters, an example being ‘N’ (Newtons, a measure of force) or ‘W’ (Watt, a measure of electrical power).

$V = lbh$

$= 3 \times 10 \times 2$

$V = 60 \text{ m}^3$

$V = 60 \text{ kL}$

$V = 60\,000 \text{ L}$

Volume and Capacity

This sheet involves both volume units (mm^3, cm^3 and m^3) and capacity units (mL, L and kL).

Column 1 starts with solids built from cube blocks. Each cube is 10 cm^3 in volume. As 1 cm^3 is equal to 1 mL, that also means that each block has a capacity of 10mL. So count the blocks and multiply by 10 for the volume and capacity. The second part of the column gives you the area of the face of the prism and its height. Use $V = Ah$ to find the volume. After you find the volume convert the cm^3 volume to mL and the m^3 volumes to kL.

Column 2 involves finding the volumes for cubes and rectangular prisms.

Volume of a Rectangular Prism:	$V = lbh$
Volume of a Cube:	$V = l^3$

To change the units remember that:

$1\ cm^3 = 1\ mL$

$1\ m^3 = 1\ kL$

Column 3 deals with triangular prisms and cylinders. The formulae to use for these is:

Volume of a Triangular Prism:	$V = \frac{1}{2}lbh$
Volume of a Cylinder:	$V = \pi r^2 h$

Remember to watch for when you are given a diameter rather than a radius. Halve the diameter (÷2) to get the radius, then use the radius in the formula.

Volume and Capacity

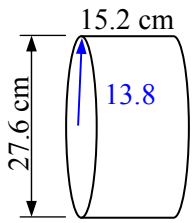
V = $\pi r^2 h$

= $\pi \times 4.1^2 \times 10.6$

V = 559.8 m^3 (1 d.p.)

Capacity = 559.8 kL

14



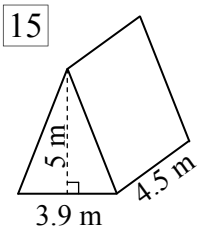
V = $\pi r^2 h$

= $\pi \times 13.8^2 \times 15.2$

V = 9 093.9 cm^3 (1 d.p.)

Capacity = 9 093.9 mL

15



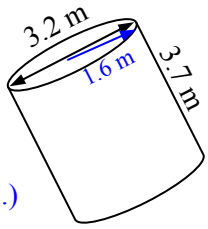
V = ½*lbh*

= ½×3.9×5×4.5

V = 43.9 m^3 (1 d.p.)

Capacity = 43.9 kL

16



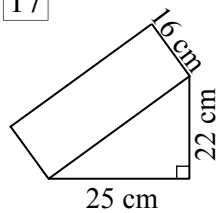
V = $\pi r^2 h$

= $\pi \times 1.6^2 \times 3.7$

V = 29.8 m^3 (1 d.p.)

Capacity = 29.8 kL

17



V = ½*lbh*

= ½×25×22×16

V = 4 400 cm^3

Capacity = 4 400 mL

Further Volume and Capacity

Volume and capacity are essentially the same thing. The only difference is that volume uses cubic length units (mm^3, cm^3, m^3) while capacity uses liquid units (ml, L, kL). The good news is that:

$1\ cm^3 = 1\ mL$
and
$1\ m^3 = 1\ kL$

Note that there is no unit conversion for litres. So if an answer requires litres then the units have to be converted from mL or kL.

Column 1 shows objects that are commonly measured in litres. But the dimensions of the objects are in cm. So the process to answer these questions is to first find the volume in cm^3. Then rewrite this only using mL. Finally divide this answer by 1 000 to convert to Litres.

Columns 2 and 3 involve objects which are measured in metres. So you will get a volume in m^3. This can be rewritten in kL, then multiplied by 1 000 to find the answer in Litres.

Further Volume and Capacity

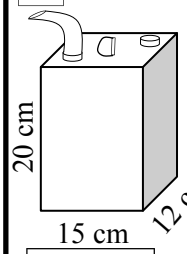
Find the volume of these objects, then convert to mL and Litres. Round to 2 d.p. when required.

1



$V = lbh$

$= 20 \times 15 \times 12$

$V = 3\,600$ cm^3

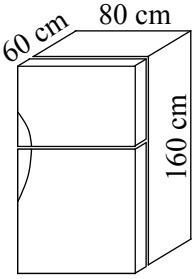
3 600 cm^3 = 3 600 mL

Convert to mL: 1 cm^3 = 1 mL

Capacity = 3.6 L

Convert to L: 1 000 mL = 1 L

2



$V = lbh$

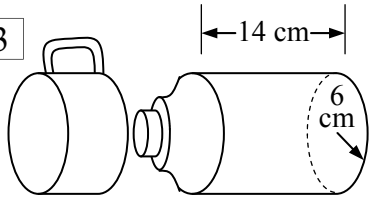
$= 60 \times 80 \times 160$

$V = 768\,000$ cm^3

768 000 cm^3 = 768 000 mL

Capacity = 768 L

3



$V = \pi r^2 h$

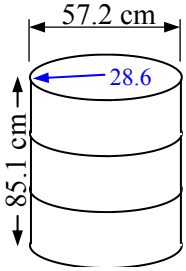
$= \pi \times 6^2 \times 14$

$V = 1\,583.36$ cm^3 (2 d.p.)

1 583.36 cm^3 = 1 583.36 mL

Capacity = 1.58 L (2 d.p.)

4



$V = \pi r^2 h$

$= \pi \times 28.6^2 \times 85.1$

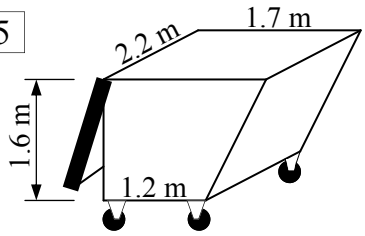
$V = 218\,681.23$ cm^3 (2 d.p.)

218 681.23 cm^3 = 218 681.23 mL

Capacity = 218.68 L (2 d.p.)

Use V=A*h* to find the volume for these, then give the capacity in kL, then in L. Round to 2 d.p.

5



$A = \frac{1}{2}(a + b) \times h$

$= \frac{1}{2} \times (1.2 + 1.7) \times 1.6$

$A = 2.32$ m^3

$V = Ah$

$= 2.32 \times 2.2$

$V = 5.10$ m^3 (2 d.p.)

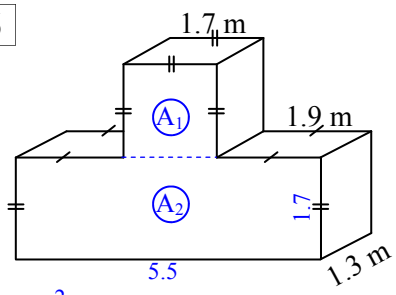
5.1 m^3 = 5.1 kL

Convert to kL: 1 m^3 = 1 kL

Capacity = 5 100 L

Convert to L: 1 kL = 1 000 L

6



$A_1 = l^2$

$= 1.7^2$

$A_1 = 2.89$ m^2

$A_2 = lb$

$= 1.7 \times 5.5$

$A_2 = 9.35$ m^2

$A = A_1 + A_2 = 2.89 + 9.35 = 12.24$ m^2

$V = Ah$

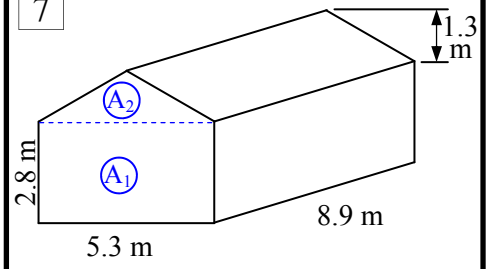
$= 12.24 \times 1.3$

$V = 15.91$ m^3 (2 d.p.)

15.91 m^3 = 15.91 kL

Capacity = 15 910 L

7



$A_1 = lb$

$= 2.8 \times 5.3$

$A_1 = 14.84$ m^2

$A_2 = \frac{1}{2}bh$

$= \frac{1}{2} \times 1.3 \times 5.3$

$A_2 = 3.45$ m^2 (2 d.p.)

$A = A_1 + A_2 = 14.84 + 3.45 = 18.29$ m^2

$V = Ah$

$= 18.29 \times 8.9$

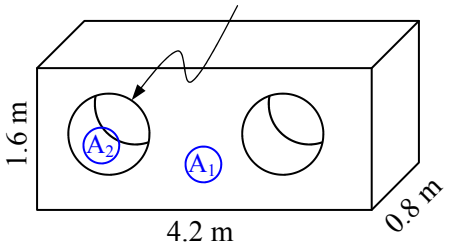
$V = 162.78$ m^3 (2 d.p.)

162.78 m^3 = 162.78 kL

Capacity = 162 780 L

8

Both holes 1 m diameter, completely through solid.



$A_1 = lb$

$= 1.6 \times 4.2$

$A_1 = 6.72$ m^2

$A_2 = \pi r^2$

$= \pi \times 0.5^2$

$A_2 = 0.79$ m^2 (2 d.p.)

$A = 6.72 - 2 \times 0.79 = 5.14$ m^2

$V = Ah$

$= 5.14 \times 0.8$

$V = 4.11$ m^3 (2 d.p.)

4.11 m^3 = 4.11 kL

Capacity = 4 110 L

Volume and Capacity Problems

These are worded questions using skills learned on previous sheets. Previous sheets should be attempted before this sheet.

Formulae required for this sheet are:

Volume of a Rectangular Prism: $V = lbh$

Volume of a Cylinder: $V = \pi r^2 h$

Volume of a Prism: $V = Ah$

Area of a Trapezium: $A = \frac{1}{2}(a + b)\, h$

Volume and Capacity Problems

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use your volume and capacity skills to answer these, to 1 d.p.

A cylindrical rainwater tank with radius 3.4 m and height 5.2 m is the water source at a property. The tank is full.

1 Draw the tank

2 Calculate the capacity of the tank, answer in litres.

3 If the family uses an average of 630 L per day, how many days supply is there without rain?

Dave is selling drinks at a school fete. The rectangular prism-shaped container has sides of 18 cm, 26 cm and 30 cm.

4 Find its volume in litres.

5 If the mix requires 15% cordial and 85% water, calculate the amount of each required.

Joanne has found an old paint can in the garage. The label is removed so she can't read its capacity. The can is 90% full and has a 22 cm diameter and 25 cm height.

6 Find the capacity of the tank when full.

7 Find the amount of paint in the can.

8 If one litre covers 14 m^2, find the coverage, to the nearest m^2, that Joanne can expect.

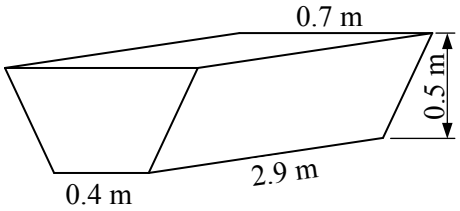
Ian has to fill a rectangular prism shaped fish tank with a cylindrical bucket. The tank has sides 60 cm, 38 cm & 25 cm, the bucket has a diameter of 23 cm and height of 34 cm. Find:

9 The tank capacity in L.

10 The bucket capacity in L.

11 How many bucketfuls will be required to fill the tank?

A water trough made from concrete is shown below. It weighs 125 kg when empty. If water weighs 1 T/m^3, find :



12 The tough's volume, (3 d.p.)

13 The weight of the trough, in kg, if it is full of water.

Amy's garden tap is dripping. If it leaks at 55 mL per minute, find:

14 The water lost after 3 hours.

15 The time taken to lose 30 L of water. (nearest minute)

16 The time taken, to the nearest min, to fill a cylindrical bucket of diameter 35 cm and height 40 cm.

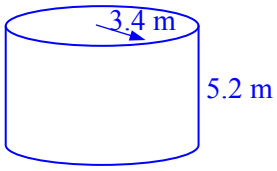
Volume and Capacity Problems

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use your volume and capacity skills to answer these, to 1 d.p.

A cylindrical rainwater tank with radius 3.4 m and height 5.2 m is the water source at a property. The tank is full.

1 Draw the tank



2 Calculate the capacity of the tank, answer in litres.

$V = \pi r^2 h$

$= \pi \times 3.4^2 \times 5.2$

$V = 188.8 \text{ m}^3$ (1 d.p.)

Capacity is 188 800 L (188 847.4 L)

3 If the family uses an average of 630 L per day, how many days supply is there without rain?

188 800 ÷ 630 = 299.7 days 1d.p.

(or 188 847.4 ÷ 630 = 299.8 days) (1 d.p.)

Dave is selling drinks at a school fete. The rectangular prism-shaped container has sides of 18 cm, 26 cm and 30 cm.

4 Find its volume in litres.

$V = lbh$

$= 18 \times 26 \times 30$

$V = 14\,040 \text{ cm}^3$

Capacity = 14 litres (1 d.p.)

5 If the mix requires 15% cordial and 85% water, calculate the amount of each required.

Cordial Amount: 0.15 × 14

= 2.1 litres

Water Amount: 14 - 2.1

= 11.9 litres

Joanne has found an old paint can in the garage. The label is removed so she can't read its capacity. The can is 90% full and has a 22 cm diameter and 25 cm height.

6 Find the capacity of the tank when full.

$V = \pi r^2 h$

$= \pi \times 11^2 \times 25$

$V = 9\,503.3 \text{ cm}^3$ (1 d.p.)

Capacity is 9.5 L

7 Find the amount of paint in the can.

Paint: 0.9 × 9.5

= 8.6 L (1 d.p.)

8 If one litre covers 14 m^2, find the coverage, to the nearest m^2, that Joanne can expect.

Coverage: 8.6 × 14

= 120 m^2 (nearest m^2)

Ian has to fill a rectangular prism shaped fish tank with a cylindrical bucket. The tank has sides 60 cm, 38 cm & 25 cm, the bucket has a diameter of 23 cm and height of 34 cm. Find:

9 The tank capacity in L.

$V = lbh$

$= 60 \times 38 \times 25$

$V = 57\,000 \text{ cm}^3$

Capacity = 57 litres.

10 The bucket capacity in L.

$V = \pi r^2 h$

$= \pi \times 11.5^2 \times 34$

$V = 14\,126.2 \text{ cm}^3$ (1 d.p.)

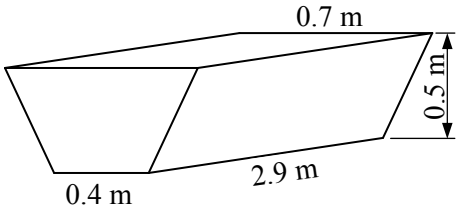
Capacity = 14.1 litres. (1 d.p.)

11 How many bucketfuls will be required to fill the tank?

Buckets Req'd = 57 ÷ 14.1

= 4.04…. So 5 buckets required

A water trough made from concrete is shown below. It weighs 125 kg when empty. If water weighs 1 T/m^3, find :



12 The tough's volume, (3 d.p.)

$A = \frac{1}{2}(a + b) \times h$

$= \frac{1}{2}(0.4 + 0.7) \times 0.5$

$A = 0.275 \text{ m}^2$

$V = Ah$

$= 0.275 \times 2.9$

$V = 0.798 \text{ m}^3$ (3 d.p.)

13 The weight of the trough, in kg, if it is full of water.

Weight Water = 0.798 × 1 000

= 798 kg

Total = 798 + 125 = 923 kg

Amy's garden tap is dripping. If it leaks at 55 mL per minute, find:

14 The water lost after 3 hours.

Water Lost = 55 × (3 × 60)

Water Lost = 9 900 mL (9.9 L)

15 The time taken to lose 30 L of water. (nearest minute)

Time = 30 000 ÷ 55

Time = 545 mins (9 h 5 min)

16 The time taken, to the nearest min, to fill a cylindrical bucket of diameter 35 cm and height 40 cm.

$V = \pi r^2 h$

$= \pi \times 17.5^2 \times 40$

$V = 38\,484.5 \text{ cm}^3$ (1 d.p.)

Time = 38 484.5 ÷ 55

Time = 700 min (nearest min)

(11 h 40 min)

Volume - Find A Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don’t colour it in too dark (using a texta for example) so that you can still read it.

ALTITUDE

REVIEW:
GRAPHS

Picture Graphs

Picture graphs are similar to bar graphs, the data is displayed by pictures or symbols of an item. Graphs usually have an axis to read off the value, Picture graphs don't require this scale as each picture of an item represents a specified number of items. Picture graphs are as accurate as their scale allows, but they are used mainly for quick reference rather than an exact display of data.

Column 1 of this sheet has the graphs drawn for you, you are asked to read the graph and answer the questions. Note the 'key' or 'scale', this tells you the value of each symbol. To increase accuracy, portions of a symbol can be used.

The computer in the first column is either: fully drawn, ¾ drawn, ½ drawn or ¼ drawn. If a fully drawn computer represents 20 computers then part drawn computers equal that fraction of 20.

Graph 2 is a representation of a Café's sales of fresh juices. This time each symbol represents 200 glasses of juice. Note that again the same fractions ¼, ½ and ¾ are used. Questions 6 and 7 are about rounding. While 2 symbols may represent 400 glasses, those same 2 symbols could also represent 390 glasses. Some students will have difficulty with this concept.

Column 2 asks you to construct graphs from data in the tables. The data can be constructed exactly by adding whole and part pieces of a symbol, you don't need to worry about rounding.

Remember that fractions of a picture are always on the end (right hand side) and there can only be one in each line. Don't use several fractions of a symbol, the purpose of a picture graph is that they are easy and quick to read, not confusing!

Picture Graphs

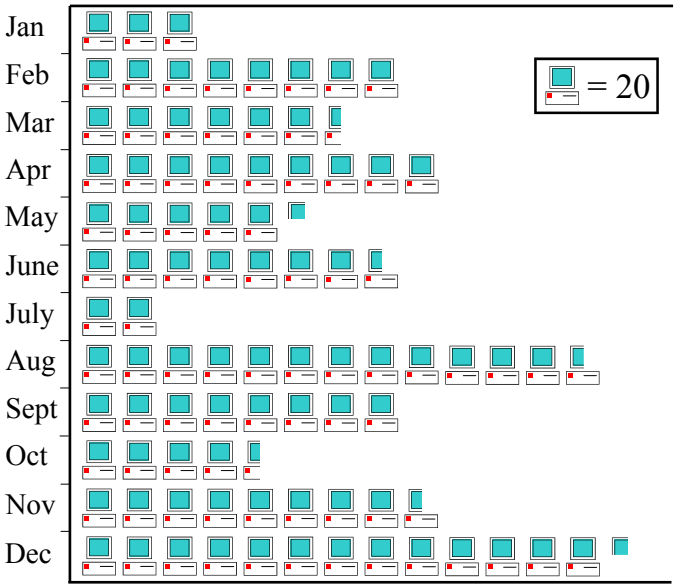
Study the graphs then answer the questions

Graph 1 : Computer Sales in 2002



1 Give the values represented by these symbols:

= ___ = ___ = ___ = ___

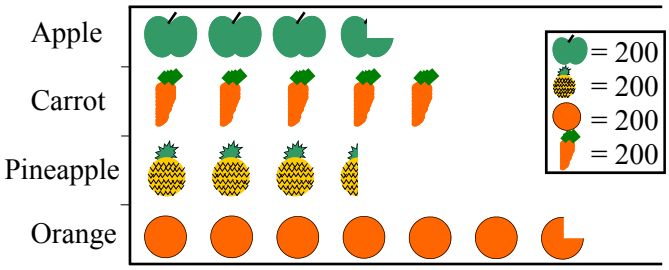
2 Name the months with the same sales figures and give the number of sales _____

3 Give the lowest sales month & sales _____

4 Give the highest sales month & sales figure, give a reason why this month could have the most sales.

_____

Graph 2 : Average Monthly Juice Sales (glass)



5 Name and give sales figures for the:

a) least popular juice _____

b) most popular juice _____

6 Actual sales figures for carrot juice could range from 975 - 1 024 glasses. Briefly explain why.

_____

7 Give the largest and smallest possible sales figures for pineapple juice _____

Now place the details in the table on the graph

Table 1 : Jeans Shop Sales Assistant Figures

Name	Ian	Deb	Mike	Luke	April
Sales	240	80	140	170	150

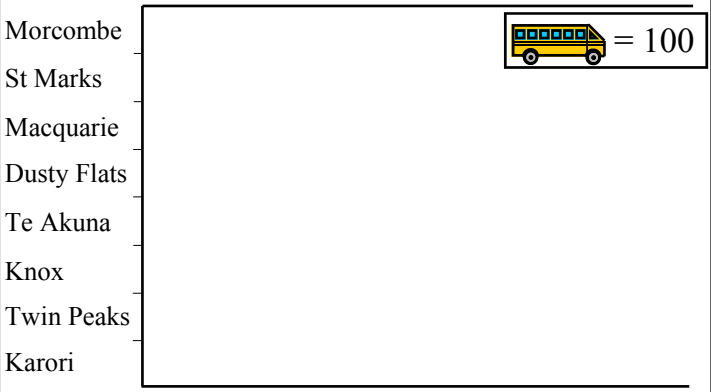
Graph 4 : Students Using Bus Transport



9 Give the values represented by these symbols:

= 25 = 50 = 75 = 125

Column Graphs

Column graphs show data with columns which are read off a vertical scale, with the horizontal axis giving the meaning of the column. This sheet has two columns, the first being reading graphs and the second being constructing graphs (from reading a table).

Column 1 starts with a column graph on the fundraising activity of a charity. It outlines the different methods of fundraising along its horizontal axis and their financial success on the vertical axis. This graph can be read to the nearest $5 000.

The second graph is about the conversion of a chicken battery farm to a free range farm. This time there are two columns for each category. The free range egg figure and the battery laid figure. Note also that the columns are rectangular prisms, these give the graph a different appearance, but be careful when reading the columns. Read the columns off the top edge that is 'closer' to you, not the edge at the back of the column. In other words, use the front face of the prism for measurement.

Column 2 starts with a question about dice. When you roll 2 dice you have 36 different combinations of the two faces of each die. The first table is just like a 6 by 6 addition table, just add the two numbers. Then count how many of each number there are for the next table. Note both tables have been started for you. Then graph the result. Note that the first column is already done for you.

Question 6 involves a survey of traffic, it requires you to read the data straight from the table and place it on the graph.

Note the use of the word frequency, frequency means the number of times something occurs.

Column Graphs

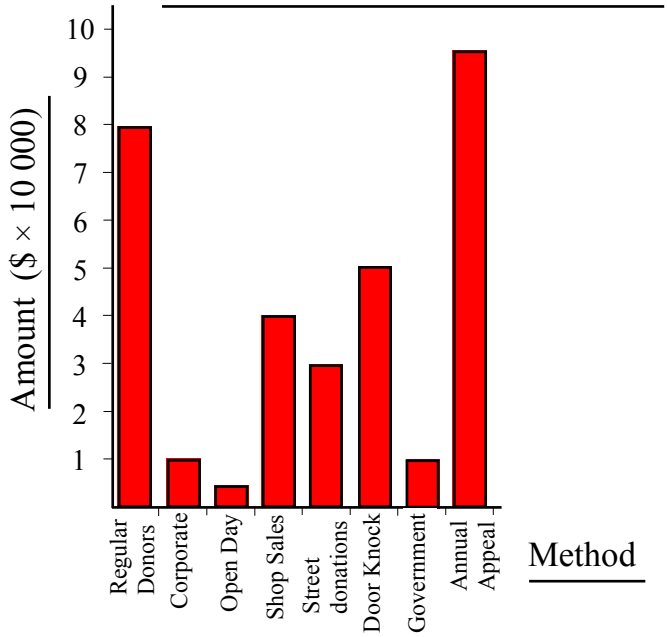
Study the column graphs below then answer the questions

Graph 1 : Fundraising by a Charity



1 Give amount raised by: *a*) Door Knock _____

b) Regular Donors _____ *c*) Shop Sales _____

2 Which method of fundraising:

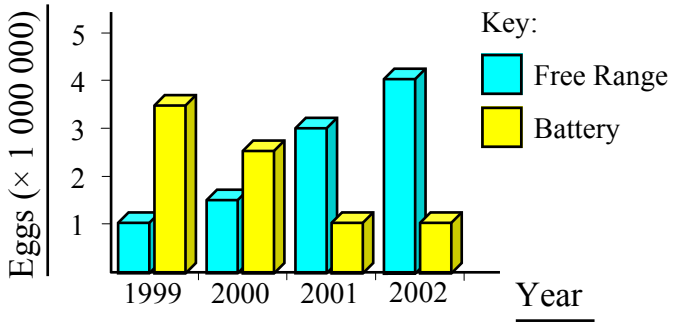
a) is the third most successful _____

b) matches Government donations _____

c) more than triples the street donations _____

d) made $5 000 _____

Graph 2 : Ingall's Hen Farm Egg Production



3 Give the total number of eggs for: *a*) 1999 _____

b) 2000 _____ *c*) 2001 _____

4 Give the year that free range production was:

a) 1 000 000 eggs less then battery laid eggs _____

b) increased and battery laid was unchanged _____

c) three times more than battery laid eggs _____

d) increased by 1 500 000 eggs _____

Complete the tables for the totals possible for 2 dice, then graph them.

5

Graph 4 : Vehicle Survey

Bar Graphs

Bar graphs display data in the same way as column graphs except the graph is on its side. These graphs all have:

- A title which describes the purpose of the graph
- Axes headings, these describe the scale on each axis
- Scales, these let you to read or construct the bars with reasonably accuracy

Column 1 asks you to extract information from constructed graphs. Both graphs have columns that are either exactly on the number or half way between two numbers on the horizontal scale. The first graph deals with Blue Whale population, Questions 1 and 2 ask you to read figures off the graph, question 3 asks you to write the years that correspond to the change in population.

The second graph refers to the way a student may spend their day. This graph uses ½ hours so write either 0.5 h or ½ h.

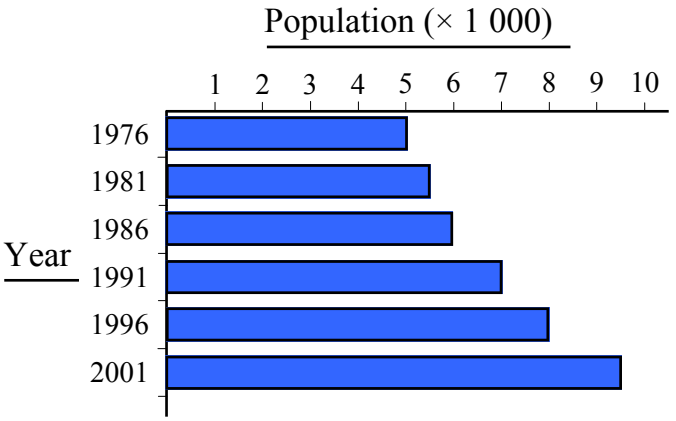
The second column asks you to create bar graphs. Write the title, axes headings and complete the scale which has been started for you. Then construct the bars.

Bar Graphs

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Answer these questions on the use of bar graphs

Graph 1 : Blue Whale Population Estimation



1 Give the estimated number of blue whales in:

a) 1976 _____ *b*) 1986 _____ *c*) 1996 _____

2 Give the increase in whale numbers between

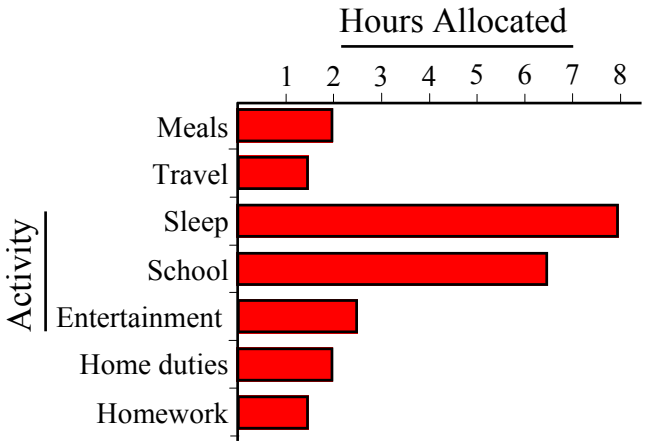
a) 1976 - 1991 _____ *b*) 1981 - 2001 _____

3 Between which years is there a population increase of:

a) 500 _____ *b*) 1 500 _____

c) 3 000 _____ *d*) 4 000 _____

Graph 2 : Analysis of a School Day



4 Give the number of hours spent: *a*) Sleeping ____

b) Eating ____ *c*) At school ____ *d*) Travelling ____

5 Give the difference in time spent on these activities:

a) Entertainment and.. Homework ____ Eating ____

b) Time at School and.. Travel ____ Sleeping ____

c) Home duties and.. School time ____ Travel ____

6 How many hours could the above student be at home each weekday _____

Now put this data on the bar graph below

Table 1 : Least Painful Home Duty

Home Duty	Student Approval
Mowing Grass	15%
Washing Dishes	10%
Tidy Bedroom	5%
Washing Car	25%
Meal Preparation	45%

A	105
B	130
C	125
D	110
E	180
F	135
G	115

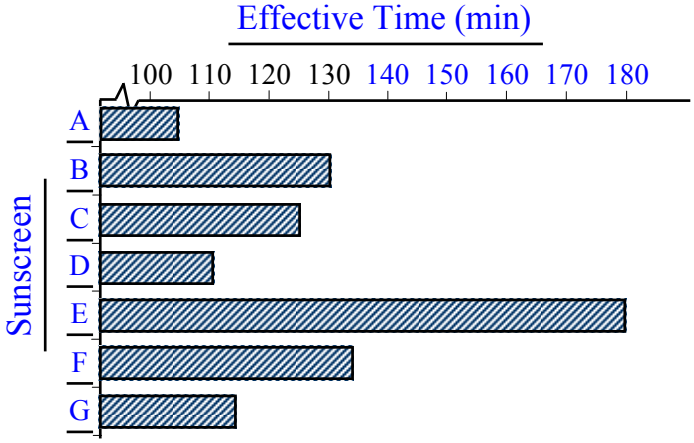
Graph 4 : Timing Sunscreen Protection



Line Graphs

Line graphs show data as a continuous line, this allows for estimations to be made between data. For example if population data is assembled every 5 years by using a line graph you can estimate the population in between those years. You should realise that there are limitations to this, as the population won't change in a straight line, it could rapidly rise and fall between actual readings. Another common use of line graphs is to relate two values against each other. This relationship may be a straight line and so values at any point on the line will be correct.

Column 1 starts with a town's population being graphed. Note the scale on the vertical axis is × 10 000, so 1 = 10 000, 1.4 = 14 000 and so on. You would use a ruler to accurately read off the graph. The second graph involves converting currency, between NZ$ and A$ (or NZD and AUD).

Column 2 questions 5, 6 and 7 refer to the column 1 graph, only you are asked to find one value from the graph and then using your number skills, find other conversions without using the graph. Remember when you multiply by 10 you move the decimal point one place to the right, 100 = 2 places and so on. For division move the decimal point to the left.

Graph 3 compares US$ with both Australian and New Zealand currencies. To convert US$ to A$ use a ruler horizontally (flat) then where the ruler intersects the black line, read off the amount on the bottom scale. To convert to from US$ to NZ$ use the same method but use the red line. Note that you could use this graph to convert between A$ and NZ$, you would go up to the red or black line, then across to other line, then down.

Line Graphs

c) A$0.40 = US$ 0.21 *d*) A$400.40 = US$ 210.21

Composite Graphs

Composite graphs stack different pieces of information together to form the total column (or bar). This method of displaying data allows access to the total as well as the basic parts to form the total.

Column 1 starts with a composite column graph showing a family's phone call history for the past 6 months. The calls are categorised as local calls, national calls, international calls and calls to mobile phones. All columns are rounded to the nearest $10 so that they are easier to read. Note that each part starts where the other stops, so to obtain a value for a specific part read off the amount at its base and subtract that from the amount at its top.

Another way of showing composite graphs is with just a single bar (or column) which is divided up into parts. These are usually to scale so that a ruler can be used to get information. Time lines are commonly in this format. Our graph is a time line about the construction of a hamburger in a fast food outlet. Use a ruler to measure each part and the total of the bar, note that 1 cm = 4 s (seconds). Q 5 shows employees being faster than standard time in certain aspects of burger building, replace the standard time with the new time and then give the reduced total time for the complete build. Q 6 refers to an employee who prefers a better quality of finish and is slower in certain phases of the build.

Column 2 asks you to construct a composite column graph comparing 5 different dentists in the procedure of putting a filling in a tooth. Position columns on top of the first part (the needle injection) which is in place for each column and build them up.

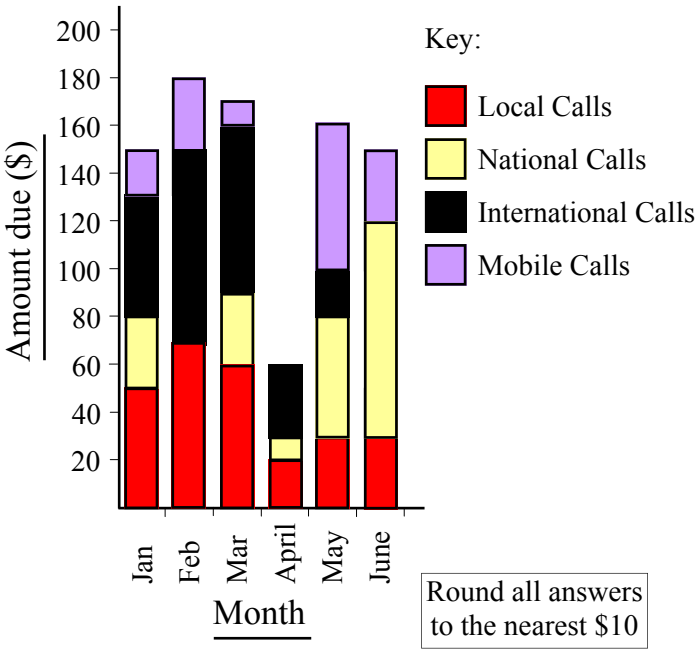
The same method is use for the composite bar graph, note that 1 cm = 10 animals (or 1 mm = 1 animal). You can colour the key the same colour as the blocks and you can write the names on as well.

Composite Graphs

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Study the composite graphs then answer the questions

Graph 1 : Forsythe Family Monthly Phone Bill



Round all answers to the nearest $10

1 Give the total amount due in:

a) Jan _____ *b*) Feb _____ *c*) May _____

2 Which month had the lowest number of calls to:

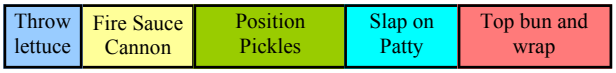
a) Mobile phones _____ *b*) Local Numbers _____

3 Give the amount spent on international calls in:

a) Jan _____ *b*) Feb _____

c) March _____ *d*) April _____

Graph 2 : Standard Times for Building a Burger



1 cm = 4 seconds

4 Give the time taken to:

a) 'Apply' lettuce _____ *b*) Build burger _____

5 If some actions can be done faster, calculate total time

a) Jackie can sauce burgers in 3 s, new total time: _____

b) Oscar can place pickles in 2 s, new total time: _____

c) Jason cannons the sauce in 5 s: new total time: _____

d) Marie slaps on a patty in 4 s, new total time: _____

6 Ryan treats burgers as art, find his total time when he takes 16 s to position the pickles and 12 s to apply sauce, all other times are unchanged _____

Construct a composite column graph for these dentists

Table 1 : Time Comparison for Filling a Tooth

Action	Dentist A	Dentist B	Dentist C	Dentist D	Dentist E
Injecting	6	4	4	7	2
Drilling	13	8	12	15	14
Filling	5	7	5	4	5
Grinding	9	6	11	10	12

All times above are in min

Graph 3 : Time Comparison for Filling a Tooth

Number	16	25	9	7	23

8 Graph 4 : Treated Animals for Day

1 cm = 10 animals

Key:

Dogs Birds Other

Cats Rabbits

Frequency Tables

The frequency of something is how often it occurs. So a Frequency Table records how many times numbers in a data set occur. There are three columns to a frequency table, when the data is not already entered. These are the 'Score', 'Tally' and 'Frequency'. Score can be replaced with a title when the data is categorical (which means not numbers), for example 'Car Type' or 'Holiday Type', it can also just be called 'x'. The frequency column is regularly written just as 'f'. Note the use of Σf at the bottom of the frequency column. Σ means 'the sum of' so Σf means add all the column up.

Example

Data: 6, 7, 5, 4, 6, 7, 10, 5, 6, 4, 9, 6, 5, 7, 6.

Score	Tally	Frequency
4		
5		
6		
7		
8		
9		
10		
		$\Sigma f =$

STEP 1

Circle the lowest score and the highest score in the data set.

STEP 2

In the score column of the table write in the lowest score at the top, increasing down the column until the highest score.

!

Note that there is no score of '8' in the data set. The number '8' is still included in the score column anyway.

Data: 6, 7, 5, 4, 6, 7, 10, 5, 6, 4, 9, 6, 5, 7, 6.

Score	Tally	Frequency
4		
5		
6	|	
7		
8		
9		
10		
		$\Sigma f =$

STEP 3

Data is now entered number by number Cross out the 6 and put a mark in the Tally column, then the 7 and so on.

!

Don't count all the 4's then all the 5's. This method is more likely to cause mistakes in large data sets. It also doesn't effectively use the Tally process.

Score	Tally	Frequency
4	||	2
5	|||	3
6	||||	5
7	|||	3
8		0
9	|	1
10	|	1
		$\Sigma f =$ 15

The 5th score is a cross stroke

STEP 4

Now change the Tally into numbers in the Frequency column.

STEP 5

Total the Frequency column to get Σf it has to equal the number of scores in the data set. If it doesn't ….start searching!

Frequency Tables

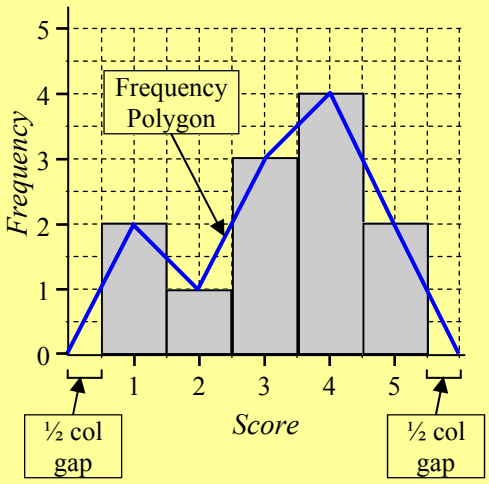
Frequency Histograms and Frequency Polygons

Frequency Histograms are very similar to column graphs, the difference being that:

- A half-column gap is left between the first column and the vertical axis.
- The columns touch each other, there is no gap between them.
- A half-column gap is left after the last column.



Frequency Polygons are similar to line graphs, they:

- Always start and finish at the horizontal axis.
- They inter-connect the centres of the top of columns.

Because a half-column gap is required, it makes sense to use columns that are '2 grids' wide so that the grids help you to draw the graph. You shouldn't make a column '1 grid wide' and the gap '½ a grid wide' because your columns won't use the grid lines, it will be harder to create and use.

Column 1 starts with transferring the data from a Frequency table to the graph. This should be straight forward. Just remember the key points. Columns touching, polygon inter-connecting the centre of the top of each column and of course the half-column gap.

Column 2 adds a step. A data set is given and a Frequency table has to be constructed first. More has to be done with the graph, a title, labeling the axes, a scale on the axes is also required.

Frequency Histograms and Frequency Polygons

Frequency Tables with Classes

A frequency table is used when there is high repetition of a certain number of scores. Such as with a die, where there are only 6 outcomes. But when there are a large range of scores then the data is best grouped together in classes.

The process is essentially the same as a frequency table, using a tally column and then changing the tally to a number in the frequency column. The only difference is that the 'Score' column is replaced with the word 'Classes' which cover a range of scores rather than just a single score.

Example. 'BarknFlea' Dog Show - Points listing

Data: ~~15~~, ~~26~~, 11, 31, 27, 44, 28, 31, 46, 23, 5,

Cross out the first score and place a stroke in the tally column, 15 is in the 10-19 class.

Repeat for 26, which is in the 20-29 class.

Class	Tally	Frequency
0 - 9		
10 - 19	|	
20 - 29	|	
30 - 39		
40 - 49		
		Σf =

Data: ~~15~~, ~~26~~, ~~11~~, ~~31~~, ~~27~~, ~~44~~, ~~28~~, ~~31~~, ~~46~~, ~~23~~, ~~5~~,

Place all scores into the tally column then change the strokes to numbers in the frequency column.

Add the frequency column up to find Σf and check that the number of scores is the same as Σf.

You are done!

Class	Tally	Frequency

Frequency Histograms and Polygons with Classes

The display of data in a Histogram/Polygon with classes uses exactly the same method as without classes, with one difference. Instead of displaying the score across the horizontal axis, you display the class centre.

The class centre is found by averaging the two scores shown in the class.

Example

$\frac{20+1}{2} = 10.5$

$\frac{21+40}{2} = 30.5$

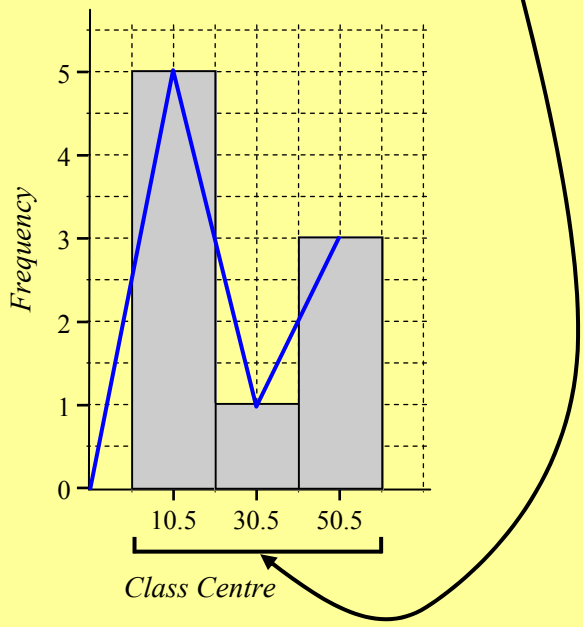
$\frac{41+60}{2} = 50.5$

c.c. is short for class centre

Class	*c.c.*	Frequency
1 - 20	10.5	5
21 - 40	30.5	1
41 - 60	50.5	3

Remember that when you divide the sum of the two numbers, press '=' before you '÷2' or you will get the wrong answer, due to order of operations principles.

Plot the data using a histogram and polygon, the only difference being that the class centres are used.



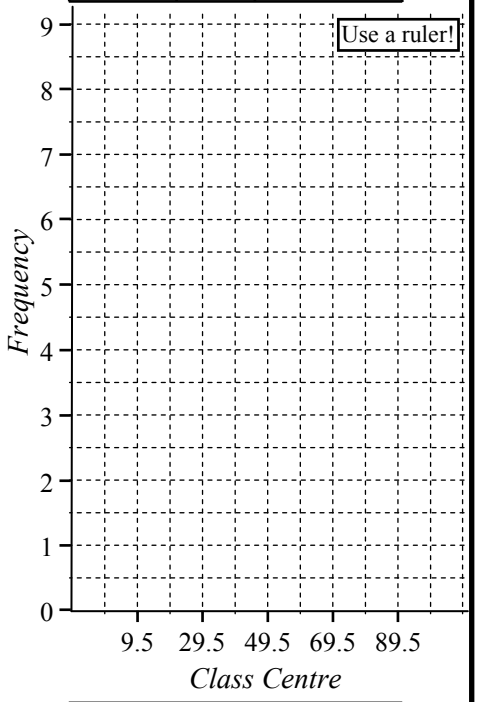
Frequency Histograms and Polygons with Classes

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Display the data below using a frequency histogram and polygon

1

Class	*c.c.*	Frequency
0 - 19	9.5	6
20 - 39	29.5	9
40 - 59	49.5	3
60 - 79	69.5	5
80 - 99	89.5	2



2

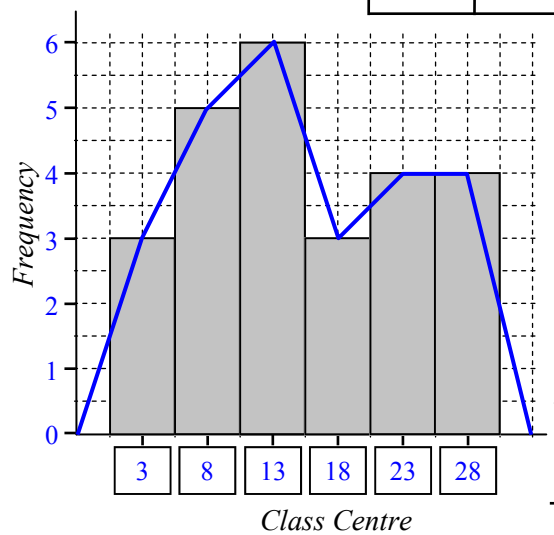
			$\Sigma f = 25$



5 How many scores are larger than 15? 11

6 How many scores between 5 and 21? 14

7 What percentage of the scores were 20 or less?

$\frac{17}{25} \times 100 = 68\%$

Dot Plots - Frequency Tables

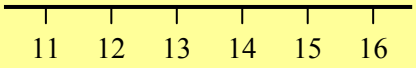
Dot Plots represent data with dots! Amazing! The beauty of a dot plot is it is simple. There is one axis which shows the score, or category and then dots are stacked above them. Dot plots can also be plotted sideways just like a column graph. Two critical features are:

- The dots have to have the same height, for example a column of four dots shouldn't be as high as a column of five dots, so be careful as you plot them.
- If you have a vertical scale then use it effectively. Because dot plots are supposed to be fast to read, a vertical scale can be included so that you don't have to count all the dots in a column.

Example

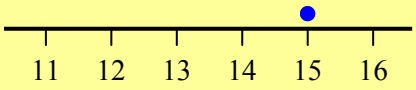
Data: 15, 12, 13, 11, 16, 15, 16, 12, 12, 15,
11, 13, 12, 11, 15, 16, 12, 13, 15, 11.

STEP 1 Circle the lowest score and the highest score in the data set.



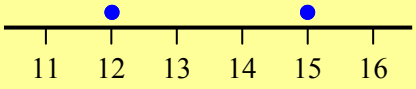
STEP 2 Number the axis from lowest to highest, note there is no 14 score, but it is still included on the axis.

Data: ~~15~~, 12, 13, 11, 16, 15, 16, 12, 12, 15,
11, 13, 12, 11, 15, 16, 12, 13, 15, 11.



STEP 3 Cross out the first score and place the dot above the number on the axis.

Data: ~~15~~, ~~12~~, 13, 11, 16, 15, 16, 12, 12, 15,
11, 13, 12, 11, 15, 16, 12, 13, 15, 11.



STEP 4 And so on until all the scores are represented with dots

Dot Plots

2	7
3	5
4	4
5	7
6	6
	$\Sigma f = 34$

9 How many times was a number less than 3 rolled? 12 times

10 How many times was an even number rolled? 17 times

11 How many times was a prime number rolled? 19 times

12 What percentage of die rolls resulted in a multiple of 3?

$\frac{11}{34} \times 100 = 32.4\%$

Answer to 1 d.p.

13 What percentage of die rolls resulted in a factor of 12?

$\frac{27}{34} \times 100 = 79.4\%$

Answer to 1 d.p.

Ordered Stem and Leaf Plots

Stem and leaf plots separate data into its units component and its tens (and above) component. They then display the 'units' on the right in the leaf section and the 'tens' on left in a stem column. The effect is to break the data up into classes and also display a simple column graph (on its side) of numbers showing the way the data is spread.

Numbers have their units removed so:

- 23 becomes 'a 2' and 'a 3'
- 15 becomes 'a 1' and 'a 5'
- 9 (is seen as 09) becomes 'a 0' and 'a 9'

Stem	Leaf
0	9
1	5
2	3

In a plot this looks like the plot shown above. But what about larger numbers?

- 106 becomes 'a 10' and 'a 6'
- 117 becomes 'a 11' and 'a 7'
- 125 becomes 'a 12' and 'a 5'
- 120 becomes 'a 12' and 'a 0'
- 110 becomes 'a 11' and 'a 0'

Stem	Leaf
10	6
11	70
12	50

Because the units have two digits in front, both digits are shown in the Stem column.

When all data has been entered into the plot, the plot then has to be rewritten in order. The stem stays the same, but the leaf is put into ascending order. That is it!

Stem	Leaf
10	6
11	70
12	50

Leaf in order →

Stem	Leaf
10	6
11	07
12	05

Negative numbers occur in data and they can also be displayed in stem and leaf plots.

Example. Place the data into a Stem and Leaf Plot

Data: 5, 8, 12, -3, -7, 17, -8, **25**, 10, **-23**, -5, 0

The lowest value is -23 so the stem starts at -2
The highest value is 25 so the stem ends at 2.

Note that with negative numbers, the stem has the minus sign, the leaf just has positive numbers.

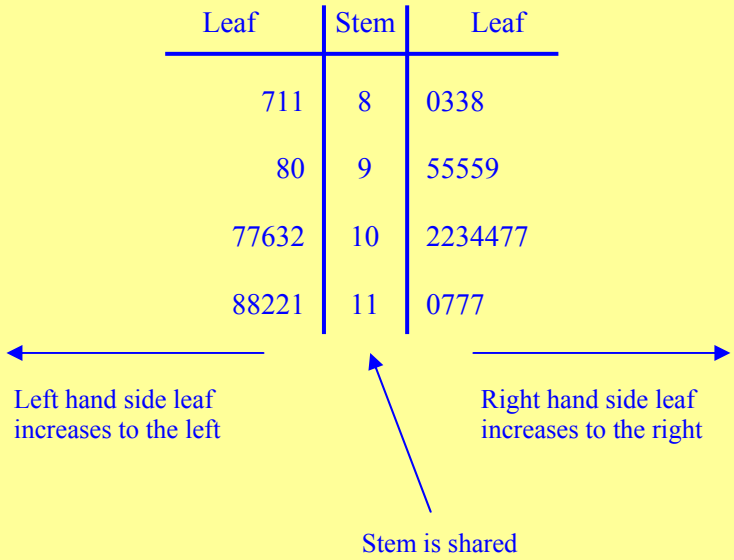
Back-to-Back Stem and Leaf Plots

Back-to-back stem and leaf plots are used to display 2 different groups of data together in the one plot. The groups are displayed separately but share a common stem. One group is displayed on the left hand side, the other on the R.H.S.

The L.H.S has its leaf in ascending order (going up) with larger numbers to the left, while the R.H.S. leaf has its numbers ascending, as with single leaf stem and leaf plots, up to the right.



This sheet shouldn't be attempted before completing the previous stem and leaf plot exercise. The process is the same other than the process being performed twice.

Two mistakes are regularly made with Stem and Leaf plots. These are:

- Commas are used in the plots, like data sets. Commas shouldn't be used in a stem and leaf plot.
- A mistake is made finding the smallest 'tens' to put in the stem, so the number is written at the bottom of the stem column. The stem has to be in order, so if you miss the smallest 'tens' then the plot should be redone.

$\frac{10}{26} \times 100 = 38.5\%$

Answer to 1 d.p.

Sector Graphs

Sector graphs, Pie charts, Circle graphs are all different names for the same graph. Sector graphs are generally used to display something that has been broken up into parts. Such as the time spent doing something or the way sales were made.

A sector is a fraction of a circle and the angle of the sector is found by multiplying fractions with 360°.

Example. Graph shows how Bill's time playing sport was spent. Create a sector graph.

Sport	Weeks	Sector Angle (Nearest °)
Cricket	11	$\frac{11}{50} \times 360 = 79°$
Squash	5	$\frac{5}{50} \times 360 = 36°$
Football	9	$\frac{9}{50} \times 360 = 65°$
Swimming	20	$\frac{20}{50} \times 360 = 144°$
Tennis	1	$\frac{1}{50} \times 360 = 7°$
Other	4	$\frac{4}{50} \times 360 = 29°$
	Σ = 50	ΣAngles = 360°

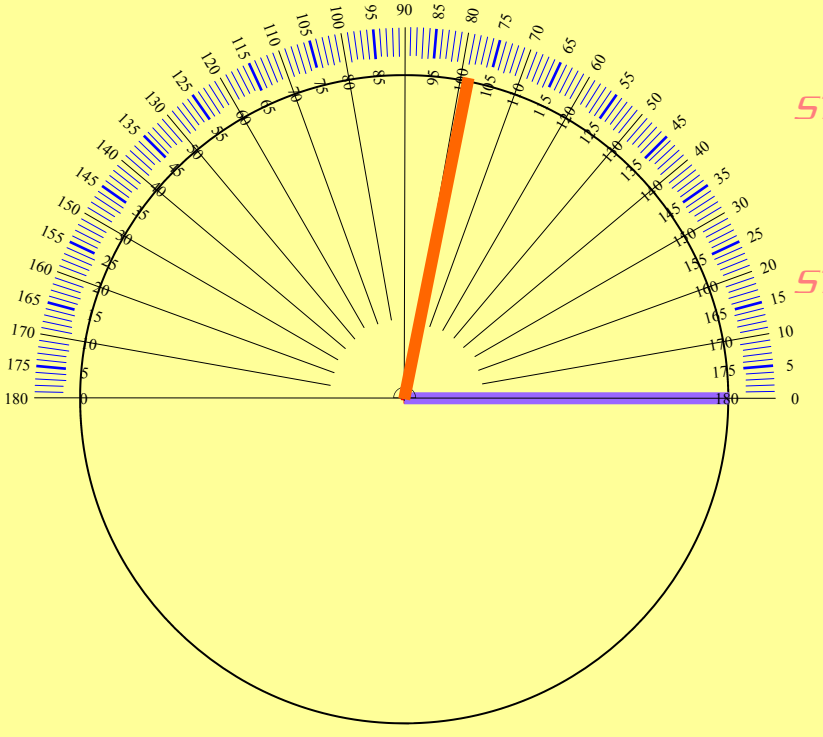
STEP 1 Add the column and write the total at the bottom of the column where the Σ is shown.

STEP 2 Make a fraction and multiply the fraction by 360°. In this case it is 11 over 50, then × 360.

STEP 3 Repeat for all the angles so that you have a sector angle for each different category (sport).

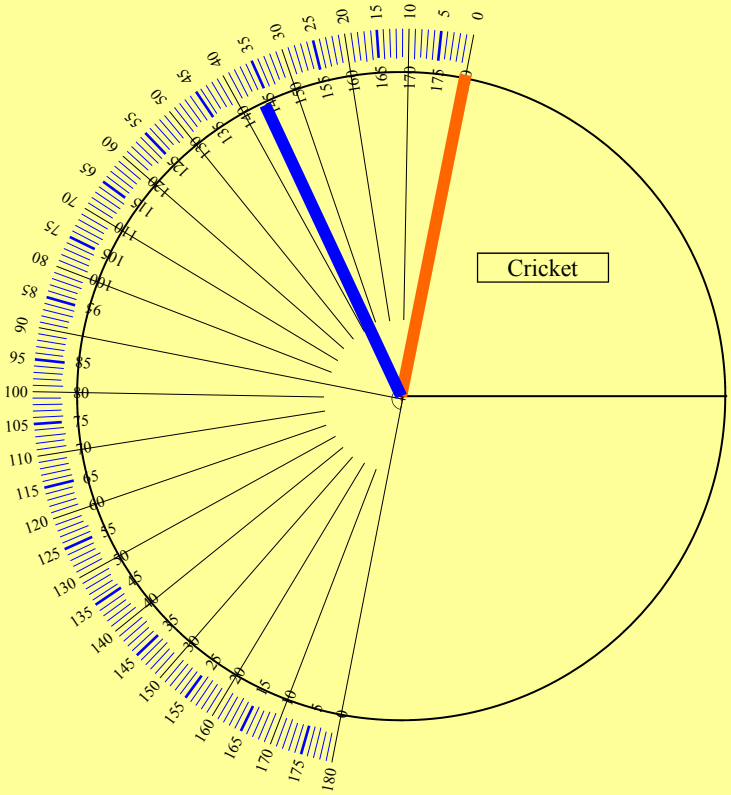
STEP 4 Sum (add) all the angles up and the total should be 360°. It may be out by a degree or two due to rounding.

Now the table has to be converted to a sector graph.



STEP 1 Draw a horizontal line from the centre of the circle to the circumference. Purple line.

STEP 2 Use a protractor to create the first sector. Shown in orange. (79° from the table).



STEP 3

Label the sector with the category name, which is cricket.

STEP 4

Rotate the protractor, the 0° line being on the last line drawn. The next sector is 36°. Blue line.

STEP 5

Label the sector and rotate the protractor and keep going!

STEP 6

The finished product has all the sectors labeled. Colour it in to improve the finished product.

	$\Sigma = 360°$	$\Sigma f = 1\,800$

4 List the animals from most to least favorite.

Dogs, cats, birds, fish, other, rabbits, mice.

5 What percentage of people prefer either cats or dogs? $\frac{165}{360} \times 100 = 45.8\%$ (1 d.p.)

6 If 3 000 were polled and their views were the same as the graph, how many would prefer dogs?

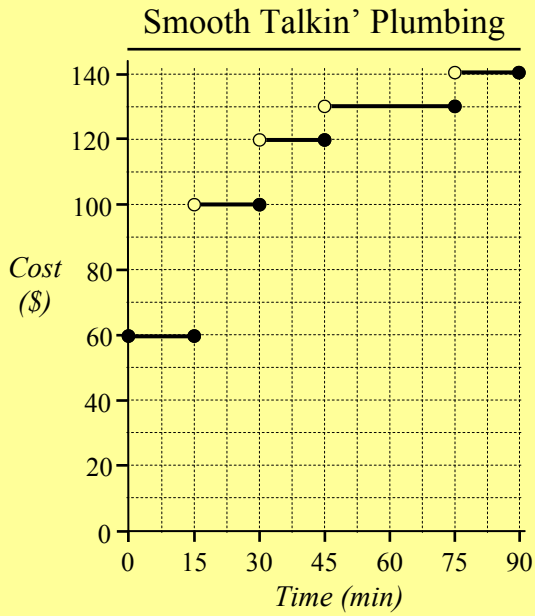
$\frac{90}{360} \times 3\,000 = 750$ people

7 How many of the 3 000 would prefer mice or rabbits? $\frac{40}{360} \times 3\,000 =$ about 333 people

Step Graphs

Not everything is smooth in practice and Step Graphs represent a way in which data can be applied in a 'jumpy' or 'broken up' way. By having different bands, separate graphs that apply costs are brought together in one graph.

In the "Smooth Talkin' Plumbing" fee scale shown to the right, you can see that for 0 min to 15 min the fee is $60.



But the circle shows this line ends at 15 min, so from 16 min through to 30 min then the charge is $100.

Again after the 30th minute is finished the fee lifts to $120. And so on.

So the fee structure is in stages, this is for simplicity and also to cover 'getting to the job' that is, travel time has to be covered by the more expensive starting rate.

Note the use of the circles. A filled-in circle means 'stop here' while a open circle means don't stop here or 'pass through'. Because the $60 first charge has a filled in circle on its right end, it means 15 min is included. If it was open, then the 15 min would travel to the next rate which is $100. Of course the circle in the $100 would have to be filled in to say 15 min is included.

Column 1 deals with obtaining information from the step graph provided. You have to use the graph two ways, to find the weight a package could be…. given price, or the price paid given a weight.

Column 2 starts off with a step graph on hiring a forklift, again working both ways, obtaining time given cost, or cost given time. The final question requires you to create the step graph from the information provided.

Step Graphs

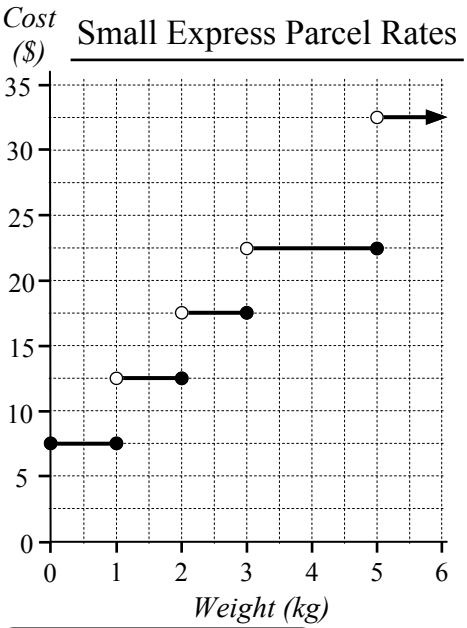
Use the step graph to answer the questions below.



What is the cost to send parcels weighing .....

1 1 kg _____

2 3 kg _____

3 4.5 kg _____

4 750 g and 1.35 kg

_____ = _____

5 4 kg and 1.75 kg

_____ = _____

6 5.9 kg and 3.2 kg

_____ = _____

What is the heaviest parcel that can be sent if you have .....

7 $22.50 _____

8 $7.50 _____

9 $20 _____

10 $11.60 _____

11 $23.90 _____

Day and hourly rates for the hire of a Forklift are shown, answer the questions using the graph.

Find the cost for :

12 7 hrs hire _____ 13 2 hrs hire _____ 14 5 hrs hire _____

Find the maximum time you can hire the forklift if you have :

15 $150 _____ 16 $275 _____ 17 $430 _____

If a job requires a forklift for 13 hours. Find the difference in cost between hiring the forklift for 13 hours in one day or .....

18 6 hr one day, 7 hr the next _____

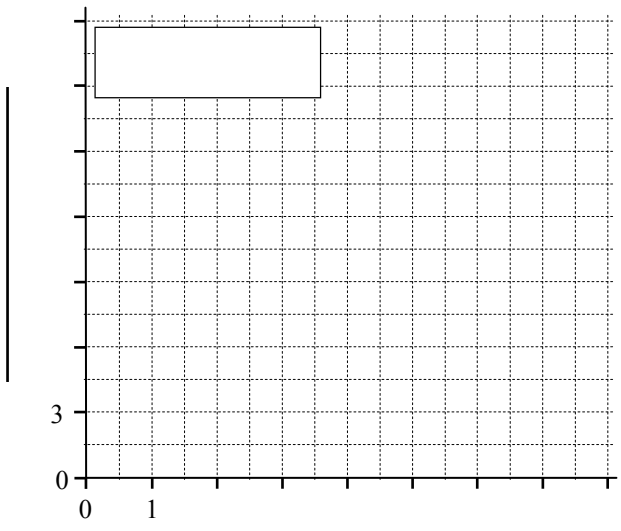
19 1 hr one day, 12 hr the next _____

20 5 hr one day, 4 hr two days _____

21 5 hr two days, 3 hr the next _____

StackEmUp Car Parking charges $6 for the first hour then $3 per additional hour. After 5 hours the day rate of $20 (only) is charged. Construct a step graph to represent the fee structure.

22

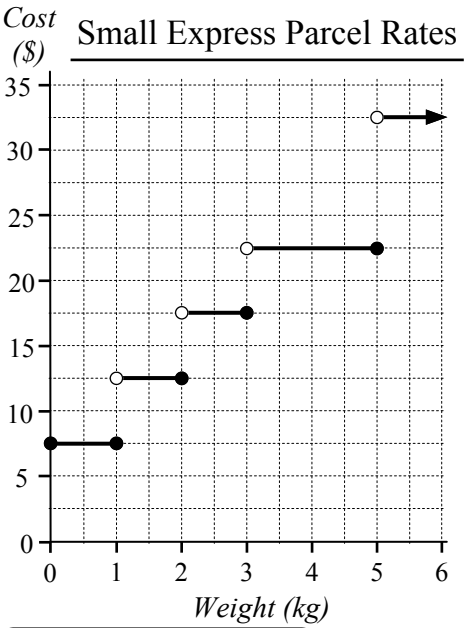


_____

Step Graphs

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use the step graph to answer the questions below.



What is the cost to send parcels weighing .....

1 1 kg $7.50

2 3 kg $17.50

3 4.5 kg $22.50

4 750 g and 1.35 kg

$7.50 + $12.50 = $20

5 4 kg and 1.75 kg

$22.50 + $12.50 = $35

6 5.9 kg and 3.2 kg

$32.50 + $22.50 = $55

What is the heaviest parcel that can be sent if you have .....

7 $22.50 5 kg

8 $7.50 1 kg

9 $20 3 kg

10 $11.60 1 kg

11 $23.90 5 kg

Day and hourly rates for the hire of a Forklift are shown, answer the questions using the graph.

Find the cost for :

12 7 hrs hire $200 13 2 hrs hire $150 14 5 hrs hire $200

Find the maximum time you can hire the forklift if you have :

15 $150 4 h 59 m 16 $275 11 h 59 m 17 $430 25 h 59 m

If a job requires a forklift for 13 hours. Find the difference in cost between hiring the forklift for 13 hours in one day or .....

18 6 hr one day, 7 hr the next 200 + 200 - 325 = $75

19 1 hr one day, 12 hr the next 100 + 325 - 325 = $100

20 5 hr one day, 4 hr two days

200 + 2 × 150 - 325

= $175

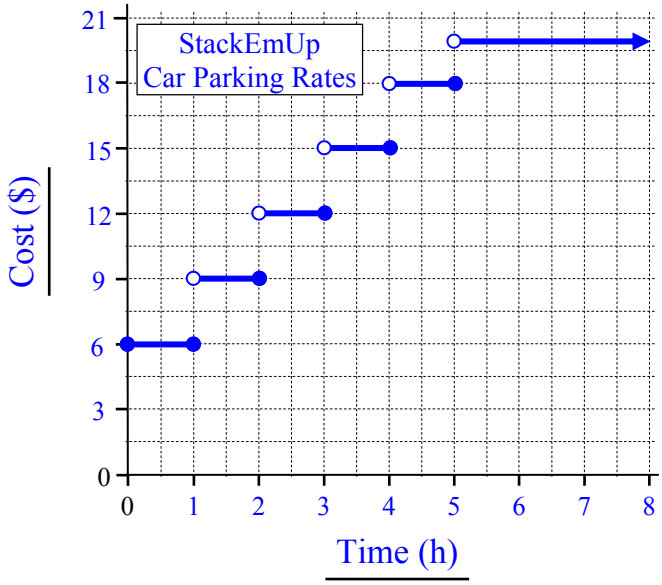
21 5 hr two days, 3 hr the next

2 × 200 + 150 - 325

= $225

StackEmUp Car Parking charges $6 for the first hour then $3 per additional hour. After 5 hours the day rate of $20 (only) is charged. Construct a step graph to represent the fee structure.

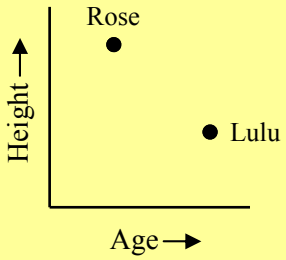
22



Scatter Diagrams

Scatter diagrams plot two different qualities against each other. These can be related, such as the amount of wood used compared with the heat generated from a fire. They can also be unrelated, such as the shoe size of a student compared with their eyesight quality.

This means that the one plotted point gives two answers, as below.



Rose and Lulu are shown on the scatter diagram, which compares age with height.

Lulu is further to the right than Rose, that means that she is older than Rose. Because as you move right, the age increases.

But Rose is taller than Lulu. Because height is measured up the vertical scale, the higher up the point, the taller the person is. Note that there is no scale, Rose could be two years younger, or three weeks younger, without a scale, you can't put a number on, or estimate the difference.

Column 1 has four graphs like the one shown above, only this time four people are compared within each graph. Read the questions and use the graph that is relevant and look at how the dots are spaced.

Column 2 asks you to plot points on a scatter diagram, a diagram about Back-burning operations. The forest names start with A and end with G, so plot the point and place a capital letter beside them, representing the forest name. Then answer the questions.

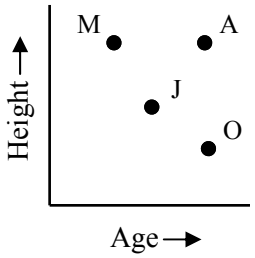
Scatter Diagrams

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

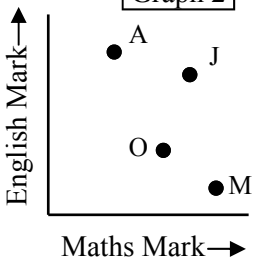
Four students are compared in the scatter diagrams below, use the graphs to answer the questions.

A = Amy, O = Oscar, M = Michael and J = Jessica

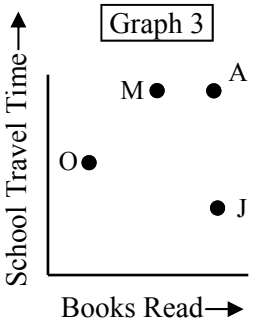
Graph 1



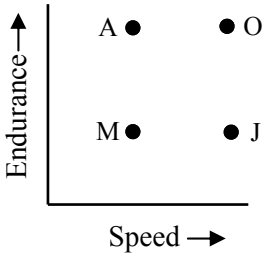
Graph 2



Graph 3



Graph 4



1 Who is the same age as Amy? _____

2 Who is the best at Maths? _____

3 Who is taller than Jessica? _____

4 Who travels the same amount of time to get to school as Amy? _____

5 Who probably reads more at home? _____

6 Who do you think is the best athlete? _____

7 List the students according to their ability:

In Maths: _____
Lowest to Highest Ability

In English: _____
Lowest to Highest Ability

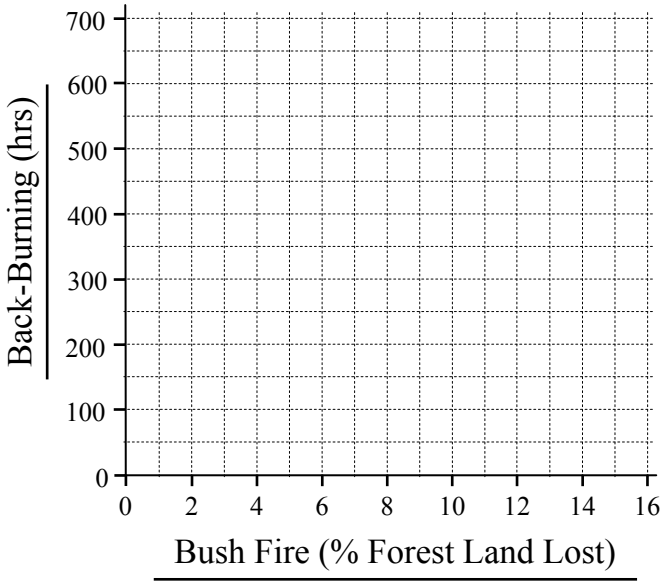
8 Name two things that Oscar is better at than Amy. _____

9 Name two things that Amy is better at than Michael. _____

Plot the data in the table on the scatter diagram grid. Then answer the questions.

Back-Burning, Forest Loss to Bushfire Data

Forest	B/Burn Hours	Forest % lost
Allenby	150	8
Bellamy	150	12
Centfall	600	2
Domino	450	5
Everturn	300	6
Fleckle	550	2
Gritten	95	16



10 As back-burning hours increase explain the result. _____

11 Which forest, Bellamy or Allenby, would you suggest is the larger? Explain why.

12 More allocation of hours is required when the Bushfire index exceeds 10. Add a column called 'B.I.' to the table above, calculate the B.I. given:

$$\text{B.I.} = \frac{\%\ \text{Forest Land Lost} \times 175}{\text{Back Burn Hours}}$$

Round to the nearest whole number

13 Which forests qualify for more allocated hours? Do you have any suggestions?

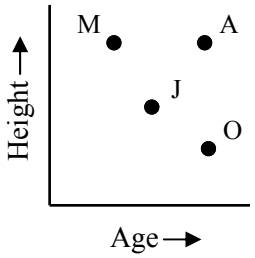
Scatter Diagrams

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

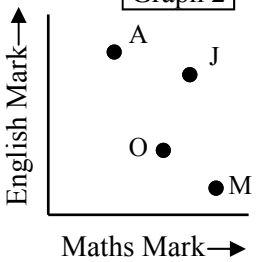
Four students are compared in the scatter diagrams below, use the graphs to answer the questions.

A = Amy, O = Oscar, M = Michael and J = Jessica

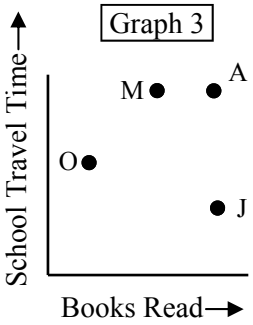
Graph 1



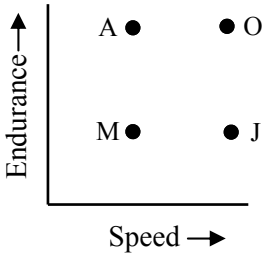
Graph 2



Graph 3



Graph 4



1 Who is the same age as Amy? Oscar

2 Who is the best at Maths? Michael

3 Who is taller than Jessica? Michael, Amy.

4 Who travels the same amount of time to get to school as Amy? Michael

5 Who probably reads more at home? Jessica

6 Who do you think is the best athlete? Oscar

7 List the students according to their ability:

In Maths: Amy, Oscar, Jessica then Michael.
Lowest to Highest Ability

In English: Michael, Oscar, Jessica then Amy.
Lowest to Highest Ability

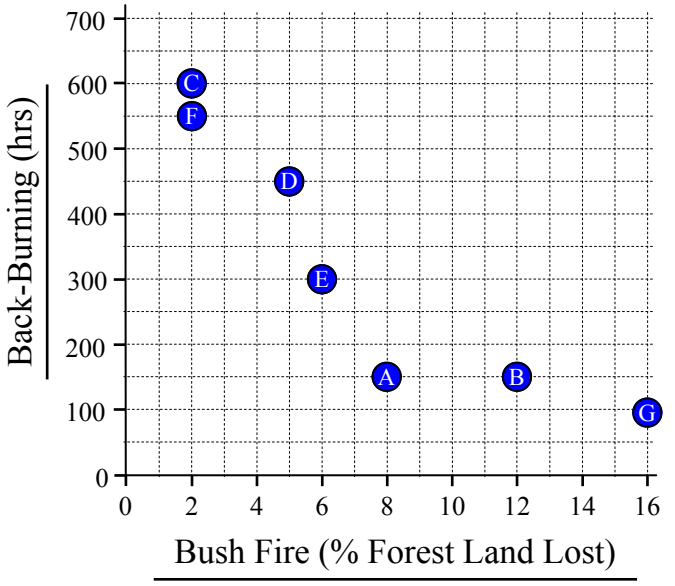
8 Name two things that Oscar is better at than Amy. Faster and better at maths.

9 Name two things that Amy is better at than Michael. More endurance, English and Reading

Plot the data in the table on the scatter diagram grid. Then answer the questions.

Back-Burning, Forest Loss to Bushfire Data

Forest	B/Burn Hours	Forest % lost	B.I.
Allenby	150	8	9
Bellamy	150	12	14
Centfall	600	2	1
Domino	450	5	2
Everturn	300	6	4
Fleckle	550	2	1
Gritten	95	16	29



10 As back-burning hours increase explain the result. There is less forest land lost to bush fires.

As back burning increases, forest loss decreases.

11 Which forest, Bellamy or Allenby, would you suggest is the larger? Explain why.

Bellamy is most likely larger as more forest was lost than Allenby despite the same hours spent.

12 More allocation of hours is required when the Bushfire index exceeds 10. Add a column called 'B.I.' to the table above, calculate the B.I. given:

$$\text{B.I.} = \frac{\%\ \text{Forest Land Lost} \times 175}{\text{Back Burn Hours}}$$

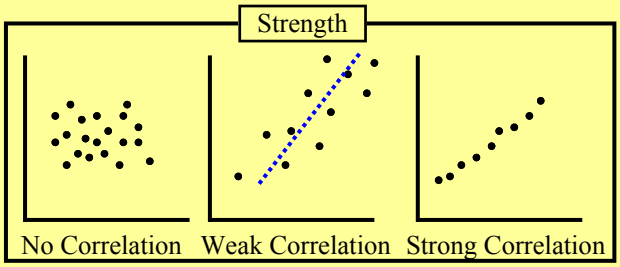
Round to the nearest whole number

13 Which forests qualify for more allocated hours? Do you have any suggestions?

Gritten and Bellamy, but Allenby also included.

Scatter Diagrams - Correlation

Correlation means ‘is there a connection’ between the data shown in a scatter diagram. This sheet introduces three categories used to describe scatter diagrams. You just have to pick which apply to the diagram in each question.



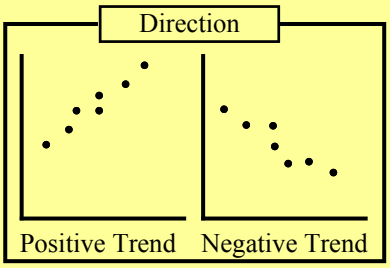
Firstly strength. There is a choice of three different words available to describe strength.

No Correlation means that the dots are scattered ‘randomly’, such as graphing two completely unrelated things.

IF THERE IS NO CORRELATION THEN NO FURTHER DESCRIPTION IS REQUIRED.

Weak correlation means that the two things have a relationship, where a line or curve can be drawn through them, but it isn’t exact. This doesn’t mean that the blue line has to pass through the points, it is saying, this is where the points are generally heading.

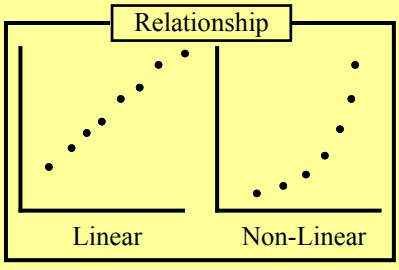
Strong correlation means that the two are very closely related and the dots clearly show this.



Secondly Direction. This requires you to indicate whether the diagram’s dots are going up to the right, which is called a positive trend.

If the dots are going down to the right then this is called a negative trend.

Lastly Relationship. If the dots are forming a line then this is called a linear relationship. If the dots are forming a curve then this is a non-linear relationship.



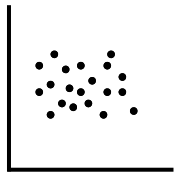
The first column asks you to fill in the appropriate circle describing the correlation. Remember, no correlation means you only have to fill the ‘No Correlation’ circle, then you are done.

The second column describes comparing two events and you have to create your own scatter diagram. These will may differ from person to another, once you have completed the diagram, describe it in words, of course using the three characteristics you have learned.

Scatter Diagrams - Correlation

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Strength



No Correlation

Weak Correlation

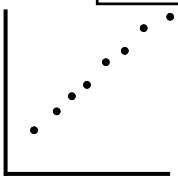
Strong Correlation

Direction

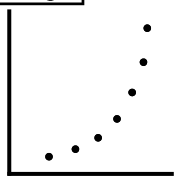
Positive Trend

Negative Trend

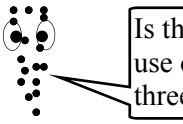
Relationship



Linear

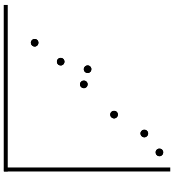


Non-Linear



Is there correlation? If so, use one of each of the three descriptors above.

Example



Strength: ○ No Correlation ○ Weak Correlation ● Strong Correlation

Direction: ○ Positive Trend ● Negative Trend

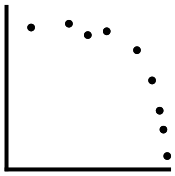
Relationship: ● Linear ○ Non-Linear

1

Strength: ○ No Correlation ○ Weak Correlation ○ Strong Correlation

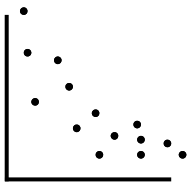
Direction: ○ Positive Trend ○ Negative Trend

Relationship: ○ Linear ○ Non-Linear



2

Strength: ○ No Correlation ○ Weak Correlation ○ Strong Correlation



Direction: ○ Positive Trend ○ Negative Trend

Relationship: ○ Linear ○ Non-Linear

3

Strength: ○ No Correlation ○ Weak Correlation ○ Strong Correlation

Direction: ○ Positive Trend ○ Negative Trend

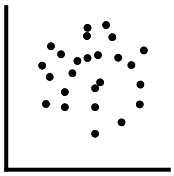
Relationship: ○ Linear ○ Non-Linear

4

Strength: ○ No Correlation ○ Weak Correlation ○ Strong Correlation

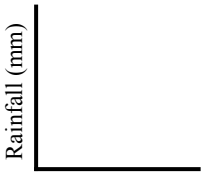
Direction: ○ Positive Trend ○ Negative Trend

Relationship: ○ Linear ○ Non-Linear

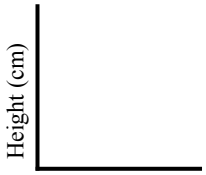


Given the situation create a possible scatter diagram and then describe the diagram as before, only with words.

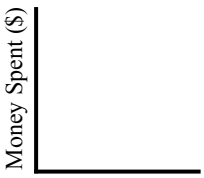
5 Rainfall vs Number of Umbrellas used.



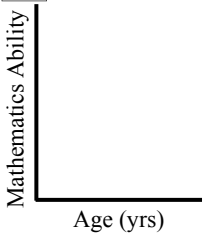
6 Student Height vs Eyesight Quality.



7 Given $20, Money Spent vs Money Saved.



8 Mathematics Ability vs Your Age



Scatter Diagrams - Correlation

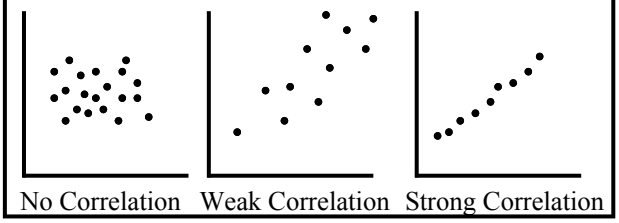
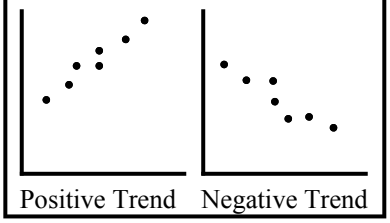
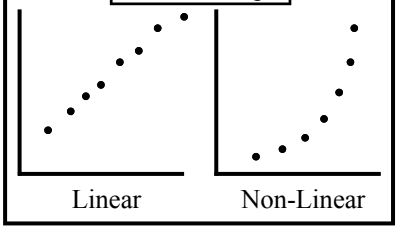
Strength



Direction

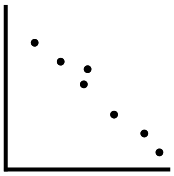


Relationship



Is there correlation? If so, use one of each of the three descriptors above.

Example

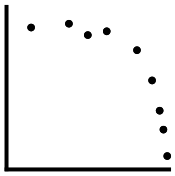


Strength: ○ No Correlation ○ Weak Correlation ● Strong Correlation

Direction: ○ Positive Trend ● Negative Trend

Relationship: ● Linear ○ Non-Linear

1

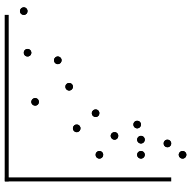


Strength: ○ No Correlation ○ Weak Correlation ● Strong Correlation

Direction: ○ Positive Trend ● Negative Trend

Relationship: ○ Linear ● Non-Linear

2



Strength: ○ No Correlation ● Weak Correlation ○ Strong Correlation

Direction: ○ Positive Trend ● Negative Trend

Relationship: ○ Linear ● Non-Linear

3

Strength: ○ No Correlation ○ Weak Correlation ● Strong Correlation

Direction: ● Positive Trend ○ Negative Trend

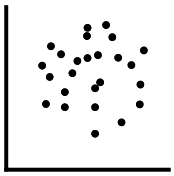
Relationship: ● Linear ○ Non-Linear

4

Strength: ● No Correlation ○ Weak Correlation ○ Strong Correlation

Direction: ○ Positive Trend ○ Negative Trend

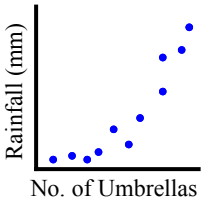
Relationship: ○ Linear ○ Non-Linear



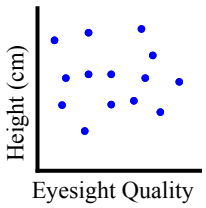
Given the situation create a possible scatter diagram and then describe the diagram as before, only with words.

5 Rainfall vs Number of Umbrellas used.

There is a weak or strong correlation, a positive trend, with a non-linear relationship.



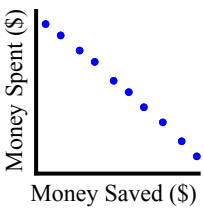
6 Student Height vs Eyesight Quality.



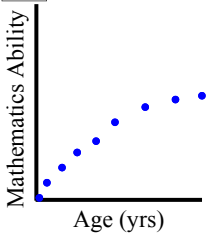
There is no correlation between student height and eyesight.

7 Given $20, Money Spent vs Money Saved.

Strong correlation with a negative trend, with a linear relationship.



8 Your Mathematics Ability vs Your Age



Hopefully strong correlation, a non-linear relationship and a positive trend.

Cumulative Frequency

Cumulative frequency 'builds' up with the frequency column, these graphs are used to help you to find the median from a frequency table using a graphical solution, this will become more clear when you learn to analyse data.

The column is simple to complete, but because it is next to the Frequency (or *f*) column it is easy to make a mistake.

Example - Adding a Cumulative Frequency Column (or *c.f.* for short)

Score	*f*	*c.f.*
0	4	4
1	2	6
2	7	13
3	4	17
$\Sigma f =$	17	check

BEFORE YOU START TOTAL THE *f* COLUMN

Write the '4' from the *f* column straight across into the *c.f.* column. This means so far there have been 4 scores.

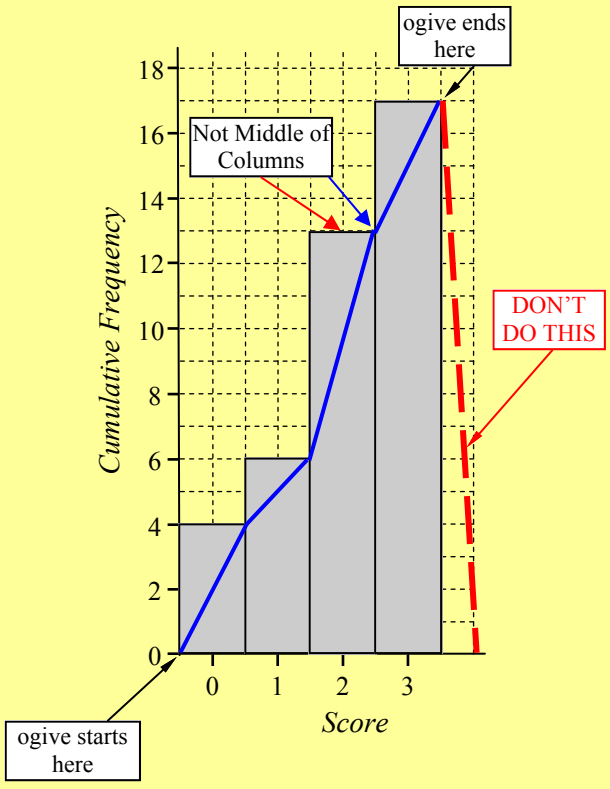
A score of '1' occurs twice. So add '2' to the '4' from the *c.f.* column. This means so far there have been 6 scores.

A score of '2' occurs seven times. So add '7' to the '6' from the *c.f.* column. This means so far there have been 13 scores.

A score of '3' occurs four times. So add '4' to the '13' from the *c.f.* column. This means there has been 17 scores.

As a final check, make sure that Σf is equal to the last number in the *c.f.* column. If they don't match, look for an error in your calculation.

When you display a cumulative frequency graph, you use a 'Cumulative Frequency Histogram'. You also include a 'Cumulative Frequency Polygon', also known as an 'Ogive'.



There are a couple of differences between a Frequency Histogram/Polygon and a Cumulative Frequency Histogram and Ogive:

- A half column gap at the start isn't required, unlike the Frequency Histogram.
- The columns always increase or stay the same height, they never reduce in height.
- The ogive interconnects the top right hand corner of the columns, not their centres.
- The ogive stops at the top right hand corner of the last column. It doesn't drop down.

REVIEW:

1-STEP EQUATIONS

Solving One Step Equations
Addition and Subtraction

One Step equations are equations you solve in one line of working. They will involve a letter (pronumeral) with two numbers, you have to solve the equation for the value of the letter.

In column 1 you are given one step equations that you can solve with no working, talk them through if it helps you. Here is an example:

$d + 20 = 30$ …. So something plus 20 equals 30
Try $d = 10$ …. 10 plus 20 equals 30, so $d = 10$

Another way to do these is to think of the equation as scales, as each side is equal you have to maintain balance by finding what number would keep the scales balanced.

Column 2 is the same as column 1 except you are asked to now show working. The goal is to get the letter by itself. One of the examples at the top of the 2nd column is $b + 15 = 85$. To get the letter by itself you have to remove the + 15, how do you remove + 15? You subtract 15. So you minus 15 from the left hand side, and because it's like a set of scales, you must do the same thing on the other side of the equals sign. So you subtract 15 from $b + 15$ and you get b on its own. You subtract 15 from 85 and you get 70. The other example is $a - 9 = 27$. You have to get a by itself, to get rid of the - 9 you have to add 9. So you add 9 to each side and you get $a = 36$.

So the questions are the same as the first column but you are showing you are following a procedure by showing your working out. You may be wondering why you have to do this when often you can see the answer without working. You have to practice the process so that when you encounter more complicated problems in the future, that you can't just see the answer for, you know the correct method to use.

Column 3 is the same as column 2 except the letter is on the right hand side of the equals sign. Solve it in the same way and you get the number equal to the letter. Then rewrite your answer so that the letter is first. Again there are examples at the top of the column.

Solving One Step Equations - Addition/Subtraction

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Look at these equations and give the value for the pronumeral

1 $k + 8 = 10$ $k =$ _____

2 $b + 3 = 15$ _____

3 $d + 4 = 9$ _____

4 $x + 20 = 60$ _____

5 $t - 10 = 5$ _____

6 $m - 8 = 20$ _____

7 $h + 9 = 30$ _____

8 $l - 20 = 70$ _____

9 $w - 15 = 104$ _____

10 $s + 12 = 13$ _____

11 $u - 9 = 9$ _____

12 $q + 7 = 23$ _____

13 $n - 100 = 40$ _____

14 $y + 22 = 30$ _____

15 $a + 16 = 50$ _____

16 $e - 7 = 6$ _____

17 $z - 11 = 5$ _____

18 $c - 10 = 94$ _____

19 $j + 3 = 101$ _____

20 $v + 35 = 100$ _____

21 $t - 4 = 24$ _____

22 $m - 17 = 4$ _____

23 $x + 11 = 100$ _____

Now solve these equations showing working

Examples

$b + 15 = 85$
(-15) (-15)
$b = 70$

$a - 9 = 27$
(+9) (+9)
$a = 36$

24 $c + 15 = 22$ _____

25 $y + 11 = 28$ _____

26 $x - 9 = 34$ _____

27 $t - 7 = 18$ _____

28 $q - 20 = 17$ _____

29 $b + 10 = 11$ _____

30 $n + 26 = 26$ _____

31 $d - 20 = 77$ _____

32 $t - 14 = 33$ _____

33 $a - 11 = 59$ _____

34 $15 + g = 33$ _____

35 $w - 9 = 8$ _____

36 $x - 12 = 38$ _____

37 $18 + c = 27$ _____

38 $e + 7 = 103$ _____

39 $i - 56 = 11$ _____

40 $37 + h = 80$ _____

41 $k - 8 = 109$ _____

42 $d - 90 = 1$ _____

43 $u - 15 = 63$ _____

The letter is on the right and so these need an extra line. Find the value of the letter.

Examples

$16 = 5 + c$
(-5) (-5)
$11 = c$
$c = 11$

Then reverse the equation

$35 = e - 7$
(+7) (+7)
$42 = e$
$e = 42$

44 $20 = f - 11$ _____

45 $19 = m + 4$ _____

46 $83 = r + 16$ _____

47 $12 = n - 36$ _____

48 $64 = 19 + k$ _____

49 $11 = m - 17$ _____

50 $87 = u - 51$ _____

51 $100 = a - 9$ _____

52 $33 = 18 + s$ _____

53 $56 = d - 24$ _____

54 $75 = p + 55$ _____

55 $86 = 37 + x$ _____

56 $11 = j - 11$ _____

57 $62 = 16 + t$ _____

Solving One Step Equations - Addition/Subtraction

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Look at these equations and give the value for the pronumeral

1	$k + 8 = 10$	$k = 2$
2	$b + 3 = 15$	$b = 12$
3	$d + 4 = 9$	$d = 5$
4	$x + 20 = 60$	$x = 40$
5	$t - 10 = 5$	$t = 15$
6	$m - 8 = 20$	$m = 28$
7	$h + 9 = 30$	$h = 21$
8	$l - 20 = 70$	$l = 90$
9	$w - 15 = 104$	$w = 119$
10	$s + 12 = 13$	$s = 1$
11	$u - 9 = 9$	$u = 18$
12	$q + 7 = 23$	$q = 16$
13	$n - 100 = 40$	$n = 140$
14	$y + 22 = 30$	$y = 8$
15	$a + 16 = 50$	$a = 34$
16	$e - 7 = 6$	$e = 13$
17	$z - 11 = 5$	$z = 16$
18	$c - 10 = 94$	$c = 104$
19	$j + 3 = 101$	$j = 88$
20	$v + 35 = 100$	$v = 65$
21	$t - 4 = 24$	$t = 28$
22	$m - 17 = 4$	$m = 21$
23	$x + 11 = 100$	$x = 89$

Now solve these equations showing working

Examples

$b + 15 = 85$
(-15) (-15)
$b = 70$

$a - 9 = 27$
(+9) (+9)
$a = 36$

24	$c + 15 = 22$ - 15 - 15 $c = 7$	25 $y + 11 = 28$ - 11 - 11 $y = 17$
26	$x - 9 = 34$ + 9 + 9 $x = 43$	27 $t - 7 = 18$ + 7 + 7 $t = 25$
28	$q - 20 = 17$ + 20 + 20 $q = 37$	29 $b + 10 = 11$ - 10 - 10 b = 1
30	$n + 26 = 26$ - 26 - 26 $n = 0$	31 $d - 20 = 77$ + 20 + 20 $d = 97$
32	$t - 14 = 33$ + 14 +14 $t = 47$	33 $a - 11 = 59$ + 11 + 11 $a = 70$
34	$15 + g = 33$ - 15 - 15 $g = 18$	35 $w - 9 = 8$ + 9 + 9 $w = 17$
36	$x - 12 = 38$ + 12 + 12 $x = 50$	37 $18 + c = 27$ - 18 - 18 $c = 9$
38	$e + 7 = 103$ - 7 - 7 $e = 96$	39 $i - 56 = 11$ + 56 + 56 $i = 67$
40	$37 + h = 80$ - 37 - 37 $h = 43$	41 $k - 8 = 109$ + 8 + 8 $k = 117$
42	$d - 90 = 1$ + 90 + 90 $d = 91$	43 $u - 15 = 63$ + 15 + 15 $u = 78$

The letter is on the right and so these need an extra line. Find the value of the letter.

Examples

$16 = 5 + c$
(-5) (-5)
$11 = c$
$c = 11$

Then reverse the equation

$35 = e - 7$
(+7) (+7)
$42 = e$
$e = 42$

44	$20 = f - 11$ + 11 + 11 $31 = f$ $f = 31$	45 $19 = m + 4$ - 4 - 4 $15 = m$ $m = 15$
46	$83 = r + 16$ - 16 - 16 $67 = r$ $r = 67$	47 $12 = n - 36$ + 36 + 36 $48 = n$ $n = 48$
48	$64 = 19 + k$ - 19 - 19 $55 = k$ $k = 55$	49 $11 = m - 17$ + 17 + 17 $28 = m$ $m = 28$
50	$87 = u - 51$ + 51 + 51 $138 = u$ $u = 138$	51 $100 = a - 9$ + 9 + 9 $109 = a$ $a = 109$
52	$33 = 18 + s$ - 18 - 18 $15 = s$ $s = 15$	53 $56 = d - 24$ + 24 + 24 $80 = d$ $d = 80$
54	$75 = p + 55$ - 55 - 55 $20 = p$ $p = 20$	55 $86 = 37 + x$ - 37 - 37 $49 = x$ $x = 49$
56	$11 = j - 11$ + 11 + 11 $22 = j$ $j = 22$	57 $62 = 16 + t$ - 16 - 16 $46 = t$ $t = 46$

Further One Step Equations
Adding and Subtracting Negative Numbers

This sheet involves one step equations that involve integers (positive and negative numbers). This sheet may challenge some students. Before you attempt this sheet you should have completed the previous one step equation sheet and the folder "Integers".

Column 1 begins with 10 questions, you are asked to write in the number that satisfies the equation (makes both sides equal). This is a quick refresher on using negative numbers. The next 11 questions are much the same, except the box has been replaced by a pronumeral (letter). If you have trouble with these questions pick a number and replace the letter with it and see if it works. If it doesn't, use another number that you think is a better choice and so on. Make sure you write the letter, an '=' sign and the answer. Not the answer alone.

The second column follows the same method used with the previous one step equation sheet. See the example at the top of the column. The second part of the column has the letter on the right hand side of the equation, solve in the same way then use the additional line to reverse the answer so that the letter is on the left hand side. This is the same method used in the third column on the previous sheet.

Column 3 is different in that the sign in front of the letter is a minus sign. When you solve this equation you will have a negative sign in front of the letter. Remove it by multiplying each side by -1, this will change the signs on both sides. There are a pair of examples at the top of the column.

Just a reminder:

$+ - \;\; = - + \;\; = -$

(a plus sign before or after a minus sign is the same as a minus sign alone)

$- - = +$

(a minus sign together with another minus sign is the same as a plus sign alone)

Further One Step Equations - Add/Sub Negative Numbers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the solution to these and put the number in the box

1 $3 - \square = -1$

2 $8 + \square = 5$

3 $-6 + \square = 11$

4 $-5 + \square = -1$

5 $\square - 8 = -6$

6 $\square + 3 = -10$

7 $\square + -7 = 4$

8 $\square - 8 = -8$

9 $\square + 5 = 7$

10 $\square + -3 = -1$

Now try these without working, test numbers to help you if necessary.

11 $g + 6 = 4$ $g =$

12 $n - 5 = -3$

13 $j - 2 = -10$

14 $v + 4 = -7$

15 $m + 6 = -2$

16 $y + 8 = -8$

17 $d + 10 = -7$

18 $q + 2 = 0$

19 $a - 7 = -2$

20 $e + -5 = 10$

21 $s - 7 = -7$

Now solve these equations showing working

Examples

$6 + z = -5$ (-6) (-6) $z = -11$

$t - 9 = -4$ (+9) (+9) $t = 5$

22 $m + 7 = 3$

23 $b - 4 = -6$

24 $n + 11 = -5$

25 $a - 3 = -2$

26 $q + 6 = -1$

27 $9 + r = -5$

28 $t - 4 = -3$

29 $c - -5 = -5$

30 $w - -2 = 0$

31 $n - 7 = -3$

Get the letter on its own then rewrite the equation so that the letter is on the left.

32 $15 = -7 + d$

33 $-3 = y - 3$

Then reverse the equation

34 $-20 = x + 9$

35 $-3 = 10 + u$

36 $5 = -3 + b$

37 $-1 = k + 6$

Solve these then change the sign on both sides of the equation so that it's positive

Examples

$7 - j = -6$ (-7) (-7) $-j = -13$ $j = 13$

$-h - 4 = 10$ (+4) (+4) $-h = 14$ $h = -14$

Multiply throughout by -1

38 $8 - m = -11$

39 $-v - 6 = 5$

40 $-t - 6 = 0$

41 $-7 - a = -3$

42 $5 - e = -2$

43 $-x - 11 = 2$

44 $14 - p = 40$

45 $-d - -9 = 12$

46 $-k - 8 = -15$

47 $-t - -6 = 4$

48 $14 - u = 20$

49 $-5 - c = 2$

50 $8 - a = -15$

51 $-80 - f = 35$

Further One Step Equations - Add/Sub Negative Numbers

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the solution to these and put the number in the box

1. 3 - [4] = - 1
2. 8 + [-3] = 5
3. -6 + [17] = 11
4. -5 + [4] = -1
5. [2] - 8 = -6
6. [-13] + 3 = -10
7. [11] + -7 = 4
8. [0] - 8 = -8
9. [2] + 5 = 7
10. [2] + -3 = -1

Now try these without working, test numbers to help you if necessary.

11. $g + 6 = 4$ — $g = -2$
12. $n - 5 = -3$ — $n = 2$
13. $j - 2 = -10$ — $j = -8$
14. $v + 4 = -7$ — $v = -11$
15. $m + 6 = -2$ — $m = -8$
16. $y + 8 = -8$ — $y = -16$
17. $d + 10 = -7$ — $d = -17$
18. $q + 2 = 0$ — $q = -2$
19. $a - 7 = -2$ — $a = 5$
20. $e + -5 = 10$ — $e = 15$
21. $s - 7 = -7$ — $s = 0$

Now solve these equations showing working

Examples

$6 + z = -5$
(-6) (-6)
$z = -11$

$t - 9 = -4$
(+9) (+9)
$t = 5$

22. $m + 7 = 3$ (-7 -7) → $m = -4$
23. $b - 4 = -6$ (+4 +4) → $b = -2$
24. $n + 11 = -5$ (-11 -11) → $n = -16$
25. $a - 3 = -2$ (+3 +3) → $a = 1$
26. $q + 6 = -1$ (-6 -6) → $q = -7$
27. $9 + r = -5$ (-9 -9) → $r = -14$
28. $t - 4 = -3$ (+4 +4) → $t = 1$
29. $c - -5 = -5$ (-5 -5) → $c = -10$
30. $w - -2 = 0$ (-2 -2) → $w = -2$
31. $n - 7 = -3$ (+7 +7) → $n = 4$

Get the letter on its own then rewrite the equation so that the letter is on the left.

32. $15 = -7 + d$ (+7 +7) → $22 = d$ → $d = 22$
33. $-3 = y - 3$ (+3 +3) → $0 = y$ → $y = 0$

Then reverse the equation

34. $-20 = x + 9$ (-9 -9) → $-29 = x$ → $x = -29$
35. $-3 = 10 + u$ (-10 -10) → $-13 = u$ → $u = -13$
36. $5 = -3 + b$ (+3 +3) → $8 = b$ → $b = 8$
37. $-1 = k + 6$ (-6 -6) → $-7 = k$ → $k = -7$

Solve these then change the sign on both sides of the equation so that it's positive

Examples

$7 - j = -6$
(-7) (-7)
$-j = -13$
$j = 13$

$-h - 4 = 10$
(+4) (+4)
$-h = 14$
$h = -14$

Multiply throughout by -1

38. $8 - m = -11$ (-8 -8) → $-m = -19$ → $m = 19$
39. $-v - 6 = 5$ (+6 +6) → $-v = 11$ → $v = -11$
40. $-t - 6 = 0$ (+6 +6) → $-t = 6$ → $t = -6$
41. $-7 - a = -3$ (+7 +7) → $-a = 4$ → $a = -4$
42. $5 - e = -2$ (-5 -5) → $-e = -7$ → $e = 7$
43. $-x - 11 = 2$ (+11 +11) → $-x = 13$ → $x = -13$
44. $14 - p = 40$ (-14 -14) → $-p = 26$ → $p = -26$
45. $-d - -9 = 12$ (-9 -9) → $-d = 3$ → $d = -3$
46. $-k - 8 = -15$ (+8 +8) → $-k = -7$ → $k = 7$
47. $-t - -6 = 4$ (-6 -6) → $-t = -2$ → $t = 2$
48. $14 - u = 20$ (-14 -14) → $-u = 6$ → $u = -6$
49. $-5 - c = 2$ (+5 +5) → $-c = 7$ → $c = -7$
50. $8 - a = -15$ (-8 -8) → $-a = -23$ → $a = 23$
51. $-80 - f = 35$ (+80 +80) → $-f = 115$ → $f = -115$

Solving One Step Equations - Multiplication

This sheet deals with one step equations that involve multiplication. The sheet starts with a column of questions that you should be able to answer by inspection without showing your working out. From column 2 onwards you are expected to show working, even if you can still solve the problems mentally.

Column 1 involves simple one step equations in that the answers are all cardinal numbers. One way to solve these is to talk them through, for example:

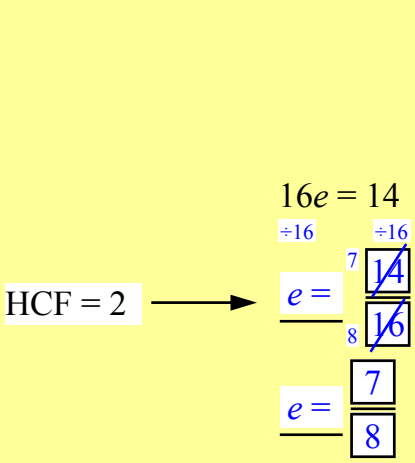
$8m = 24$ …. say 8 times something equals 24
Try $m = 3$ …. say 8 times 3 is 24 so write $m = 3$

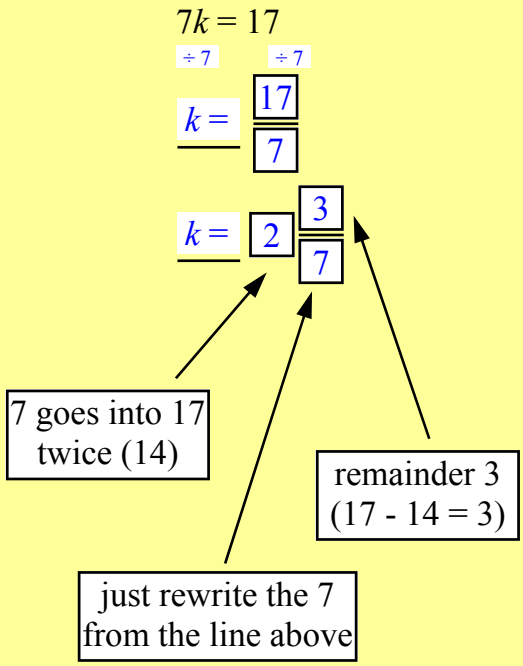
Column 2 asks you to show working and also includes fractions. These fractions won't simplify until Q 34. Follow the examples at the top of the column by dividing the number on the right hand side by the number on the left hand side (in front of the letter). Show your working as the example shows.

From Q 34 it's fractions only, this time they simplify. So use the same method to get the first line, then find the HCF (Highest Common Factor) or the largest number that goes into the top and bottom numbers and divide through.

The third column changes with the last 6 questions. These involve answers that are mixed numerals (number + fraction). Use the same method to get to the first line by dividing through. You will have an improper fraction (the numerator or top number is larger than the denominator). Then convert to mixed numerals….do you remember how? Ask yourself:

- how many times does the bottom number go into the top number, write this in the whole number box at the front
- then write the remainder (amount left over) in the top box.
- the bottom box has the same number as the bottom box in the line above.





Solving One Step Equations - Multiplication

Look at these equations and give the value for the pronumeral

1 $4d = 8$ $d =$

2 $6h = 12$

3 $5x = 45$

4 $9g = 36$

5 $10n = 120$

6 $7e = 42$

7 $8y = 56$

8 $5t = 55$

9 $11a = 44$

10 $9q = 18$

11 $3z = 39$

12 $2w = 30$

13 $5r = 15$

14 $15p = 45$

15 $4b = 28$

16 $6c = 36$

17 $2k = 48$

18 $9y = 90$

19 $30u = 180$

20 $15x = 60$

21 $2v = 34$

22 $7j = 84$

23 $5t = 0$

Solve these equations only this time show your working out.

Examples

$6p = 54$ (÷6) (÷6) $p = 9$

$5d = 3$ (÷5) (÷5) $d = \frac{3}{5}$

24 $3e = 36$

25 $9u = 4$

26 $8a = 40$

27 $2w = 54$

28 $11q = 9$

29 $17t = 7$

30 $12c = 60$

31 $15x = 13$

32 $20m = 9$

33 $7r = 42$

These will have fraction answers that can be simplified

34 $6j = 3$

35 $8d = 6$

36 $15k = 9$

37 $20e = 12$

38 $40a = 25$

39 $12v = 10$

40 $24f = 6$

41 $20s = 16$

42 $30h = 12$

43 $35x = 28$

These can be changed from improper fractions to mixed numerals

44 $4t = 9$

45 $3c = 11$

46 $8n = 35$

47 $14d = 33$

48 $11z = 50$

49 $4k = 33$

22	$7j = 84$	$j = 12$
23	$5t = 0$	$t = 0$

Solve these equations only this time show your working out.

Examples

$6p = 54$ (÷6 ÷6) $p = 9$

$5d = 3$ (÷5 ÷5) $d = \frac{3}{5}$

24 $3e = 36$ (÷3 ÷3) $e = 12$

25 $9u = 4$ (÷9 ÷9) $u = \frac{4}{9}$

26 $8a = 40$ (÷8 ÷8) $a = 5$

27 $2w = 54$ (÷2 ÷2) $w = 27$

28 $11q = 9$ (÷11 ÷11) $q = \frac{9}{11}$

29 $17t = 7$ (÷17 ÷17) $t = \frac{7}{17}$

30 $12c = 60$ (÷12 ÷12) $c = 5$

31 $15x = 13$ (÷15 ÷15) $x = \frac{13}{15}$

32 $20m = 9$ (÷20 ÷20) $m = \frac{9}{20}$

33 $7r = 42$ (÷7 ÷7) $r = 6$

These will have fraction answers that can be simplified

34 $6j = 3$ (÷6 ÷6) $j = \frac{\cancel{3}^{1}}{\cancel{6}_{2}}$ $j = \frac{1}{2}$

35 $8d = 6$ (÷8 ÷8) $d = \frac{\cancel{6}^{3}}{\cancel{8}_{4}}$ $d = \frac{3}{4}$

36 $15k = 9$ (÷15 ÷15) $k = \frac{\cancel{9}^{3}}{\cancel{15}_{5}}$ $k = \frac{3}{5}$

37 $20e = 12$ (÷20) $e = \frac{\cancel{12}^{3}}{\cancel{20}_{5}}$ $e = \frac{3}{5}$

38 $40a = 25$ (÷40 ÷40) $a = \frac{\cancel{25}^{5}}{\cancel{40}_{8}}$ $a = \frac{5}{8}$

39 $12v = 10$ (÷12 ÷12) $v = \frac{\cancel{10}^{5}}{\cancel{12}_{6}}$ $v = \frac{5}{6}$

40 $24f = 6$ (÷24 ÷24) $f = \frac{\cancel{6}^{1}}{\cancel{24}_{4}}$ $f = \frac{1}{4}$

41 $20s = 16$ (÷20 ÷20) $s = \frac{\cancel{16}^{4}}{\cancel{20}_{5}}$ $s = \frac{4}{5}$

42 $30h = 12$ (÷30 ÷30) $h = \frac{\cancel{12}^{2}}{\cancel{30}_{5}}$ $h = \frac{2}{5}$

43 $35x = 28$ (÷35 ÷35) $x = \frac{\cancel{28}^{4}}{\cancel{35}_{5}}$ $x = \frac{4}{5}$

These can be changed from improper fractions to mixed numerals

44 $4t = 9$ (÷4 ÷4) $t = \frac{9}{4}$ $t = 2\frac{1}{4}$

45 $3c = 11$ (÷3 ÷3) $c = \frac{11}{3}$ $c = 3\frac{2}{3}$

46 $8n = 35$ (÷8 ÷8) $n = \frac{35}{8}$ $n = 4\frac{3}{8}$

47 $14d = 33$ (÷14 ÷14) $d = \frac{33}{14}$ $d = 2\frac{5}{14}$

48 $11z = 50$ (÷11 ÷11) $z = \frac{50}{11}$ $z = 4\frac{6}{11}$

49 $4k = 33$ (÷4 ÷4) $k = \frac{33}{4}$ $k = 8\frac{1}{4}$

Further One Step Equations - Multiplication

This sheet involves the use of negative numbers in one step equations. To answer this sheet you should have first completed the 'Integers' folder or already have learnt about negative numbers. The methods used in this sheet are identical to the previous sheet except that the rules for operations with negative numbers are included.

Column 1 begins with revision of operations with negative numbers, you are asked to write in the answer (with the sign) in the box provided. Remember that:

- negative × (or ÷) negative = positive
- negative × (or ÷) positive = negative
- positive × (or ÷) negative = negative

The second part of column 1 is the same as above except the box is replaced by a letter and you have to specify the value of the letter. Talk it through to yourself if it makes it easier. So if you had:

$8b = -40$: say→ eight times something gives me -40. I know 8 times 5 gives me 40, so eight times -5 must give me -40.

so $b = -5$.

Note that you can test numbers to see if they work and modify your number until you get your answer also.

Column 2 uses division by the number (including the sign) that is in front of the letter. Look at the examples at the top of the column. The questions have the letter on the right hand side in the second part of the column. Use the same method then reverse your answer, as shown in the example at the base of this sheet.

Column 3 is the same as the third column on the previous sheet. Simplify the fraction on the first line by dividing through by the HCF. From Q 44 the answers are to be expressed as mixed numerals. Have a look at the examples below.

$-35 = -7x$

÷ -7 ÷ -7

$5 = x$

$x = 5$

$-32u = 56$

÷ -32 ÷ -32

$u = \frac{56}{-32}$ (7, -4)

$u = -\frac{7}{4}$

$-5w = -19$

÷ -5 ÷ -5

$w = \frac{-19}{-5}$

$w = 3\frac{4}{5}$

Further One Step Equations - Multiplication

$\div -3 \quad \div -3$

$x = \frac{5}{-3}$

$x = -1\frac{2}{3}$

Solving One Step Equations - Division

These one step equations have the letter being divided by a number (or decimal). As with addition, subtraction and multiplication you will use the opposite operation to solve these exercises. The opposite sign to ÷ is ×, so you will use multiplication to solve these questions.

Column 1 starts with questions that you should be able to complete mentally. Talk it through to yourself, for example if you have $^{t}/_{6} = 4$:
$^{t}/_{6} = 4$ ….. say something divided by 6 equals 4
t = 24 ….. say 24 divided by 6 is equal to 4, so *t* = 24

Column 2 then uses multiplication to solve the problems. Look at the number that the letter is being divided by and multiply both sides by it. Examples are at the top of the column.

Column 3 uses the same solving method except decimals are involved. Follow the examples at the top of the column then see if you can answer the first 4 questions mentally. From then on when you multiply, use the multiplication working space to get your answer. Write your answer and remember to write the letter then '=' before your answer.

$$\begin{array}{r} {\scriptstyle 2} \\ 7.4 \times \\ 5 \\ \hline 37.0 \end{array}$$

Further One Step Division Equations and Solutions to Equations

This sheet involves using negative numbers, you should have covered 'Integers' before you attempt this sheet.

Column 1 carries on from the previous sheet only this time negative numbers are involved. Examples are at the top of the column, the method is the same as the previous sheet.

Column 2 uses substitution, (when the letter is replaced by a number). These questions aren't to find the value for the letter that makes the equation true. A value is already given and you are asked to test to see whether it is a solution. This is done by replacing the letter with the value given in each question, simplifying the left hand side of the equation (L.H.S.) and checking if it equals the right hand side (R.H.S.) of the equation.

If the same number is on both sides of the = sign then the value 'satisfies' the equation (it is a solution). If the numbers aren't the same on either side of the = sign then you write ≠ (not equal to) and say that it isn't a solution. As in the example at the top of column 2.

Column 3 follows on from column 2 except that brackets are introduced. You have to evaluate the brackets before you multiply by the outside number.

Test for $b = 6$

$2(b - 9) = -6$

$2 \times (6 - 9) = -6$ (-3)

$-6 = -6$

LHS = RHS so 6 satisfies the equation.

Further One Step Division Equations and Solutions to Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the value of the letter that make these true.

Examples

$\frac{j}{6} = -12$ (× 6, × 6)

$j = -72$

$\frac{n}{-8} = -5$ (× -8, × -8)

$n = 40$

1 $\frac{a}{5} = -6$

2 $\frac{t}{-7} = 9$

3 $\frac{h}{-3} = -15$

4 $\frac{y}{5} = -12$

5 $\frac{t}{7} = -1$

6 $\frac{m}{-6} = -3$

7 $\frac{u}{9} = -5$

8 $\frac{b}{16} = -2$

9 $\frac{d}{-3} = -11$

10 $\frac{g}{-5} = 60$

11 $\frac{f}{20} = -12$

12 $\frac{q}{-7} = -8$

13 $\frac{m}{17} = -3$

14 $\frac{e}{15} = -5$

15 $\frac{x}{19} = -2$

16 $\frac{k}{-2} = -1$

Substitute the value for the letter to see if it is a solution for the equation

Example

$g + 17 = 40$ Try $g = 33$

$33 + 17 = 40$ LHS ≠ RHS so 33

$50 \neq 40$ is not a solution

17 Test for $n = 31$

$n - 12 = 19$

18 Test for $t = 16$

$t + 37 = 63$

19 Test for $m = 7$

$3m = 23$

20 Test for $u = -4$

$8u = 32$

21 Test for $c = -6$

$19 - c = 25$

22 Test for $q = 9$

$-5 - q = 14$

23 Test for $a = -3$

$-6a = 18$

24 Test for $k = -8$

$k^2 = 64$

25 Test for $g = 5$

$7(g + 3) = 56$

26 Test for $d = 12$

$5(9 - d) = -2$

27 Test for $x = -27$

$\frac{x}{-3} = -9$

28 Test for $e = -9$

$2(3 - e) = 24$

29 Test for $v = 3$

$5(v - 8) = -30$

Further One Step Division Equations and Solutions to Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the value of the letter that make these true.

Examples

$\frac{j}{6} = -12$ (× 6 / × 6)

$j = -72$

$\frac{n}{-8} = -5$ (× -8 / × -8)

$n = 40$

1 $\frac{a}{5} = -6$ (× 5 / × 5)

$a = -30$

2 $\frac{t}{-7} = 9$ (× -7 / × -7)

$t = -63$

3 $\frac{h}{-3} = -15$ (× -3 / × -3)

$h = 75$

4 $\frac{y}{5} = -12$ (× 5 / × 5)

$y = -60$

5 $\frac{t}{7} = -1$ (× 7 / × 7)

$t = -7$

6 $\frac{m}{-6} = -3$ (× -6 / × -6)

$m = 18$

7 $\frac{u}{9} = -5$ (× 9 / × 9)

$u = -45$

8 $\frac{b}{16} = -2$ (× 16 / × 16)

$b = -32$

9 $\frac{d}{-3} = -11$ (× -3 / × -3)

$d = 33$

10 $\frac{g}{-5} = 60$ (× -5 / × -5)

$g = -300$

11 $\frac{f}{20} = -12$ (× 20 / × 20)

$f = -240$

12 $\frac{q}{-7} = -8$ (× -7 / × -7)

$q = 56$

13 $\frac{m}{17} = -3$ (× 17 / × 17)

$m = -51$

14 $\frac{e}{15} = -5$ (× 15 / × 15)

$e = -75$

15 $\frac{x}{19} = -2$ (× 19 / × 19)

$x = -38$

16 $\frac{k}{-2} = -1$ (× -2 / × -2)

$k = 2$

Substitute the value for the letter to see if it is a solution for the equation

Example

$g + 17 = 40$ Try $g = 33$

$33 + 17 = 40$ LHS ≠ RHS so 33

$50 \neq 40$ is not a solution

17 Test for $n = 31$

$n - 12 = 19$ LHS = RHS so 31

$31 - 12 = 19$ is a solution

$19 = 19$

18 Test for $t = 16$

$t + 37 = 63$ LHS ≠ RHS so 16

$16 + 37 = 63$ is not a solution

$53 \neq 63$

19 Test for $m = 7$

$3m = 23$ LHS ≠ RHS so 7 is

$3 \times 7 = 23$ not a solution

$21 \neq 23$

20 Test for $u = -4$

$8u = 32$ LHS ≠ RHS so

$8 \times -4 = 32$ -4 is not a

$-32 \neq 32$ solution

21 Test for $c = -6$

$19 - c = 25$ LHS = RHS so

$19 - -6 = 25$ -6 is a solution

$25 = 25$

22 Test for $q = 9$

$-5 - q = 14$ LHS ≠ RHS so 9

$-5 - 9 = 14$ is not a solution

$-14 \neq 14$

23 Test for $a = -3$

$-6a = 18$ LHS = RHS so

$-6 \times -3 = 18$ -3 is a solution

$18 = 18$

24 Test for $k = -8$

$k^2 = 64$ LHS = RHS so

$(-8)^2 = 64$ -8 is a solution

$64 = 64$

25 Test for $g = 5$

$7(g + 3) = 56$ LHS = RHS so

$7 \times (5 + 3) = 56$ (8) 5 is a solution

$56 = 56$

26 Test for $d = 12$

$5(9 - d) = -2$ LHS ≠ RHS so

$5 \times (9 - 12) =$ (-3) 12 is not a

$-15 \neq -2$ solution

27 Test for $x = -27$

$\frac{x}{-3} = -9$ LHS ≠ RHS so

-9 is not a

$\frac{-27}{-3} = -9$ solution

$9 \neq 9$

28 Test for $e = -9$

$2(3 - e) = 24$ LHS = RHS so

$2 \times (3 - -9) =$ (12) -9 is a solution

$24 = 24$

29 Test for $v = 3$

$5(v - 8) = -30$ LHS ≠ RHS so 3

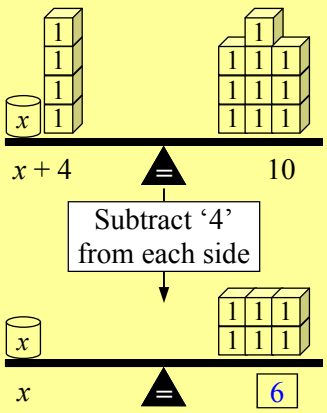
$5 \times (3 - 8) = -30$ (-5) is not a solution

$-25 \neq -30$

Equation Process Diagrams

This sheet is an introduction sheet to solving equations. As equations have an 'equals sign' in them, this means that both sides of the equation are equal, or balanced. So imagine a balance, or scales, or seesaw, with possibly different objects on each side but still weighing the same amount. If you take off the same amount from both sides, the balance is maintained. If you halve each side, or multiply each side by the same amount then the balance is maintained.

Example



The goal is to get x by itself. If you remove the 4 cubes on the left, that are with the x, then the x is left by itself, so subtract 4, but subtract from both sides to maintain the balance.

You have your answer for x. After the 4 is removed you are left with six cubes. As the weight of x and the cubes are the same, x must be 6.

The same process above with the scales is then applied to questions without the scales being there. But the approach to solve them is the same. You were told to 'subtract 4' from each side of the equation, the questions in column 2 also tell you to subtract, or divide, or add in the same way. Just follow the process.

Examples - Column 2 questions

$x - 6 = 13$

$+6 \quad +6$

$x = 19$

This question has '-6' with the x. How do you remove the -6? Add 6 and it becomes 0. So '+6' to each side and x is by itself. $13 + 6 = 19$, so $x = 19$.

$5x = 45$

$\div 5 \quad \div 5$

$x = 9$

This time there is a 5 in front of the x. This is the same as '$5 \times x$' or if you like '$x \times 5$'. The opposite to multiplying by 5 is dividing by 5. So divide the other side by 5 as well and you have your answer. $45 \div 5 = 9$, so $x = 9$.

Column 3 starts with questions that require two-steps to solve. This means that they are solved by adding or subtracting a number first, then dividing by a number to solve. So the questions are like the two questions above … only joined together.

The last questions in column 3 gives you the answer to the equation, you just have to write in the steps that have been taken to get that answer.

Equation Process Diagrams

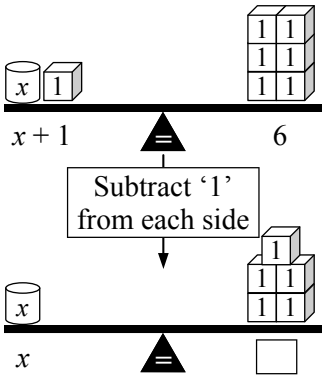
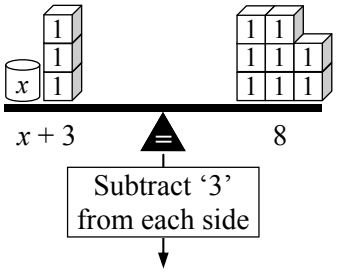
To find the mass 'x', follow the steps using the balance.

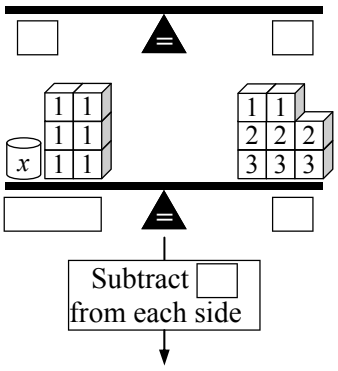
1



2

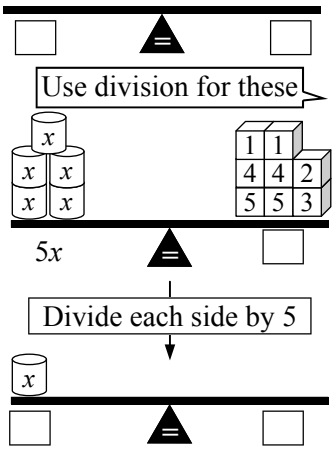


3

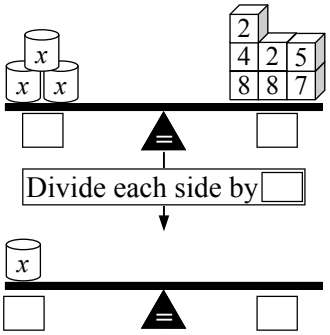


Use division for these

4

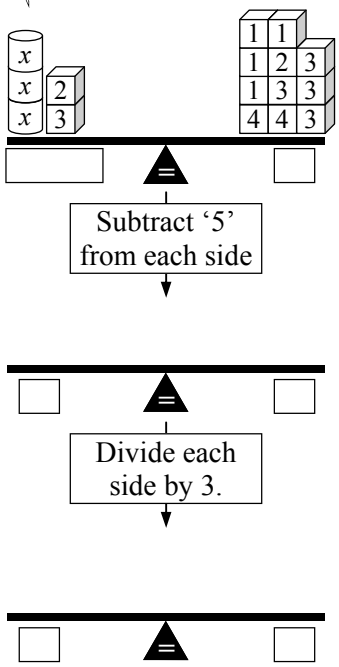


5



Combine the subtraction and division process.

6



The balance is gone, but the process is the same. Find x.

7 $x + 3 = 15$ (−3 / −3)

8 $x + 6 = -5$ (−6 / −6)

9 $x - 4 = 1$ (+4 / +4)

10 $x - 8 = 0$ (+8 / +8)

11 $x + 9 = -6$ (−9 / −9)

12 $x - 4 = -2$ (+4 / +4)

13 $6x = 18$ (÷6 / ÷6)

14 $4x = -12$ (÷4 / ÷4)

15 $7x = 35$ (÷7 / ÷7)

16 $5x = -25$ (÷5 / ÷5)

Now combine the two.

17 $2x + 3 = 17$ (−3 / −3, ÷2 / ÷2)

18 $5x - 4 = 26$ (+4 / +4, ÷5 / ÷5)

19 $6x - 2 = 4$ (+2 / +2, ÷6 / ÷6)

20 $7x + 11 = -10$ (−11 / −11, ÷7 / ÷7)

21 $10 + 2x = 4$ (−10 / −10, ÷2 / ÷2)

22 $18 - 3x = 33$ (−18 / −18, ÷-3 / ÷-3)

23 $12 + 3x = 0$ (−12 / −12, ÷3 / ÷3)

24 $16 - 2x = -2$ (−16 / −16, ÷-2 / ÷-2)

The process needs to be filled in this time. What has been done to get to the line below?

25 $x + 7 = 10$ → $x = 3$

26 $k - 5 = 9$ → $k = 14$

27 $2y + 4 = 10$ → $2y = 6$ → $y = 3$

28 $4t - 2 = 26$ → $4t = 28$ → $t = 7$

One Step Equations - Review

You may have covered 1-Step equations already and you just need a quick refresher. Well if that is the case, do we have a sheet for you! Examples are at the top of each column.

1-Step Equations - Review

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Remember to remove a +, you minus. To remove a -, you add. Solve these + and - questions.

Examples

$t - 4 = -3$ → (+4) (+4) → $t = 1$ (Show your working)

$c + 5 = 9$ → (-5) (-5) → $c = 4$ (Show your working)

1 $k + 7 = 2$

2 $d + 9 = 25$

3 $y - 3 = 11$

4 $f + 3 = 0$

5 $5 + n = -8$

6 $h - 9 = -91$

7 $w + 2 = -2$

8 $t + 8 = -7$

9 $u - 3 = 0.7$

10 $g - 1.6 = -2$

11 $1 + c = 5\frac{1}{2}$

12 $b - 4 = -\frac{2}{3}$

13 $t + 20 = -9$

14 $k - 2 = 0$

15 $e - 7 = -3.1$

16 $q - 0.2 = 0.8$

Remember to remove a ×, you divide. To remove a ÷, you multiply. Solve these.

Examples

$4y = -12$ → (÷4) (÷4) → $y = -3$ (Show your working)

$\frac{a}{5} = 6$ → (×5) (×5) → $a = 30$ (Show your working)

17 $\frac{r}{3} = 2$

18 $8y = 192$

19 $\frac{t}{6} = -7$

20 $\frac{a}{9} = 1$

21 $2c = 5$

22 $y \div 11 = 5$

23 $4k = -30$

24 $-6d = 18$

25 $\frac{v}{8} = -0.4$

26 $-3x = -24$

27 $-7u = -17.5$

28 $\frac{p}{-5} = -1$

29 $-\frac{h}{3} = \frac{2}{3}$

30 $\frac{-a}{4} = 0.85$

31 $0.3m = 12$

32 $-5.5y = -88$

These are a mix of the first two columns. Solve these.

33 $y - 15 = -12$

34 $3b = -165$

35 $\frac{m}{7} = 5.25$

36 $d + 7 = -9$

37 $e - 9 = -9$

38 $\frac{t}{15} = -5.3$

39 $-c = 20$

40 $f + 11 = -4$

The letter is on the R.H.S., solve & reverse the equation.

41 $11 = h - 3$ → (+3) (+3) → $\square = h$, $h = \square$

42 $20 = -8q$ → $\square = q$, $q = \square$

43 $0.5 = i + 7$

44 $-16 = \frac{w}{-2}$

Turn these upside-down before you do anything. Solve.

45 $\frac{3}{q} = \frac{1}{2}$ → $\frac{\square}{\square} = \square$

46 $\frac{4}{c} = \frac{2}{11}$ → $\frac{\square}{\square} = \frac{\square}{\square}$

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Remember to remove a +, you minus. To remove a -, you add. Solve these + and - questions.

Examples

$t - 4 = -3$ (+4) (+4) → $t = 1$ (Show your working)

$c + 5 = 9$ (-5) (-5) → $c = 4$

1 $k + 7 = 2$ (-7) (-7) → $k = -5$

2 $d + 9 = 25$ (-9) (-9) → $d = 16$

3 $y - 3 = 11$ (+3) (+3) → $y = 14$

4 $f + 3 = 0$ (-3) (-3) → $f = -3$

5 $5 + n = -8$ (-5) (-5) → $n = -13$

6 $h - 9 = -91$ (+9) (+9) → $h = -82$

7 $w + 2 = -2$ (-2) (-2) → $w = -4$

8 $t + 8 = -7$ (-8) (-8) → $t = -15$

9 $u - 3 = 0.7$ (+3) (+3) → $u = 3.7$

10 $g - 1.6 = -2$ (+1.6) (+1.6) → $g = -0.4$

11 $1 + c = 5\frac{1}{2}$ (-1) (-1) → $c = 4\frac{1}{2}$

12 $b - 4 = -\frac{2}{3}$ (+4) → $b = 3\frac{1}{3}$

13 $t + 20 = -9$ (-20) (-20) → $t = -29$

14 $k - 2 = 0$ (+2) (+2) → $k = 2$

15 $e - 7 = -3.1$ (+7) (+7) → $e = 3.9$

16 $q - 0.2 = 0.8$ (+0.2) (+0.2) → $q = 1$

Remember to remove a ×, you divide. To remove a ÷, you multiply. Solve these.

Examples

$4y = -12$ (÷4) (÷4) → $y = -3$ (Show your working)

$\frac{a}{5} = 6$ (×5) (×5) → $a = 30$

17 $\frac{r}{3} = 2$ (×3) (×3) → $r = 6$

18 $8y = 192$ (÷8) (÷8) → $y = 24$

19 $\frac{t}{6} = -7$ (×6) (×6) → $t = -42$

20 $\frac{a}{9} = 1$ (×9) (×9) → $a = 9$

21 $2c = 5$ (÷2) (÷2) → $c = 2.5$

22 $y \div 11 = 5$ (×11) (×11) → $y = 55$

23 $4k = -30$ (÷4) (÷4) → $k = -7.5$

24 $-6d = 18$ (÷-6) (÷-6) → $d = -3$

25 $\frac{v}{8} = -0.4$ (×8) (×8) → $v = -3.2$

26 $-3x = -24$ (÷-3) (÷-3) → $x = 8$

27 $-7u = -17.5$ (÷-7) (÷-7) → $u = 2.5$

28 $\frac{p}{-5} = -1$ (×-5) (×-5) → $p = 5$

29 $-\frac{h}{3} = \frac{2}{3}$ (×-3) (×-3) → $h = -2$

30 $\frac{-a}{4} = 0.85$ (×-4) (×-4) → $a = -3.4$

31 $0.3m = 12$ (÷0.3) (÷0.3) → $m = 40$

32 $-5.5y = -88$ (÷-5.5) (÷-5.5) → $y = 16$

These are a mix of the first two columns. Solve these.

33 $y - 15 = -12$ (+15) (+15) → $y = 3$

34 $3b = -165$ (÷3) (÷3) → $b = -55$

35 $\frac{m}{7} = 5.25$ (×7) (×7) → $m = 36.75$

36 $d + 7 = -9$ (-7) (-7) → $d = -16$

37 $e - 9 = -9$ (+9) (+9) → $e = 0$

38 $\frac{t}{15} = -5.3$ (×15) (×15) → $7 = -79.5$

39 $-c = 20$ (÷-1) (÷-1) → $c = -20$

40 $f + 11 = -4$ (-11) (-11) → $f = -15$

The letter is on the R.H.S., solve & reverse the equation.

41 $11 = h - 3$ (+3) (+3) → $\boxed{14} = h$ → $h = \boxed{14}$

42 $20 = -8q$ (÷-8) (÷-8) → $\boxed{-2.5} = q$ → $q = \boxed{-2.5}$

43 $0.5 = i + 7$ (-7) (-7) → $-6.5 = i$ → $i = -6.5$

44 $-16 = \frac{w}{-2}$ (×-2) (×-2) → $32 = w$ → $w = 32$

Turn these upside-down before you do anything. Solve.

45 $\frac{3}{q} = \frac{1}{2}$ → $\frac{\boxed{q}}{\boxed{3}} = \boxed{2}$ (×3) (×3) → $q = 6$

46 $\frac{4}{c} = \frac{2}{11}$ → $\frac{\boxed{c}}{\boxed{4}} = \frac{\boxed{11}}{\boxed{2}}$ (×4) (×4) → $c = 22$

Two Step Equations (Sheet 1)

You solve two-step equations in two steps …. pick yourself up off the floor. The equations in this worksheet have an algebraic term (number with a letter) and a constant, (a number by itself). The process is to first remove the constant, then the coefficient (number in front of or below the letter). There are two different types of equations in this sheet, examples are below.

Example, Solve $4n - 2 = 10$.

$4n - 2 = 10$ — Remove the constant first, so remove the -2. So what is the opposite to -2? It's +2!

$(+2) \quad (+2)$

$4n = 12$

$(\div 4) \quad (\div 4)$ — Remove the coefficient, so get rid of 4! Use ÷4.

$n = 3$

Example, Solve $4n + 2 = 10$.

$4n + 2 = 10$ — Remove the constant first, so remove the +2. So what is the opposite to +2? It's -2!

$(-2) \quad (-2)$

$4n = 8$

$(\div 4) \quad (\div 4)$ — Remove the coefficient, so get rid of 4! Use ÷4.

$n = 2$

Example, Solve $-4n - 2 = 10$.

$-4n - 2 = 10$ — Remove the constant first, so remove the -2. So what is the opposite to -2? It's +2!

$(+2) \quad (+2)$

$-4n = 12$

$(\div -4) \quad (\div -4)$ — Remove the coefficient, so get rid of -4! Use ÷-4.

$n = -3$

Example, Solve $-4n + 2 = -10$.

$-4n + 2 = -10$ — Remove the constant first, so remove the +2. So what is the opposite to +2? It's -2!

$(-2) \quad (-2)$

$-4n = -12$

$(\div -4) \quad (\div -4)$ — Remove the coefficient, so get rid of -4! Use ÷-4.

$n = 3$

The second type of equation has a fractional coefficient. So there is a number under the letter.

Example, Solve $\frac{t}{2} - 4 = 6$

$\frac{t}{2} - 4 = 6$ — Remove the constant first, so remove the -4. So what is the opposite to -4? It's +4!

$(+4) \quad (+4)$

$\frac{t}{2} = 10$

$(\times 2) \quad (\times 2)$ — Remove the denominator, so get rid of the ÷2! Use ×2.

$t = 20$

Example, Solve $\frac{t}{2} + 4 = 6$

$\frac{t}{2} + 4 = 6$ — Remove the constant first, so remove the +4. So what is the opposite to +4? It's -4!

$(-4) \quad (-4)$

$\frac{t}{2} = 2$

$(\times 2) \quad (\times 2)$ — Remove the denominator, so get rid of the ÷2! Use ×2.

$t = 4$

Example, Solve $-\frac{t}{2} - 4 = 6$

$-\frac{t}{2} - 4 = 6$ — Remove the constant first, so remove the -4. So what is the opposite to -4? It's +4!

$(+4) \quad (+4)$

$\frac{t}{-2} = 10$ — Write the negative sign on the denominator to remind you what you have to multiply by.

$(\times -2) \quad (\times -2)$

$t = -20$ — Remove the denominator, so get rid of the ÷-2! Use ×-2.

Example, Solve $-\frac{t}{2} + 4 = -6$

$-\frac{t}{2} + 4 = -6$ — Remove the constant first, so remove the +4. So what is the opposite to +4? It's -4!

$(-4) \quad (-4)$

$\frac{t}{-2} = -10$

$(\times -2) \quad (\times -2)$ — Remove the denominator, so get rid of the ÷-2! Use ×-2.

$t = 20$

The columns start off with examples and also questions with the operation required already supplied. Column 3 is a mixture of the first two columns.

Two Step Equations (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Follow the operation in the circle to solve these 2-Step Equations.

Example

$3x + 5 = 23$

(-5) (-5) ← Remove the number that is with the algebraic term first, get rid of 5!

$3x = 18$

(÷3) (÷3) ← Remove the coefficient, so get rid of 3! Use ÷.

$x = 6$

1 $2n + 3 = 17$

(-3) (-3)

(÷2) (÷2)

2 $7y - 4 = -32$

(+4) (+4)

(÷7) (÷7)

3 $-5k - 2 = -12$

(+2) (+2)

(÷-5) (÷-5)

4 $9w - 7 = 11$

(+7) (+7)

(÷9) (÷9)

5 $6t + 9 = -15$

(-9) (-9)

(÷6) (÷6)

6 $4 - 2x = -46$

(-4) (-4)

(÷-2) (÷-2)

Now attempt these without the hints.

9 $3g + 15 = -12$

8 $-4j + 8 = 20$

9 $10t - 9 = -29$

10 $-6c + 12 = -12$

This time the coefficient is a fraction. Solve these using '×'.

Example

$\frac{k}{8} - 2 = 9$

(+2) (+2) ← Remove the number that is with the algebraic term first, get rid of the -2.

$\frac{k}{8} = 11$

(×8) (×8) ← Remove the fraction, so multiply by 8.

$k = 88$

11 $\frac{n}{4} + 5 = 12$

(-5) (-5)

$\frac{\square}{\square} = \square$

(×4) (×4)

12 $\frac{d}{5} - 3 = -4$

(+3) (+3)

$\frac{\square}{\square} = \square$

(×5) (×5)

13 $-\frac{t}{6} + 4 = -8$

(-4) (-4)

$\frac{\square}{\square} = \square$

(×-6) (×-6)

14 $\frac{-c}{3} - 10 = -6$

(+10) (+10)

$\frac{\square}{\square} = \square$

(×-3) (×-3)

15 $\frac{e}{2} - 9 = 5$

16 $\frac{h}{7} + 12 = 3$

17 $-\frac{u}{5} + 13 = 0$

18 $\frac{m}{-2} + 4 = -11$

19 $\frac{w}{15} - 8 = -5$

20 $\frac{-a}{6} + 7 = -2$

These are a mix of the first two columns. Solve.

21 $7k - 9 = -23$

22 $\frac{t}{8} - 3 = 0$

23 $-2y + 35 = -9$

24 $\frac{n}{3} - 14 = 3$

25 $-\frac{a}{2} + 7 = -2$

26 $\frac{k}{5} - 12 = -10$

27 $9n + 13 = -14$

28 $-y + 9 = -15$

29 $\frac{c}{-2} - 8 = -8$

30 $23 - 6d = -7$

31 $6 - 5h = -9$

32 $-11 - \frac{w}{3} = 7$

Two Step Equations (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Follow the operation in the circle to solve these 2-Step Equations.

Example

$3x + 5 = 23$

(-5) (-5) ← Remove the number that is with the algebraic term first, get rid of 5!

$3x = 18$

(÷3) (÷3) ← Remove the coefficient, so get rid of 3! Use ÷.

$c = 4$

This time the coefficient is a fraction. Solve these using '×'.

Example

$\frac{k}{8} - 2 = 9$

(+2) (+2) ← Remove the number that is with the algebraic term first, get rid of the -2.

$\frac{k}{8} = 11$

(×8) (×8) ← Remove the fraction, so multiply by 8.

$k = 88$

11

$\frac{n}{4} + 5 = 12$

(-5) (-5)

$\frac{n}{4} = 7$

(×4) (×4)

$n = 28$

12

$\frac{d}{5} - 3 = -4$

(+3) (+3)

$\frac{d}{5} = -1$

(×5) (×5)

$d = -5$

13

$-\frac{t}{6} + 4 = -8$

(-4) (-4)

$\frac{t}{-6} = -12$

(×-6) (×-6)

$t = 72$

14

$\frac{-c}{3} - 10 = -6$

(+10) (+10)

$\frac{-c}{3} = 4$

(×-3) (×-3)

$c = -12$

15

$\frac{e}{2} - 9 = 5$

(+9) (+9)

$\frac{e}{2} = 14$

(×2) (×2)

$e = 28$

16

$\frac{h}{7} + 12 = 3$

(-12) (-12)

$\frac{h}{7} = -9$

(×7) (×7)

$h = -63$

17

$-\frac{u}{5} + 13 = 0$

$\frac{w}{-3} = 18$

(×-3) (×-3)

$w = -54$

Two Step Equations (Sheet 2)

This sheet involves division in two-step equations. The whole L.H.S. (Left-hand-side) of the equation has a denominator, so the process is to remove the denominator first. The previous sheet had you removing the constant first then the denominator. So the process is reversed, so try to remember the difference. Below are examples of the two different types of equations you will be solving on the worksheet.

Column 1 Typical Questions

Example, Solve $\frac{n-8}{7} = 2$

$\frac{n-8}{7} = 2$

$\times 7 \quad \times 7$ ← Remove the denominator first, so remove the 7. So what is the opposite to ÷7? It's ×7!

$n - 8 = 16$

$+8 \quad +8$ ← It is now a 1-Step Equation, remove the -8 by +8.

$n = 24$

Example, Solve $\frac{n-8}{-7} = 2$

$\frac{n-8}{-7} = 2$

$\times -7 \quad \times -7$ ← Remove the denominator first, so remove the -7. So what is the opposite to ÷-7? It's ×-7!

$n - 8 = -14$

$+8 \quad +8$ ← It is now a 1-Step Equation, remove the -8 by +8.

$n = -6$

Column 2 Typical Questions

Example, Solve $\frac{2m}{3} = 4$

$\frac{2m}{3} = 4$

$\times 3 \quad \times 3$ ← Remove the denominator first, so remove the 3. So what is the opposite to ÷3? It's ×3!

$2m = 12$

$\div 2 \quad \div 2$ ← It is now a 1-Step Equation, remove the 2 by ÷2.

$m = 6$

Example, Solve $\frac{-6m}{5} = -12$

$\frac{-6m}{5} = -12$

$\times 5 \quad \times 5$ ← Remove the denominator first, so remove the 5. So what is the opposite to ÷5? It's ×5!

$-6m = -60$

$\div -6 \quad \div -6$ ← It is now a 1-Step Equation, remove the -6 by ÷-6.

$m = 10$

Column 3 is a mix of the first two columns.

Two Step Equations (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Follow the operation in the circle to solve these 2-Step Equations.

Example

$\frac{x+4}{3} = 9$

$\times 3$ $\times 3$ ← Remove the denominator first. It becomes a 1-Step!

$x + 4 = 27$

-4 -4 ← Remove the constant.

$x = 23$

1 $\frac{a+2}{5} = 3$

$\times 5$ $\times 5$

-2 -2

2 $\frac{n-6}{2} = 8$

$\times 2$ $\times 2$

$+6$ $+6$

3 $\frac{k-5}{7} = -9$

$\times 7$ $\times 7$

$+5$ $+5$

4 $\frac{3+t}{-4} = -2$

$\times -4$ $\times -4$

-3 -3

5 $\frac{b+2}{3} = 5$

6 $\frac{w-3}{2} = 8$

7 $\frac{c-5}{7} = -4$

8 $\frac{5+y}{-2} = -6$

9 $\frac{1+d}{-5} = -3$

10 $\frac{t-2}{-2} = 0$

Solve these 2-Step Equations by removing the denominator, then the numerator.

Example

$\frac{2x}{3} = 6$

$\times 3$ $\times 3$ ← Remove the denominator first.

$2x = 18$

$\div 2$ $\div 2$ ← Then remove the coefficient to solve.

$x = 9$

11 $\frac{3g}{5} = 6$

$\times 5$ $\times 5$

$\div 3$ $\div 3$

12 $\frac{-f}{9} = 1$

$\times 9$ $\times 9$

$\div -1$ $\div -1$

13 $\frac{2e}{7} = 6$

14 $\frac{6k}{5} = -12$

15 $\frac{4c}{-3} = -8$

16 $\frac{-7w}{2} = 17.5$

You can answer these faster by using the reciprocal. Invert that fraction!

17 $\frac{2b}{5} = 4$

$\times \frac{5}{2}$ $\times \frac{5}{2}$

$b =$ ☐

18 $\frac{3u}{2} = -6$

$\times \frac{2}{3}$ $\times \frac{2}{3}$

$u =$ ☐

19 $\frac{3x}{8} = 12$

20 $\frac{5h}{6} = 10$

21 $\frac{-3a}{4} = -9$

22 $\frac{8v}{-3} = 16$

Now for a mix, solve these.

23 $\frac{x+7}{3} = 9$

24 $\frac{2n}{7} = 6$

You may not need to use the 3rd line.

25 $\frac{5h}{3} = 15$

26 $\frac{u-3}{2} = -11$

27 $\frac{k+6}{-4} = 3$

28 $\frac{-2y}{5} = 8$

29 $\frac{-a}{3} = -4$

30 $\frac{3e}{-5} = -6$

31 $\frac{2+y}{6} = 2.5$

32 $\frac{a-5}{10} = 3.1$

33 $\frac{-u}{5} = 1$

34 $\frac{q-1}{-8} = 5.5$

Two Step Equations (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Follow the operation in the circle to solve these 2-Step Equations.

Example

$\frac{x+4}{3} = 9$ (×3) (×3)

$x + 4 = 27$ (-4) (-4)

$x = 23$

Remove the denominator first. It becomes a 1-Step!

Remove the constant.

1 $\frac{a+2}{5} = 3$ (×5) (×5) $a + 2 = 15$ (-2) (-2) $a = 13$

2 $\frac{n-6}{2} = 8$ (×2) (×2) $n - 6 = 16$ (+6) (+6) $n = 22$

3 $\frac{k-5}{7} = -9$ (×7) (×7) $k - 5 = -63$ (+5) (+5) $k = -58$

4 $\frac{3+t}{-4} = -2$ (×-4) (×-4) $3 + t = 8$ (-3) (-3) $t = 5$

5 $\frac{b+2}{3} = 5$ (×3) (×3) $b + 2 = 15$ (-2) (-2) $b = 13$

6 $\frac{w-3}{2} = 8$ (×2) (×2) $w - 3 = 16$ (+3) (+3) $w = 19$

7 $\frac{c-5}{7} = -4$ (×7) (×7) $c - 5 = -28$ (+5) (+5) $c = -23$

8 $\frac{5+y}{-2} = -6$ (×-2) (×-2) $5 + y = 12$ (-5) (-5) $y = 7$

9 $\frac{1+d}{-5} = -3$ (×-5) (×-5) $1 + d = 15$ (-1) (-1) $d = 14$

10 $\frac{t-2}{-2} = 0$ (×-2) (×-2) $t - 2 = 0$ (+2) (+2) $t = 2$

Solve these 2-Step Equations by removing the denominator, then the numerator.

Example

$\frac{2x}{3} = 6$ (×3) (×3)

$2x = 18$ (÷2) (÷2)

$x = 9$

Remove the denominator first.

Then remove the coefficient to solve.

11 $\frac{3g}{5} = 6$ (×5) (×5) $3g = 30$ (÷3) (÷3) $g = 10$

12 $\frac{-f}{9} = 1$ (×9) (×9) $-f = 9$ (÷-1) (÷-1) $f = -9$

13 $\frac{2e}{7} = 6$ (×7) (×7) $2e = 42$ (÷2) (÷2) $e = 21$

14 $\frac{6k}{5} = -12$ (×5) (×5) $6k = -60$ (÷6) (÷6) $k = -10$

15 $\frac{4c}{-3} = -8$ (×-3) (×-3) $4c = 24$ (÷4) (÷4) $c = 6$

16 $\frac{-7w}{2} = 17.5$ (×2) (×2) $-7w = 35$ (÷-7) (÷-7) $w = -5$

You can answer these faster by using the reciprocal. Invert that fraction!

17 $\frac{2b}{5} = 4$ (×$\frac{5}{2}$) (×$\frac{5}{2}$) $b =$ 10

18 $\frac{3u}{2} = -6$ (×$\frac{2}{3}$) (×$\frac{2}{3}$) $u =$ -4

19 $\frac{3x}{8} = 12$ (×$\frac{8}{3}$) (×$\frac{8}{3}$) $x = 32$

20 $\frac{5h}{6} = 10$ (×$\frac{6}{5}$) (×$\frac{6}{5}$) $h = 12$

21 $\frac{-3a}{4} = -9$ (×$\frac{-4}{3}$) (×$\frac{-4}{3}$) $a = 12$

22 $\frac{8v}{-3} = 16$ (×$\frac{-3}{8}$) (×$\frac{-3}{8}$) $v = -6$

Now for a mix, solve these.

23 $\frac{x+7}{3} = 9$ (×3) (×3) $x + 7 = 27$ (-7) (-7) $x = 20$

24 $\frac{2n}{7} = 6$ (×7) (×7) $2n = 42$ (÷2) (÷2) $n = 21$

You may not need to use the 3rd line.

25 $\frac{5h}{3} = 15$ (×3) (×3) $5h = 45$ (÷5) (÷5) $h = 9$

26 $\frac{u-3}{2} = -11$ (×2) (×2) $u - 3 = -22$ (+3) (+3) $u = -19$

27 $\frac{k+6}{-4} = 3$ (×-4) (×-4) $k + 6 = -12$ (-6) (-6) $k = -18$

28 $\frac{-2y}{5} = 8$ (×5) (×5) $-2y = 40$ (÷-2) (÷-2) $y = -20$

29 $\frac{-a}{3} = -4$ (×3) (×3) $-a = -12$ (÷-1) (÷-1) $a = 12$

30 $\frac{3e}{-5} = -6$ (×-5) (×-5) $3e = 30$ (÷3) (÷3) $e = 10$

31 $\frac{2+y}{6} = 2.5$ (×6) (×6) $2 + y = 15$ (-2) (-2) $y = 13$

32 $\frac{a-5}{10} = 3.1$ (×10) (×10) $a - 5 = 31$ (+5) (+5) $a = 36$

33 $\frac{-u}{5} = 1$ (×5) (×5) $-u = 5$ (÷-1) (÷-1) $u = -5$

34 $\frac{q-1}{-8} = 5.5$ (×-8) (×-8) $q - 1 = -44$ (+1) (+1) $q = -43$

Further Two-Step Equations

The previous sheets on Two-Step Equations involved integer answers. This sheet has answers that are either decimals or fractions.

Column 1 has questions that will give decimal answers. The process for solving these is the same as the previous sheets, the only difference is that the answer is a decimal.

Example, Solve $4n - 2 = 8$.

$4n - 2 = 8$

$\oplus 2 \quad \oplus 2$ ← Remove the constant first, so remove the -2. So what is the opposite to -2? It's +2!

$4n = 10$

$\div 4 \quad \div 4$ ← Remove the coefficient, so get rid of 4! Use ÷4.

$n = 2.5$

Calculator Steps:

1 0 ÷ 4 =

Calculator Screen:

2.5

OR

Calculator Steps:

1 0 $a^b/_c$ 4 =

Calculator Screen: 2 ⌟ 1 ⌟ 2

$a^b/_c$

Calculator Screen: 2.5

Column 2 requires the answers to be fractions. So give your answer as a proper or improper fraction. These questions include an extra step. Rather than achieving your answer and moving to the next question, these questions require you to check your answer, by substituting the answer back into the equation. This makes the question more time consuming, but it is important to be able to check your answer, especially when tests are involved.

Example. Solve $3k - 5 = 6$, perform a substitution to verify your answer.

$3k - 5 = 6$

$\oplus 5 \quad \oplus 5$

$3k = 11$

$\div 3 \quad \div 3$

$k = {}^{11}/_3$

SOLVE
THEN
SUBSTITUTE

Substitute into eq^n.

$3k - 5 = 6$ ← Write the equation from the question again.

$3 \times {}^{11}/_3 - 5 = 6$ ← Substitute your answer for the pronumeral, in this case it is $k = {}^{11}/_3$

$6 = 6$ ✓ ← If the L.H.S. = R.H.S. then your answer is correct

Column 3 also involves fractions, this time you can answer as proper, improper or mixed numerals.

Further Two-Step Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Solve these equations. Leave your answers as decimals.

1 $6j + 3 = 0$

(-3) (-3)

(÷6) (÷6)

2 $-10 + 5y = -2$

3 $\frac{k}{7} - 4 = 2.2$

4 $\frac{5a}{7} = 6.2$

5 $\frac{c + 12}{3} = 9.2$

6 $-\frac{t}{3} + 7 = 0.4$

7 $1.2 - 12d = 5.7$

8 $8 - 8x = -2$

9 $\frac{-5a}{3} = -0.18$

10 $\frac{h - 5.7}{0.2} = -3$

11 $1 - 4y = 0$

12 $\frac{1 + b}{7} = 8.6$

Solve, answering with fractions. Then substitute your answer to verify that it is correct.

13 $3m + 2 = 4$

(-2) (-2)

(÷3) (÷3)

Substitute into eqn.

$3m + 2 = 4$

$3 \times \square + 2 = 4$

$\square = 4$ ✓

14 $7d - 3 = 12$

Substitute into eqn.

$7d - 3 = 12$

$7 \times \frac{\square}{\square} - 3 = 12$

15 $9 - 5c = -3$

Substitute into eqn.

16 $10d - 8 = 8$

Substitute into eqn.

17 $25 - 100p = 5$

Substitute into eqn.

$\frac{h - 5.7}{0.2} = -3$

$\times 0.2 \quad \times 0.2$

$h - 5.7 = -0.6$

$+5.7 \quad +5.7$

$h = 5.1$

11

$1 - 4y = 0$

$-1 \quad -1$

$-4y = -1$

$\div -4 \quad \div -4$

$y = 0.25$

12

$\frac{1 + b}{7} = 8.6$

$\times 7 \quad \times 7$

$1 + b = 60.2$

$-1 \quad -1$

$b = 59.2$

Solve, answering with fractions. Then substitute your answer to verify that it is correct.

13

$3m + 2 = 4$

$-2 \quad -2$

$3m = 2$

$\div 3 \quad \div 3$

$m = \frac{2}{3}$

Substitute into eqn.

$3m + 2 = 4$

$3 \times \frac{2}{3} + 2 = 4$

$4 = 4$ ✓

14

$7d - 3 = 12$

$+3 \quad +3$

$7d = 15$

$\div 7 \quad \div 7$

$d = \frac{15}{7}$

Substitute into eqn.

$7d - 3 = 12$

$7 \times \frac{15}{7} - 3 = 12$

$12 = 12$ ✓

15

$9 - 5c = -3$

$-9 \quad -9$

$-5c = -12$

$\div -5 \quad \div -5$

$c = \frac{12}{5}$

Substitute into eqn.

$9 - 5c = -3$

$9 - 5 \times \frac{12}{5} = -3$

$-3 = -3$ ✓

16

$10d - 8 = 8$

$+8 \quad +8$

$10d = 16$

$\div 10 \quad \div 10$

$d = \frac{8}{5}$

Substitute into eqn.

$10d - 8 = 8$

$10 \times \frac{8}{5} - 8 = 8$

$8 = 8$ ✓

17

$25 - 100p = 5$

$-25 \quad -25$

$-100p = -20$

$\div -100 \quad \div -100$

$d = \frac{1}{5}$

Substitute into eqn.

$25 - 100p = 5$

$25 - 100 \times \frac{1}{5} = 5$

$5 = 5$ ✓

18

$8f - 5 = 7$

$+5 \quad +5$

$8f = 12$

$\div 8 \quad \div 8$

$f = \frac{3}{2}$

Substitute into eqn.

$8f - 5 = 7$

$8 \times \frac{3}{2} - 5 = 7$

$7 = 7$ ✓

Solve these, leaving the answers as fractions or mixed numerals.

19

$m - 7 = \frac{2}{5}$

$+7 \quad +7$

$m = \frac{37}{5}$ $(7\frac{2}{5})$

Unknowns on Both Sides

These equations has algebraic terms on both sides of the '=' sign, they often also have a constant (number) on each side. If you are after an answer like $x = 4$, then you can see that the x is on the left hand side (L.H.S.) and that the 4 is on the R.H.S.

So to answer these questions you have to get the numbers to the R.H.S. and the terms to the L.H.S. Once you do that you have a 1-step equation to solve. There is an example at the top of the column for you to follow, as well as the first 4 questions having the process shown.

The second column asks you to substitute the answer that you found back into the equation, if the L.H.S. and the R.H.S. of the equation is equal, your solution is correct.

Unknowns on Both Sides

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

To solve these you have to get the number on the right hand side, and the term (letter) on the left.

All answers are integers in this column.

Example $4x + 2 = 20 - 2x$

-2 -2 ← Remove the number on the LHS.

$4x = 18 - 2x$

$+2x$ $+2x$ ← Remove the term on the RHS.

$6x = 18$

$\div 6$ $\div 6$ ← Divide through to solve the equation.

$x = 3$

1 $3c = c + 32$

$-c$ $-c$

$\div 2$ $\div 2$

2 $9a = 2a - 14$

$-2a$ $-2a$

$\div 7$ $\div 7$

3 $8k - 21 = 5k$

$+21$ $+21$

$-5k$ $-5k$

$\div 3$ $\div 3$

4 $5y + 5 = 3y - 5$

-5 -5

$-3y$ $-3y$

$\div 2$ $\div 2$

5 $6n - 17 = 2n + 3$

6 $6p + 2 = 16 - p$

7 $k - 4 = 5k + 36$

8 $20 - d = -4 - 3d$

9 $-13 - g = 37 + 9g$

10 $4b + 23 = 23 - 4b$

Fraction answers this time, solve then substitute your answer to test that you are correct.

11 $8n = 2n + 5$

12 $8n = 2n + 5$

$8 \times \square = 2 \times \square + 5$

$\frac{\square}{\square} = \frac{\square}{\square}$

L.H.S. = R.H.S.

$\therefore \square$ is a solution

13 $3v - 2 = 5 - v$

14 $3v - 2 = 5 - v$

$3 \times \frac{\square}{\square} - 2 = 5 - \frac{\square}{\square}$

$\frac{\square}{\square} = \frac{\square}{\square}$

L.H.S. = R.H.S.

$\therefore \square$ is a solution

15 $15 - 2x = x + 7$

16

17 $10 - 3d = 4 + 2d$

18

19 $-v - 7 = -9 - 4v$

20

Unknowns on Both Sides

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

To solve these you have to get the number on the right hand side, and the term (letter) on the left.

All answers are integers in this column.

Example

$4x + 2 = 20 - 2x$

-2 -2 ← Remove the number on the LHS.

$4x = 18 - 2x$

$+2x$ $+2x$ ← Remove the term on the RHS.

$6x = 18$

$\div 6$ $\div 6$ ← Divide through to solve the equation.

$x = 3$

1 $3c = c + 32$

$-c$ $-c$

$2c = 32$

$\div 2$ $\div 2$

$c = 16$

$+13$ $+13$

$-g = 50 + 9g$

$-9g$ $-9g$

$-10g = 50$

$\div -10$ $\div -10$

$g = -5$

10 $4b + 23 = 23 - 4b$

-23 -23

$4b = -4b$

$+4b$ $+4b$

$8b = 0$

$\div 8$ $\div 8$

$b = 0$

Fraction answers this time, solve then substitute your answer to test that you are correct.

11 $8n = 2n + 5$

$-2n$ $-2n$

$6n = 5$

$\div 6$ $\div 6$

$n = {}^{5}/_{6}$

12 $8n = 2n + 5$

$8 \times \frac{5}{6} = 2 \times \frac{5}{6} + 5$

$6\frac{2}{3} = 6\frac{2}{3}$

L.H.S. = R.H.S.

$\therefore \frac{5}{6}$ is a solution

13 $3v - 2 = 5 - v$

$+2$ $+2$

$3v = 7 - v$

$+v$ $+v$

$4v = 7$

$\div 4$ $\div 4$

$v = {}^{7}/_{4}$

14 $3v - 2 = 5 - v$

$3 \times \frac{7}{4} - 2 = 5 - \frac{7}{4}$

$3\frac{1}{4} = 3\frac{1}{4}$

L.H.S. = R.H.S.

$\therefore \frac{7}{4}$ is a solution

15 $15 - 2x = x + 7$

-15 -15

$-2x = x - 8$

$-x$ $-x$

$-3x = -8$

$\div -3$ $\div -3$

$x = {}^{8}/_{3}$

16 $15 - 2x = x + 7$

$15 - 2 \times {}^{8}/_{3} = {}^{8}/_{3} + 7$

$9^{2}/_{3} = 9^{2}/_{3}$

L.H.S. = R.H.S.

$\therefore {}^{8}/_{3}$ is a solution

17 $10 - 3d = 4 + 2d$

-10 -10

$-3d = -6 + 2d$

$-2d$ $-2d$

$-5d = -6$

$\div -5$ $\div -5$

$d = {}^{6}/_{5}$

18 $10 - 3d = 4 + 2d$

$10 - 3 \times {}^{6}/_{5} = 4 + 2 \times {}^{6}/_{5}$

$6^{2}/_{5} = 6^{2}/_{5}$

L.H.S. = R.H.S.

$\therefore {}^{6}/_{5}$ is a solution

19 $-v - 7 = -9 - 4v$

$+7$ $+7$

$-v = -2 - 4v$

$+4v$ $+4v$

$3v = -2$

$\div 3$ $\div 3$

$v = {}^{-2}/_{3}$

20 $-v - 7 = -9 - 4v$

$-({}^{-2}/_{3}) - 7 = -9 - 4 \times ({}^{-2}/_{3})$

$-6^{1}/_{3} = -6^{1}/_{3}$

L.H.S. = R.H.S.

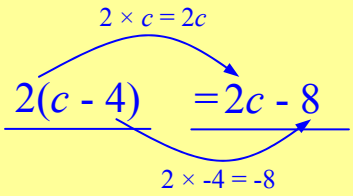
$\therefore {}^{-2}/_{3}$ is a solution

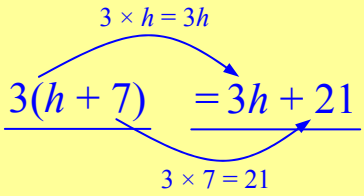
Equations with Expansions

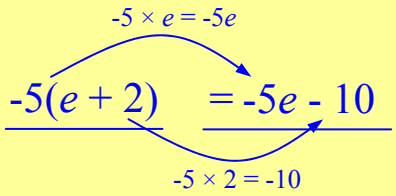
This worksheet combines 2-step equation skills with expansion. So the process isn't new, it is just two methods you have already learned …. combined.

Column 1 starts with expanding expressions, this should be revision for you. Remember that you multiply the outside term with the inside terms. There are examples at the top of the column but here are a few more.

Example - Expanding algebraic expressions.







So a negative number in front of the brackets will change the sign when multiplied.

Then Column 1 and 2 deals with solving equations that include expansions. There is an example before Q.9 and the next 3 questions give you the required operations to help you along. Column 2 is just the same except there are no hints and negatives are introduced.

A term can be outside the brackets as well. Column 3 has an example which shows that the term or constant outside of the brackets isn't included in the expansion. Once you have expanded you can then collect like terms and ….. you have a 2-step equation again. So it is just an extra step.

Equations with Expansions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Expand these expressions.

Examples

$4(x + 2)$ $= 4x + 8$

$3(k - 4)$ $= 3k - 12$

$-3(n - 2)$ $= -3n + 6$

1 $2(y + 5) = 2\square + \square$

2 $4(p - 6) = 4\square - \square$

3 $3(t - 2) =$

4 $5(b + 7) =$

5 $9(c - 4) =$

6 $-2(f + 8) =$

7 $-(d - 2) =$

8 $-5(g - 4) =$

Expand these bracketed expressions, then solve just like a 2-Step equation. All answers are integers.

Example

$2(y + 7) = 10$

$2y + 14 = 10$ ← Expand the expression

(-14) (-14) ← Remove constant LHS

$2y = -4$

(÷2) (÷2) ← Divide for solution.

$y = -2$

9

$3(m + 8) = 51$

Expand expression

(-24) (-24) Subtract LHS constant

(÷3) (÷3) Divide by coefficient

10

$4(h - 3) = 24$

(+12) (+12)

(÷4) (÷4)

11

$2(v + 5) = 6$

(-10) (-10)

(÷2) (÷2)

Keep going … remember to expand, remove the constant and then divide through.

10 $7(p + 9) = -7$

11 $5(e - 9) = -35$

12 $4(t - 4) = -8$

13 $6(k + 3) = -18$

Now negatives - Remember change the sign!

14 $-3(u + 2) = 12$

15 $-8(h - 4) = 24$

16 $-5(y - 6) = -15$

17 $-2(a - 7) = 56$

18 $-(x + 9) = -7$

19 $-10(b - 3) = 0$

If a term or constant is outside the brackets, it isn't included in the expansion. Solve these.

Example

$2(k + 5) + 5k = 31$

$2k + 10 + 5k = 31$ ← $5k$ stays as is.

$7k + 10 = 31$ ← Collect the like terms

(-10) (-10)

$7k = 21$

(÷7) (÷7) 2-Step Equation! Solve as before.

$k = 3$

20 $3(y - 8) + 9y = 36$

21 $7(c + 4) - 19 = -26$

22 $5t + 3(t - 3) = 47$

23 $10g - 4(g - 2) + 11 = 1$

Equations with Expansions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Expand these expressions.

Examples

$4(x + 2) = 4x + 8$

$3(k - 4) = 3k - 12$

$-3(n - 2) = -3n + 6$

1. $2(y + 5) = 2y + 10$
2. $4(p - 6) = 4p - 24$
3. $3(t - 2) = 3t - 6$
4. $5(b + 7) = 5b + 35$
5. $9(c - 4) = 9c - 36$
6. $-2(f + 8) = -2f - 16$
7. $-(d - 2) = -d + 2$
8. $-5(g - 4) = -5g + 20$

Expand these bracketed expressions, then solve just like a 2-Step equation. All answers are integers.

Example

$2(y + 7) = 10$

$2y + 14 = 10$ ← Expand the expression

$-14 \quad -14$ ← Remove constant LHS

$2y = -4$

$\div 2 \quad \div 2$ ← Divide for solution.

$y = -2$

9

$3(m + 8) = 51$

$3m + 24 = 51$ Expand expression

$-24 \quad -24$ Subtract LHS constant

$3m = 27$

$\div 3 \quad \div 3$ Divide by coefficient

$m = 9$

10

$4(h - 3) = 24$

$4h - 12 = 24$

$+12 \quad +12$

$4h = 36$

$\div 4 \quad \div 4$

$h = 9$

11

$2(v + 5) = 6$

$2v + 10 = 6$

$-10 \quad -10$

$2v = -4$

$\div 2 \quad \div 2$

$v = -2$

Keep going … remember to expand, remove the constant and then divide through.

10

$7(p + 9) = -7$

$7p + 63 = -7$

$-63 \quad -63$

$7p = -70$

$\div 7 \quad \div 7$

$p = -10$

11

$5(e - 9) = -35$

$5e - 45 = -35$

$+45 \quad +45$

$5e = 10$

$\div 5 \quad \div 5$

$e = 2$

12

$4(t - 4) = -8$

$4t - 16 = -8$

$+16 \quad +16$

$4t = 8$

$\div 4 \quad \div 4$

$t = 2$

13

$6(k + 3) = -18$

$6k + 18 = -18$

$-18 \quad -18$

$6k = -36$

$\div 6 \quad \div 6$

$k = -6$

Now negatives - Remember change the sign!

14

$-3(u + 2) = 12$

$-3u - 6 = 12$

$+6 \quad +6$

$-3u = 18$

$\div -3 \quad \div -3$

$u = -6$

15

$-8(h - 4) = 24$

$-8h + 32 = 24$

$-32 \quad -32$

$-8h = -8$

$\div -8 \quad \div -8$

$h = 1$

16

$-5(y - 6) = -15$

$-5y + 30 = -15$

$-30 \quad -30$

$-5y = -45$

$\div -5 \quad \div -5$

$y = 9$

17

$-2(a - 7) = 56$

$-2a + 14 = 56$

$-14 \quad -14$

$-2a = 42$

$\div -2 \quad \div -2$

$a = -21$

18

$-(x + 9) = -7$

$-x - 9 = -7$

$+9 \quad +9$

$-x = 2$

$\div -1 \quad \div -1$

$x = -2$

19

$-10(b - 3) = 0$

$-10b + 30 = 0$

$-30 \quad -30$

$-10b = -30$

$\div -10 \quad \div -10$

$b = 3$

If a term or constant is outside the brackets, it isn't included in the expansion. Solve these.

Example

$2(k + 5) + 5k = 31$

$2k + 10 + 5k = 31$ ← $5k$ stays as is.

$7k + 10 = 31$ ← Collect the like terms

$-10 \quad -10$

$7k = 21$

$\div 7 \quad \div 7$

$k = 3$

2-Step Equation! Solve as before.

20

$3(y - 8) + 9y = 36$

$3y - 24 + 9y = 36$

$12y - 24 = 36$

$+24 \quad +24$

$12y = 60$

$\div 12 \quad \div 12$

$y = 5$

21

$7(c + 4) - 19 = -26$

$7c + 28 - 19 = -26$

$7c + 9 = -26$

$-9 \quad -9$

$7c = -35$

$\div 7 \quad \div 7$

$c = -5$

22

$5t + 3(t - 3) = 47$

$5t + 3t - 9 = 47$

$8t - 9 = 47$

$+9 \quad +9$

$8t = 56$

$\div 8 \quad \div 8$

$t = 7$

23

$10g - 4(g - 2) + 11 = 1$

$10g - 4g + 8 + 11 = 1$

$6g + 19 = 1$

$-19 \quad -19$

$6g = -18$

$\div 6 \quad \div 6$

$g = -3$

Further Expansion - Solving Equations

This is an extension sheet involving double expansions, the previous Expansion sheet should be completed before attempting this sheet. An example for column 1 questions is below.

Example - Column 1 - Double Expansion - Same Side of Equation

$5(k + 2) - 3(4k - 4) = 8$ ← The Question to be solved

$5k + 10 - 12k + 12 = 8$ ← Expand the expression. Note the effect of the -3 in front of the second brackets, it changes the sign.

$-7k + 22 = 8$ ← Collect like terms

(-22) (-22)

$-7k = -14$

(÷-7) (÷-7)

$k = 2$

Solve the 2-Step Equation

Example - Column 2 - Double Expansion - Opposite Sides of Equation

$4(h - 2) = -2(h - 6)$ ← The Question to be solved

$4h - 8 = -2h + 12$ ← Expand the expression. Note the effect of the -2 on the RHS, it changes the sign.

(+8) (+8)

$4h = -2h + 20$

(+2h) (+2h)

$6h = 20$

(÷6) (÷6)

$h = {}^{10}/_{3}$

Solve the 'unknown on both sides' Equation.

Column three has two questions that apply the skills above to area applications. Q.10 uses the same skills as Column 1, Q. 11 uses the same skills as Column 2.

Further Expansion - Solving Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Expand, gather like terms and then solve the equations below. Answers may involve fractions.

1 $2(y + 2) + 3(y - 4) = 7$

Expand the expression

Collect like terms

+8 +8

÷5 ÷5

2 $6(a - 5) + 3(a + 1) = -6$

3 $5(4 + d) - 2(d + 3) = 20$

4 $3(4x - 5) - 3(1 - 5x) = 36$

5 $12c - 6(1 - 4c) + 16 = 31$

Now the expansions are on both sides of the equation. Solve.

6 $2(x - 6) = 5(x + 2)$

Expand the expression

+12 +12

-5x -5x

÷-3 ÷-3

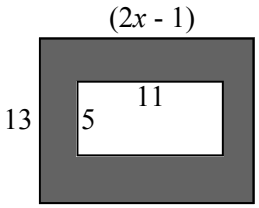
7 $7(k - 5) = 3(8 - k)$

8 $-3(b + 7) = 4(6 - 2b)$

9 $-7(r - 9) = 2(12 - 5r)$

The shaded area is 140 cm^2, find the perimeter of the outside rectangle. Lengths are in cm.

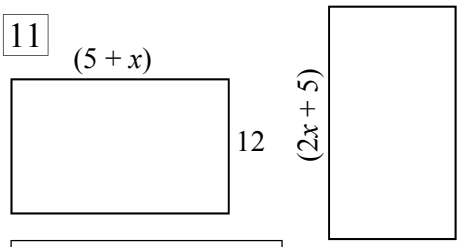
10



Not to scale

These two rectangles have the same area, find the area.

11



Drawings not to scale

Further Expansion - Solving Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Expand, gather like terms and then solve the equations below. Answers may involve fractions.

1 $2(y + 2) + 3(y - 4) = 7$

$2y + 4 + 3y - 12 = 7$

Expand the expression

$5y - 8 = 7$

Collect like terms

(+8) (+8)

$5y = 15$

(÷5) (÷5)

$y = 3$

2 $6(a - 5) + 3(a + 1) = -6$

$6a - 30 + 3a + 3 = -6$

$9a - 27 = -6$

(+27) (+27)

$9a = 21$

(÷9) (÷9)

$a = {}^{7}/_{3}$

3 $5(4 + d) - 2(d + 3) = 20$

$20 + 5d - 2d - 6 = 20$

$3d + 14 = 20$

(-14) (-14)

$3d = 6$

(÷3) (÷3)

$d = 2$

4 $3(4x - 5) - 3(1 - 5x) = 36$

$12x - 15 - 3 + 15x = 36$

$27x - 18 = 36$

(+18) (+18)

$27x = 54$

(÷27) (÷27)

$x = 2$

5 $12c - 6(1 - 4c) + 16 = 31$

$12c - 6 + 24c + 16 = 31$

$36c + 10 = 31$

(-10) (-10)

$36c = 21$

(÷36) (÷36)

$c = {}^{7}/_{12}$

Now the expansions are on both sides of the equation. Solve.

6 $2(x - 6) = 5(x + 2)$

$2x - 12 = 5x + 10$

Expand the expression

(+12) (+12)

$2x = 5x + 22$

(-5x) (-5x)

$-3x = 22$

(÷-3) (÷-3)

$x = {}^{-22}/_{3}$

7 $7(k - 5) = 3(8 - k)$

$7k - 35 = 24 - 3k$

(+35) (+35)

$7k = 59 - 3k$

(+3k) (+3k)

$10k = 59$

(÷10) (÷10)

$k = {}^{59}/_{10}$

8 $-3(b + 7) = 4(6 - 2b)$

$-3b - 21 = 24 - 8b$

(+21) (+21)

$-3b = 45 - 8b$

Substitution

Substitution is the replacement of a pronumeral (letter) with a number. Substitution is used often with formulae where the letters in the formula represent a measurement of distance, time, speed, etc.

Column 1 starts with algebraic expressions. You are given the values of each letter, replace the letter with the number and evaluate. Remember two important features:

When pronumerals are beside each other, it is like there is a '×' in between them.
So: $ab = a \times b$

If powers are involved, the power is only on the pronumeral it follows.
So $ab^2 = a \times b^2$ not $a^2 \times b^2$ or $(ab)^2$

There are two examples at the top of Column 1, note that there are three steps. Write the expression (already in the question), make the substitution, solve.

Columns 2 and 3 involve using formulae, some of which you may have experienced already. There are 3 lines required for each question, write the formula on the first line, make the substitution on the second line and solve (showing the units) on the third line. Some of these questions use units you may not have experienced before, like Joules and Newtons. The units are given to you, just write them after your answer, which is to be rounded to 1 decimal place.

Substitution

$= 114 \times 8 + 5 \times (-242)^2$

$g = 293\,732$

12 $b = gk \div y$

$= 293\,732 \times (-2) \div 8$

$b = -73\,433$

Equations are used regularly in mathematics and science, use these formulae. Round to 1 d.p.

13 Rectangle Area: $A = lb$

Find A *in* m^2, *given*:

$l = 10.9$ m and $b = 8.6$ m.

$A = lb$

$= 10.9 \times 8.6$

$A = 93.7\ m^2$ (1 d.p.)

14 Square's Perimeter: $P = 4l$

Find P *in* cm, *given*: $l = 13.7$ cm

$P = 4l$

$= 4 \times 13.7$

$P = 54.8$ cm

15 Force: $F = ma$

Find F *in* N (Newtons), *given*:

$m = 85$ kg and $a = 9.8$ m/s^2.

$F = ma$

$= 85 \times 9.8$

$F = 833$ N

16 Volume Rect. Prism: $V = lbh$

Find V *in* m^3, *given*:

$l = 3.4$ m, $b = 2.7$ m & $h = 4.2$ m

$V = lbh$

$= 3.4 \times 2.7 \times 4.2$

$F = 38\,556\ m^3$

17 Kinetic Energy: $KE = \frac{1}{2}mv^2$

Find KE *in* J (Joules), *given*:

$m = 6.2$ kg and $v = 12$ m/s.

$KE = \frac{1}{2}mv^2$

$= \frac{1}{2} \times 6.2 \times 12^2$

$KE = 446.4$ J

18 Converting Temperature:

$C = \frac{5}{9}(F - 32)$

Find C *in* °C, *given* F = 100°F.

$C = \frac{5}{9}(F - 32)$

$= \frac{5}{9}(100 - 32)$

$C = 37.8$ °C (1 d.p.)

19 Trapezium Area:

$A = \frac{1}{2}(a + b)h$

Find A *in* cm^2, *given*:

$a = 35$ cm, $b = 16$ cm & $h = 9$ cm

$A = \frac{1}{2}(a + b)h$

$= \frac{1}{2}(35 + 16) \times 9$

$A = 229.5\ cm^2$

20 Speed: $S = \frac{D}{T}$

Find S *in* km/h, *given*:

D = 252 km and T = 4.5 h

$S = \frac{D}{T}$

$= \frac{252}{4.5}$

$S = 56$ km/h

21 Annulus Area: $A = \pi(R^2 - r^2)$

Find A *in* mm^2, *given*:

$R = 45$ mm and $r = 16$ mm

$A = \pi(R^2 - r^2)$

$= \pi(45^2 - 16^2)$

$A = 5\,557.5\ mm^2$ (1 d.p.)

22 Rectangle Perimeter:

$P = 2l + 2b$

Find P *in* m, *given*:

$l = 27.6$ m and $b = 18.3$ m

$P = 2l + 2b$

$= 2 \times 27.6 + 2 \times 18.3$

$A = 91.8$ m

Further Substitution

This sheet is difficult in concept for some students, before it is attempted the previous sheet on 'Substitution' should be completed. This sheet deals with using formulae, but unlike the previous sheet the unknown value is on the RHS not the LHS of the '=' sign. This means that rather than a substitution and solve exercise, it is a substitution, perform an operation (or two) then solve.

The entire sheet is the same in layout, the only difference between questions is that there may be one or two operations to carry out. Below is an example, there is an example at the top of the first column also.

Example - Finding the height of a rectangular prism, given its length and breadth.

Rectangular Prism Volume: $V = lbh$ ← The formula to use is shown here.

Find h in cm, given: ← The unknown that you need to find, and units.

$V = 11\ 730\ cm^3$, $l = 34$ cm and $b = 15$ cm. ← Values to substitute into the formula.

$V = lbh$ ← First step is to write the formula.

$11\ 730 = 34 \times 15 \times h$ ← Substitute all the given values.

$11\ 730 = 510 \times h$ ← Perform calculations to simplify.

$\div 510$ $\div 510$

$23 = h$ ← Get the unknown by itself. In this case we remove the 510 by $\div 510$.

$h = 23$ cm ← Rewrite with the 'letter' on the LHS. Write the units after the value.

Column 1 has support to assist you in solving the questions, as does the first question in Column 2.

Further Substitution

Using formulae may require some manipulation. Solve.

Example

Rectangle Area: $A = lb$

Find b in m, given:

$A = 34.32$ m^2 and $l = 5.2$ m.

$A = lb$ ← Write the formula

$34.32 = 5.2 \times b$ ← Substitute

$\div 5.2$ $\div 5.2$ ← Pronumeral must be by itself. So Remove the × 5.2

$6.6 = b$

$b = 6.6$ m ← Reverse solution

1 Rectangle Area: $A = lb$

Find l in cm, given:

$A = 810$ cm^2 and $b = 22.5$ cm.

$A = lb$

$\square = l \times \square$

$\div$ $\div$

$\square = l$

$l = \square$ cm

2 Square Perimeter: $P = 4l$

Find l in cm, given: $P = 70$ cm

$P = 4l$

$\square = 4 \times l$

$\div$ $\div$

$\square = l$

$l = \square$ cm

3 Area of a Triangle: $A = \frac{1}{2}bh$

Find h in mm, given:

$A = 2\,890$ mm^2 and $b = 68$ mm.

$A = \frac{1}{2}bh$

$\square = \frac{1}{2} \times \square \times h$

$\square = \square \times h$

$\div$ $\div$

$\square = h$

$h = \square$ mm

4 Line : $y = 4x + 2$

Find x, given: $y = -2$.

$-$ $-$

$\div$ $\div$

5 Line : $y = -3x + b$

Find x, given: $y = 13$ & $b = -8$.

6 Speed: $S = \frac{D}{T}$

Find D in km, given:

S = 68 km/h and T = 8.5 h.

7 Force on a Object: $F = ma$

Find m in kg, given:

$F = 548.8$ N and $a = 9.8$ m/s^2.

8 Line : $y = mx + b$

Find x, if $y = 5$, $m = 2$ & $b = -9$

9 Trapezium Area:

$A = \frac{1}{2}(a + b)h$

Find h in cm, given: $a = 41$ cm, $b = 63$ cm and $A = 2\,444$ cm^2.

10 Pythagoras theorem:

$c^2 = a^2 + b^2$

Find b in cm, given:

$a = 28$ cm and $c = 53$ cm.

Further Substitution

Using formulae may require some manipulation. Solve.

Example — Rectangle Area: $A = lb$

Find b in m, given:

$A = 34.32$ m^2 and $l = 5.2$ m.

$A = lb$ ← Write the formula

$34.32 = 5.2 \times b$ ← Substitute

$\div 5.2 \quad \div 5.2$

$6.6 = b$ ← Pronumeral must be by itself. So Remove the × 5.2

$b = 6.6$ m ← Reverse solution

1 Rectangle Area: $A = lb$

Find l in cm, given:

$A = 810$ cm^2 and $b = 22.5$ cm.

$A = lb$

$810 = l \times 22.5$

$\div 22.5 \quad \div 22.5$

$36 = l$

$l = 36$ cm

2 Square Perimeter: $P = 4l$

Find l in cm, given: $P = 70$ cm

$P = 4l$

$70 = 4 \times l$

$\div 4 \quad \div 4$

$17.5 = l$

$l = 17.5$ cm

3 Area of a Triangle: $A = \frac{1}{2}bh$

Find h in mm, given:

$A = 2\,890$ mm^2 and $b = 68$ mm.

$A = \frac{1}{2}bh$

$2\,890 = \frac{1}{2} \times 68 \times h$

$2\,890 = 34 \times h$

$\div 34 \quad \div 34$

$85 = h$

$h = 85$ mm

4 Line : $y = 4x + 2$

Find x, given: $y = -2$.

$y = 4x + 2$

$-2 = 4x + 2$

$-2 \quad -2$

$-4 = 4x$

$\div 4 \quad \div 4$

$-1 = x$

$x = -1$

5 Line : $y = -3x + b$

Find x, given: $y = 13$ & $b = -8$.

$y = -3x + b$

$13 = -3x - 8$

$+8 \quad +8$

$21 = -3x$

$\div -3 \quad \div -3$

$-7 = x$

$x = -7$

6 Speed: $S = \frac{D}{T}$

Find D in km, given:

$S = 68$ km/h and $T = 8.5$ h.

$S = {}^{D}/_{T}$

$68 = \frac{D}{8.5}$

$\times 8.5 \quad \times 8.5$

$578 = D$

$D = 578$ km

7 Force on a Object: $F = ma$

Find m in kg, given:

$F = 548.8$ N and $a = 9.8$ m/s^2.

$F = ma$

$548.8 = m \times 9.8$

$\div 9.8 \quad \div 9.8$

$56 = m$

$m = 56$ kg

8 Line : $y = mx + b$

Find x, if $y = 5$, $m = 2$ & $b = -9$

$y = mx + b$

$5 = 2x - 9$

$+9 \quad +9$

$14 = 2x$

$\div 2 \quad \div 2$

$7 = x$

$x = 7$

9 Trapezium Area:

$A = \frac{1}{2}(a + b)h$

Find h in cm, given: $a = 41$ cm, $b = 63$ cm and $A = 2\,444$ cm^2.

$A = \frac{1}{2}(a + b)h$

$2\,444 = \frac{1}{2} \times (41 + 63) \times h$

$2\,444 = 52 \times h$

$\div 52 \quad \div 52$

$47 = h$

$h = 47$ cm

10 Pythagoras theorem:

$c^2 = a^2 + b^2$

Find b in cm, given:

$a = 28$ cm and $c = 53$ cm.

$c^2 = a^2 + b^2$

$53^2 = 28^2 + b^2$

$2\,809 = 784 + b^2$

$-784 \quad -784$

$2\,025 = b^2$

$b^2 = 2025$

$\sqrt{\ } \quad \sqrt{\ }$

$b = 45$ cm

Inequations

Inequations are just like equations except rather than using an '=' they use <, >, ⩽ and ⩾. The solution to the inequation can be also shown on a number line. Below are some examples of showing your solution on a number line.

Examples

$x < 5$

This number line shows x as all numbers less than 5. Note that the circle on the 5 is hollow, so 5 isn't included. The < sign in $x < 5$ looks like an arrow pointing left, and that is the way the arrow on the number line is graphed, so they match ... look at the inequality symbol like it is an arrow.

$x > -1$

This number line shows x as all numbers greater than -1. Note the arrow and the > (greater than) sign match.

$x \geqslant -1$

This number line shows x as all numbers greater than or equal to -1. Note the arrow and the > still match, but the circle on the -1 is now filled in. This means it is included.

Column 1 starts with graphs that are already drawn, so just write down the inequation, remember the arrow direction and if the circle is filled or hollow. There is a reminder at the top of the column about the arrow and circle use. From Q. 6 you are asked to graph the inequation, try to position the number where the arrow starts in the centre of the graph, look at the arrow direction and fill in the circle if needed.

Column 2 deals with solving 1-step and 2-step inequations. Use the same method as with solving equations, just replace the = sign with an inequality sign. Then graph your result.

Inequations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Give the inequation that is shown in the following graphs.

< If arrow points left and ○
⩽ If arrow points left and ●
> If arrow points right and ○
⩾ If arrow points right and ●

1 
$x \leqslant \square$

2 
3 
4 
5 
Now the opposite, given the inequation ….. graph it.

Write the number near the centre of the graph

6 $x > 7$

7 $x < -2$

8 $x \leqslant 9$

9 $x > -3$

10 $x \geqslant -8$

Solve the inequations and then graph the result.

11 $x + 5 \leqslant 9$
(-5) (-5)
$x \leqslant \square$

12 $x - 7 > -3$
(+7) (+7)

Give the inequation that is shown in the following graphs.

< If arrow points left and ○
⩽ If arrow points left and ●
> If arrow points right and ○
⩾ If arrow points right and ●

1

$x \leqslant 3$

2

$x \geqslant 6$

3

$x > 0$

4

$x < -4$

5

$x \geqslant -2$

Now the opposite, given the inequation ….. graph it.

Write the number near the centre of the graph

6 $x > 7$

7 $x < -2$

8 $x \leqslant 9$

9 $x > -3$

10 $x \geqslant -8$

Solve the inequations and then graph the result.

11 $x + 5 \leqslant 9$

(-5) (-5)

$x \leqslant 4$

12 $x - 7 > -3$

(+7) (+7)

$x > 4$

$3x \leqslant -33$

(÷3) (÷3)

$x \leqslant -11$

Expand and then solve

Further Inequations

This sheet deals inequations with a negative coefficient. What does that mean? It means that the number in front of the x now has a negative sign. So you divide or multiply by -1 and it changes the sign. Except with inequations when you multiply or divide by a negative number, the direction of the inequality symbol is reversed. It points the opposite direction.

Example - Solve and then graph the inequation

$20 - 2x > 8$ ← Solve. First remove the constant, 20.

$-20 \quad -20$

$-2x > -12$ ← Then divide by -2 to get x by itself.

$\div -2 \quad \div -2$

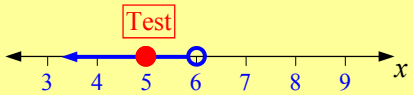
$x < 6$ ← Because you have divided by a negative number (-2) the inequality is reversed.

While the above isn't a huge earth shattering piece of information, it is easy to forget. You are busy following the process of solving the equation and forget to reverse the sign. In a test especially, it makes sense to check your answer and this is performed by using a test point.

In the graph above it includes all values to the left of 6, so pick a number to the left of the 6 and substitute it into the inequation, if the substitution is correct, then the direction of your 'arrow' is also correct. This test process features in Column 3 of the worksheet.

Example - Testing a Point

Note that 5 is to the left of 6, (on the arrow) so substitute 5 and check that the inequation is satisfied.



$20 - 2x > 8$ ← Rewrite the original inequation.

$20 - 2 \times 5 > 8$ ← Replace x with the test point, in this case, 5.

$10 > 8$ ← Perform the calculation

$\therefore$ Correct ← 10 is greater than 8, so you are correct. If you obtain a false statement then your arrow direction or your inequation solution are incorrect.

Further Inequations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Changing the sign of the variable reverses the direction of the inequality symbols. Rewrite, then plot on the number line.

1 $-x \leqslant -5 \longrightarrow x \geqslant \square$

x

$3(-8 - 4) \geqslant 5(-8)$

$-36 \geqslant -40$

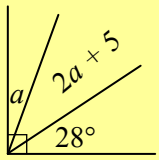
$\therefore$ Correct

For 17:

Application of Equations

This sheet uses equations to solve questions involving angles, perimeter, area and number operations. Below is an example of the use of equations.

Example Finding the unknown angles.



$a + 2a + 5 + 28 = 90$ ← All the angles add to give a right angle, which is 90°. So add all angles, then '= 90'.

$3a + 33 = 90$ ← Gather like terms.

$-33 \quad -33$

$3a = 57$ ← Solve. First remove constant.

$\div 3 \quad \div 3$

$a = 19°$ ← Then remove the coefficient.

Note that this doesn't answer the question. One angle is 'a' so it is 19°, but there is another angle '$2a + 5$'. You need to substitute $a = 19$, to calculate this angle.

$2a + 5 = 2 \times 19 + 5$

$2a + 5 = 43°$

Questions vary but the method of solution is the same process. Note that you can perform a check to make sure your solution is correct. For the above: $a = 19°$, $2a + 5 = 43°$, so add the angles and they should total 90°.

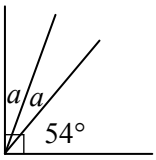
$19 + 43 + 28 = 90$

Application of Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use your equation skills to solve for the missing angles.

Example



$2a + 54 = 90$

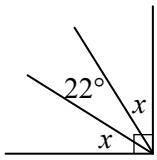
$-54 \quad -54$

$2a = 36$

$\div 2 \quad \div 2$

$a = 18°$

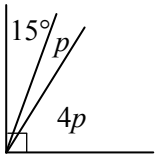
1



$-22 \quad -22$

$\div 2 \quad \div 2$

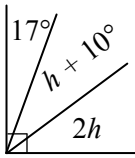
2



$4p = 4 \times \square = \square$

3

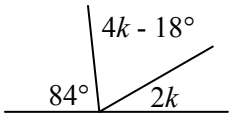
$\square + \square + \square = \square$



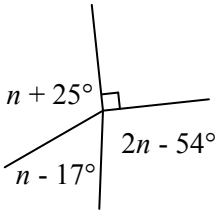
$2h = 2 \times \square = \square$

$h + 10 = \square + 10 = \square$

4



5



How old are these people? Use equations to solve.

6 Jane is 'x' years old. Dan is twice as old as Jane, Pete is 4 years older than Dan. Find the age of each person if together their ages total 89 years.

$x + 2x + 2x + 4 = 89$

Jane is $\square$ years old

Dan $= 2 \times \square$

Dan is $\square$ years old

Pete $= \square + 4$

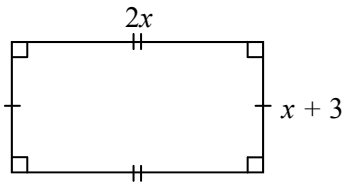
Pete is $\square$ years old

7 Joe is 4 years older than Tom. Dave is twice as old as Joe. Their ages add to 120 years. Find the age of each person.

The equation above should feature brackets

Given the perimeter or area, find the unknown side lengths.

8 Perimeter = 72 cm



$\square + \square + \square + \square = 72$

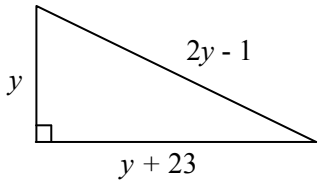
$2x = 2 \times \square$

$2x = \square$ cm

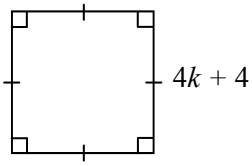
$x + 3 = \square + 3$

$x + 3 = \square$ cm

9 Perimeter = 154 mm



10 Area = 256 cm^2

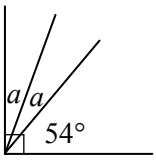


Application of Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use your equation skills to solve for the missing angles.

Example



$2a + 54 = 90$

$-54 \quad -54$

$2a = 36$

$\div 2 \quad \div 2$

$a = 18°$

1

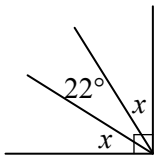
$2x + 22 = 90$

$-22 \quad -22$

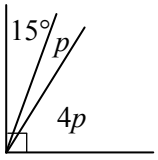
$2x = 68$

$\div 2 \quad \div 2$

$x = 34°$



2



$5p + 15 = 90$

$-15 \quad -15$

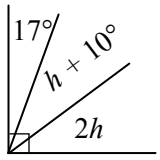
$5p = 75$

$\div 5 \quad \div 5$

$p = 15°$

$4p = 4 \times \boxed{15} = \boxed{60°}$

3 $\boxed{17} + \boxed{h + 10} + \boxed{2h} = \boxed{90}$



$3h + 27 = 90$

$-27 \quad -27$

$3h = 63$

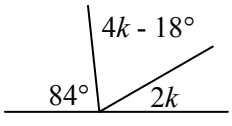
$\div 3 \quad \div 3$

$h = 21°$

$2h = 2 \times \boxed{21} = \boxed{42°}$

$h + 10 = \boxed{21} + 10 = \boxed{31°}$

4 $84 + 4k - 18 + 2k = 180$



$6k + 66 = 180$

$-66 \quad -66$

$6k = 114$

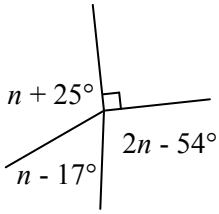
$\div 6 \quad \div 6$

$k = 19°$

$4k - 18 = 4 \times 19 - 18 = 58°$

$2k = 2 \times 19 = 38°$

5 $n + 25 + n - 17 + 2n - 54 + 90 = 360$



$4n + 44 = 360$

$-44 \quad -44$

$4n = 316$

$\div 4 \quad \div 4$

$n = 79°$

$n + 25 = 79 + 25 = 104°$

$n - 17 = 79 - 17 = 62°$

$2n - 54 = 2 \times 79 - 54 = 104°$

How old are these people? Use equations to solve.

6 Jane is 'x' years old. Dan is twice as old as Jane, Pete is 4 years older than Dan. Find the age of each person if together their ages total 89 years.

$x + 2x + 2x + 4 = 89$

$5x + 4 = 89$

$-4 \quad -4$

$5x = 85$

$\div 5 \quad \div 5$

$x = 17$

Jane is $\boxed{17}$ years old

Dan $= 2 \times \boxed{17}$

Dan is $\boxed{34}$ years old

Pete $= \boxed{34} + 4$

Pete is $\boxed{38}$ years old

7 Joe is 4 years older than Tom. Dave is twice as old as Joe. Their ages add to 120 years. Find the age of each person.

$t + t + 4 + 2(t + 4) = 120$

The equation above should feature brackets

$t + t + 4 + 2t + 8 = 120$

$4t + 12 = 120$

$-12 \quad -12$

$4t = 108$

$\div 4 \quad \div 4$

$t = 27$

Tom is 27 years old

Joe $= 27 + 4$

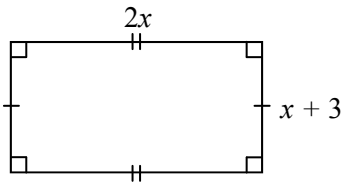
Joe is 31 years old

Dave $= 2 \times 31$

Dave is 62 years old

Given the perimeter or area, find the unknown side lengths.

8 Perimeter = 72 cm



$\boxed{2x} + \boxed{x + 3} + \boxed{2x} + \boxed{x + 3} = 72$

$6x + 6 = 72$

$-6 \quad -6$

$6x = 66$

$\div 6 \quad \div 6$

$x = 11$

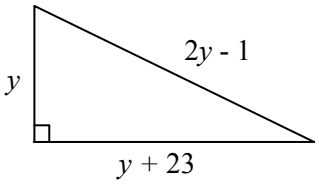
$2x = 2 \times \boxed{11}$

$2x = \boxed{22}$ cm

$x + 3 = \boxed{11} + 3$

$x + 3 = \boxed{14}$ cm

9 Perimeter = 154 mm



$y + y + 23 + 2y - 1 = 154$

$4y + 22 = 154$

$-22 \quad -22$

$4y = 132$

$\div 4 \quad \div 4$

$y = 33$ cm

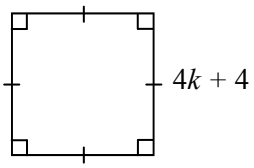
$y + 23 = 33 + 23$

$y + 22 = 56$ cm

$2y - 1 = 2 \times 33 - 1$

$2y - 1 = 65$ cm

10 Area = 256 cm^2



$4k + 4 = \sqrt{256}$

$4k + 4 = 16$

$-4 \quad -4$

$4k = 12$

$\div 4 \quad \div 4$

$k = 3$

$4k + 4 = 4 \times 3 + 4$

$4k + 4 = 16$ cm

Equations & Inequations - Find a Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don’t colour it in too dark (using a texta for example) so that you can still read it.

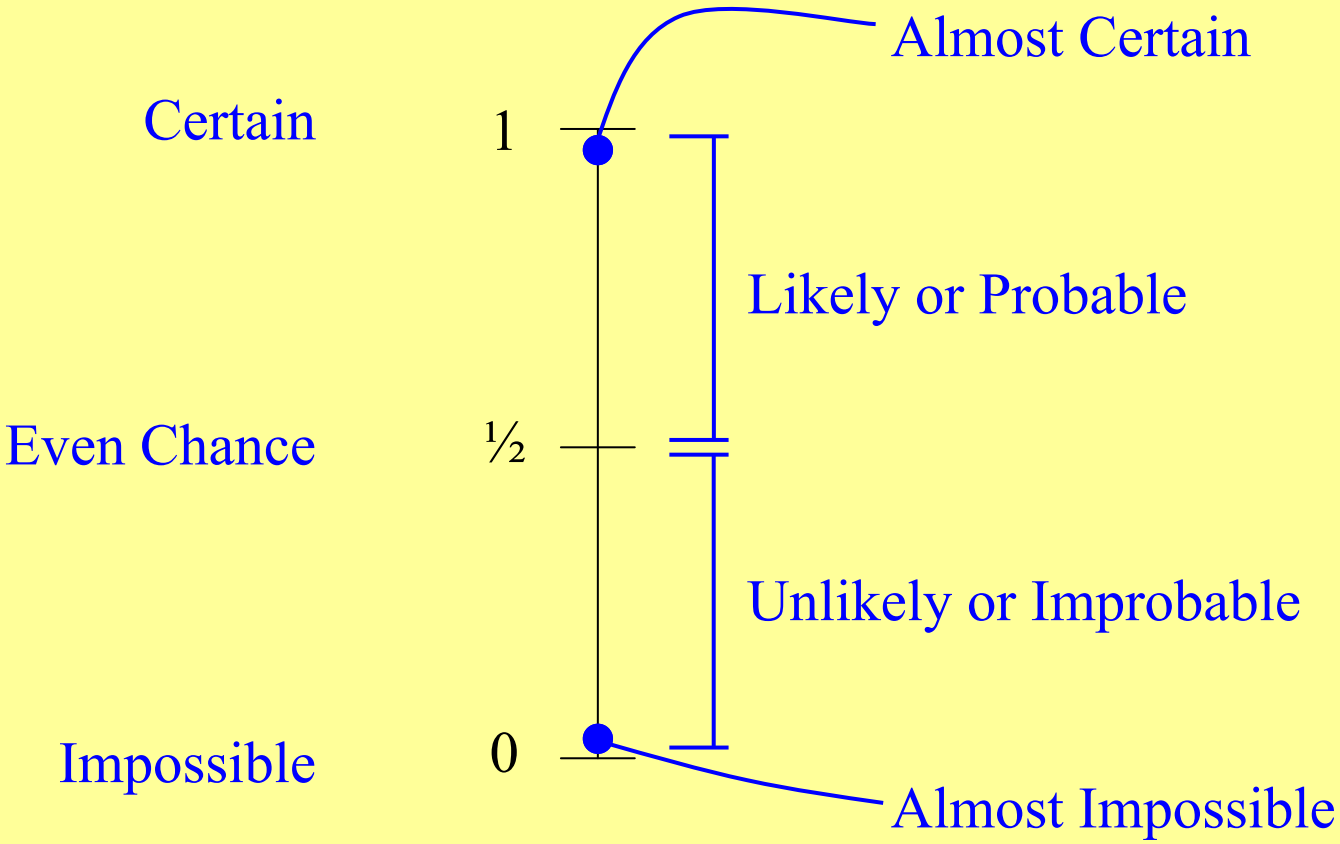
ALTITUDE

PROBABILITY

The Language of Chance

The chance of something happening, or the probability of something happening….means the same thing. In Mathematics the measurement of chance can be through the use of numbers, but also the use of words.

Probability varies from zero to one (0 → 1), or 0% to 100% if percentages are used. But what if you can't describe something exactly, if there are no numbers to base your answer on? Then you need to use words instead. Look at the probability scale below, which shows where these words occur.



So an event that is certain has a probability of 1, an event that is impossible has a probability of 0. An even chance has a probability of ½.

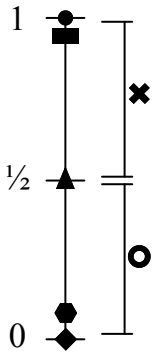
When something is almost certain it is extremely close to1, and when an event is almost impossible is almost 0. To the right of the scale are the two ranges of likely (above an even chance but not certain) and unlikely (below an even chance but not impossible).

The Language of Chance

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Place the appropriate word that matches the shape in the probability scale.

Use this word list for the symbols: Impossible, likely, unlikely, even chance, certain, highly unlikely and almost certain.



1 ● = _____

2 ▲ = _____

3 ◆ = _____

4 ⬢ = _____

5 ○ = _____

6 ▬ = _____

7 ✖ = _____

Place the question numbers on the probability scale below, where you think they go.

8 The rolling of a number less than 3 with a fair die.

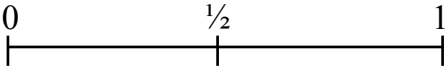
9 Selecting a red card from a deck of cards

10 The chance of buying one ticket and winning the lottery.

11 Selecting a number card from a deck of cards

12 Rolling a die and getting a number less than 7

Place numbers below the scale



Explain the meaning of an event having ...

13 A Probability of 1.

_____

_____

14 A Probability of ½.

_____

_____

15 A Probability of 0.

_____

_____

Using a bag of marbles that contains either blue or green marbles, or a mix of both, describe an event that is ….

16 Almost impossible.

_____

_____

_____

17 An even chance.

_____

_____

_____

18 Certain. _____

_____

_____

19 Impossible.

_____

_____

_____

Draw a line between the word and its match.

20

Certain	Even Chance
Likely	Impossible
Should Happen	50/50 Chance
Almost Impossible	Has to happen
Cannot happen	Highly Unlikely

Use the words above to answer these sentences.

21 The chance you will celebrate your 53rd birthday tomorrow. _____

22 The chance you will use your eraser today. _____

23 The chance you will loan money to the person seated closest to you. _____

24 The chance you will answer this question with your non-writing hand. _____

25 The chance the next baby born at the local hospital will be a boy. _____

26 The chance the next birth at your local hospital will be triplets. _____

27 The chance of reading this question while patting a live mammoth. _____

28 The chance of tossing a coin and getting a head or a tail.

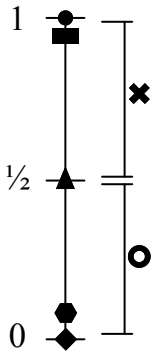
_____

The Language of Chance

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Place the appropriate word that matches the shape in the probability scale.

Use this word list for the symbols: Impossible, likely, unlikely, even chance, certain, highly unlikely and almost certain.



1 ● = Certain

2 ▲ = Even Chance

3 ◆ = Impossible

4 ⬢ = Highly Unlikely

5 ○ = Unlikely

6 ▬ = Almost Certain

7 ✖ = Likely

Place the question numbers on the probability scale below, where you think they go.

8 The rolling of a number less than 3 with a fair die.

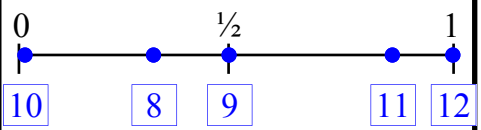
9 Selecting a red card from a deck of cards

10 The chance of buying one ticket and winning the lottery.

11 Selecting a number card from a deck of cards

12 Rolling a die and getting a number less than 7

Place numbers below the scale



10 8 9 11 12

Explain the meaning of an event having ...

13 A Probability of 1.

The event has to happen, it is certain.

14 A Probability of ½.

The event has an equal chance of happening or not happening.

15 A Probability of 0.

The event cannot happen, it is impossible.

Using a bag of marbles that contains either blue or green marbles, or a mix of both, describe an event that is ….

16 Almost impossible.

Selecting a blue marble from a bag that contains 1 000 green marbles and 1 blue marble.

17 An even chance.

Selecting a green marble from a bag that contains 5 green and 5 blue marbles.

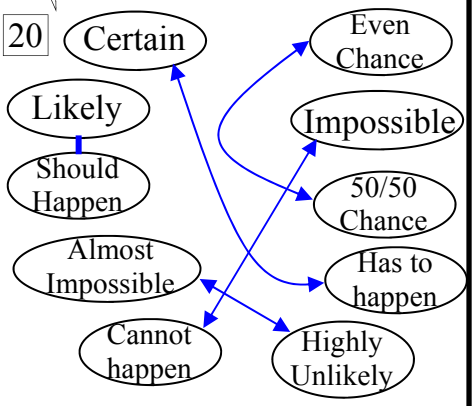
18 Certain. Selecting a green marble from a bag that only contains green marbles.

19 Impossible.

Selecting a blue marble from a bag that contains only green marbles.

Draw a line between the word and its match.

20



Use the words above to answer these sentences.

21 The chance you will celebrate your 53rd birthday tomorrow. Impossible. (student)

22 The chance you will use your eraser today. Likely.

23 The chance you will loan money to the person seated closest to you. Answer will vary

24 The chance you will answer this question with your non-writing hand. Highly unlikely? or certain

25 The chance the next baby born at the local hospital will be a boy. Even chance.

26 The chance the next birth at your local hospital will be triplets. Highly unlikely.

27 The chance of reading this question while patting a live mammoth. Impossible.

28 The chance of tossing a coin and getting a head or a tail. Certain.

Sample Space and Theoretical Probability

Sample space is a list of all the possible outcomes for an event. The sample space is normally listed using braces and commas, eg. Sample space of a coin = {H, T} or {Head, Tail}.
So look at all the outcomes and list them. If one outcome could happen twice then list it twice.

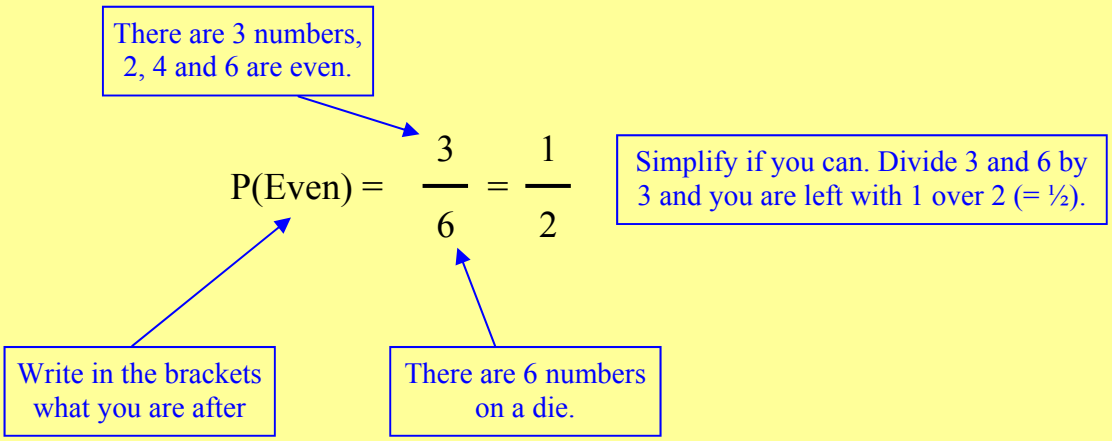
Theoretical probability is the theoretical chance of an event occurring it is found by:

$$P(E) = \frac{\text{Number of favourable outcomes}}{\text{Total number of outcomes}}$$

If the above is a bit confusing then think of it as:

$$P(E) = \frac{\text{How many of what you are after}}{\text{Size of sample space}}$$

Example - Find the probability of rolling an even number with a die.



Column 1 starts with finding the sample space. Write 'Sample Space = {' then list all the possibilities, separated by commas. At the bottom of column 1 is a few questions on simplifying. To answer these put the fraction into your calculator and press '=' or divide the top and bottom (numerator and denominator) by the largest number that goes into both, (HCF).

Column 2 and 3 are all probability questions. Remember to write what you are looking for in the brackets, then write the fraction and simplify if possible. Question 28 is a little tricky, see how you go.

Sample Space and Theoretical Probability

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

List the sample space for the following.

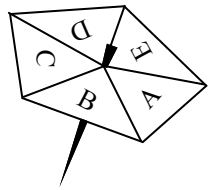
1 A coin.

Sample Space is { _____ }

2 A die.

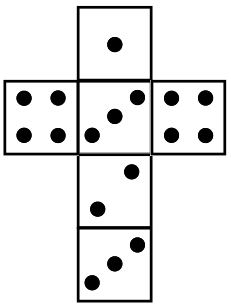
Sample Space is { _____ }

3 The spinner shown.



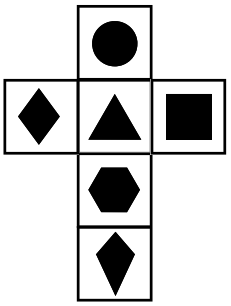
_____

4 The dice with nets shown.



_____

5



_____

_____

_____

Simplify these fractions.

6 $\frac{5}{20} = \frac{\square}{\square}$

7 $\frac{18}{24} = \frac{\square}{\square}$

8 $\frac{45}{75} = \frac{\square}{\square}$

9 $\frac{32}{48} = \frac{\square}{\square}$

Find the probability for these events.

A hat contains 3 blue marbles, 7 red and 6 green marbles. Find the probability (simplify) of selecting a:

10 Green marble P(G) = _____

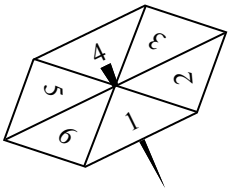
11 Blue marble _____

12 Black marble _____

13 Red or blue marble

_____

The spinner below is numbered 1 through 6. If the spinner is spun once find the probability of spinning:



14 An even number

_____

15 A number less than 5

_____

16 Spinning a factor of 8

_____

17 Not spinning a 2

_____

A standard deck of cards has 4 suits with 13 cards in each suit. There are no jokers included. For a standard deck of cards, find the probability (simplify your answer) of selecting a:

18 Black card _____

19 King _____

20 Red Ace or a 2 or 3 from any suite

_____

A lottery has 60 tickets, numbered 1 to 60. If a single ticket is selected, calculate the probability that the selected ticket will be a number that:

21 Is less than 20 _____

22 Is a single digit number

_____

23 Is a multiple of 7

_____

24 Has at least one 5 as a digit

_____

A carnival dart throwing stall gives a prize if more than 20 points are scored from 3 throws. If David's first 2 throws total 12 points. Calculate the probability of him winning with his last throw. The dart board is as below.

Carnival Dart Board

5	2	10	4	8	9
10	3	7	3	9	8
3	10	2	5	5	10
8	5	8	7	9	3
2	5	9	10	2	9
9	8	2	5	10	7

25 _____

From a deck of cards (no jokers) calculate the probability of selecting:

26 A card that isn't red or a picture card.

_____

27 A black king or a 'spades' card.

_____

A bag contains 6 red discs, 3 yellow discs and an unknown number of black discs. The probability of selecting a red disc is 2/5 how many black discs are in the bag?

28 _____

Sample Space and Theoretical Probability

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

List the sample space for the following.

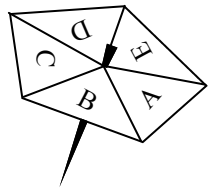
1 A coin.

Sample Space is { H, T. }

2 A die.

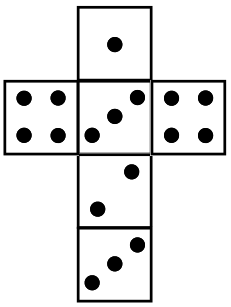
Sample Space is { 1, 2, 3, 4, 5, 6. }

3 The spinner shown.



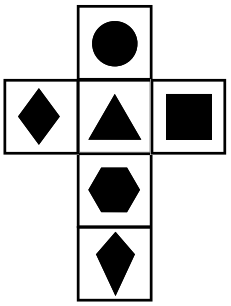
Sample space is {A, B, C, D, E}

4 The dice with nets shown.



Sample space is {1, 2, 3, 3, 4, 4}

5



Sample space is {Circle, Kite, Square, Triangle, Hexagon, Rhombus or diamond}

Simplify these fractions.

6 $\frac{5}{20} = \frac{1}{4}$

7 $\frac{18}{24} = \frac{3}{4}$

8 $\frac{45}{75} = \frac{3}{5}$

9 $\frac{32}{48} = \frac{2}{3}$

Find the probability for these events.

A hat contains 3 blue marbles, 7 red and 6 green marbles. Find the probability (simplify) of selecting a:

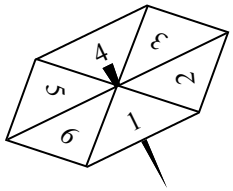
10 Green marble $P(G) = \frac{6}{16} = \frac{3}{8}$

11 Blue marble $P(B) = \frac{3}{16}$

12 Black marble $P(\text{Black}) = 0$

13 Red or blue marble $P(\text{Red, Blue}) = \frac{10}{16} = \frac{5}{8}$

The spinner below is numbered 1 through 6. If the spinner is spun once find the probability of spinning:



14 An even number $P(\text{Even}) = \frac{3}{6} = \frac{1}{2}$

15 A number less than 5 $P(<5) = \frac{4}{6} = \frac{2}{3}$

16 Spinning a factor of 8 $P(\text{Factor of 8}) = \frac{3}{6} = \frac{1}{2}$

17 Not spinning a 2 $P(\widetilde{2}) = \frac{5}{6}$

A standard deck of cards has 4 suits with 13 cards in each suit. There are no jokers included. For a standard deck of cards, find the probability (simplify your answer) of selecting a:

18 Black card $P(\text{Black}) = \frac{1}{2}$

19 King $P(\text{King}) = \frac{4}{52} = \frac{1}{13}$

20 Red Ace or a 2 or 3 from any suite $P(\text{R.Ace, 2, 3}) = \frac{10}{52} = \frac{5}{26}$

A lottery has 60 tickets, numbered 1 to 60. If a single ticket is selected, calculate the probability that the selected ticket will be a number that:

21 Is less than 20 $P(<20) = \frac{19}{60}$

22 Is a single digit number $P(<10) = \frac{9}{60} = \frac{3}{20}$

23 Is a multiple of 7 $P(\text{Multiple of 7}) = \frac{8}{60} = \frac{2}{15}$

24 Has at least one 5 as a digit $P(\text{5 as a digit}) = \frac{15}{60} = \frac{1}{4}$

A carnival dart throwing stall gives a prize if more than 20 points are scored from 3 throws. If David's first 2 throws total 12 points. Calculate the probability of him winning with his last throw. The dart board is as below.

Carnival Dart Board

5	2	(10)	4	8	(9)
(10)	3	7	3	(9)	8
3	(10)	2	5	5	(10)
8	5	8	7	(9)	3
2	5	(9)	(10)	2	(9)
(9)	8	2	5	(10)	7

25 $P(\text{9 or more}) = \frac{12}{36} = \frac{1}{3}$

From a deck of cards (no jokers) calculate the probability of selecting:

26 A card that isn't red or a picture card. $P(\text{Not Red or Pic}) = \frac{20}{52} = \frac{5}{13}$

27 A black king or a 'spades' card. $P(\text{B.King or Spades}) = \frac{14}{52} = \frac{7}{26}$

A bag contains 6 red discs, 3 yellow discs and an unknown number of black discs. The probability of selecting a red disc is 2/5 how many black discs are in the bag?

28 $\frac{2}{5} = \frac{6}{x}$ 15 - 6 - 3 = 6 black

Theoretical Probability - Sheet 2

19 Find P(Number < 10) _____

20 Find P(Number > 5) _____

21 Find P(Multiple of 3) _____

Now use the grid to find the following.

22 If the two dice were rolled 108 times how many times would you expect to roll a total of 7?

_____

23 If the two dice were rolled 300 times how many times would you expect to roll a total of 4?

_____

If the two dice were rolled 1 000 times how many times would you expect to roll a total that was….

24 A multiple of 4? _____

25 10 or more? _____

_____

Theoretical Probability - Sheet 2

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Complete the table for the tossing of two coins. Then answer the questions.

Coin 1

Coin 2	Head	Tail
Head	(Head, Head)	(Head, Tail)
Tail	(Tail, Head)	(Tail, Tail)

1 How many outcomes are possible? 4

2 Find P(T,T) $\frac{1}{4}$ 3 Find P(H,H) $\frac{1}{4}$

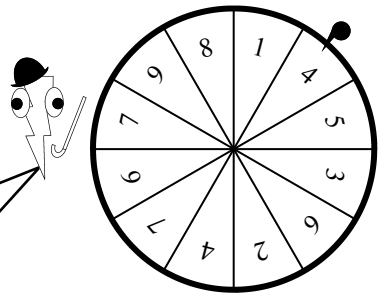
4 Find P(H,T) $\frac{1}{4}$ 5 Find P(T,H) $\frac{1}{4}$

If two coins were tossed 100 times, how many times would you expect to get...

6 Two Heads? 25 7 Two Tails? 25

8 A head and a tail in either order? 50

The carnival is in town and Don's wheel is in sideshow alley. It costs $2 to spin, if you spin an even number you get $3, (your $2 + $1), spin an odd number and you lose the $2.



9 List the sample space for the wheel.

Sample space = {1, 2, 3, 4, 4, 5, 6, 6, 7, 7, 8, 9}

10 Find P(Win) and P(Lose). P(Win) = $\frac{6}{12} = \frac{1}{2}$

P(Lose) = $\frac{6}{12} = \frac{1}{2}$

11 Is this a fair bet? Explain how it is or isn't.

It isn't a fair bet because while there is an equal chance of winning and losing, when you win you only gain $1 while losing costs you $2.

12 If the wheel was spun 400 times in a night how much money is Don likely to make?

200 wins will earn Don $400. 200 × 2 = $400

200 losses will cost Don $200 200 × 1 = $200

So he should make about $200. 400 - 200 = $200

The grid below is for the sum of the face numbers of two rolled dice. So it is an addition table. Fill er' up!

Dice 1

Dice 2

+	1	2	3	4	5	6
1	2	3	4	5	6	7
2	3	4	5	6	7	8
3	4	5	6	7	8	9
4	5	6	7	8	9	10
5	6	7	8	9	10	11
6	7	8	9	10	11	12

13 How many outcomes are possible? 36

14 Find P(10) $\frac{3}{36} = \frac{1}{12}$ 15 Find P(3) $\frac{2}{36} = \frac{1}{18}$

16 Find P(7) $\frac{6}{36} = \frac{1}{6}$ 17 Find P(2) $\frac{1}{36}$

18 Find P(Even Number) $\frac{18}{36} = \frac{1}{2}$

19 Find P(Number < 10) $\frac{30}{36} = \frac{5}{6}$

20 Find P(Number > 5) $\frac{26}{36} = \frac{13}{18}$

21 Find P(Multiple of 3) $\frac{12}{36} = \frac{1}{3}$

Now use the grid to find the following.

22 If the two dice were rolled 108 times how many times would you expect to roll a total of 7?

$108 \times \frac{1}{6}$ = 18 times

23 If the two dice were rolled 300 times how many times would you expect to roll a total of 4?

$300 \times \frac{3}{36}$ = 25 times.

If the two dice were rolled 1 000 times how many times would you expect to roll a total that was….

24 A multiple of 4? $1\,000 \times \frac{9}{36}$ = 250 times.

25 10 or more? $1\,000 \times \frac{6}{36}$ = 166⅔

So about 166 times.

Experimental Probability

Experimental probability bases theory on results that are achieved. So if you roll a dice 10 times and you don't roll 'a 6' then the probability of rolling a 6 is P(6) = 0. Of course you know that the chance of rolling 'a 6' isn't zero, but you are acting on the experimental results obtained.

It is important to remember that experimental probability is very dependant upon the size of the sample space. The more you roll the dice, toss the coin or spin the spinner, the more the experimental results will tend towards the theoretical results. But a reduced amount of trials could result in experimental probabilities that suggest unrealistic or inaccurate probabilities.

As experimental probability requires a number of trials, the results are normally displayed in a table. This is a Frequency table but it has an additional column called 'Relative Frequency' or '*r.f.*' for short.

$$r.f. = \frac{\text{frequency for event}}{\text{sum of frequency column}} = \frac{f}{\Sigma f}$$

Colour	f	$r.f.$
Red	35	$\frac{35}{75} = \frac{7}{15}$
Blue	24	$\frac{24}{75} = \frac{8}{25}$
Green	16	$\frac{16}{75}$
	$\Sigma f = 75$	

STEP 2

Make a fraction by writing 'f' over Σf. If you can simplify the fraction, do so.

STEP 1

Add the column and write the total at the bottom of the column where the Σ is shown.

Once you have the relative frequency for each event you can then apply this to the questions. For example the sample space was 75 for the table above. If the sample space was 150 how many people would choose red? 150 is double 75 so you would expect to double the frequency for Red, so 2 × 35 = 70. But using the relative frequency this would be:

Relative frequency → $\frac{7}{15} \times 150 = 70$

New sample space

So if the sample space was 150, Red would occur 70 times….. but would it? Remember that experimental frequency is indicating a probability. It may not happen, but based on the results, this is the most likely outcome. But the result isn't certain.

Experimental Probability

Find the relative frequency (as a fraction) for the traffic results shown in the table.

1 Table: Traffic Type

Vehicle Type	f	$r.f.$
Cars	150	$\frac{150}{210} = \frac{5}{7}$
Trucks	28	$\frac{28}{210} = \frac{2}{15}$
Buses	6	$\frac{6}{210} = \frac{1}{35}$
Motorcycles	3	$\frac{3}{210} = \frac{1}{70}$
Utilities	18	$\frac{18}{210} = \frac{3}{35}$
Vans	5	$\frac{5}{210} = \frac{1}{42}$
	$\Sigma f = 210$	

What is the probability that the next vehicle to pass by would ..

2 Be a truck or a van? $\frac{33}{210} = \frac{11}{70}$

3 Be a bus or a car? $\frac{156}{210} = \frac{26}{35}$

4 Not be a Utility? $\frac{192}{210} = \frac{32}{35}$

If 11 655 vehicles used the street in a week, how many of the vehicles would you expect..

5 To be cars? $\frac{5}{7} \times 11\,655$

$= 8\,325$ cars

6 To be buses? $\frac{1}{35} \times 11\,655$

$= 333$ buses

7 To be trucks or vans?

$\frac{33}{210} \times 11\,655 \approx 1\,831$ vehicles

If 450 cars used the street in a day, estimate how many…..

8 Buses used the street.

$\frac{450}{150} \times 6 = 18$ buses

9 Trucks used the street.

$\frac{450}{150} \times 28 = 84$ trucks

A die is rolled 60 times with the results shown. Place the data into a frequency table, with a relative frequency column ($r.f.$) expressed as a fraction. Then answer the questions.

Data:

53142 23561 33456
61224 43125 54522
36412 53361 32453
41222 52431 42332

Face No.	Tally	f	$r.f.$
1	𝍸 |	8	$\frac{8}{60} = \frac{2}{15}$
2	𝍸 𝍸	15	$\frac{15}{60} = \frac{1}{4}$
3	𝍸 𝍸 |||	13	$\frac{13}{60}$
4	𝍸 ||||	10	$\frac{10}{60} = \frac{1}{6}$
5	𝍸 ||||	9	$\frac{9}{60} = \frac{3}{20}$
6	𝍸	5	$\frac{5}{60} = \frac{1}{12}$
		$\Sigma f = 60$	

Basing your answers from the table, estimate the probability of ….

10 Rolling a 2 or a 6?

$P(2,6) = \frac{20}{60} = \frac{1}{3}$

11 Rolling an even number?

$P(\text{Even}) = \frac{30}{60} = \frac{1}{2}$

12 Not rolling a 5?

$P(\widetilde{5}) = \frac{51}{60}$

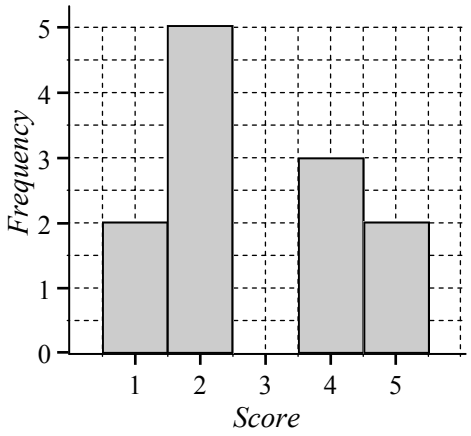
13 Rolling a composite number?

$P(4,6) = \frac{15}{60} = \frac{1}{4}$

14 Would you consider this a fair die? Outline your reasoning.

From the results only no it isn't fair, but a larger sample space is required to effectively indicate whether the die is fair or not.

A spinner numbered 1to 5 is spun with the results shown in the frequency histogram below. Examine the graph then answer the questions.



15 Which spinner number occurred the most? 2

16 How many times was the spinner spun? 12 times

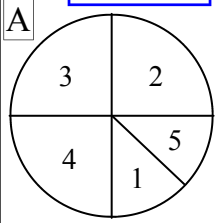
17 Find P(4) $= \frac{3}{12} = \frac{1}{4}$

18 Find P(1) $= \frac{2}{12} = \frac{1}{6}$

19 Find P(3) $= \frac{0}{12} = 0$

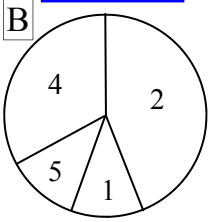
20 2 is too small, 3 is too large

A



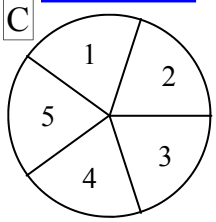
3 still must be featured

B

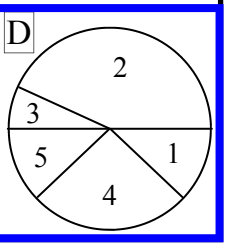


Doesn't allow for results

C



D



Probability Experiment Sheet

This sheet is designed to compare experimental results with theoretical results. There are two sheets as the first sheet has the "Sum of two Dice" grid left blank, the second grid has the numbers filled in, to avoid mistakes if this is an issue. As this is an experiment sheet there are no answers.

Column 1 has a table for recording the tossing of two coins. This requires either 2 different coins so that one is called 'Coin 1' and the other 'Coin 2', or use a single coin and toss it twice. The table has a tally and frequency column to complete, find $\sum f$ at the base of the column to verify the correct number of tosses has occurred. The data can then be transferred to the column graph below the table which has the theoretical results already graphed.

Compare the results and describe how your results related to the theoretical, indicate how the sample space size (the number of times the coins are tossed) affects the results.

Column 2 requires you to roll two dice 72 times. The dice can be rolled at the same time. Once rolled, add the two upper face numbers together to get a total and record the sum in the table using the tally column, converting to a frequency on completion. Again find the two $\sum f$'s and add them to verify that you have rolled the dice 72 times.

Now complete the theoretical probability grid (if blank) by adding the two numbers. You should notice a pattern along the diagonals. Plot the experimental result, then plot the theoretical result by counting all the same numbers in the grid, but because you rolled the dice 72 times then you have to double this number. Use different coloured columns for experimental and theoretical results.

Compare the results and describe how your results related to the theoretical, indicate how the sample space size (the number of times the dice are rolled) affects the results.

Probability Experiment Sheet

Probability with Decimals and Percentages - Non Replacement

Probability can be shown as a fraction but also as a decimal and a percentage. To convert to a decimal calculate the probability as a fraction, and either use the calculator division key, or the fraction key.

Example - Rolling a die and getting a 6, P(6) = $^1/_6$

Using the Fraction key

1 $a^b/_c$ 6 =

Answer on Screen 1⌟ 6

$a^b/_c$

Answer on Screen 0.1666..
Round to 2 decimal places
0.17

Using the Division key

1 ÷ 6 =

Answer on Screen 0.1666..
Round to 2 decimal places
0.17

Faster Method

It also helps you to remember that $a^b/_c$ = ÷

If you are asked to change to a percentage, then multiply the fraction (or decimal) by 100.

Example - Rolling a die and getting a 6, P(6) = $^1/_6$

Using the Fraction key

1 $a^b/_c$ 6 × 1 0 0 =

Answer on Screen 16⌟ 2⌟ 3

$a^b/_c$

Answer on Screen 16.6666...
Round to 1 decimal place
16.7%

Using the Division key

1 ÷ 6 × 1 0 0 =

Answer on Screen 16.6666...
Round to 1 decimal place
16.7%

Faster Method

It also helps you to remember that $a^b/_c$ = ÷

This sheet also includes non-replacement. This is when a selection is made and the sample space is reduced, then another selection is made. If you have 5 cards with 1, 2, 3, 4, and 5 being on separate cards.

Then to select a 3: P(3) = 1/5 = 0.2 (decimal)

If the 3 isn't replaced the sample space is reduced to 4 cards.

Then to select a 5: P(5) = 1/4 = 0.25 (decimal)

So if a card, or cards are removed the sample space reduces and the chance of selecting another card increases because the denominator in the fraction is getting smaller each time.

Probability with Decimals and Percentages - Non Replacement

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

The word IRRESISTIBLE is written with each letter on a card and placed face down on a table. Find the probability, as a percentage of selecting ...

Example

An 'I' $P(I) = \frac{3}{12} \times 100 = 25\%$

Round to 1 decimal place when required

1 An 'E' _____

2 A 'T' _____

3 A vowel

_____

4 An 'I' or 'S' or 'E'

_____

5 If an 'E' was selected and not replaced, find P(T).

_____

If an 'E', 'B' and 'I' were selected and not replaced, find:

6 P(I) _____

7 P(E) _____

8 P(R) _____

9 P(B) _____

If the cards with vowels were removed, find the probability as a decimal (to 2 d.p.) of:

10 P(T) _____

11 P(S) _____

12 P(R, S)

_____

13 P(B, T, L)

_____

Two darts are thrown at the board below, if you get the same number twice, the second dart is removed and re-thrown. If you get 10 points or more, you win a prize.

5	3	2	4
6	1	2	8
5	1	3	7
2	1	2	2

Answer as a percentage Round to 1 d.p. when required

14 If a '4' was scored with the first dart, find P(Win).

_____

15 If a '3' was scored with the first dart, find P(Win).

_____

16 If a '2' was scored with the first dart, find P(Win).

_____

17 If an '8' was scored with the first dart, find P(Lose).

_____

A marble bag contains 4 blue, 7 red, 6 white and 3 green marbles. Find as a decimal to 2 d.p. ……

18 P(Blue) _____

19 P(B, R) _____

20 P(Not White) _____

21 P(Yellow) _____

If a marble was selected from the bag and replaced 32 times, how often would you expect to select a marble that was :

22 Green _____

_____

23 Blue or red _____

_____

If one person is chosen, show the probabilities as a column graph below.

24

Name	Sex	Age
Elizabeth	Female	50
Johan	Male	51
Lars	Male	17
Kristi	Female	8
James	Male	13

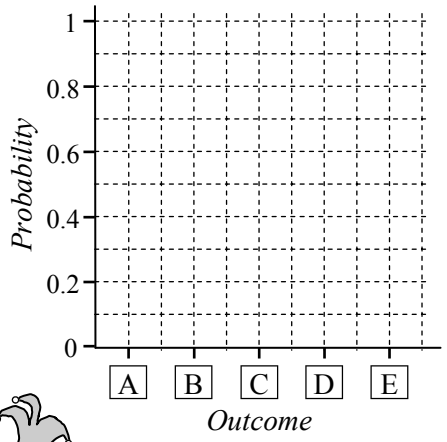
A The person is male

B The person is older than 8 years.

C The person is a teenager.

D The persons name has 2 vowels.

E The person is male or female.



A card is selected from a standard deck (no jokers), express the probability as a percentage (to 1 d.p.).

25 P(King) _____

_____

26 P(J, Q, K , A) _____

_____

27 P(Red Even Number Card)

_____

28 P(10,5,2) if a 10, a 5 and a 7 have been selected/not replaced.

_____

_____

Probability with Decimals and Percentages - Non Replacement

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

The word IRRESISTIBLE is written with each letter on a card and placed face down on a table. Find the probability, as a percentage of selecting ...

Example

An 'I' $P(I) = \frac{3}{12} \times 100 = 25\%$

Round to 1 decimal place when required

1 An 'E' $P(E) = \frac{2}{12} \times 100 = 16.7\%$

2 A 'T' $P(T) = \frac{1}{12} \times 100 = 8.3\%$

3 A vowel

$P(\text{Vowel}) = \frac{5}{12} \times 100 = 41.7\%$

4 An 'I' or 'S' or 'E'

$P(I, S, E) = \frac{7}{12} \times 100 = 58.3\%$

5 If an 'E' was selected and not replaced, find P(T).

$P(T) = \frac{1}{11} \times 100 = 9.1\%$

If an 'E', 'B' and 'I' were selected and not replaced, find:

6 P(I) $P(I) = \frac{2}{9} \times 100 = 22.2\%$

7 P(E) $P(E) = \frac{1}{9} \times 100 = 11.1\%$

8 P(R) $P(R) = \frac{2}{9} \times 100 = 22.2\%$

9 P(B) $P(B) = \frac{0}{9} \times 100 = 0\%$

If the cards with vowels were removed, find the probability as a decimal (to 2 d.p.) of:

10 P(T) $P(T) = \frac{1}{7} = 0.14$

11 P(S) $P(S) = \frac{2}{7} = 0.29$

12 P(R, S)

$P(R, S) = \frac{4}{7} = 0.57$

13 P(B, T, L)

$P(B, T, L) = \frac{3}{7} = 0.43$

Two darts are thrown at the board below, if you get the same number twice, the second dart is removed and re-thrown. If you get 10 points or more, you win a prize.

5	3	2	4
6	1	2	8
5	1	3	7
2	1	2	2

Answer as a percentage Round to 1 d.p. when required

14 If a '4' was scored with the first dart, find P(Win).

$P(\text{Win}) = \frac{3}{15} \times 100 = 20\%$

15 If a '3' was scored with the first dart, find P(Win).

$P(\text{Win}) = \frac{2}{14} \times 100 = 20\%$

16 If a '2' was scored with the first dart, find P(Win).

$P(\text{Win}) = \frac{1}{11} \times 100 = 9.1\%$

17 If an '8' was scored with the first dart, find P(Lose).

$P(\text{Lose}) = \frac{3}{15} \times 100 = 20\%$

A marble bag contains 4 blue, 7 red, 6 white and 3 green marbles. Find as a decimal to 2 d.p. ……

18 P(Blue) $P(\text{Blue}) = \frac{4}{20} = 0.20$

19 P(B, R) $P(B, R) = \frac{11}{20} = 0.55$

20 P(Not White) $= \frac{14}{20} = 0.70$

21 P(Yellow) $P(Y) = \frac{0}{20} = 0$

If a marble was selected from the bag and replaced 32 times, how often would you expect to select a marble that was :

22 Green $P(G) = \frac{3}{20} = 0.15$

$0.15 \times 32 = 4.8 \approx 5$ times

23 Blue or red $P(B, R) = 0.55$

$0.55 \times 32 = 17.6 \approx 18$ times

24 If one person is chosen, show the probabilities as a column graph below.

Name	Sex	Age
Elizabeth	Female	50
Johan	Male	51
Lars	Male	17
Kristi	Female	8
James	Male	13

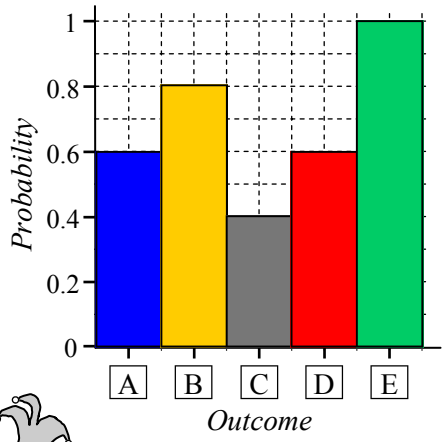
A The person is male

B The person is older than 8 years.

C The person is a teenager.

D The persons name has 2 vowels.

E The person is male or female.



A card is selected from a standard deck (no jokers), express the probability as a percentage (to 1 d.p.).

25 P(King) $P(\text{King}) = \frac{4}{52} \times 100$

$P(\text{King}) = 7.7\%$

26 P(J, Q, K , A)

$P(J, Q, K, A) = \frac{16}{52} \times 100 = 30.8\%$

27 P(Red Even Number Card)

$P(\text{Red/Even}) = \frac{10}{52} \times 100 = 19.2\%$

28 P(10,5,2) if a 10, a 5 and a 7 have been selected/not replaced.

$P(10, 5, 2) = \frac{10}{49} \times 100 = 20.4\%$

Complementary Events

The complement to an event is essentially the opposite to the event. For example the complement to “Rolling a 6 with a die”, would be “Not rolling a 6 with a die”. Note that the probability of rolling a 6 is $^1/_6$ while the probability not of rolling a 6 is $^5/_6$. When you add these probabilities you get a total of 1.

$$P(E) + P(\widetilde{E}) = 1 \qquad (100\%)$$

Percentage

Probability of an event

Complement to the event

Note that the complement is shown with a wavy line. Some examples are below:

$P(\widetilde{6})$ - Probability of not rolling a 6

$P(\widetilde{Car})$ - Probability of the vehicle not being a car

$P(\widetilde{wet\ day})$ - Probability of the day not being wet

$P(\widetilde{King})$ - Probability of not selecting a King

Column 1 starts with sentences that require you to write the complement, this is fairly straight forward, just consider what the opposite is and write that as a sentence. In most cases it just requires one word being changed.

From Q.6. onwards, the questions are probability questions, the only difference being that at times you are finding the complementary event. Just watch for the wavy line and if you see it then just imagine finding the opposite, or ***NOT*** finding what is in the brackets.

Remember to simplify your fraction answers and note that some questions require non-fraction answers. Questions 14 - 19 require percentage answers, while 31 - 35 are decimal answers (or change them to fractions or percentages as the answering method isn’t specified in the question).

Complementary Events

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Write the complement to these events.

1 It will rain all day today.

2 This team has no chance of winning the final.

3 It is unlikely this car will break down.

4 The train is certain to arrive on time.

5 Its likely my next pizza will have mushrooms.

Use complementary events to answer some of these questions.

In the word HYPOTENUSE, find the fraction for:

6 P(Y) = $\frac{\square}{\square}$

7 P($\widetilde{E}$) = $\frac{\square}{\square}$

8 P(vowel) = $\frac{\square}{\square}$

9 P($\widetilde{O,T,E}$) = $\frac{\square}{\square}$

A fund-raising raffle has sold 100 tickets which are numbered 1 to 100, one ticket is chosen, find the probability the ticket:

10 Will be numbered 70 or more. $\frac{\square}{\square}$

11 Won't be 57. $\frac{\square}{\square}$

12 Will have a 5 as its 2nd digit. $\frac{\square}{\square}$

13 Won't end in zero. $\frac{\square}{\square}$

A coffee shop critic finds coffee could be too hot, too cold or perfect. Probability is P(Hot) = 0.3 and P(cold) = 0.06. Find as a percentage:

14 P($\widetilde{Hot}$) = _____

15 P(Perfect) = _____

16 P($\widetilde{Cold}$) = _____

17 P($\widetilde{Perfect}$) = _____

18 P($\widetilde{Cold}$) + P(Cold) = _____

19 P(Perfect) - P($\widetilde{Cold}$) + P(Hot) = _____

The Kings, Queens and Jacks are removed from a deck of cards and placed face down on a table, one card can then be turned over. Find the probability, as a fraction, of :

20 Selecting a Queen. $\frac{\square}{\square}$

21 Selecting a Red King. $\frac{\square}{\square}$

22 Not selecting a Jack or a Red card. $\frac{\square}{\square}$

A fair die is rolled. Find the probability, as a fraction, for the following:

23 P(1, 5) = $\frac{\square}{\square}$

24 P(Odd) = $\frac{\square}{\square}$

25 P(Prime) = $\frac{\square}{\square}$

26 P($\widetilde{<5}$) = $\frac{\square}{\square}$

27 P($\widetilde{0}$) = $\frac{\square}{\square}$ ____

28 P($\widetilde{3}$) - P(3) = $\frac{\square}{\square}$

Peter, Anne, Jerry and Deb are in a foot race. The odds of winning the event are: P(Peter) = 0.1, P(Anne) = 0.27. If Jerry is twice as likely to win when compared with Deb. Find the chance of:

29 Deb winning. _____

30 One of the boys winning. _____

31 Anne not winning. _____

32 Jerry or Anne not winning. _____

33 A hat contains 20 marbles that are blue, red and black. If 6 are blue and P($\widetilde{Black}$) = 3/5, how many red marbles are there?

_____ _____

_____ _____

Complementary Events

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Write the complement to these events.

1 It will rain all day today.

It won't rain at all today.

2 This team has no chance of winning the final.

This team will win the final.

3 It is unlikely this car will break down.

It is likely this car will break down.

4 The train is certain to arrive on time.

The train will not arrive on time.

5 Its likely my next pizza will have mushrooms.

It is unlikely my next pizza will have mushrooms.

Use complementary events to answer some of these questions.

In the word HYPOTENUSE, find the fraction for:

6 P(Y) = $\frac{1}{10}$

7 P($\widetilde{E}$) = $\frac{4}{5}$

8 P(vowel) = $\frac{2}{5}$

9 P($\widetilde{O,T,E}$) = $\frac{6}{10}$

A fund-raising raffle has sold 100 tickets which are numbered 1 to 100, one ticket is chosen, find the probability the ticket:

10 Will be numbered 70 or more. P(>69)= $\frac{31}{100}$

11 Won't be 57. P($\widetilde{57}$)= $\frac{99}{100}$

12 Will have a 5 as its 2nd digit. P(_5) = $\frac{9}{100}$

13 Won't end in zero. P($\widetilde{\text{end 0}}$) = $\frac{90}{100}$

A coffee shop critic finds coffee could be too hot, too cold or perfect. Probability is P(Hot) = 0.3 and P(cold) = 0.06. Find as a percentage:

14 P($\widetilde{\text{Hot}}$) = 70%

15 P(Perfect) = 64%

16 P($\widetilde{\text{Cold}}$) = 94%

17 P($\widetilde{\text{Perfect}}$) = 36%

18 P($\widetilde{\text{Cold}}$) + P(Cold) = 100%

19 P(Perfect) - P($\widetilde{\text{Cold}}$) + P(Hot) = 0%

The Kings, Queens and Jacks are removed from a deck of cards and placed face down on a table, one card can then be turned over. Find the probability, as a fraction, of :

20 Selecting a Queen. P(Q) = $\frac{1}{3}$

21 Selecting a Red King. P(RK)= $\frac{1}{6}$

22 Not selecting a Jack or a Red card. P($\widetilde{\text{J or red}}$) = $\frac{1}{3}$

A fair die is rolled. Find the probability, as a fraction, for the following:

23 P(1, 5) = $\frac{1}{3}$

24 P(Odd) = $\frac{1}{2}$

25 P(Prime) = $\frac{1}{2}$

26 P($\widetilde{<5}$) = $\frac{1}{3}$

27 P($\widetilde{0}$) = $\frac{6}{6}$ = 1

28 P($\widetilde{3}$) - P(3) = $\frac{2}{3}$

Peter, Anne, Jerry and Deb are in a foot race. The odds of winning the event are: P(Peter) = 0.1, P(Anne) = 0.27. If Jerry is twice as likely to win when compared with Deb. Find the chance of:

29 Deb winning. 1 - 0.1 - 0.27 = 0.63

$\frac{0.63}{3}$ = 0.21 P(Deb) = 0.21

30 One of the boys winning. 0.1 + 2×0.21 = 0.52

P(Peter, Jerry) = 0.52

31 Anne not winning. P($\widetilde{A}$) = 1 - 0.27 = 0.73

32 Jerry or Anne not winning. P($\widetilde{J, A}$) = 0.31

33 A hat contains 20 marbles that are blue, red and black. If 6 are blue and P($\widetilde{\text{Black}}$) = 3/5, how many red marbles are there?

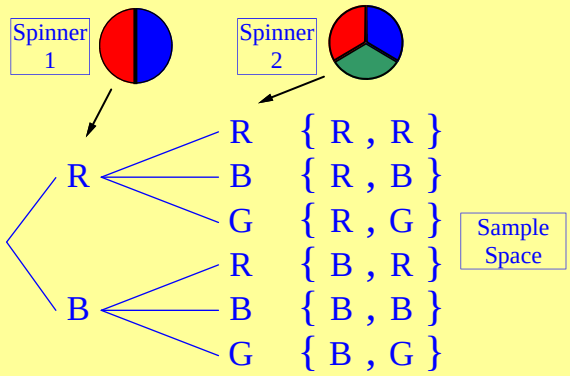
$\frac{3}{5} = \frac{12}{20}$ 20 - 12 = 8 So 8 black marbles.

20 - 6 - 8 = 6 There are 6 red marbles

Multi-Staged Events - Tree diagrams

A tree diagram can be used to show a multi-staged event, which is an event that has more than one event within it. For example, rolling a die and tossing a coin has two events. A tree diagram displays the process graphically allowing you to construct a sample space for all the outcomes for the event.

Example - Spinning two spinners.



The tree diagram shows the first spinner with two options, either red or blue. Note that Spinner 2 has been shown twice, it has been shown the first time if a red is spun on Spinner 1, it has been shown a second time if a blue was spun on Spinner 1.

The sample space is then shown, by following the tree's branches in a path.

Column 1 has the trees constructed for you, you just have to put in all the outcomes and then list the sample space. The first question is for the rolling of a die and tossing of a coin. The second question is for spinning two spinners, after you list the sample space it might be easier to add the two numbers and write the sum to the right of each pair, it will help you to answer the questions below the tree diagram.

Column 2 and 3 ask you to draw up your own trees and list the sample space. Remember to show the outcome at the end of each branch and when you list the sample space make sure you use braces {} and a comma , to display them. Question 19 has a three stage event on the tossing of three coins, so give your self room when drawing the tree.

Multi-Staged Events - Tree diagrams

19

Tree Diagram: T → T, H; H → T, H; T → T, H; H → T, H; T → T, H; H → T, H; T → T, H; H → T, H

Sample Space: {T, T, T}, {T, T, H}, {T, H, T}, {T, H, H}, {H, T, T}, {H, T, H}, {H, H, T}, {H, H, H}

20 How many outcomes are there? 8 Outcomes

21 Find P(H, T, H) = $\frac{1}{8}$

22 Find P(At least 2 tails) = $\frac{1}{2}$

23 Find P(Heads) = $\frac{1}{8}$

24 P(H & 2T) any order = $\frac{3}{8}$

25 Find P(3H or 3T) = $\frac{1}{4}$

Probability - Find A Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don’t colour it in too dark (using a texta for example) so that you can still read it.

REVIEW:
GEOMETRY

Bisecting an Interval

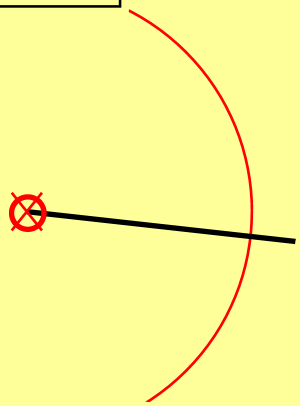
Bisecting something is cutting it into two equal pieces. This sheet deals with bisecting intervals. An interval is a straight line but instead of going on forever it has specific length. The intervals on this sheet have markers at their ends for you to position instruments more effectively.

Column 1 starts with asking you to bisect these five intervals with a ruler. Measure the length of the interval, write your answer in the space, give the answer in mm. Divide this number by 2 and write that answer in the ‘half length’ space. Mark off half-way with a small stroke.

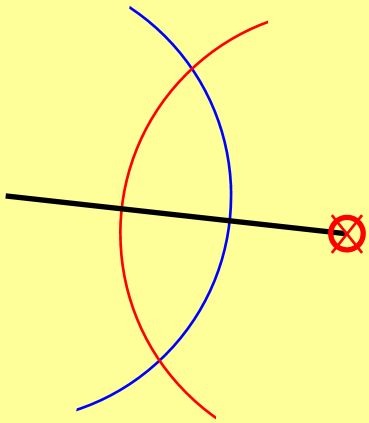
Questions 6 through 10 involve the same 60 mm interval, the questions ask you to break the interval up into a specific number of parts. Divide 60 by the number of parts required in the question and that is the measured gap required between 'marks'.

Columns 2 and 3 are the same, it is asking you to bisect the given intervals using a compass. Below is the process outlined step-by-step.

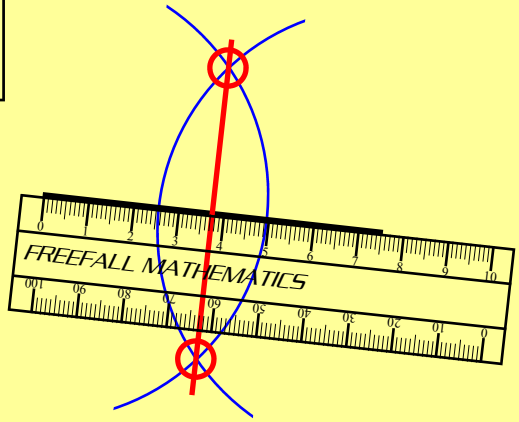
1 Draw an arc from one end of the interval (red circle). Open the compass more than half the interval’s length.



2 Repeat for the other end of the interval. Keep the compass set at the same distance.



3 Draw a line through the two intersection points (red circles). Use a ruler to measure the lengths as a check.



Bisecting an Interval

Using your ruler, measure then bisect these intervals

1 Interval length : _____

Half length : _____

2 Interval length : _____

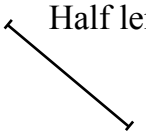
Half length : _____

3 Interval length : _____

Half length : _____

4 Interval length : _____

Half length : _____



5 Interval length : _____

Half length : _____

Divide the 60 mm intervals into 3, 4, 5, 6 and 10 parts

6 3 parts, interval = _____ mm

7 4 parts, interval = _____ mm

8 5 parts, interval = _____ mm

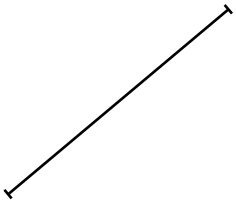
9 6 parts, interval = _____ mm

10 10 parts, interval = _____ mm

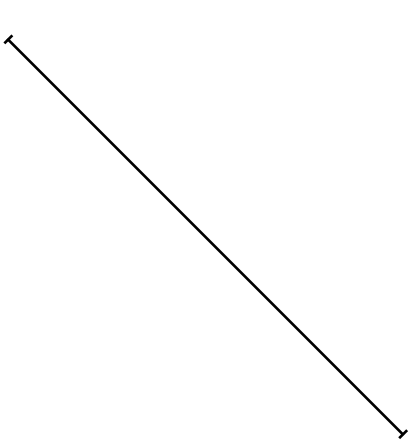
Use a compass to bisect these intervals. Give the measurement from one end to the midpoint (cm)

11 Half length : _____

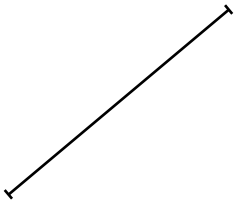
12 Half length : _____



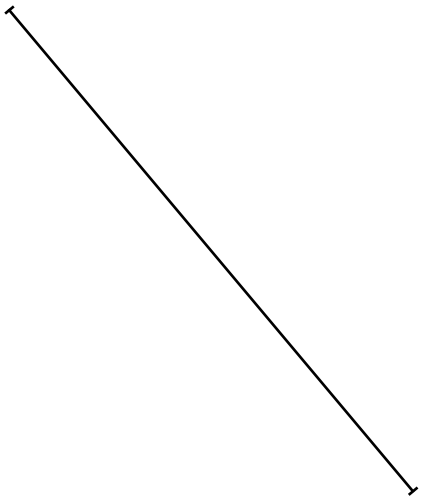
13 Half length : _____



14 Half length : _____



15 Half length : _____



16 Half length : _____

Bisecting an Interval

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Using your ruler, measure then bisect these intervals

1 Interval length : 60 mm

Half length : 30 mm

2 Interval length : 48 mm

Half length : 24 mm

3 Interval length : 36 mm

Half length : 18 mm

4 Interval length : 21 mm

Half length : 10.5 mm

5 Interval length : 42 mm

Half length : 21 mm

Divide the 60 mm intervals into 3, 4, 5, 6 and 10 parts

6 3 parts, interval = 20 mm

7 4 parts, interval = 15 mm

8 5 parts, interval = 12 mm

9 6 parts, interval = 10 mm

10 10 parts, interval = 6 mm

Use a compass to bisect these intervals. Give the measurement from one end to the midpoint (cm)

11 Half length : 2.8 cm

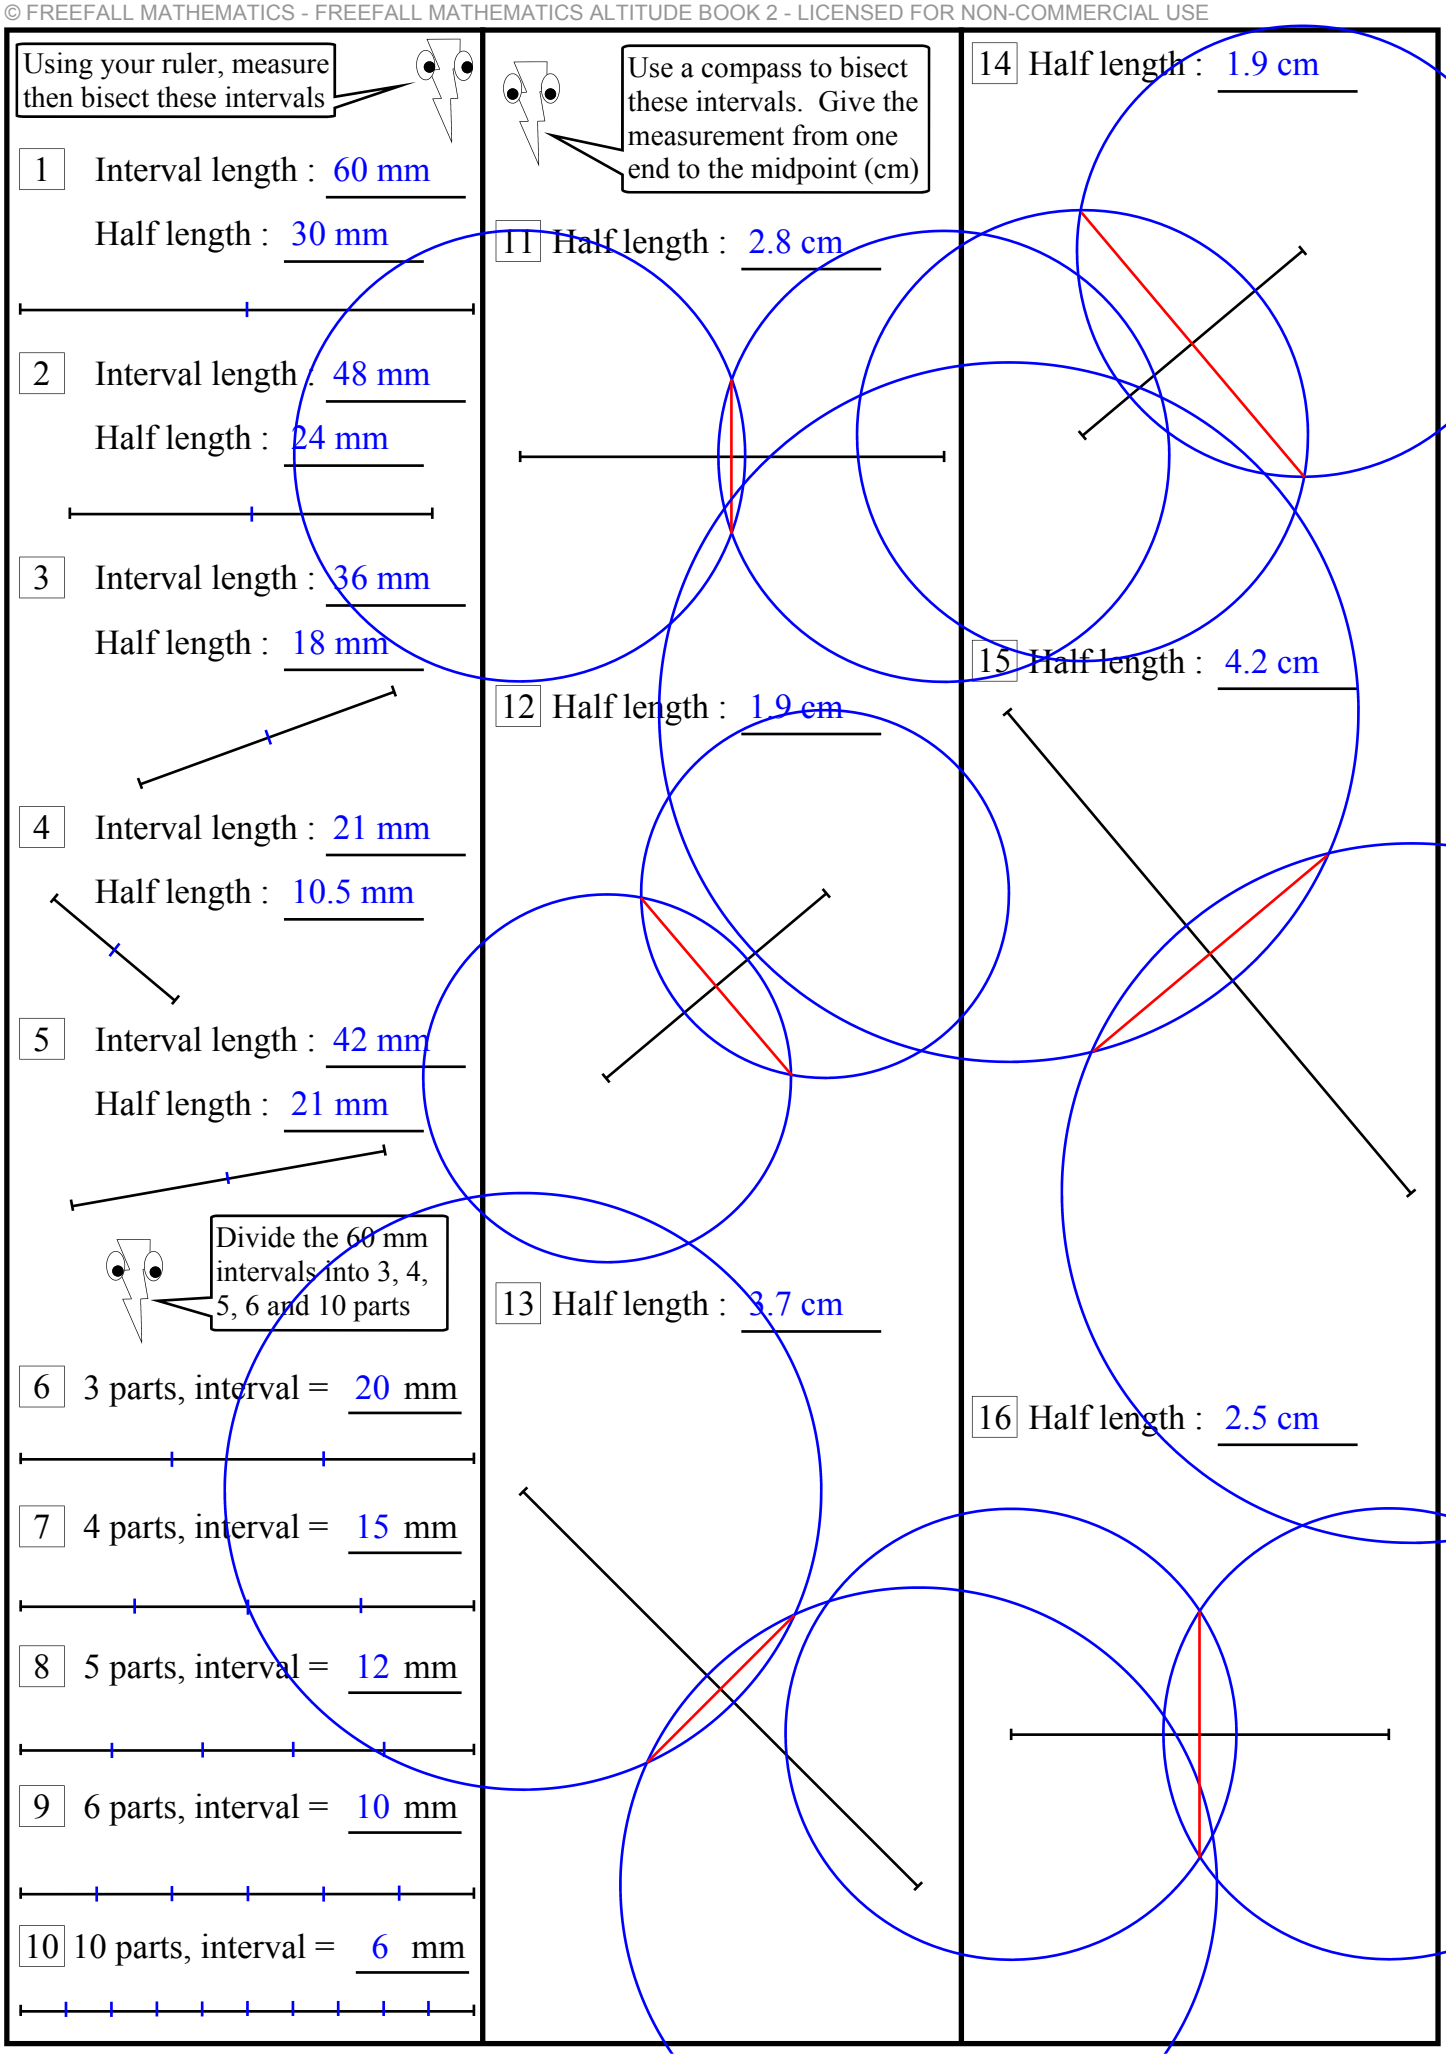
12 Half length : 1.9 cm

13 Half length : 3.7 cm

14 Half length : 1.9 cm

15 Half length : 4.2 cm

16 Half length : 2.5 cm

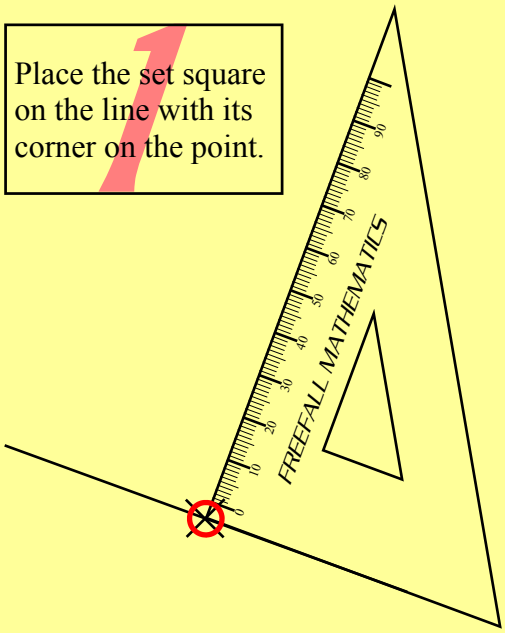


Perpendicular and Parallel Lines

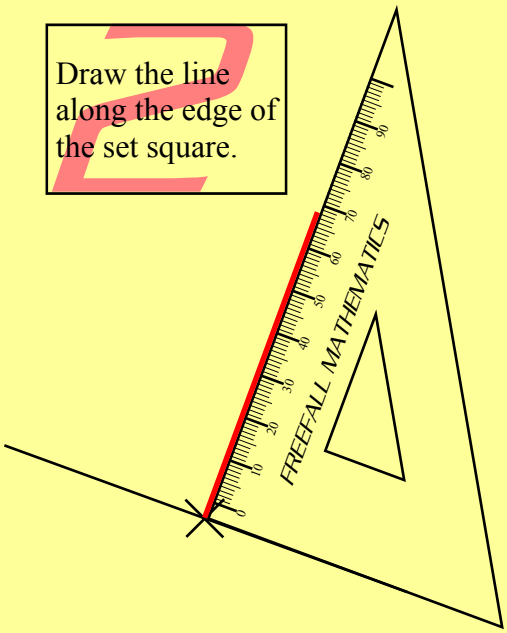
Perpendicular lines are lines that are at right angles to each other, so the angles formed when the lines intersect are 90º. Parallel lines are lines that are the same distance apart throughout their length and so they never intersect (touch each other). This sheet requires the use of a compass and a set square to create parallel and perpendicular lines.

Column 1 - Perpendicular from a point on a line - Set Square

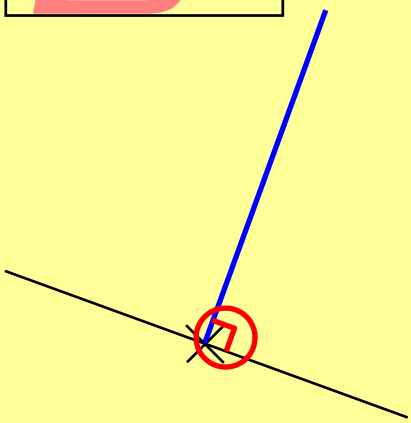
1 Place the set square on the line with its corner on the point.



2 Draw the line along the edge of the set square.

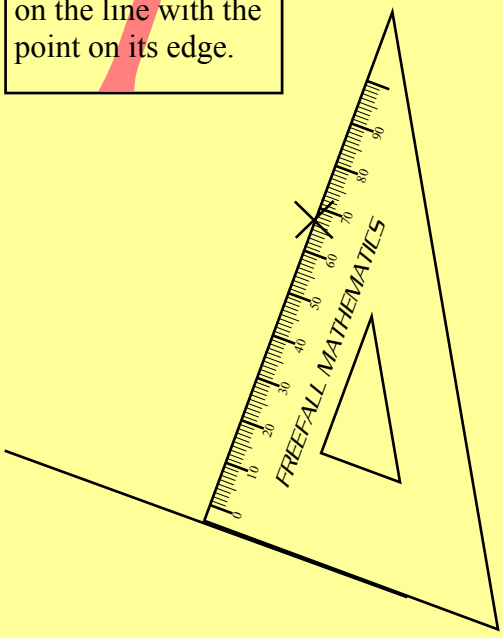


3 Place right angle markings to show it is a perpendicular.

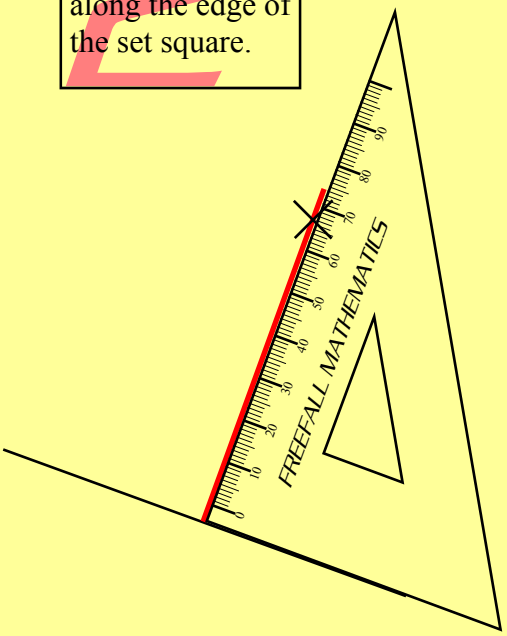


Column 1 - Perpendicular from a point away from a line - Set Square

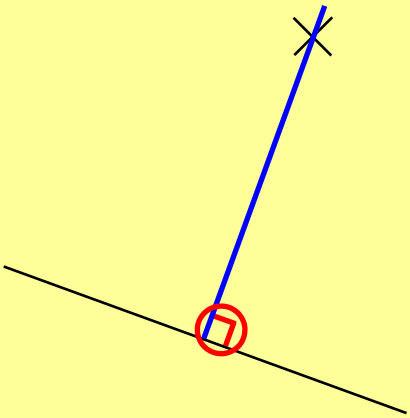
1 Place the set square on the line with the point on its edge.



2 Draw the line along the edge of the set square.

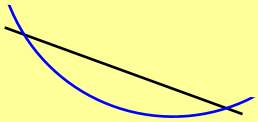


3 Place right angle markings to show it is a perpendicular.

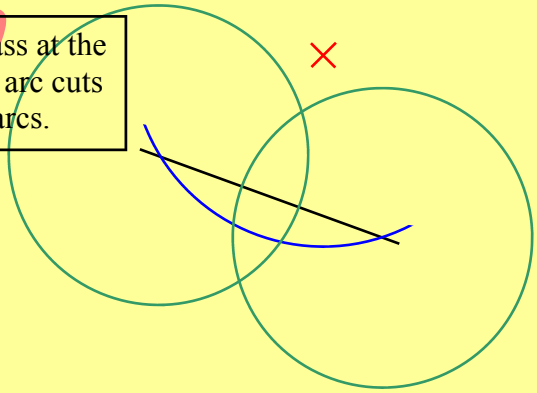


Column 2 - Perpendicular from a point away from on a line - Compass

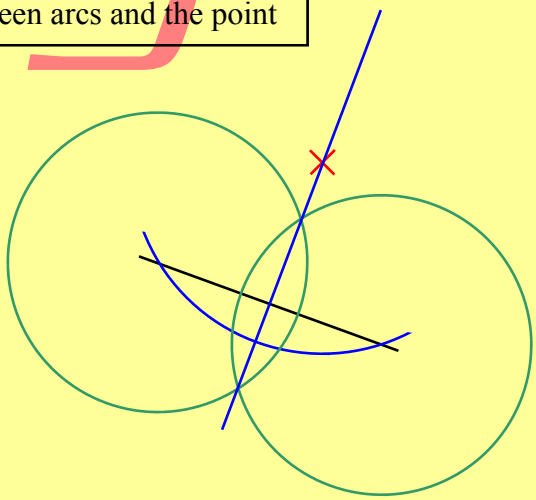
1 Position the compass in the point and draw an arc that cuts the interval in two places



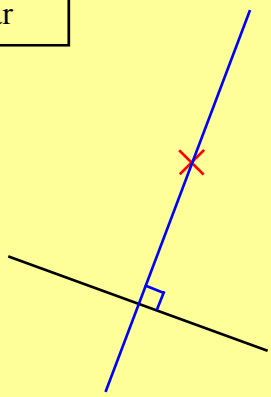
2 Then place the compass at the points where the blue arc cuts the interval, create 2 arcs.



3 Draw a line through the intersection points of the green arcs and the point



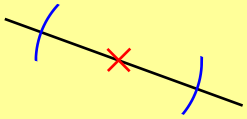
4 Place right angle markings to show it is a perpendicular



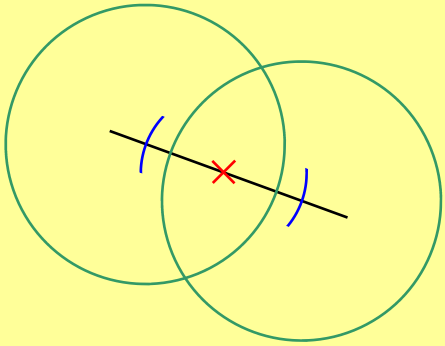
5 Green arcs and blue arcs don't have to be the same size

Column 2 - Perpendicular from a point away from on a line - Compass

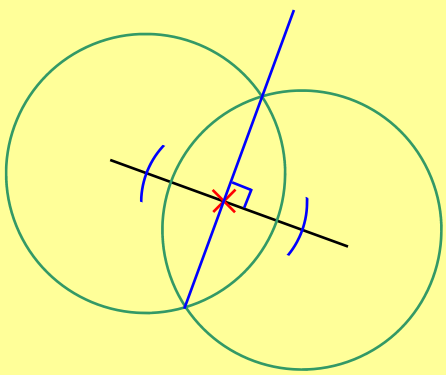
1 Position the compass at the point and draw an arc cutting the interval each side of the point (blue).



2 Position the compass where the blue arcs cut the interval and draw 2 arcs as shown, (green circles).



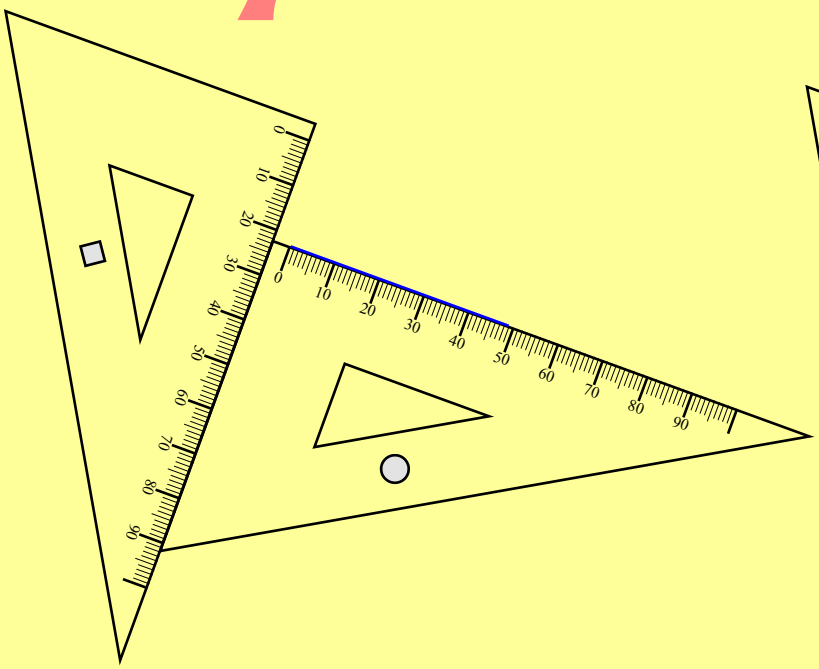
3 Draw a line through the two intersection points and the original point. Add a right angle symbol to complete.



Column 3 - Drawing a Parallel line - Set Square

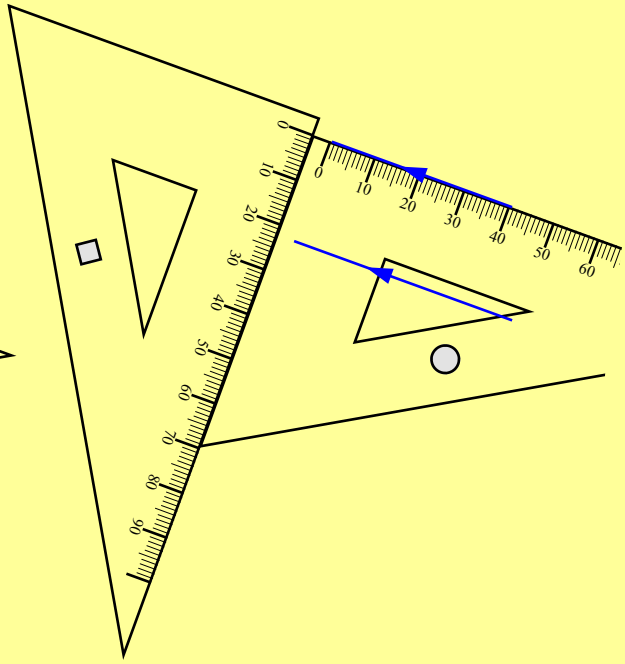
1

Position the set square marked with a circle on the line. Place another set square (square) or ruler on its edge, slide it to the required length (2.2 cm).



2

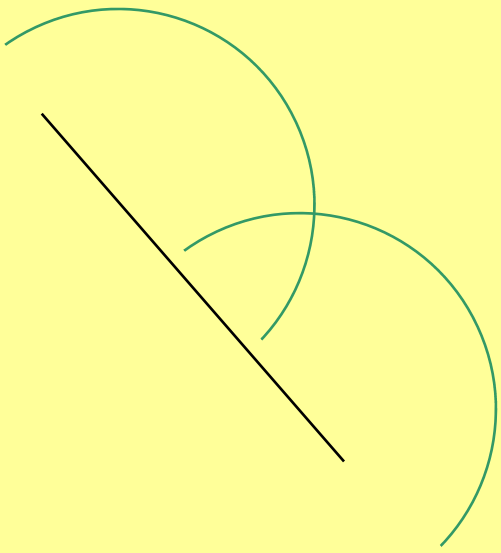
Slide the set square (circle) up to the zero then draw your line. To show the lines are parallel draw an arrow-head on each line.



Column 3 - Drawing a Parallel line - Compass

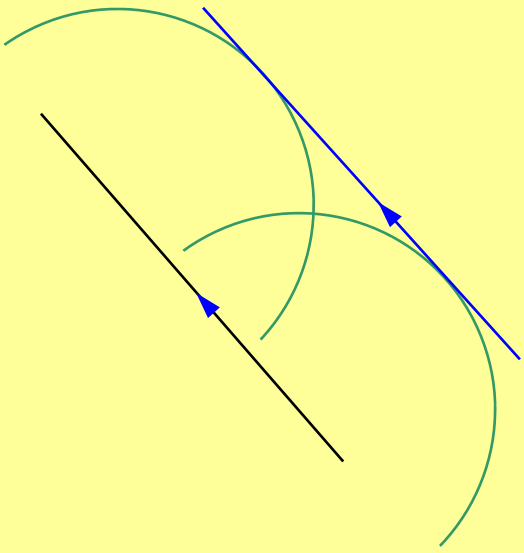
1

Open your compass the required distance and draw two arcs from any position on the interval.



2

Draw a line across the edges of the circles. Place arrow heads on the lines to show they are parallel.



Perpendicular and Parallel Lines

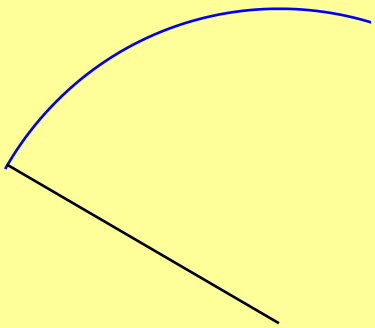
Equilateral and Scalene Triangles

Equilateral triangles are triangles with all sides equal and all interior angles equal (all 60º). This sheet is about constructing equilateral triangles with a compass (and a ruler). This is best described in steps, follow the steps outlined below.

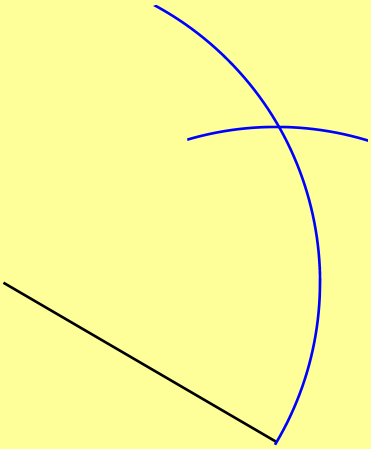
Scalene triangles have no equal sides. Follow the steps on the next page for constructing these triangles. Note that when a scalene triangle has an interior angle that is 90°, it isn't a scalene triangle it is a right (angled) triangle.

Column 1 - Constructing Equilateral Triangles - Compass

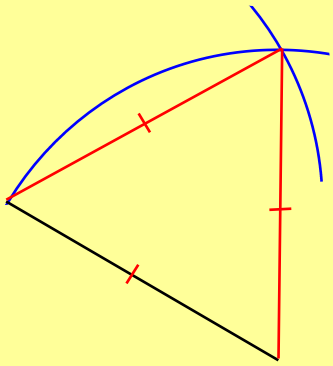
1 Position the compass at the end of the interval and open it to the interval length and draw an arc.



2 Repeat for the other end of the interval to create a point of intersection.

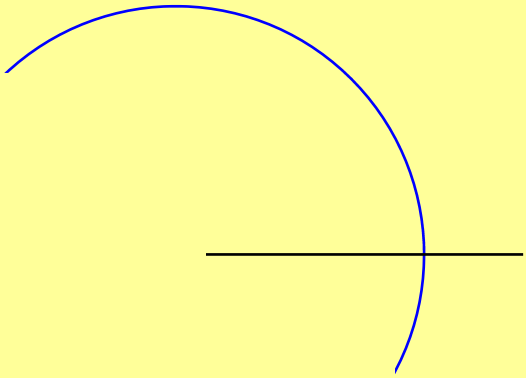


3 Draw a line from the end of the interval to the intersection point and then repeat for the other end of the interval. Mark the sides to show sides are all equal.

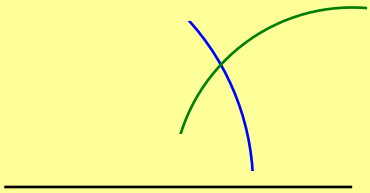


Column 2 - For the second part of the column rule a line first then repeat the above steps.

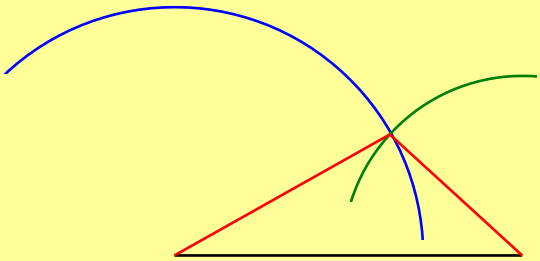
Column 2 - Constructing Scalene Triangles - Compass



1 Position the compass at the end of the interval and open it to the given length and draw an arc.



2 Repeat for the other end of the interval to create a point of intersection.



3 Draw a line from the end of the interval to the intersection point and then repeat for the other end of the interval.

Column 2 - For the second part of the column rule a line first then repeat the above steps. Rule the longest line first, then use your compass to create the other two lines.

Equilateral and Scalene Triangles

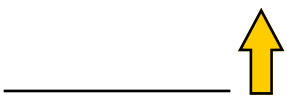
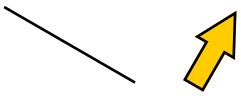
2

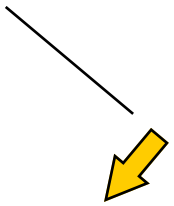


3



4

5



6

Now construct equilateral triangles with the side lengths given below

7 5.5 cm

8 6.3 cm

Now make scalene triangles with one side drawn and the other two sides given.

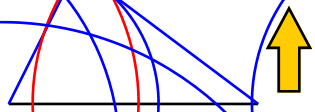
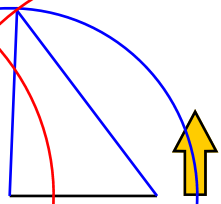
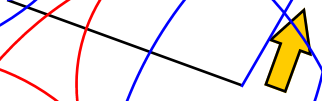
9 2 cm and 3 cm



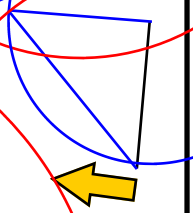
10 2.5 cm and 3.1 cm



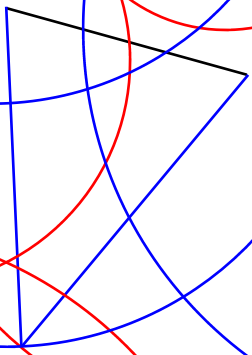
11 2.2 cm and 4.3 cm



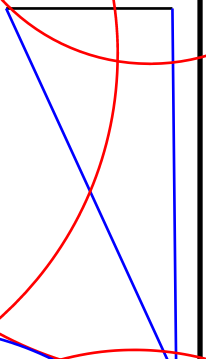
12 1.9 cm and 2.7 cm



13 4.5 cm and 4.7 cm

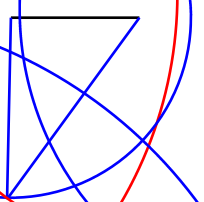


14 5.4 cm and 4.9 cm

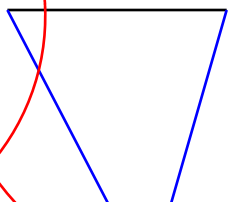


Construct scalene triangles with the side lengths given below

15 3 cm, 1.7 cm and 2.4 cm



16 3.8 cm, 2.9 cm and 4.1 cm



Creating Isosceles and Side-Angle-Side Triangles

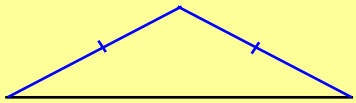
Column 1 - Constructing Isosceles Triangles - Compass

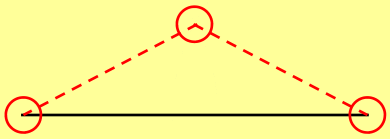
1 Open your compass to the given length then position the compass at the end of the line and draw an arc.

2 Repeat for the other end of the line to create a point of intersection. Note that the second line may not be the same length as the first.

3 Using a ruler, draw lines from the intersection point to the ends of the line.

4 Label the two sides of equal length with dashes.





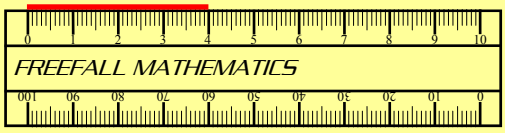
Questions 7 & 8 - Rule a line first then repeat the above steps. Rule the longest line first, then use your compass to construct the other two lines.

Creating Isosceles and Side-Angle-Side Triangles

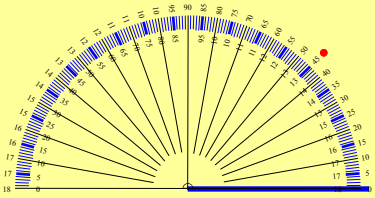
Column 2 - Constructing Triangles - Protractor & Ruler

Example:
4 cm, 3 cm
& 45° angle

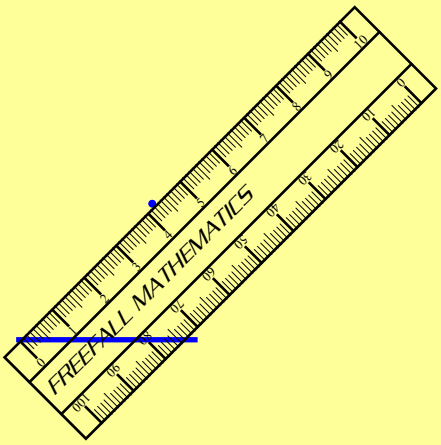
1 Draw the line of longest line first, the 4 cm line in our example.



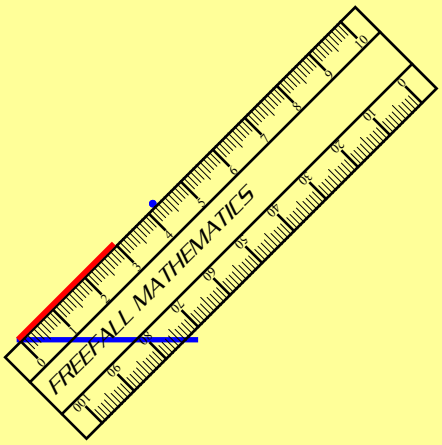
2 Place a protractor at the end of the line and plot a point at the given angle. In our example it is 45º.



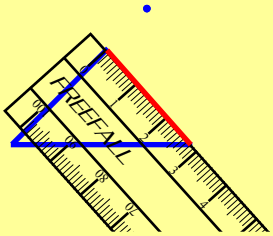
3 Remove the protractor and place a ruler with the zero at the end of the line and the point on the ruler's edge.



4 Rule the other line given in the question. It doesn't have to pass through the point.



5 Complete the final side by using a ruler between the two points



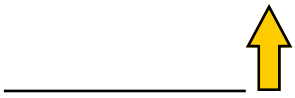
Making Isosceles and Side Angle Side Triangles

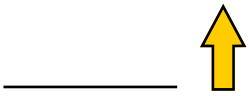
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Make an isosceles triangle, one side is already drawn for you. Use the two other measurements to complete it.

1 3 cm & 3 cm

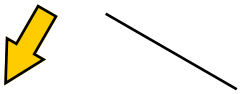
2 2.3 cm & 1.6 cm





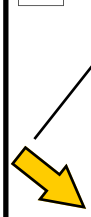
3 2.6 cm & 2 cm

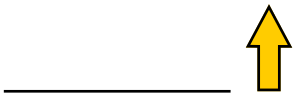
4 4.2 cm & 4.2 cm



5 3.3 cm & 3.3 cm

6 1.2 cm & 3 cm





Now construct isosceles triangles with the side lengths given below

7 2.6 cm, 4.1 cm and 4.1 cm

8 2.7 cm, 3.8 cm and 3.8 cm

Here are two sides with the angle between them. Use a protractor and a ruler to draw them, then join the ends for the third side

9 4 cm, 3 cm, 60º

10 2.5 cm, 3.2 cm, 40º

12 7.1 cm, 6.3 cm, 38º

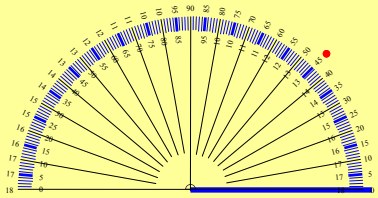
Angle-Angle-Side Triangles and Properties

A triangle can be constructed when you are given two angles and a side. This sheet requires a protractor and a ruler. The steps are below:

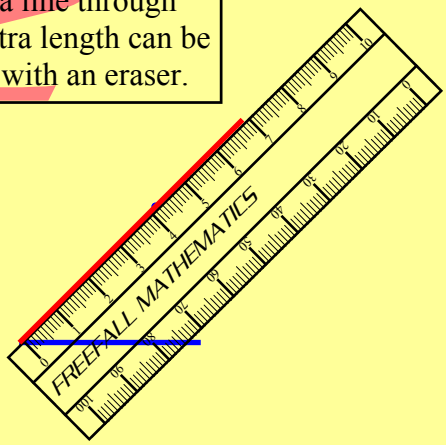
Column 1 - Constructing AAS Triangles - Protractor & Ruler

Example: 45° and 60° Base Angles

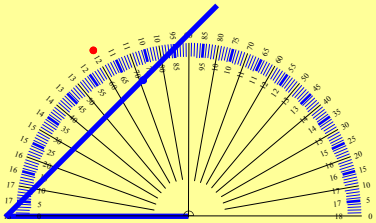
1 Using your protractor place it at one end of the line and measure the first angle. Plot a dot at the first angle.



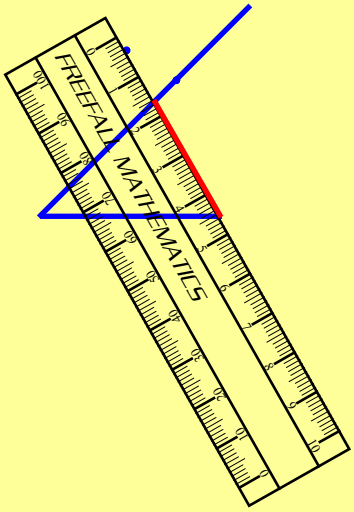
2 Place a ruler at the end of the line and draw a line through the dot, the extra length can be removed later with an eraser.



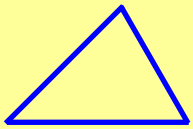
3 Repeat for the other end of the line.



4 Use a ruler to draw the final side. Stop when the line intersects the other side.



5 Erase the extended side length. All done!



Column 2 - Q.8 - Q.11.

Use the same method as above after first ruling the line.

The second part of the sheet aims to outline the relationship between the largest angle of a triangle and the triangle's longest side. Name the longest side and largest angle and in Q.15 explain how the angle and side are always located on a triangle.

Angle-Angle-Side Triangles and Properties

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use a protractor and a ruler to create triangles with base internal angles as given below

1 40º & 50º

2 23º & 55º

3 70º & 80º

4 52º & 47º

5 15º & 38º

6 117º & 29º

7 60º & 60º

This time draw the given side then use the same method. Be careful where you choose to place the line.

8 2.5 cm, 30º, 40º

9 3.7 cm, 22º, 47º

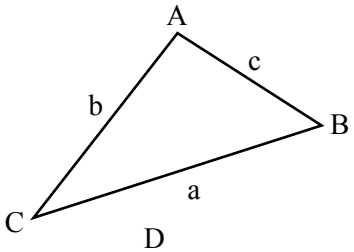
10 4.4 cm, 53º, 35º

11 1.7 cm, 75º, 75º

Name the largest angle and the largest side in these triangles

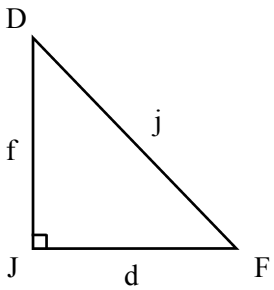
12 Side : ____

Angle : ∠ _____



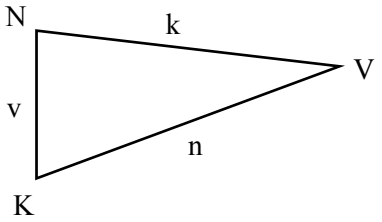
13 Side : ____

Angle : ∠ _____



14 Side : ____

Angle : ∠ _____



15 What is the relationship between the largest angle and the longest side? _____

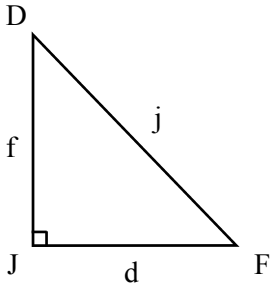
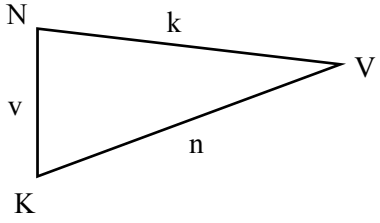
Angle : ∠ DJF



14 Side : n

Angle : ∠ VNK



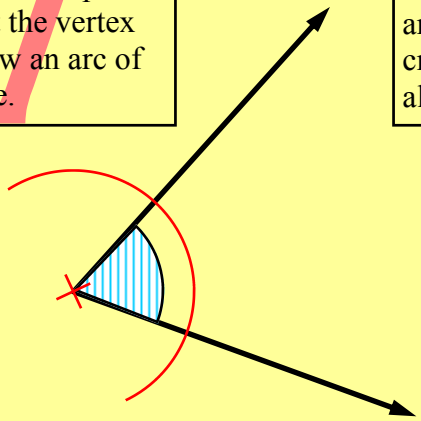
15 What is the relationship between the largest angle and the longest side? They are always opposite each other.

Bisecting Angles and Making 45° Angles

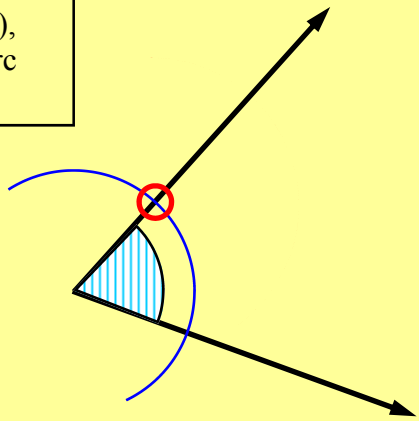
This sheet is about bisecting an angle, this means cutting the angle in half. The second part of the sheet is about creating 45° angles using a compass and a ruler. When you make a 45° angle you are also making a 135° angle, it's the angle's supplement, it will be the adjacent obtuse angle beside the 45° angle.

Column 1 - Bisecting Angles - Protractor & Ruler

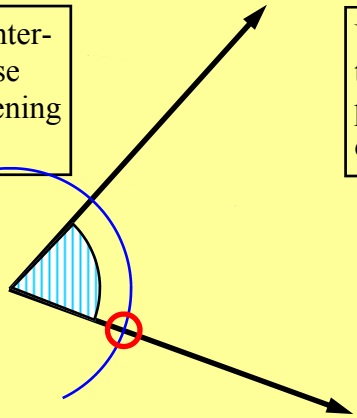
1 Place the compass point at the vertex and draw an arc of any size.



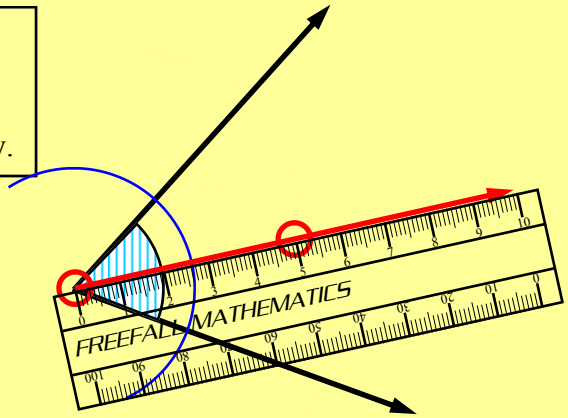
2 Using the intersection of the arc and the ray (red circle), create another arc. This arc also can be of any size.



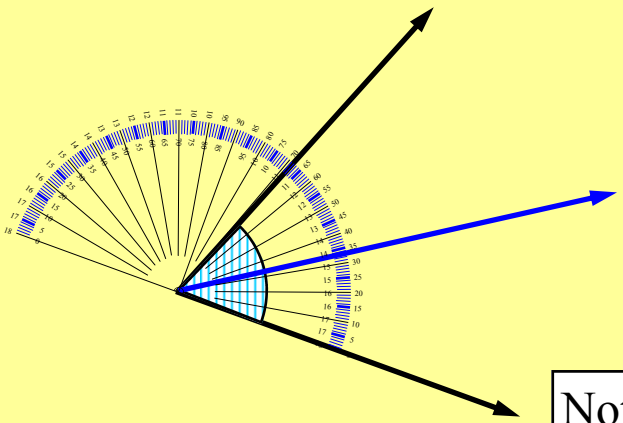
3 Repeat for the other intersection point (red). Use the same compass opening as the previous arc.



4 Using the vertex and the arc intersection point (red circles), draw the bisecting ray.



5 Use a protractor to measure the size of the bisection and original angle to check that your method is correct.



Note Q.4 is a reflex angle so a working space is provided.

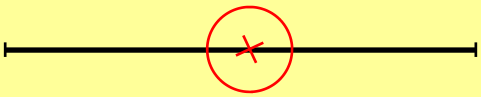
Bisecting Angles and Making 45° Angles

A 45º angle can be constructed by first making a 90º angle and bisecting it. So a right angle is created, then the same process from the previous column is repeated.

Column 2 - Constructing 45º Angles - Compass & Ruler

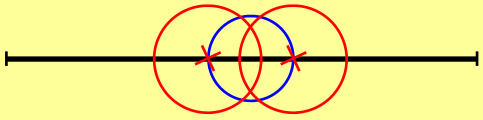
1

Using a compass draw a circle near the centre of the interval.



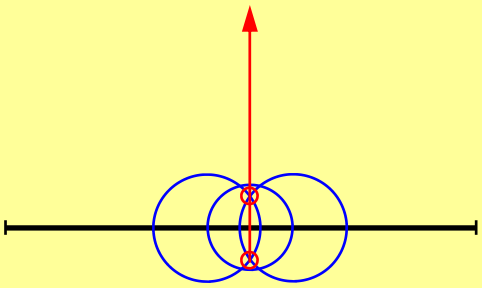
2

Using the intersection points, create two more circles (or arcs).



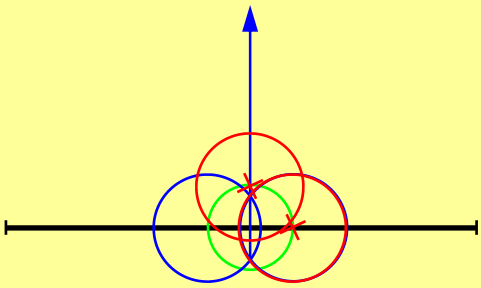
3

Use the intersection points created by the two circles (red), draw a perpendicular line. This is a 90º angle.



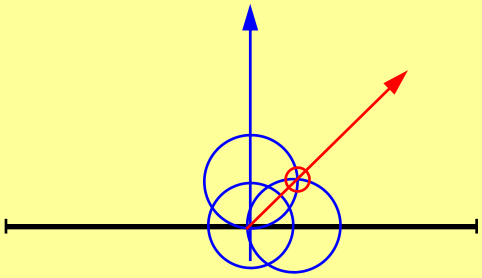
4

The first circle (green) intersects the perpendicular and the interval. Using these point create two arcs or circles (red circles).



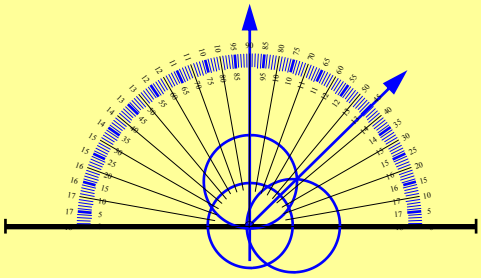
5

Draw a line through the vertex and intersection point (red circle) and its done!



6

Check your work with a protractor.



Bisecting Angles and Making 45° Angles

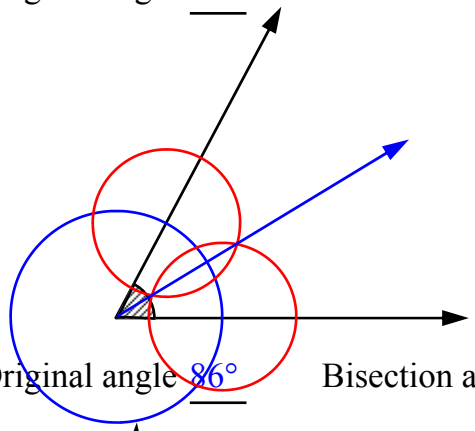
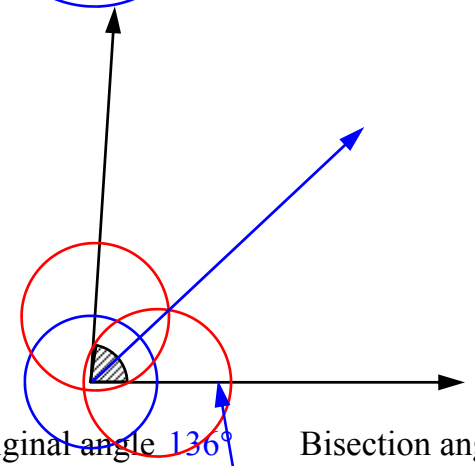
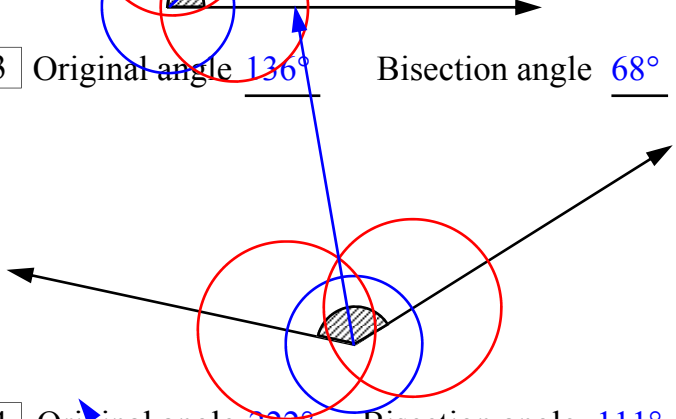
1 Original angle 62 ° Bisection angle 31 °



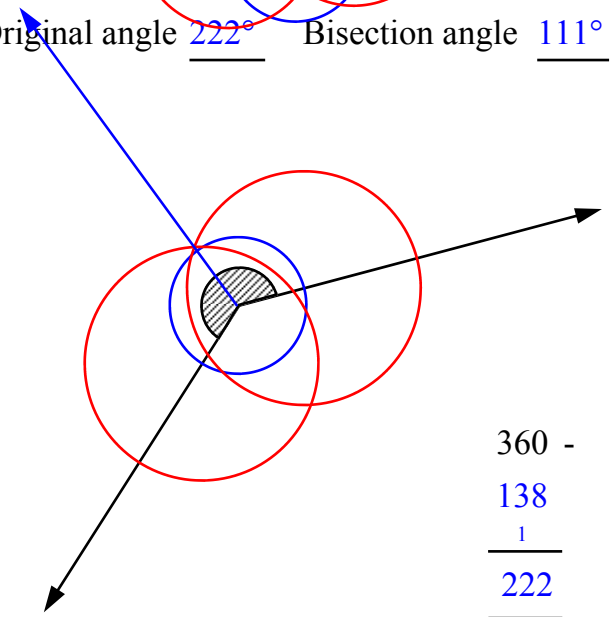
2 Original angle 86° Bisection angle 43°



3 Original angle 136° Bisection angle 68°



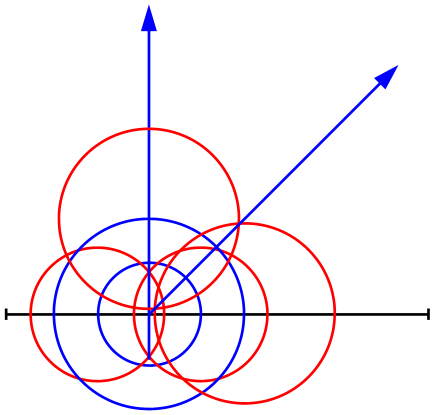
4 Original angle 222° Bisection angle 111°



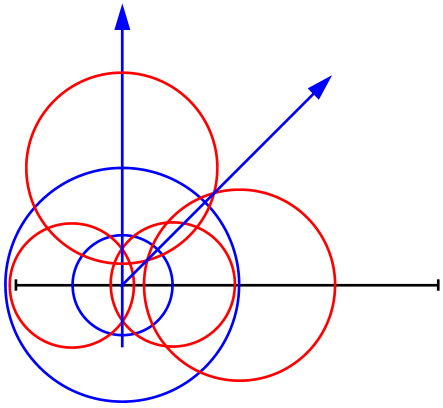
360 - 138 = 222

To make a 45° angle create a 90° angle (perpendicular) then bisect it. A 45° angle could also be 135°!

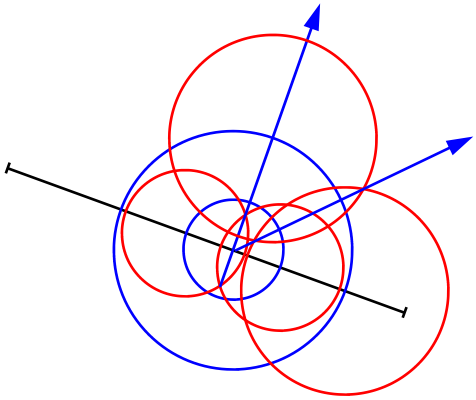
5



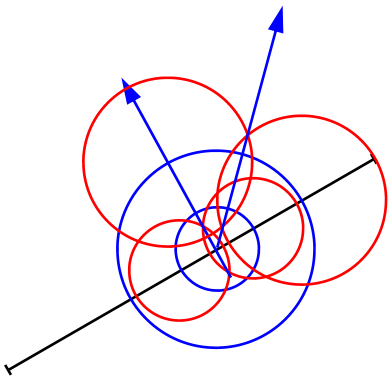
6



7



8



Constructing 60° and 30° Angles

This sheet is about constructing a 60° angle and a 30° angle (a bisected 60° angle), to complete this sheet you require a compass and a ruler. One important thing to remember is that if you make a 60° angle you are also making a 120° angle, it's the supplementary angle. It will be the adjacent obtuse angle beside the 60° angle. Likewise when you make a 30° angle the adjacent obtuse angle will be 150°.

Column 1 - Constructing 60º & 120º Angles - Compass & Ruler

1

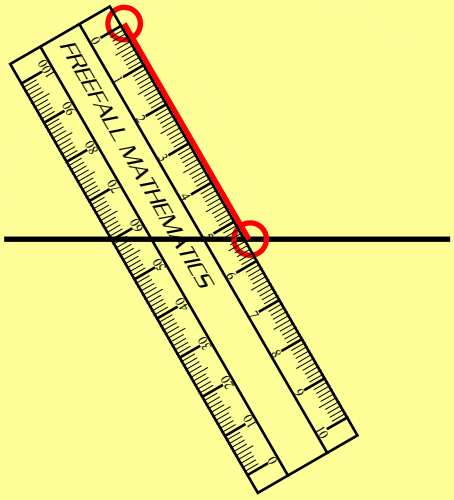
Place the compass at the end of the interval, open to any size and draw an arc.

2

Using the intersection of the arc and the interval (red circle), keep the compass at the same opening and draw another arc.

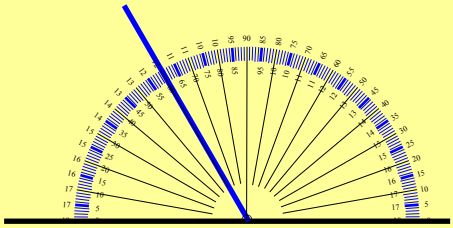
3

Use a ruler to connect the two intersection points (red circles).



4

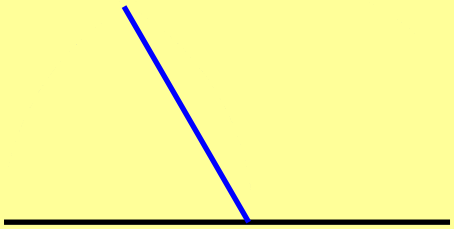
Check your work with a protractor.



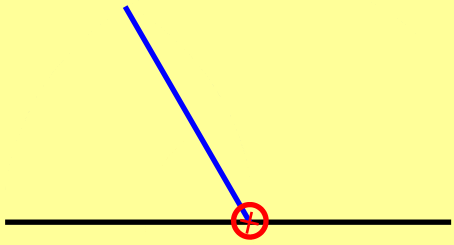
Constructing 60° and 30° Angles

Column 2 - Constructing 30º & 150º Angles - Compass & Ruler

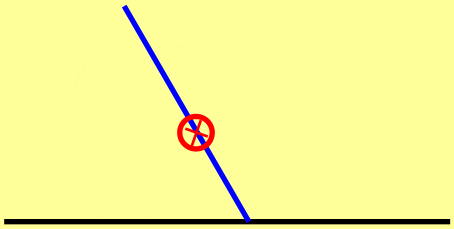
1 Create a 60º angle as outlined on the previous page. A 30º angle is made by bisecting a 60º angle.



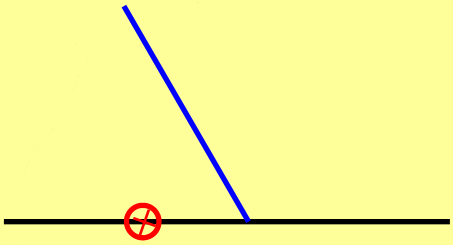
2 Draw an arc from the vertex of the angle (red circle) of any length.



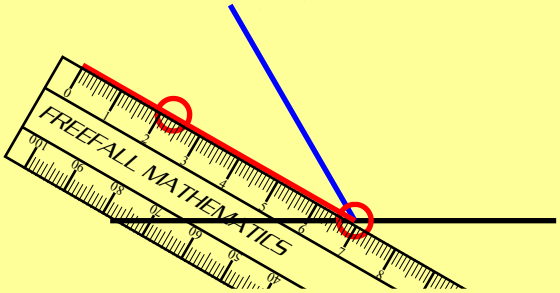
3 Draw an arc from one intersection point (red circle).



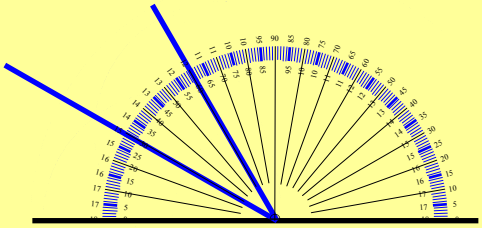
4 Then repeat for the other intersection point (red circle). Keep the compass at the same opening.



5 Use a ruler to connect the intersection point and the vertex (red circles). All done!



6 Using a protractor, check your work.



Constructing 60° and 30° Angles

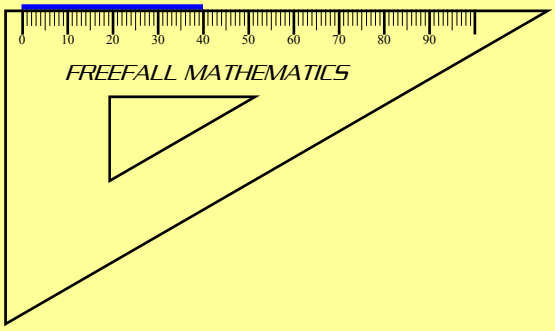
Drawing Quadrilaterals

This sheet involves the construction of four different plane (2-D) shapes. These are squares, rectangles, rhombi (plural of rhombus) and parallelograms.

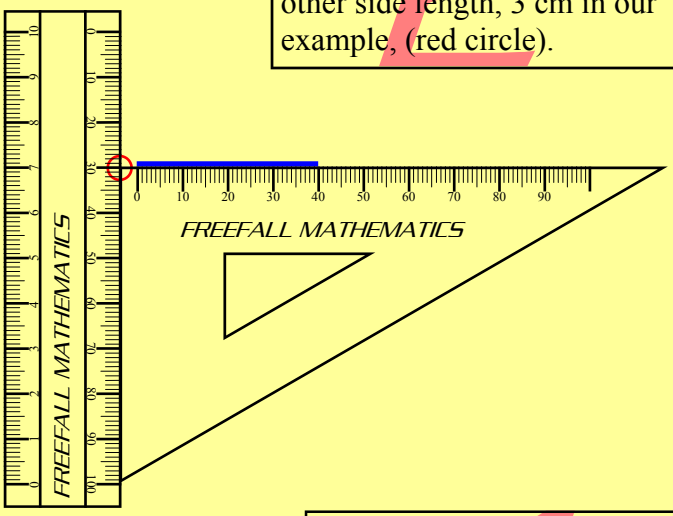
Column 1 - Constructing Squares & Rectangles - Set Square & Ruler

Example:
4 cm × 3 cm
Rectangle

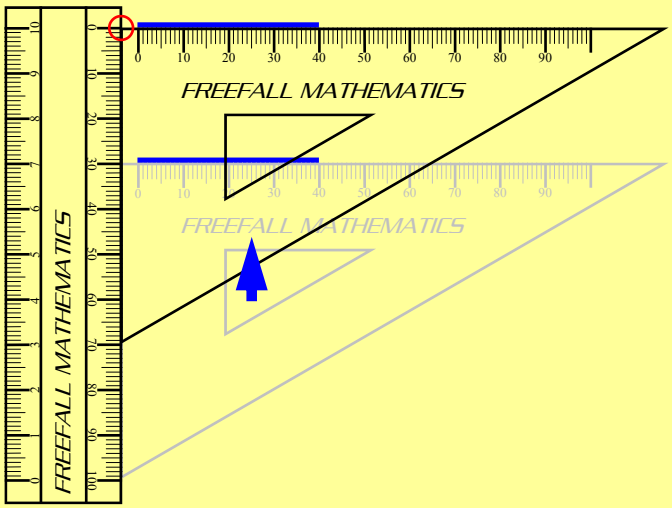
1 Using your set square draw a line the required length. In our example, 4 cm in length.



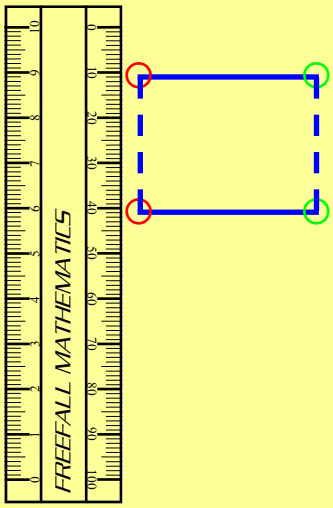
2 Place a ruler on the set square's edge so that the corner is at the other side length, 3 cm in our example, (red circle).

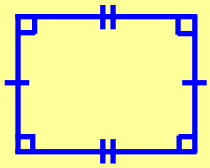


3 Slide the set square along the ruler edge until its corner is at zero, (red circle). Then draw the same length line as previously drawn, 4 cm in our example



4 Use a ruler to draw the remaining two sides. In our example they are 3 cm.





5 Place right angle markings in each corner and mark the opposite equal sides with dashes. All done!

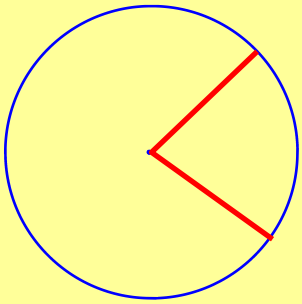
Drawing Quadrilaterals

Column 2 - Constructing a Rhombus - Compass & Ruler

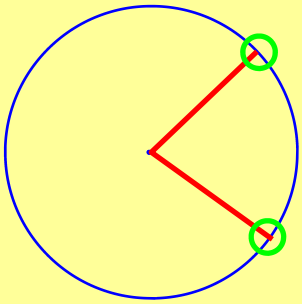
Example:
4 cm Rhombus

1 Draw a point where you wish to start.

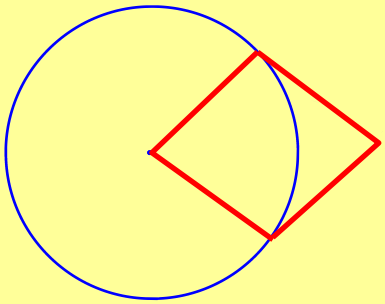
2 Open your compass to the side length (4 cm in our example) and draw a circle. Then draw 2 lines from the centre to the circumference, at any angle you like.



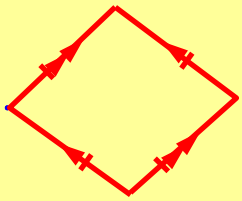
3 Using the compass open at the same length, draw 2 arcs from the intersection points shown below in green.



4 Use your ruler to complete the rhombus.

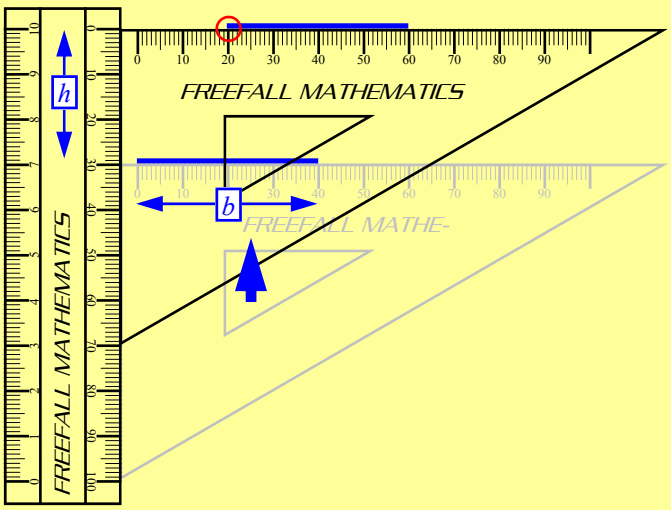


5 Show the parallel sides with arrows. Label all the equal sides with dashes.

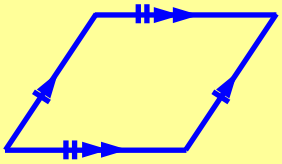


Column 2 - Constructing a Parallelogram - Set Square & Ruler

1 Start by using the same method as with the construction of a square or rectangle. When drawing the second line, instead of starting from zero start from another number, in the example below 2 cm was chosen.



2 Complete the sides and place arrows on parallel sides. You should also put dashes on the sides to show that they are the same length, that way a rhombus isn't confused with a parallelogram.



Drawing Quadrilaterals

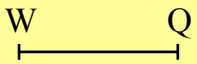
ALTITUDE

REVIEW:
ANGLES

Naming Angles

Naming angles allows you to explain which angle or part of a shape you're dealing with.

The first column introduces intervals, lines and rays. With intervals and lines you can name them in either direction. The interval below could be WQ or QW. You are asked to give both the names in these questions.



With rays, name them in the direction of the arrow only. The ray below is called HG only, not GH.

In column 2 you are asked to name the rays and also the vertex, this is the meeting point of the two rays, the 'elbow' if you like. The vertex is named by the letter at the point alone. To show it is a vertex we put a hat on it, like an upside-down 'v'.

To name an angle we generally use 3 letters, moving from ray-to vertex-to ray. The vertex is always in the middle. To show that it is an angle you put an angle sign in front of it or write the letters placing a hat over the vertex.

$\angle ABC$ or, $\hat{A}BC$

When you name a shape (in column 3) you start at any point then go around the shape the one way. If the letters are in alphabetical order you might like to start at the earliest letter. No symbol is put before the name of a shape, though sometimes this is done with triangles. (e.g. ΔABC)

Naming Angles

22  ENTKPJ, + ∠ TNK, ★ ∠ JKN, ♦ ∠ JEN

Place the given symbol in the following angles

23 
Note E is the point of contact

▲ ∠ BCD ♥ ∠ AED

★ ∠ FED + ∠ AEI

♦ ∠ IHG × ∠ ABC

Classifying Angles

Classification means to group into categories. There are six classifications in all:

- acute angles are between 0° and 90°
- a right angle is exactly 90°
- obtuse angles are between 90° and 180°
- a straight angle is exactly 180°
- reflex angles are between 180° and 360°
- and a revolution is 360°

How do you remember all these? You should be able to remember the straight angle, right angle and revolution, it is the others you could mix up. Remember that as the angle increases you move through the alphabet. A (acute) is before O(Obtuse) which is before R(reflex). There is a guide at the top of the page to refer to. With the angles, the measured side is the side marked with the arc (part circle) or the right angle symbol.

When asked to name angles remember that you can use either the hat or the angle sign method, as below.

$\angle ABC$ or, $\hat{ABC}$

In column 3 the word internal is used. What does internal mean? It means the inside (interior), so the internal angles are the angles on the inside of a shape.

Classifying Angles

i) acute angles that can be made 3

ii) pieces eaten to make a right angle 4

iii) pieces eaten to make the largest obtuse angle 7

iv) reflex angles that can be made 7

Estimating and Measuring Angles

An angle is used to measure rotation, a protractor is required for this worksheet.

To answer this sheet look at each angle and estimate its size, estimate meaning a skilled guess, so it is unlikely to guess the exact answer, but within say 15° would be very good. Don't use a protractor until you have estimated all of the angles, use the guide at the top right of the sheet if you need the help.

When using a standard protractor ensure you use the correct scale (inside or outside, make sure the scale used starts at 0°) and if the angle is a reflex (greater than 180°), measure the outside of the angle then subtract the angle from 360°. If an angle is measured and it is above 90°, then it must be larger than a right angle, if it isn't you have made a mistake. Use your estimation as a guide as well, and then see how close you were.

Estimating and Measuring Angles

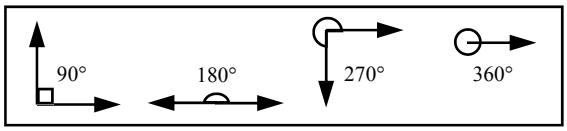
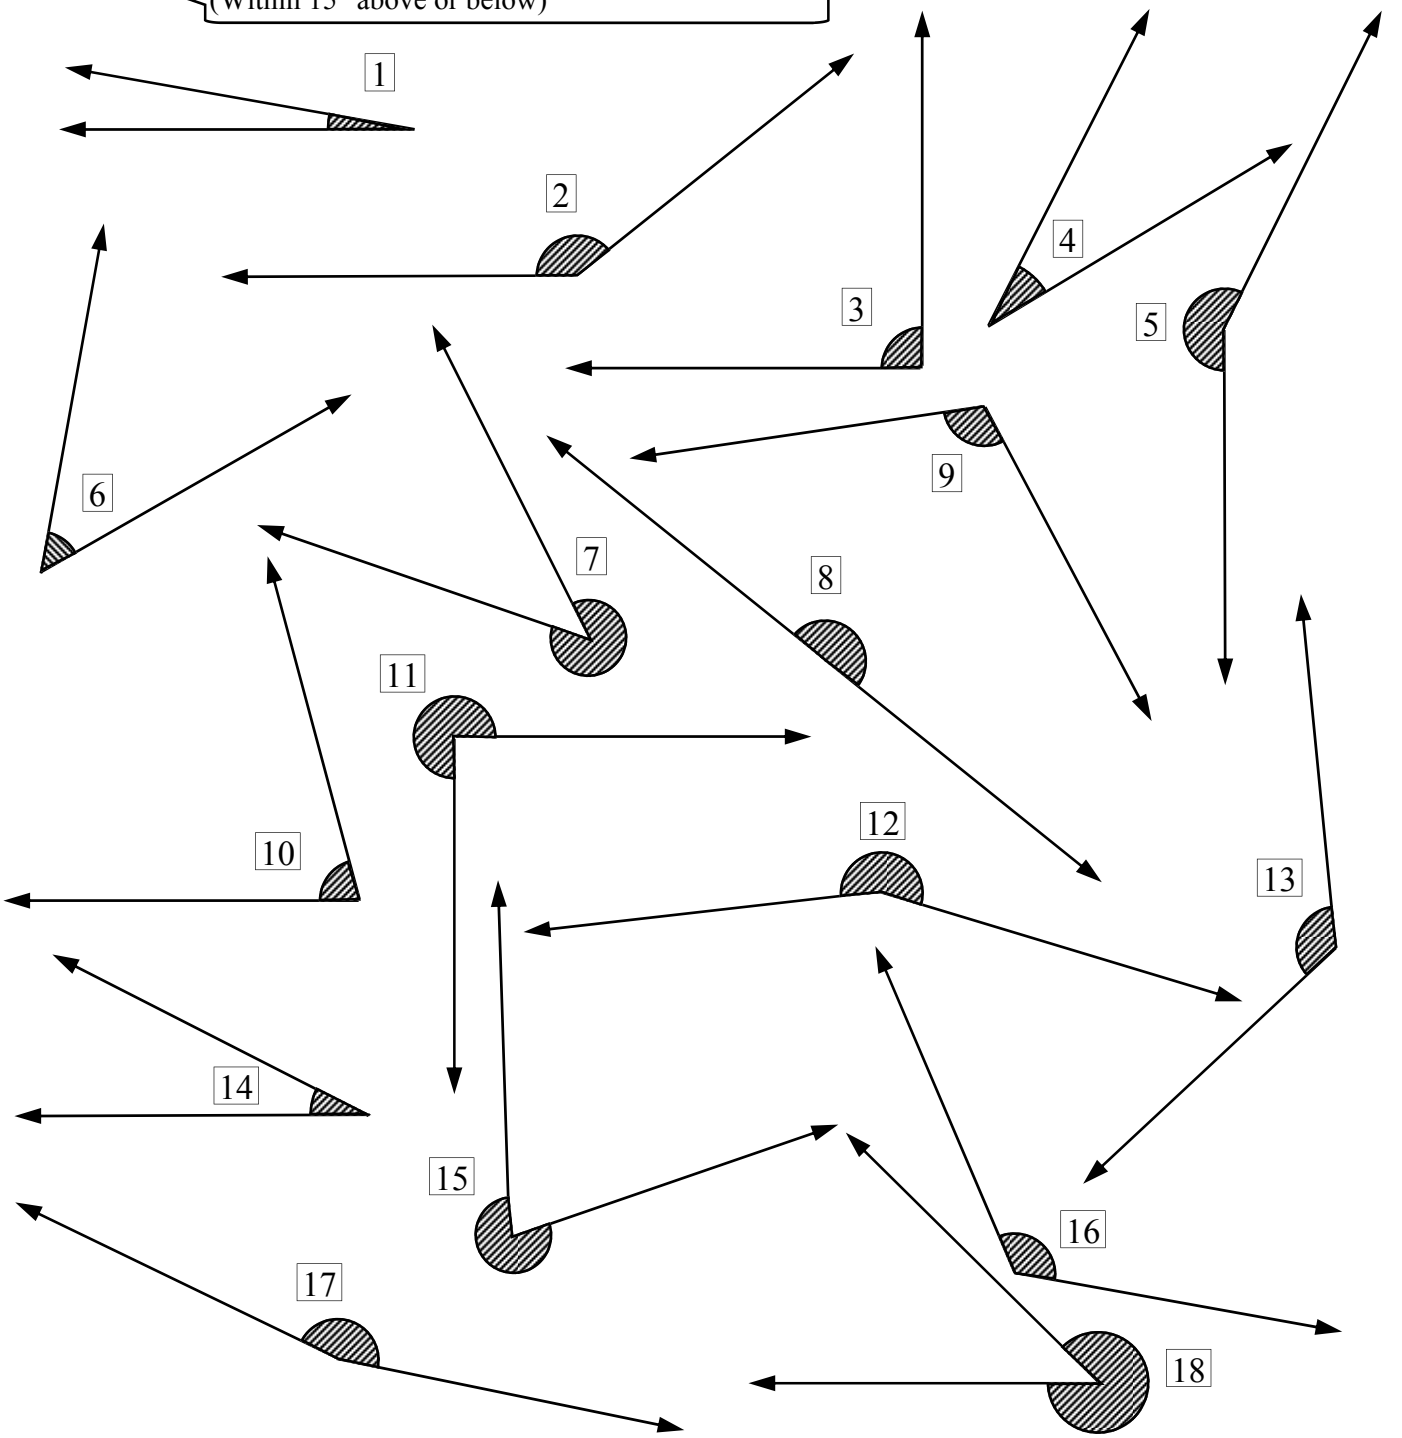
Estimate the size of all the shaded angles and place your answers in the table. Then using a protractor measure all the angles. See how well you estimated. (Within 15° above or below)





No	Estimate	Measured	No	Estimate	Measured	No	Estimate	Measured
1	5 ~ 25°	10°	7	300 ~ 330°	316°	13	115 ~ 140°	127°
2	125 ~ 155°	141°	8	180°	180°	14	20 ~ 35°	27°
3	85 ~ 95°	90°	9	95 ~ 125°	110°	15	270 ~ 300°	287°
4	20 ~ 40°	32°	10	65 ~ 85°	75°	16	110 ~ 135°	123°
5	190 ~ 220°	206°	11	265 ~ 275°	270°	17	150 ~ 170°	166°
6	40 ~ 60°	50°	12	190 ~ 220°	203°	18	300 ~ 330°	316°

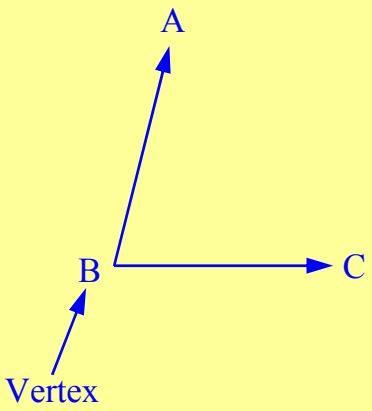
Constructing Angles

The previous sheet involved measuring angles, this sheet is about the construction of angles.

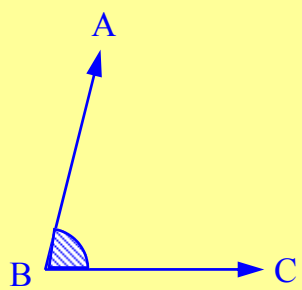
The method is as follows:

- Draw a horizontal line
- Measure the given angle from the end of the drawn line, plotting a point at the angle
- Draw a line from the end of the line to the point
- Label the angle with the letters supplied in the question, remember the vertex is point on the elbow of the angle.
- Draw an arc or sector at the vertex to show the angle is the inside or outside of the angle.
- If the angle is greater than 180° then calculate (360° - the angle) the obtuse/acute angle and use that angle. Draw the sector on the other side of the angle.

A completed angle



A completed angle with sector



A completed reflex angle with sector

12 Construct an 254° angle
∠ PUK

Adjacent Angles

Adjacent means next to, in the case of angles this means that the angle shares a common ray (or arm) and vertex with the angle beside it.

In column 1 the table requires you to add the two angles together to get a total, the sum of two adjacent angles. This continues down the column only with graphical representation, note that these angles aren't to scale, so don't use the angles as a guide. In question 3 there are 3 angles but only 2 angles have numbers, the third is a right angle which is 90°. It is suggested that you write in the '90°', that way you won't forget it in the addition.

In the 2nd column question 6 asks you to name the adjacent angle. This requires you to name the 2 angles that touch the given angle. As the layout is circular that means each angle has an adjacent angle on each side of it, don't name one angle then the same angle with the letters reversed. Question 7 is another table which this time gives you the total of two angles, and one of the angles. Subtract the angle from the total and you have the answer.

The same method is used for the rest of the sheet Subtract the known angles from the total to obtain the unknown angle. Except questions 10 and 12, with these use division! Question 10 gives you the hint.

Adjacent Angles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Angles 1 and 2 are adjacent find the sum of the two angles

1

Angle 1	Angle 2	Total
35°	42°	77°

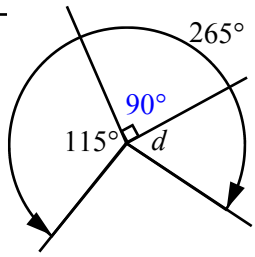
c = 29°

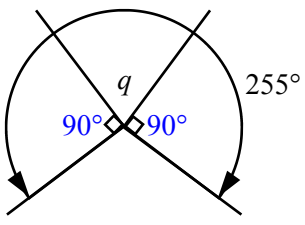
14



d = 265° - 115° - 90°

d = 60°

15



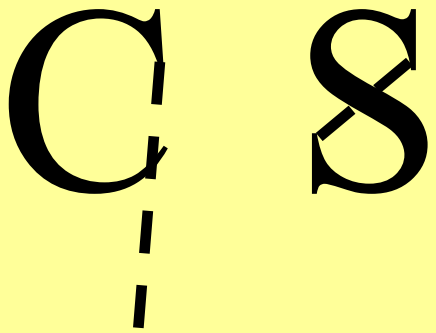
q = 255° - 90° - 90°

q = 75°

Complementary Angles

Complementary angles are angles that add to 90°. Supplementary angles add to 180° (the next sheet). How do you remember which is which? C comes before S in the alphabet, as 90° comes before 180°. Or look at the construction below.

The C can be changed to a 9 (90°) and the S can be changed to an 8 to remember 180°



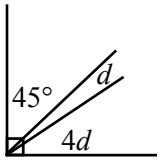
In Column 1 you are asked to find the complement, this means find the angle that when added to the angle given, has a total of 90°. You do this by subtracting the given angle from 90°. This continues down the column, subtract the angle given on the diagram from 90° to find the answer. The most common mistake is thinking that a right angle is 100°, or at least using it in calculations remember 90 not 100!

The 2nd column through to question 16 in the 3rd column is an extension of this. The same method is used only more than one angle is subtracted from 90°. Question 7 shows the method of working required.

Questions 17 and 18 require you to add the letters together, these equal 90°. Then divide by the number in front of the letter to get the value of the pronumeral. Note that the value of the pronumeral is being found, this isn't necessarily the value of the angle.

Questions 19 and 20 are more difficult questions and require an extra step. The letters are added on the left of the equals sign, and the subtraction of the angle from 90° is put on the right side. See the example below.

Example



$5d = 90° - 45°$

$5d = 45°$

$d = 9°$

Divide by 5

Complementary Angles

Find the complementary angle to those given in the table below.

1

Angle	Complement
30°	60°
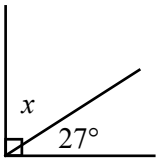
45°	45°
73°	17°
21°	69°
9°	81°
57°	33°
84°	6°

Find the complementary angle for the following

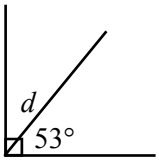
2



$x = 90° - 27°$

$x = 63°$

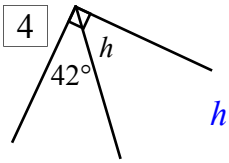
3



$d = 90° - 53°$

$d = 37°$

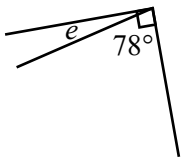
4



$h = 90° - 42°$

$h = 48°$

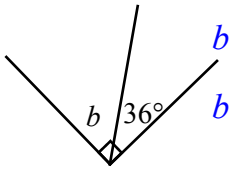
5



$e = 90° - 78°$

$e = 12°$

6

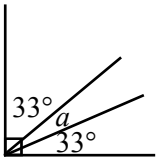


$b = 90° - 36°$

$b = 54°$

Now there are more than 2 angles. Solve these.

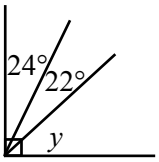
7



$a = 90° - 33° - 33°$

$a = 24°$

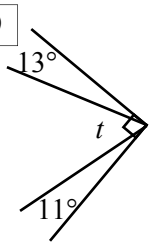
8



$y = 90° - 24° - 22°$

$y = 44°$

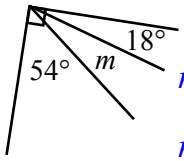
9



$t = 90° - 11° - 13°$

$t = 66°$

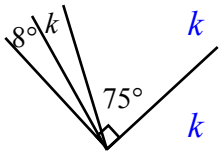
10



$m = 90° - 54° - 18°$

$m = 18°$

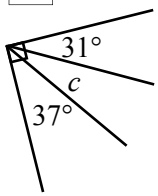
11



$k = 90° - 8° - 75°$

$k = 7°$

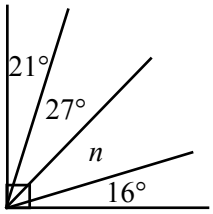
12



$c = 90° - 37° - 31°$

$c = 22°$

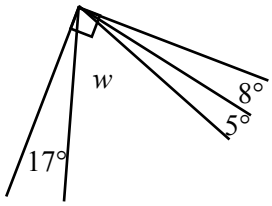
13



$n = 90° - 21° - 27° - 16°$

$n = 26°$

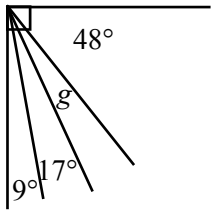
14



$w = 90° - 17° - 8° - 5°$

$w = 60°$

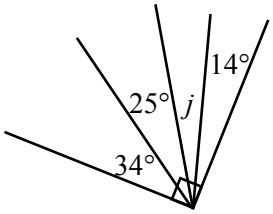
15



$g = 90° - 9° - 17° - 48°$

$g = 16°$

16

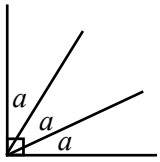


$j = 90° - 34° - 25° - 14°$

$j = 17°$

Use division to find the value of these unknowns.

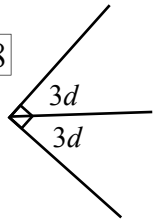
17



$3a = 90°$

$a = 30°$

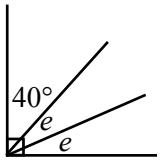
18



$6d = 90°$

$d = 15°$

19

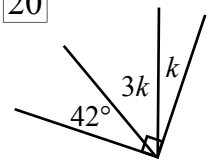


$2e = 90° - 40°$

$2e = 50°$

$e = 25°$

20



$4k = 90° - 42°$

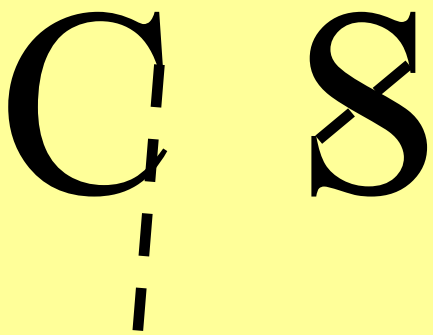
$4k = 48°$

$k = 12°$

Supplementary Angles

Supplementary angles are angles that add to 180°. How do you remember the difference between supplementary and complementary? C comes before S in the alphabet, just as 90° comes before 180°. Or look at the construction below.

The C can be changed to a 9 (90°) and the S can be changed to an 8 to remember 180°



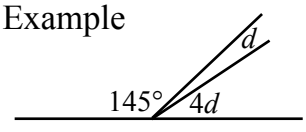
In column 1 you are asked to find the supplement, this means find the angle that when added to the angle given, has a total of 180°. You do this by subtracting the given angle from 180°. This continues down the column, subtract the angle given on the diagram from 180° to get the answer.

The 2nd column has a table to complete, this time both the complementary and supplementary angles are required. Subtract the angle from 180° to get the supplement and from 90° for the complement. Questions 9 through 16 add more angles into the problem, but the problem is still solved the same way, by subtracting all the given angles from 180°.

Questions 17 and 19 requires you to add the letters together, these equal 180°. Then divide by the number in front of the letter to get the value of the pronumeral. Note that the value of the pronumeral is being found which isn't necessarily the value of the angle (see question 20).

Question 18 is a more difficult question and requires an extra step. The letters are added on the left of the equals sign, and the subtraction of the angle from 90° is put on the right side. See the example below.

Example



$5d = 180° - 145°$

$5d = 35°$

$d = 7°$

Divide by 5

Supplementary Angles

Supplementary Angles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

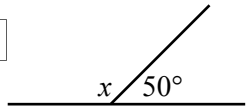
Find the supplementary angle to those given in the table below.

1

Angle	Supplement
110°	70°
45°	135°
162°	18°
16°	164°
123°	57°
27°	153°
177°	3°

Find the supplementary angle for the following

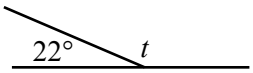
2



x = 180° - 50°

x = 130°

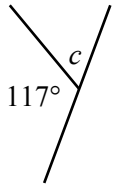
3



t = 180° - 22°

t = 158°

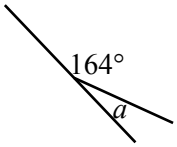
4



c = 180° - 117°

c = 63°

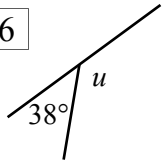
5



a = 180° - 164°

a = 16°

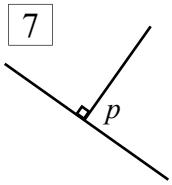
6



u = 180° - 38°

u = 142°

7



p = 180° - 90°

p = 90°

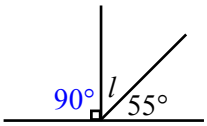
For the angles below find both the supplement and the complement.

8

Angle	Supplement	Complement
25°	155°	65°
65°	115°	25°
13°	167°	77°
79°	101°	11°
57°	123°	33°
3°	177°	87°
41°	139°	49°

Now there are more than 2 angles. Solve these.

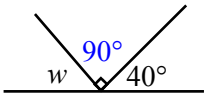
9



l = 180° - 90° - 55°

l = 35°

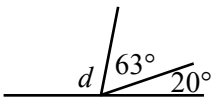
10



w = 180° - 90° - 40°

w = 50°

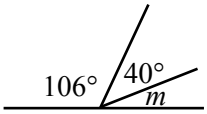
11



d = 180° - 63° - 20°

d = 97°

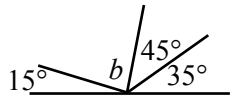
12



m = 180° - 106° - 40°

m = 34°

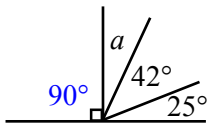
13



b = 180° - 15° - 45° - 35°

b = 85°

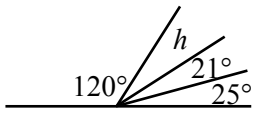
14



a = 180° - 90° - 42° - 25°

a = 23°

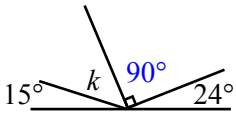
15



h = 180° - 120° - 21° - 25°

h = 14°

16

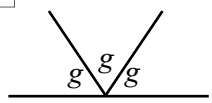


k = 180° - 15° - 90° - 24°

k = 51°

Use division to find the value of these unknowns.

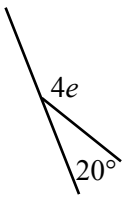
17



$3g$ = 180°

g = 60°

18

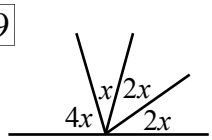


$4e$ = 180° - 20°

$4e$ = 160°

e = 40°

19



$9x$ = 180°

x = 20°

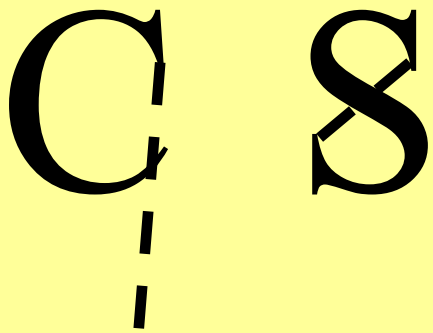
20 With the value of x found above, find the value of:

$2x$ = 40° $4x$ = 80°

Complementary and Supplementary Angles

Complementary angles are angles that add to 90°, and supplementary angles are angles that add to 180°. How do you remember which is which? C comes before S in the alphabet, as 90° comes before 180°. Or look at the construction below.

The C can be changed to a 9 (90°) and the S can be changed to an 8 to remember 180°



In column 1 the first 3 questions ask you to verify that the two angles are complementary. Add the two angles together, if the sum equals 90° then yes they are.

For the rest of column 1 you have to find the angle that when added to the angle given, has a total of 90°. You answer this by subtracting the given angle from 90°. The most common mistake is thinking that a right angle is 100°, or at least using it in calculations, remember 90 not 100!

The 2nd column has the same layout as the first but instead of the angles adding to give 90° they should total 180°, to be supplementary. The remainder of the column requires you to subtract the given angle from 180° to get the answer. When a right angle is involved write in 90°, this process should always be done as the angle may be overlooked.

The 3rd column is a mixture of the first 2 columns.

$k = 47°$

Angles at a Point

Just like a circle, the angle sum at a point is 360°. To find the size of an unknown angle subtract all the given angles from 360°.

In column 1 the unknown angle is given a letter, just write the letter then '=' and subtract all the given angles from 360°. Some angles are right angles, write '90°' in these so that you don't forget to include the angle in your calculation.

Column 2 requires you to use your algebra skills, add the letters and then divide 360° by the number in front of the letter. Questions 13 through 15 have an additional step, use the same method to find the value of the letter, but then multiply that value by the number in front of the letter for each angle. For example if you find $x = 25°$ and the angle in the question is $3x$, then $3x = 3 \times 25° = 75°$. If the question asks 'to solve for x', then you don't need to do this, it is only when you are asked for the angle, as the angle is $3x$ you must find the size of the angle, as the size of x isn't sufficient.

Column 3 is a harder column and some students may experience difficulty with these. The steps are a combination of the earlier problems.

- add the letters together and write it then an equals, (in question 16. $e + e = 2e$)
- then subtract the given angles (remember the right angles) from 360°
- the next line write the letters sum again only evaluate 360° - the angle
- then use division to solve like earlier problems
- the last 2 questions are harder, they require multiplication to get the angle (like questions 13 though 15)

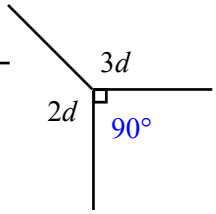
$5d = 270°$

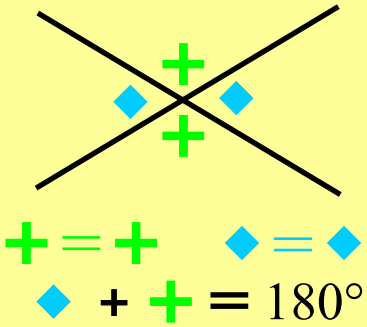
$d = 54°$



$2d = 108°$ $3d = 162°$

Vertically Opposite Angles

Vertically opposite angles are equal when formed by intersecting straight lines. The diagram below illustrates this. Don't let the word 'vertical' confuse you, as you can see if angles are opposite each other horizontally they are also considered vertically opposite (equal).



In column 1 identify the vertically opposite angle, by drawing a star in the angle and then also by naming it. Write the name of the angle on the line and colour the star beside it the same colour as the one you placed on the diagram. Question 5 is more difficult as many angles are all on the one diagram so take care with this question.

Column 2 asks you to find the value of the letter, this is just identification, (the answer is in front of you) for questions 6 through 9. But from Question 10 on…. some mathematics is required, this will always be subtraction or division look at the examples below.

With column 3 questions 15 and 16 use the same method as the example above them, establishing 2 angles from identification then the 3rd by supplementary angle methods, look at the example at the top of the column. The last 2 questions are more difficult and require you to choose vertically opposite or supplementary methods to solve them.

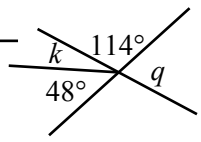
$b = 95°$

18



$k = 180° - 114° - 48°$

$k = 18°$

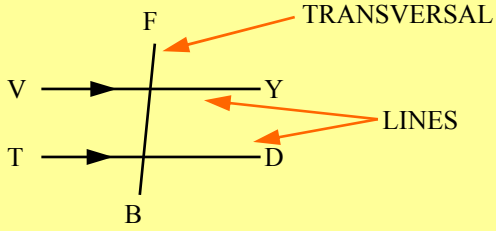
$q = 48° + 18°$

$q = 66°$

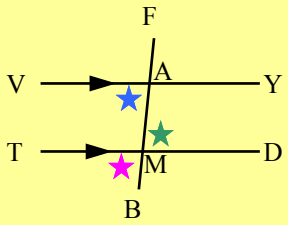
Parallel Lines and the Transversal

When parallel lines are crossed by a line the angles formed are related to each other by properties. This will require you to remember certain words and their meaning.

The first word is 'transversal' this is the name of the line that cuts across parallel lines. In column 1 you are asked to name the transversal and the parallel lines, write the 2 letters that represent the line, this can be done either way as the example below shows. The naming of angles uses the 3 point method, there is 4 possible answers for some questions as the example below shows, realise that if the answer doesn't match your answer you still may be correct, but the middle letter (vertex) must always be the same.



Lines are VY or YV and TD or DT
Transversal is either FB or BF



★ ∠VAM or ∠VAB or ∠MAV or ∠BAV

★ ∠AMD or ∠FMD or ∠DMA or ∠DMF

★ ∠TMB or ∠BMT

When lines cross, pairs of angles are made. Co-interior angles (called C angles) are the pair of angles formed on one side of the transversal inside the parallel lines, a 'c' can be formed around the angles (one is back to front). There are only two co-interior angle pairs in a standard 2-line 1 transversal problem. Remember the word interior means on the inside (of the parallel lines and the transversal).

Alternate angles (called Z angles) are also on the inside of the parallel lines but unlike co-interior angles they are on opposite sides of the transversal. A 'Z' can be made by the lines that include these angles.

Both alternate and co-interior angles are inside the two parallel lines. Corresponding angles (called F angles) require one point to be on the inside of the parallel lines and the other to be on the outside. An 'F ' or back to front ‘F’ is made by the lines that include these angles. With corresponding angles the angle is in exactly the same position on both points of intersection. Column 3 asks you to write either 'alternate', 'co-interior' or 'corresponding'. Questions 32 through 37 are more challenging but the same method is used.

Parallel Line Angle Properties

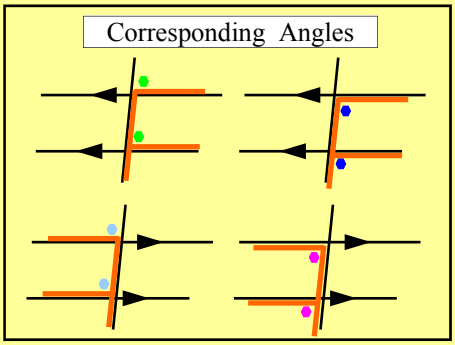
When two parallel lines are crossed by a transversal, pairs of angles are made that we can use mathematically. The previous sheet taught you alternate, co-interior and corresponding angles, now we can use their angle properties, which are:

- corresponding angles are equal if lines are parallel
- alternate angles are equal if lines are parallel
- co-interior angle sum is 180° if lines are parallel (the two angles add to 180°)

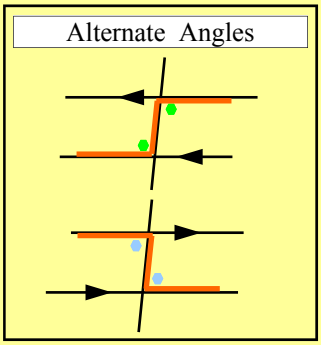
In Column 1 an angle is given and an unknown angle is required. The unknown angle will be either the alternate, corresponding or co-interior angle to the given angle. The first step is identifying which. Once identified if the angle is the alternate angle or the corresponding angle it is the same as the given angle, no working required. If the relationship is co-interior then subtract the given angle from 180° to obtain the answer.

Column 2 gives both angles, identify if the relationship between the 2 angles is either alternate or corresponding. If it is, the angles must be the same for the lines to be parallel, if the angles aren't equal then the lines aren't parallel. If the relationship between the 2 angles is co-interior then the sum of the two angles must equal 180° for the lines to be parallel. If they don't add to 180º then the lines aren't parallel. This includes if the angles are the same, the same co-interior angle means the lines aren't parallel, unless the angles are 90°. See the example at the top of the column.

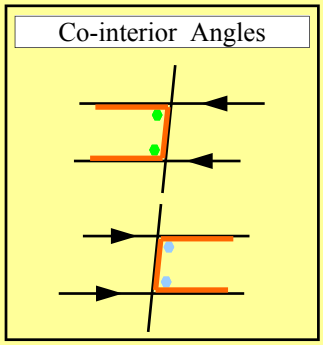
Column 3 is the same as column 1 in procedure, the only difference being that you have to divide the angle by the number in front of the letter to get your answer. The last 3 questions require a subtraction to take place before the division.



Corresponding angles are equal if the lines are parallel



Alternate angles are equal if the lines are parallel



Co-interior angles add to 180° if the lines are parallel

Parallel Lines Angle Properties

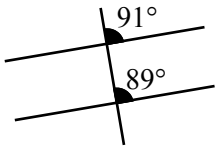
$g = 90°$

Find if the lines below are parallel, give a brief reason for your decision.

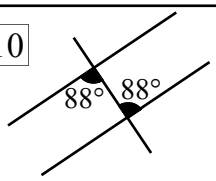
Example



Parallel?
Circle: Yes / No

Corresponding angles not equal so lines aren't parallel.

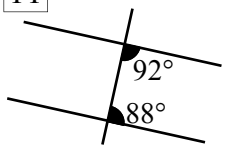
10



Parallel?
Circle: Yes / No

Alternate angles equal so lines are parallel.

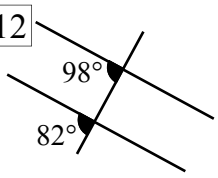
11



Parallel?
Circle: Yes / No

Co-interior angle sum is 180° so lines are parallel

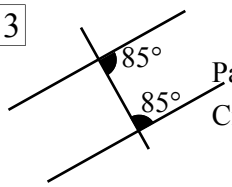
12



Parallel?
Circle: Yes / No

Corresponding angles not equal so lines aren't parallel.

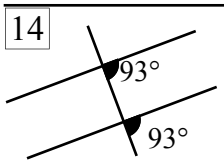
13



Parallel?
Circle: Yes / No

Co-interior angle sum isn't 180° so lines aren't parallel

14

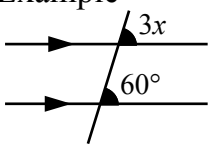


Parallel?
Circle: Yes / No

Corresponding angles equal so lines are parallel.

Find the value of x

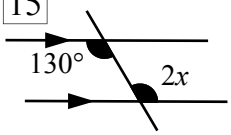
Example



$3x = 60°$

$x = 20°$

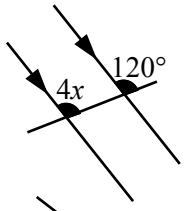
15



$2x = 130°$

$x = 65°$

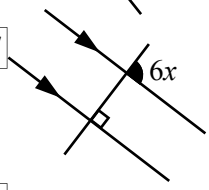
16



$4x = 120°$

$x = 30°$

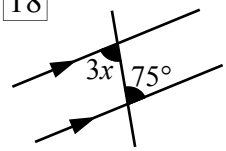
17



$6x = 90°$

$x = 15°$

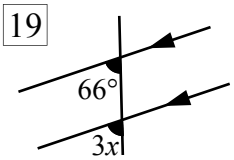
18



$3x = 75°$

$x = 25°$

19



$3x = 66°$

$x = 22°$

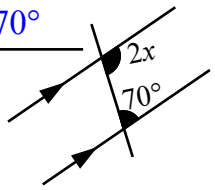
Co-interior angles require an extra step, find the value of x in these

20

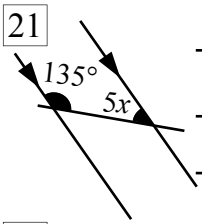
$2x = 180° - 70°$

$2x = 110°$

$x = 55°$



21



$5x = 180° - 135°$

$5x = 45°$

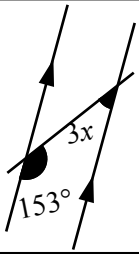
$x = 9°$

22

$3x = 180° - 153°$

$3x = 27°$

$x = 9°$



Further Parallel Lines

If two parallel lines are crossed by a transversal eight angles are formed. Given one angle, all of the other angles can be found by using these properties:

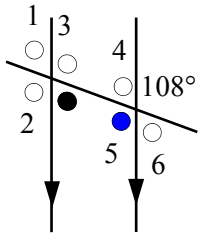
- supplementary, the angles adjacent (next to it) to the angle can be found by subtracting the given angle from 180°
- vertically opposite, the angle opposite the given angle is the same size as the angle
- then parallel line properties are used. Alternate, corresponding and co-interior can be used (it isn't necessary to use them all)

In column 1 a single angle is given, you are required to find the value of the black dotted angle in two solution 'moves'. The first step requires you to use supplementary or vertically opposite methods then for the second step use one of the parallel line properties.

The example below shows the angle given is 108°, vertically opposite was used to find 5 then co-interior to the black dotted angle. Note we could also use two other methods. Supplement to 4 then alternate to black dot or supplement to 6 and corresponding to black dot. Either way is correct. Note that the dots can be coloured, ensure that your colour choice is matched on the solution line.

Column 3 is an extension, this time the seven other angles are required. Use any method you like just make sure you give a reason, like the example below.

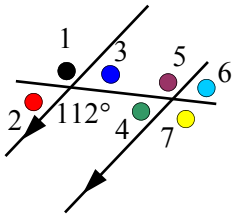
Example



● = 108° as vertically opposite

● = 72° as co-interior to ●

Example



● = 68° as supplement

● = 112° as vertically opposite

● = 68° as supplement

● = 68° as co-interior

● = 112° as alternate

● = 68° as supplement to ●

● = 112° as corresponding

Further Parallel Lines

1

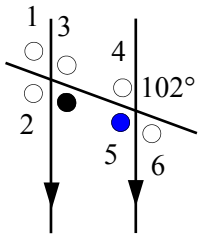
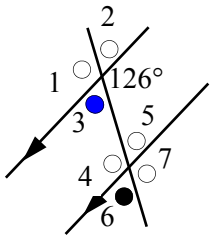
- (2)=55° as vertically opposite
- = 55° as 2 corresponds to •

2



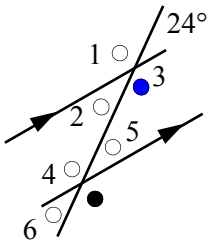
- (5)=102° as vertically opposite
- = 78° as 5 co-interior to •

3



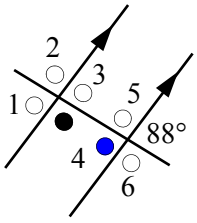
- (3) = 54° as supplement
- = 54° as corresponds to •

4



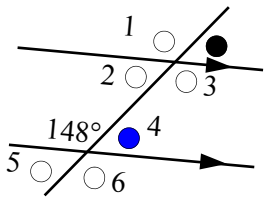
- (3) = 156° as supplement
- = 156° as corresponds to •

5



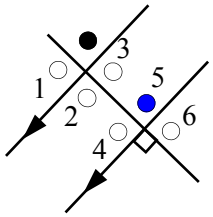
- (4)=92° as vertically opposite
- = 88° as co-interior to •

6



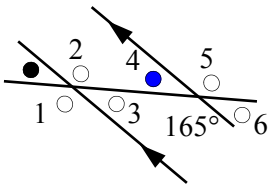
- (4) = 32° as supplement
- = 32° as corresponds to •

7



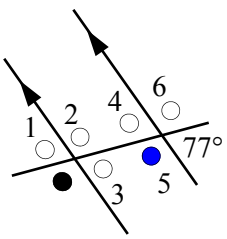
- (5)=90° as vertically opposite
- = 90° as corresponds to •

8



- (4) = 15° as supplement
- = 15° as corresponds to •

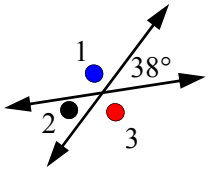
9



- (5) = 103° as supplement
- = 103° as corresponds to •

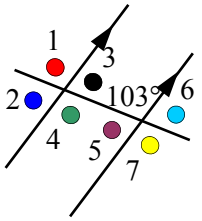
Now using the same skills find all the angles on the diagram, with reasons.

10



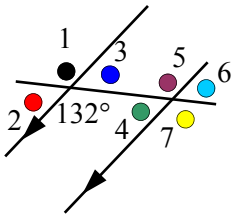
- (1)= 142° as supplement
- (2)=38° as vertically opposite
- (3)= 142° as supplement

11



- (3)= 77° as 5 co-interior
- (5)= 77° as supplement
- (4)= 103° as alternate
- (6)= 77° as supplement
- (7)= 103° as vertically opposite
- (1)= 103° as corresponding
- (2)= 77° as supplement to •

12



- (2)= 48° as supplement
- (1)= 132° as vertically opposite
- (3)= 48° as supplement
- (4)= 48° as co-interior
- (5)= 132° as alternate
- (6)= 48° as supplement to •
- (7)= 132° as corresponding

Measuring Angles in Triangles

This exercise is an introductory exercise to show that the angle sum of a triangle is 180°. Use a protractor to measure each angle in the triangles, note you should expect to experience some error in any measurement exercise, your total may be out by a degree.
Follow these steps:

- measure the angles with a protractor and then using the addition spaces in the bottom left corner add them and compare the total to 180°
- Repeat for all the triangles

Why are there errors? As the angles are not exactly a whole degree you may round them up or down, this will affect your total.

Angles in Triangles

The angle sum of a triangle is 180°. This property holds true regardless of the type of triangle. Types of triangles are:

- Equilateral - all sides equal length, all (internal) angles are 60°
- Isosceles - two sides equal length, two angles equal, note that the equal sides are opposite the equal angles
- Right angled triangle - has a right angle in the triangle with the other two angles being unequal
- Right Isosceles triangle - is a right angled triangle with the other two angles being equal (they must be 45°)
- Scalene triangle - all sides and all angles unequal, the words acute and obtuse can be used to further the description
- Acute triangle - all angles are less than 90°
- Obtuse triangle - one angle is greater than 90°, note that you can't have more than one obtuse angle in a triangle

Column 1 requires you to find the missing angle. Two angles are always given, subtract these from 180° to get the answer, (example at top of column). Once you have the 3 angles describe the type of triangle it is from the selection at the top of the sheet. Often the case is to use the word ‘obtuse’ in describing a triangle but not ‘acute’. So that if obtuse isn't used the triangle must be acute. This classification will only apply to scalene and isosceles triangles, right angled triangles and equilateral triangles can't contain an obtuse angle.

Column 3 tests your knowledge of isosceles and equilateral triangles. With equilateral triangles you know the angle is always 60°. So if the angle is $12w$ then that means $12w = 60°$ (÷ by 12) and $w = 5°$. If it was $15t$ then $15t = 60°$ (÷ by 15) and $t = 4°$. Note that in these questions you asked to find the value of the letter, this is different than finding the angle. For example if an angle is $20k$ in the corner of an equilateral triangle, $k = 3°$ but the actual angle is still 60°.

With isosceles triangles the process is the same except that instead of 60° the angle will match another angle on the diagram, question 18 is more challenging.

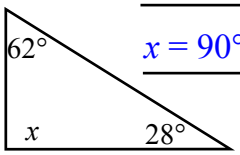
Find the missing angle, then classify (name the type of) the triangle.

Example $x = 180° - 62° - 28°$

$x = 90°$



Type: Right angled triangle

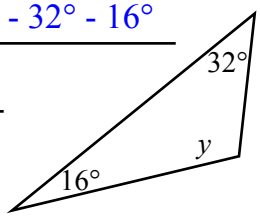
1 $y = 180° - 32° - 16°$

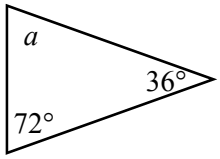
$y = 132°$



Type: Obtuse scalene triangle

2 $a = 180° - 72° - 36°$

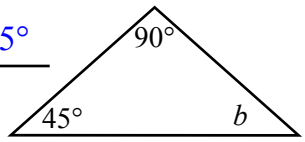
$a = 72°$



Type: Acute Isosceles Triangle

3 $b = 180° - 90° - 45°$

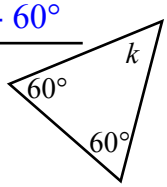
$b = 45°$



Type: Right Isosceles Triangle

4 $k = 180° - 60° - 60°$

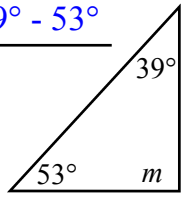
$k = 60°$



Type: Equilateral triangle

5 $m = 180° - 39° - 53°$

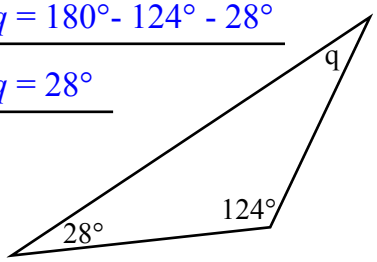
$m = 88°$



Type: Acute scalene triangle

6 $q = 180° - 124° - 28°$

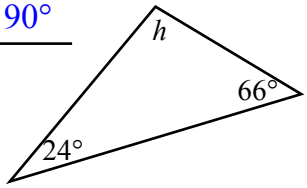
$q = 28°$



Type: Obtuse isosceles triangle

7 $h = 180° - 24° - 66°$

$h = 90°$



Type: Right angled triangle

Use the same method to solve, identify the type of triangle formed. Use '$x =$'

8 A triangle has angles 23° and 46°, find the other angle

$x = 180° - 23° - 46°$

$x = 111°$

Type: Obtuse scalene triangle

9 A triangle has angles 56° and 68°, find the other angle

$x = 180° - 56° - 68°$

$x = 56°$

Type: Acute isosceles triangle

10 Two identical angles in a triangle total 120°, find the other angle

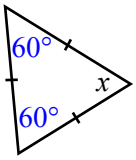
$x = 180° - 120°$

$x = 60°$

Type: Equilateral triangle

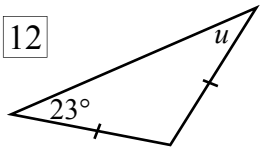
Use the side lengths to help you choose a method to find the value of the letters

11



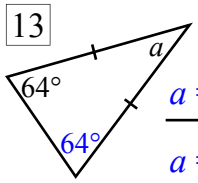
$x = 60°$

12



$u = 23°$

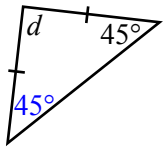
13



$a = 180° - 64° - 64°$

$a = 52°$

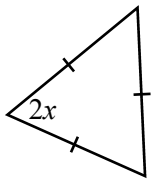
14



$d = 180° - 45° - 45°$

$d = 90°$

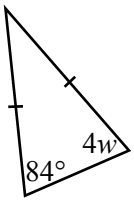
15



$2x = 60°$

$x = 30°$

16

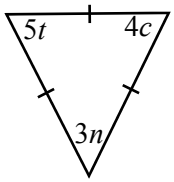


$4w = 84°$

$w = 21°$

These are harder

17



$4c = 60°$

$c = 15°$

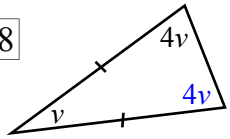
$5t = 60°$

$t = 12°$

$3n = 60°$

$n = 20°$

18



$9v = 180°$

$v = 20°$

Isosceles Triangles

Your knowledge of isosceles triangles and their properties will be tested throughout your mathematics studies, the 3 methods of finding missing angles are dealt with on this sheet. In column 1 your are given one angle and asked to find another. With a scalene triangle this is impossible because you require 2 angles to find the remaining angle, but because these are isosceles triangles you know that the angles opposite the sides with markings are equal.

Column 1 is done all the same way, place the number in the empty corner then you have your 2 angles. Then subtract the 2 angles from 180°. Look at question 1, the unlabelled angle is also 48°, so the working is s = 180° - 48° - 48° or s = 180° - 2 × 48°. The most common mistake when answering these questions is you will forget the unlabelled angle and subtract 48° from 180° instead of 48° doubled.

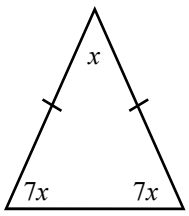
In column 2 the second type of problem is encountered, this time you are given the non-paired angle. This time 2 × (the letter) = 180° - (the given angle). An example is at the top of the column, the entire column is done using the same method. It is up to you if you write the letter in the unlabelled corner, but it is recommended.

Column 3 has written problems, 17 - 19 are the same as the previous columns, you just have to decide which method is used. The last 2 questions are harder, an example is below.

Example (questions 20 and 21)

A triangle has a pair of angles which are seven times the size of the other angle, find the size of all the angles. Let x = the smallest angle.

How this appears as a diagram:



The working required:

$7x + 7x + x = 15x$

$15x = 180°$

$\div 15$

$x = 12°$

$x = 12°$ and $7x = 84°$

Isosceles Triangles

Find the value of the pronumeral

1

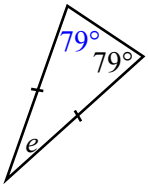
$s = 180° - 48° - 48°$

$s = 84°$

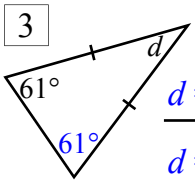
2



$e = 180° - 79° - 79°$

$e = 22°$

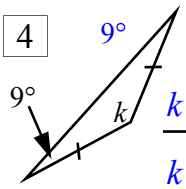
3



$d = 180° - 61° - 61°$

$d = 58°$

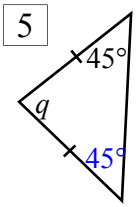
4



$k = 180° - 9° - 9°$

$k = 162°$

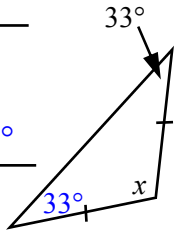
5



$q = 180° - 45° - 45°$

$q = 90°$

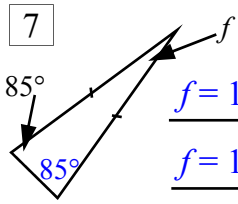
6



$x = 180° - 33° - 33°$

$x = 114°$

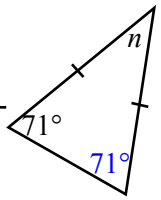
7



$f = 180° - 85° - 85°$

$f = 10°$

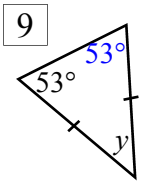
8



$n = 180° - 71° - 71°$

$n = 38°$

9



$y = 180° - 53° - 53°$

$y = 74°$

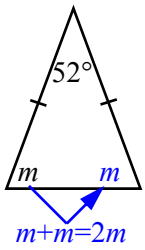
Find the value of the letter, these will take 3 lines to solve.

Example

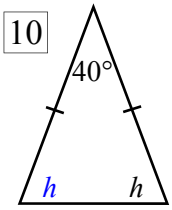
$2m = 180° - 52°$

$2m = 128°$

$m = 64°$



10

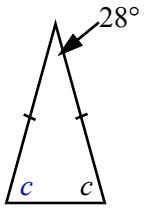


$2h = 180° - 40°$

$2h = 140°$

$h = 70°$

11

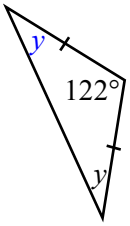


$2c = 180° - 28°$

$2c = 152°$

$c = 76°$

12

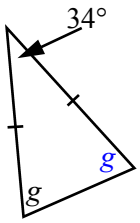


$2y = 180° - 122°$

$2y = 58°$

$y = 29°$

13

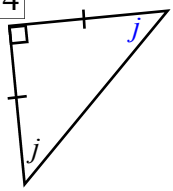


$2g = 180° - 34°$

$2g = 146°$

$g = 73°$

14

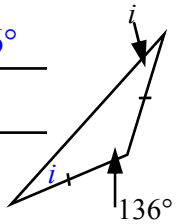


$2j = 180° - 90°$

$2j = 90°$

$j = 45°$

15

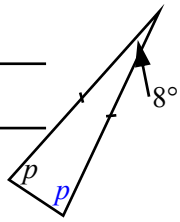


$2i = 180° - 136°$

$2i = 44°$

$i = 22°$

16



$2p = 180° - 8°$

$2p = 172°$

$p = 86°$

Solve these, you might not always need 3 lines. Use 'x=' in your working.

17 An isosceles triangle has one angle of 102°, find the size of the other angles

$2x = 180° - 102°$

$2x = 78°$

$x = 39°$

18 An isosceles triangle has a pair of angles of 17°, find the size of the other angle

$x = 180° - 17° - 17°$

$x = 146°$

19 An isosceles triangle has a pair of angles of 55°, find the size of the other angle

$x = 180° - 55° - 55°$

$x = 70°$

These are harder!

20 An isosceles triangle has a pair of angles that are twice the size of the other angle find the angles (Hint: use x and $2x$)

$5x = 180°$

$x = 36°$

$x = 36°$ $2x = 72°$

21 Repeat the above question only this time the angles are 4 times the size of the other.

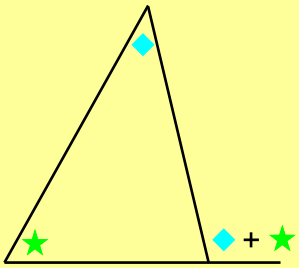
$9x = 180°$

$x = 20°$

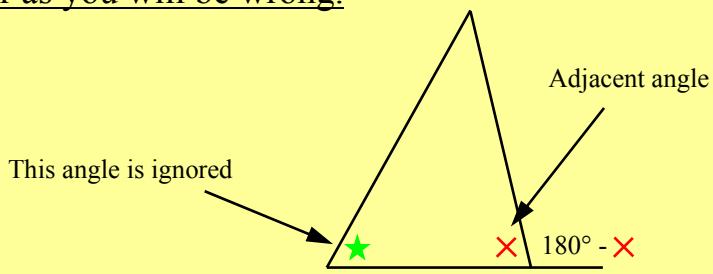
$x = 20°$ $4x = 80°$

Exterior Angles of a Triangle

There is a relationship between the exterior angle of a triangle and the 2 opposite interior angles, the sum of the 2 opposite interior angles = the exterior angle. In other words when you add the 2 opposite interior angles you get the exterior angle. The diagram below shows this graphically. It is important that you realise that the two opposite angles aren't adjacent to (don't touch) the exterior angle.



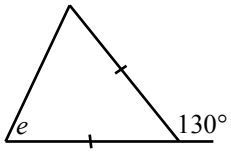
Column 1 Q.1 - 5 require you to add the two interior angles together to get the exterior angle. The adjacent angle is kept out of these questions. An example is at the top of the column. The next 3 questions show that if you have the adjacent internal angle you just take the supplement to get the external angle (subtract from 180°). So if the adjacent angle is one of the 2 angles, then just take the supplement (subtract it from 180°) of the adjacent angle. This is where the most common mistake is made, if the adjacent angle is given don't add it to the other angle to get your answer as you will be wrong.



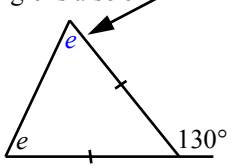
Column 2 works in reverse, you are given the exterior angle and have to calculate the missing interior angle. Do these by subtracting the given interior angle from the exterior angle, see the example at the top of the column.

The third column is challenging as it requires you to use your skills with isosceles and equilateral triangles as well as algebra. There is an example below.

Example : Find the angle



Because the triangle is isosceles the other base angle is also e



Solution:

$2e = 130°$ (opposite angle sum = exterior)

$e = 65°$

Exterior Angles of a Triangle

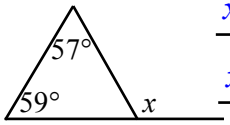
Find the exterior angle for the following triangles.

Example



$x = 57 + 59$

$x = 116°$

1

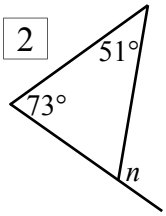
$h = 56 + 42$

$h = 98°$

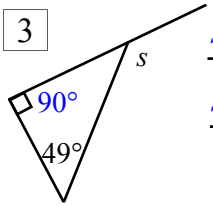
2



$n = 51 + 73$

$n = 124°$

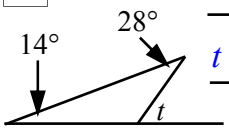
3



$s = 90 + 49$

$s = 139°$

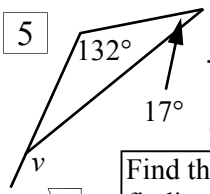
4



$t = 14 + 28$

$t = 42°$

5

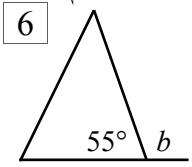


$v = 132 + 17$

$v = 149°$

Find the exterior angle by finding the supplement, ignore any extra angles.

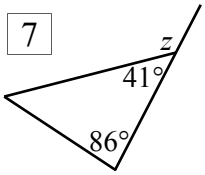
6



$b = 180 - 55$

$b = 125°$

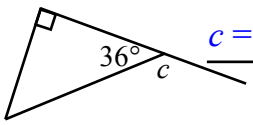
7



$z = 180 - 41$

$z = 139°$

8

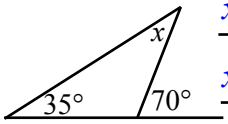


$c = 180 - 36$

$c = 144°$

Now the exterior angle is given, use subtraction to find the unknown angle.

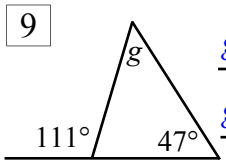
Example



$x = 70 - 35$

$x = 35°$

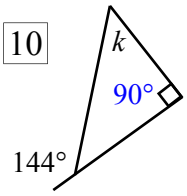
9



$g = 111 - 47$

$g = 64°$

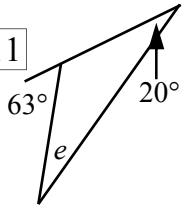
10



$k = 144 - 90$

$k = 54°$

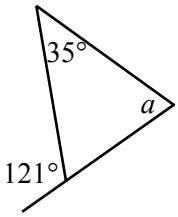
11



$e = 63 - 20$

$e = 43°$

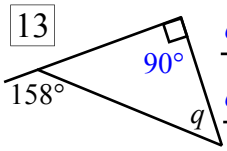
12



$a = 121 - 35$

$a = 86°$

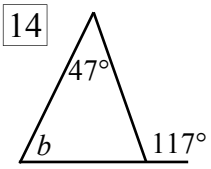
13



$q = 158 - 90$

$q = 68°$

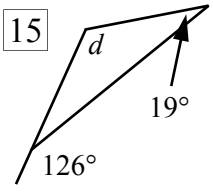
14



$b = 117 - 47$

$b = 70°$

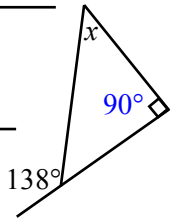
15



$d = 126 - 19$

$d = 107°$

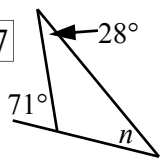
16



$x = 138 - 90$

$x = 48°$

17

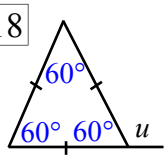


$n = 71 - 28$

$n = 43°$

Use your knowledge of triangle properties to find the value of the angles

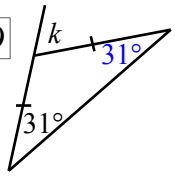
18



$u = 60 + 60$

$u = 120°$

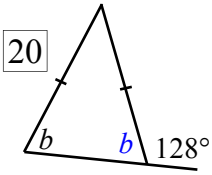
19



$k = 31 + 31$

$k = 62°$

20



$b = 180 - 128$

$b = 52°$

21 Hint: Find a then b then c

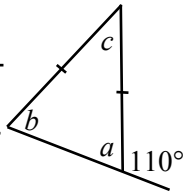
$a = 180 - 110$

$a = 70°$

$b = 70°$ (isos)

$c = 110 - 70$

$c = 40°$



22

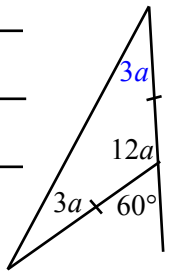
$3a + 3a = 6a$

$6a = 60$

$a = 10°$

$3a = 30°$

$12a = 120°$



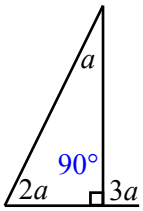
23

$3a = 180 - 90$

$3a = 90$

$a = 30°$

$2a = 60°$



Angles in Quadrilaterals

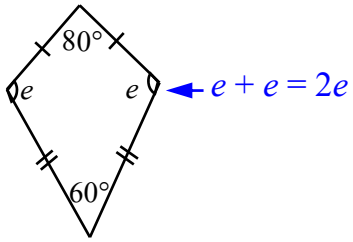
The angle sum of a quadrilateral is 360°, this means that when all the angles inside the shape are added, they total 360°. If you are given 3 angles then to find the missing angle subtract the 3 angles from 360° and what is left is the your answer.

In column 1 through to question 11 the exercises are all done the same way, you are given 3 angles (remember a right angle is 90°), subtract these from 360°. If you write in '90°' in the space next to the right angle sign you have less chance of forgetting it in your calculations. The question at the top of the 1st column shows the setting out for the exercises.

The rest of column 2 involves a small amount of algebra. The exercises are done in the same way as the first column in that the missing angles equal 360° minus the given angles. Because in the questions the 2 unknown angles are the same then you can add the letters together, i.e. $a + a = 2a$, $x + x = 2x$. An example is below. Question 20 is a similar style of question.

Column 3 is the same as the first column only one of the angles given is an exterior angle. To change the exterior angle to an interior angle subtract it from 360°. Then you have 3 interior angles which subtracted from 360° gives you the missing angle. The most common mistake is forgetting to change the exterior angle it to an interior angle in these questions.

Example: Find the value of e



Solution:

$2e = 360° - 80° - 60°$

$2e = 220°$

$e = 110°$

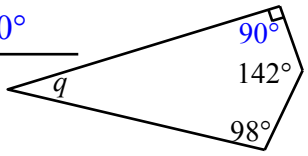
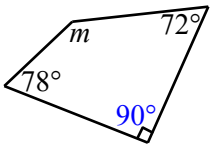
9 $q = 360° - 90° - 142° - 98°$

$q = 30°$



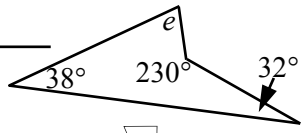
10 $m = 360° - 78° - 90° - 72°$

$m = 120°$



11 $e = 360° - 38° - 32° - 230°$

$e = 60°$

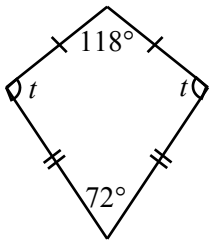


These have 2 unknown angles

12 $2t = 360° - 118° - 72°$

$2t = 170°$

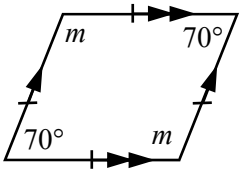
$t = 85°$



13 $2m = 360° - 70° - 70°$

$2m = 220°$

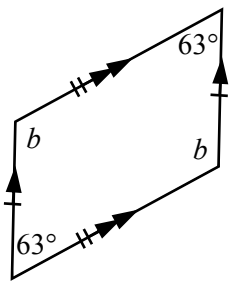
$m = 110°$



14 $2b = 360° - 63° - 63°$

$2b = 234°$

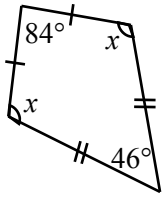
$b = 117°$



15 $2x = 360° - 84° - 46°$

$2x = 230°$

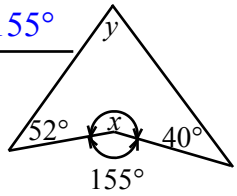
$x = 115°$



Convert the exterior angles to interior angles to find x then solve for y.

16 $x = 360° - 155°$

$x = 205°$

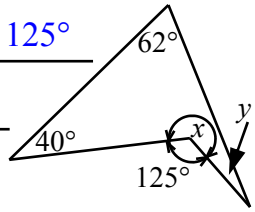


$y = 360° - 205° - 52° - 40°$

$y = 63°$

17 $x = 360° - 125°$

$x = 235°$

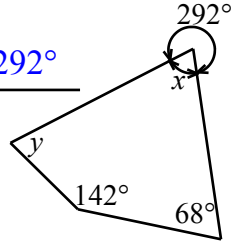


$y = 360° - 235° - 40° - 62°$

$y = 23°$

18 $x = 360° - 292°$

$x = 68°$

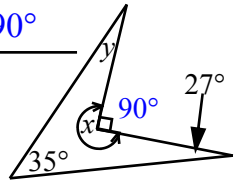


$y = 360° - 68° - 68° - 142°$

$y = 82°$

19 $x = 360° - 90°$

$x = 270°$

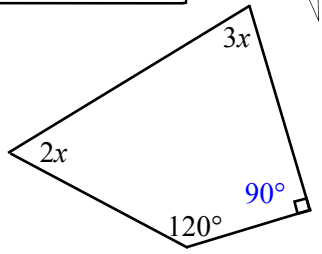


$y = 360° - 270° - 27° - 35°$

$y = 28°$

Find the 2 angles

20



$5x = 360° - 120° - 90°$

$5x = 150°$ $2x = 60°$

$x = 30°$ $3x = 90°$

Classifying, Naming and Measuring Angles

Classification means to group into categories. There are six classifications in all:

- acute angles are between 0° and 90°
- a right angle is exactly 90°
- obtuse angles are between 90° and 180°
- a straight angle is exactly 180°
- reflex angles are between 180° and 360°
- and a revolution is 360°

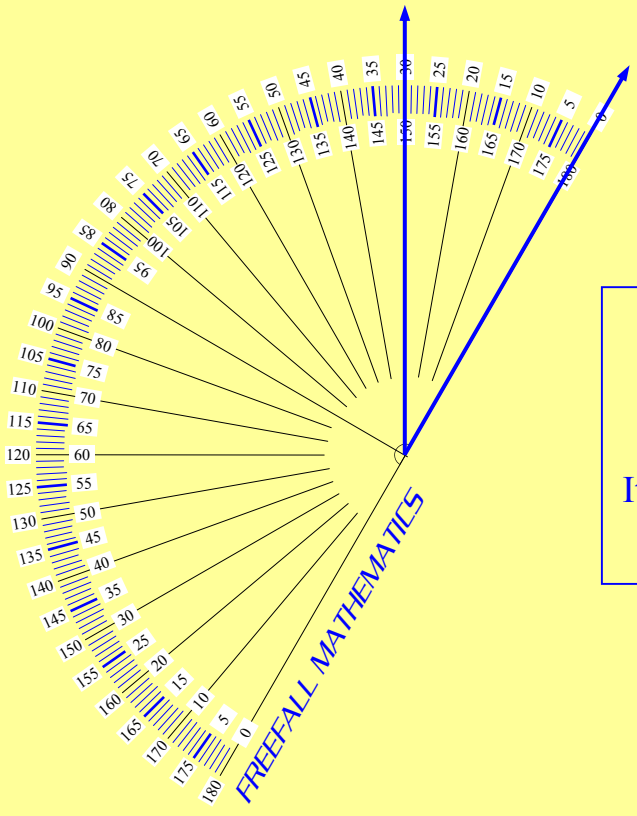
How do you remember all these? You should be able to remember the straight angle, right angle and revolution, it is the others you could mix up. Remember that as the angle increases you move through the alphabet. A (acute) is before O(Obtuse) which is before R(reflex).

To name an angle we generally use 3 letters, moving from ray-to vertex-to ray. The vertex is always in the middle. To show that it is an angle you put an angle sign in front of it or write the letters placing a hat over the vertex.

$\angle ABC$ or, $\hat{ABC}$

A protractor is required for the second column of this worksheet.

When using a standard protractor ensure you use the correct scale (inside or outside, make sure the scale used starts at 0°) and if the angle is a reflex (greater than 180°), measure the outside of the angle then subtract the angle from 360°. If an angle is measured and it is above 90°, then it must be larger than a right angle, so when you record the size of the angle, look at the angle and check in relation to 90° and 180°.



This angle would be 30° not 150°. Look at where the 0° is, that is the scale you use.

It is also less than a right angle, so it can't be more than 90°.

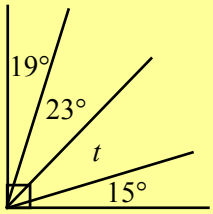
29	∠ XBJ	340°	Reflex
30	∠ NXE	82°	Acute
31	∠ TNP	90°	Right
32	∠ ACD	187°	Reflex

Adjacent, Complementary and Supplementary Angles

Adjacent means next to, in the case of angles this means that the angle shares a common ray (or arm) and vertex with the angle beside it. Complementary angles add to give 90°, while supplementary angles add to 180°.

Here are a few examples of Column 1 style questions. Find the unknown angles.

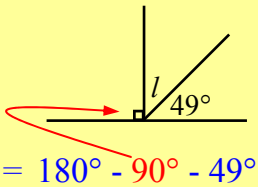
Complementary Angles add to 90°



t = 90° - 19° - 23° - 15°

t = 33°

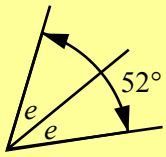
Supplementary Angles add to 180°



l = 180° - 90° - 49°

l = 41°

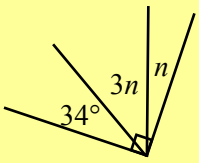
Adjacent Angles add to the total of the angles



$2e$ = 52°

e = 26°

The second column involves the use of 2-step equations. Below is an example.



$n + 3n + 34 = 90$ ← Add up all the angles, the total will equal 90° because the angles sum to a right angle.

$4n + 34 = 90$ ← Collect like terms: ($n + 3n = 4n$)

-34 -34 ← Remove the number from the LHS, so subtract 34 from both sides.

$4n = 56°$

÷4 ÷4 ← Remove the coefficient from the LHS, so Divide both sides by 4

$n = 14°$

$3n = 42°$ ← The value of n has been found, which is one of the angles. The other angle is $3n$, so multiply n by 3 to find $3n$. $3 \times 14 = 42°$.

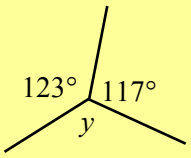
Angles at a Point & Vertically Opposite Angles

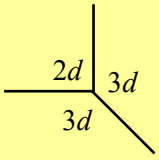
Angles at a point sum to 180°. These questions are answered the same way as complementary angles and supplementary angles, the difference being instead of a 90° or 180° total, it is 360°. Vertically opposite angles are equal. So when two straight lines intersect, the angles formed that are opposite each other are equal. Because these angles are formed by straight lines, the adjacent angle can be found by finding its supplement. (Subtracting it from 180°.)

Some examples of Angle at a point questions:



$y = 360° - 123° - 117°$

$y = 120°$

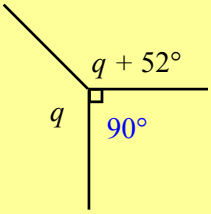


$2d = 90°$

$8d = 360°$

$d = 45°$

$3d = 135°$



$q + q + 52 + 90 = 360$

$2q + 142 = 360$

$-142 \quad -142$

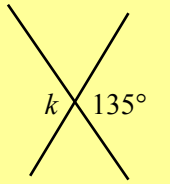
$2q = 218$

$\div 2 \quad \div 2$

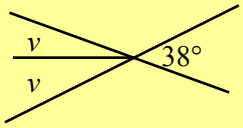
$q = 109°$

$q + 52 = 161°$

Some examples of Vertically opposite angles questions:

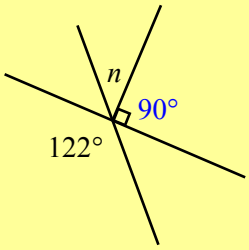


$k = 135°$



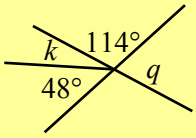
$2v = 38°$

$v = 19°$



$n = 122° - 90°$

$n = 32°$



$k = 180° - 114° - 48°$

$k = 18°$

$q = 48° + 18°$

$q = 66°$

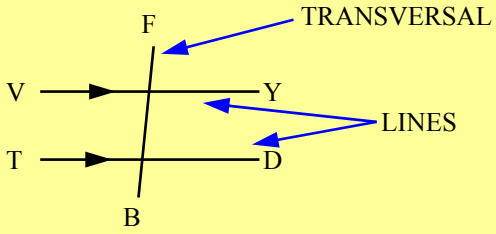
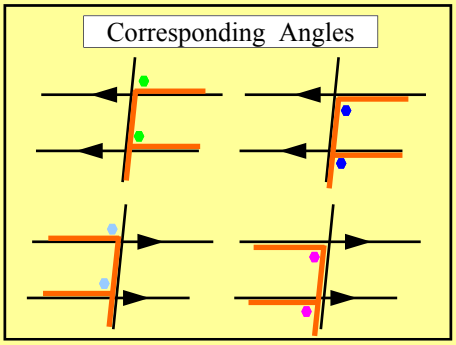
Parallel Line Properties

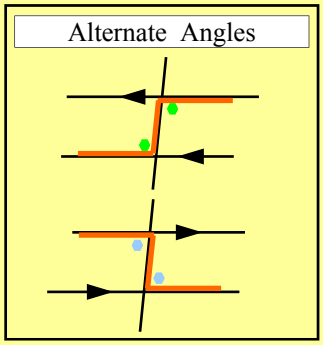
When two lines are parallel they are an equal distance apart for their full length and never touch. A transversal is a line that cuts across parallel lines, by crossing the lines 8 angles are created.

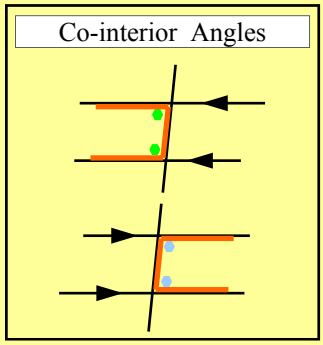


Lines are VY or YV and TD or DT
Transversal is either FB or BF

These angles can be paired off with each other in the following way:







Corresponding angles (called F angles) require one point to be on the inside of the parallel lines and the other to be on the outside. An 'F ' or back to front ‘F’ is made by the lines that include these angles.

Alternate angles (called Z angles) are also on the inside of the parallel lines but unlike co-interior angles they are on opposite sides of the transversal. A 'Z' can be made by the lines that include these angles.

Co-interior angles (called C angles) are the pair of angles formed on one side of the transversal inside the parallel lines, a 'c' can be formed around the angles (one is back to front). There are only two co-interior angle pairs in a standard 2-line 1 transversal exercise. Remember the word interior means on the inside (of the parallel lines and the transversal).

Column 1 of the worksheet asks you to name the transversal and parallel lines. Use the letters at the end of the lines, it doesn’t matter which way you name them. The next questions ask you to say whether the marked angles are corresponding, co-interior or alternate angles. So look at the positions of the square and circle and then choose. The last questions ask you to mark the corresponding (alternate or co-interior) angle by colouring in a circle.

Column 2 asks you to find the angles and state if they are corresponding etc. Corresponding and Alternate angles are equal when lines are parallel. Co-interior angles are supplementary, that is, given one angle subtract it from 180° to find the other.

Parallel Line Properties

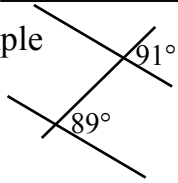
Are these lines parallel? Explain why they are or aren't, using angle properties in your description.

Example 


Lines aren't parallel because corresponding angles aren't equal.

30 
Lines aren't parallel because co-interior angle sum isn't 180°.

31 
Lines aren't parallel because co-interior angle sum isn't 180°.

32 
Lines are parallel as co-interior angles are equal.

Parallel Lines

The previous sheet dealt parallel line properties. When a transversal intersects a pair of parallel lines then co-interior, corresponding and alternate angles are formed. This sheet uses those properties to calculate other angles. The sheet also uses vertically opposite angles, angles at a point, supplementary angles and angle sum of a triangle.

The requirement is that you solve a question using the above properties, give your answer, then indicate which one of the properties you used to get the answer. In other words you are giving a reason why the angle is the size you have calculated.

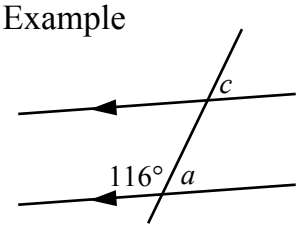
There is an example at the top of the column, note that you can get the same answer by using different methods. For example a student may use alternate angles when another uses corresponding angles. Both can be correct, as they can be using a different angle to get to their answer.

Parallel Lines

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the unknown angles. Give a reason for how you found the angle using, for example: Co-interior angles, Corresponding angles, Alternate angles, Vertically opposite, Supplementary, etc.

Example



$a = 180 - 116 = 64°$

Supplementary angles.

$c = 64°$

Corresponding angles.

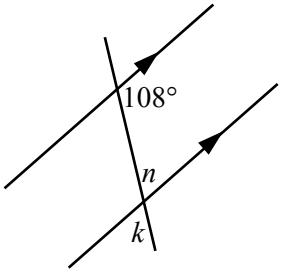
1 $n = 180 - 108 = 72°$

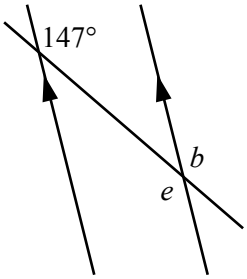
Co-interior angles.

$k = 72°$

Vertically opposite n



2



$e = 147°$

Alternate angles.

$b = 147°$

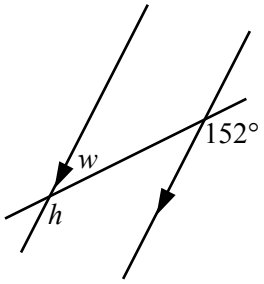
Vertically opposite e

3 $h = 152°$

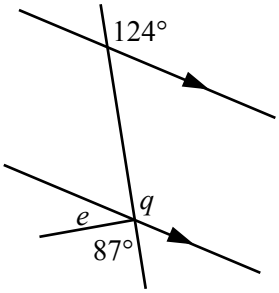
Corresponding angles.

$w = 180 - 152 = 28°$

Supplementary angles.



4



$q = 124°$

Corresponding angles.

$e = 124 - 87 = 37°$

Adjacent angles are vertically opposite q

5 $c = 51°$

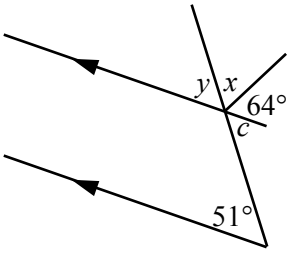
Alternate angles.

$y = 51°$

Vertically opposite c

$x = 180 - 64 - 51 = 65°$

Supplementary angles.



6 $p = 71°$

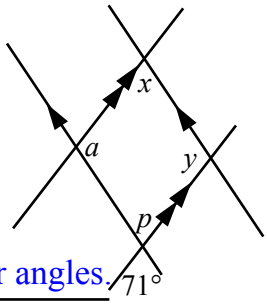
Vertically opposite.

$a = 180 - 71 = 109°$

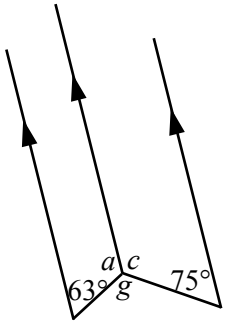
Co-interior angles.

$y = 180 - 71 = 109°$ Co-interior angles.

$y = 180 - 109 = 71°$ Co-interior angles.



7



$c = 180 - 75 = 105°$

Co-interior angles.

$a = 180 - 63 = 117°$

$g = 360 - 117 - 105 = 138°$

Angle sum at a point is 360°.

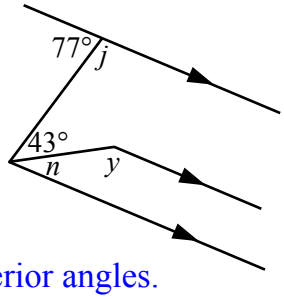
8 $j = 180 - 77 = 103°$

Supplementary angles.

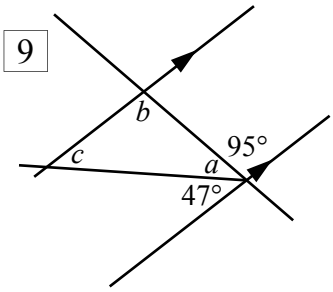
$n = 77 - 43 = 34°$

Alternate angles.

$y = 180 - 34 = 146°$ Co-interior angles.



9



$a = 180 - 47 - 95 = 38°$

Supplementary angles.

$b = 95°$

Alternate angles.

$c = 47°$

Alternate angles.

10 $v = 58°$

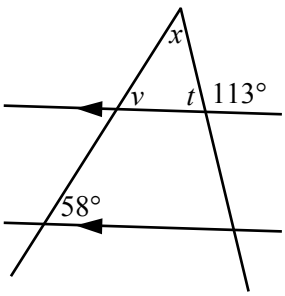
Corresponding angles.

$t = 180 - 113 = 67°$

Supplementary angles.

$x = 180 - 58 - 67 = 55°$

Angle sum of a triangle is 180°



Angles in Triangles

The angle sum of a triangle is 180°. This property holds true regardless of the type of triangle.

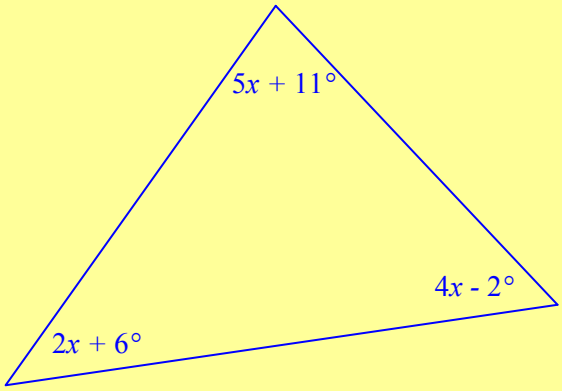
Column 1 requires you to find the missing angle. Two angles are always given, unless the triangle has a particular property such as equilateral triangles. Subtract the given angles from 180° to get the answer, (example at top of column). Note that you may have to use your vertically opposite and supplementary geometry skills.

Column 2 deals with isosceles triangles, base angles are the same with isosceles triangles. Place the same number in the empty corner then you have your two angles. Then subtract the angles from 180°.

In column 2 from question 11 the second type of problem is encountered. This time you are given the non-paired angle. This time 2 × (the letter) + the given angle = 180°. So a 2-Step equation is used to solve these. Question 11 guides you through the process.

The last two questions in Column 3 require you to collect like terms, then solve the resulting 2 -Step equation. An example is below.

Example - Find the angles in the triangle below.



$2x + 6 + 5x + 11 + 4x - 2 = 180$ ← Sum of internal angles = 180°

$11x + 15 = 180$ ← Collect like terms

$-15 \quad -15$

$11x = 165$ ← Remove the constant

$\div 11 \quad \div 11$

$x = 15°$ ← Remove the coefficient

$2x + 6 = 36°$ $\quad 5x + 11 = 86°$ ← Now find the individual angles

$4x - 2 = 58°$

Use your calculator to add the three angles to make sure that the angle sum is 180°.

Angles in Triangles

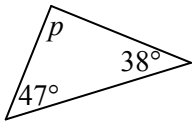
Angles in Triangles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Angles in triangles sum to 180°. Find the value of the unknown in these triangles.

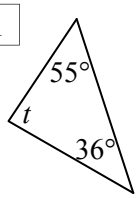
Example



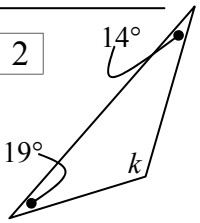
$p = 180 - 47 - 38$

$p = 95°$

1



2



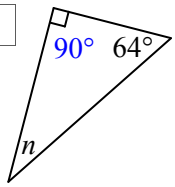
1 → $t = 180 - \boxed{55} - \boxed{36}$

$t = 89°$

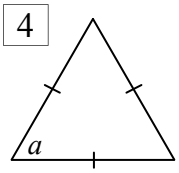
2 → $k = 180 - 14 - 19$

$k = 147°$

3



4



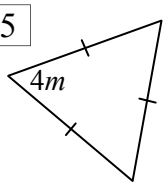
3 → $n = 180 - 90 - 64$

$n = 26°$

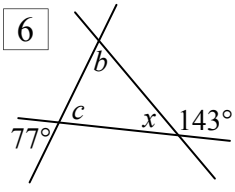
4 → $a = 60°$ or $3a = 180$

$a = 60°$

5



6



5 → $4m = 60°$

$m = 15°$

6 → $c = 77°$

$x = 180 - 143$

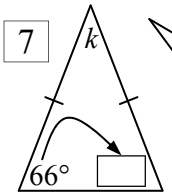
$x = 37°$

$b = 180 - 77 - 37$

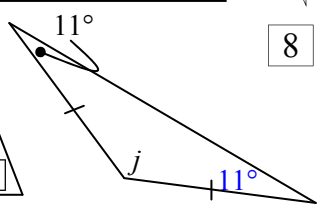
$b = 66°$

For these isosceles triangles, write in the matching angle, then find the unknown value.

7



8



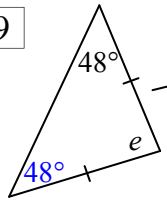
7 → $k = 180 - \boxed{66} - \boxed{66}$

$k = 48°$

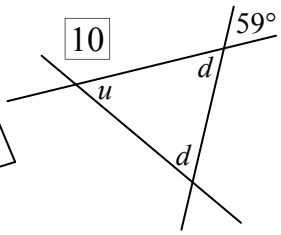
8 → $j = 180 - 11 - 11$

$j = 158°$

9



10



9 → $e = 180 - 48 - 48$

$e = 84°$

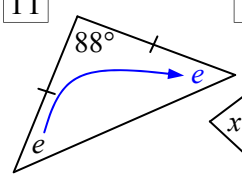
10 → $d = 59°$

$u = 180 - 59 - 59$

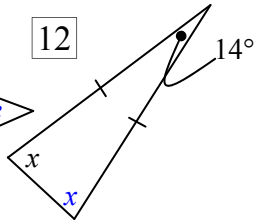
$u = 62°$

Use 2-step equations to find the value of the unknown.

11



12



11 → $2e + 88 = 180$

$-88 \quad -88$

$2e = \boxed{92}$

$\div 2 \quad \div 2$

$e = 46°$

12 → $2x + 14 = 180$

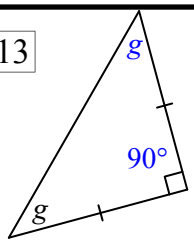
$-14 \quad -14$

$2x = 166$

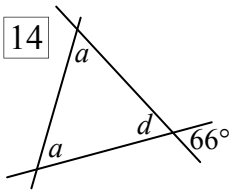
$\div 2 \quad \div 2$

$x = 83°$

13



14



13 → $2g + 90 = 180$

$-90 \quad -90$

$2g = 90$

$\div 2 \quad \div 2$

$g = 45°$

14 → $d = 66°$

$2a + 66 = 180$

$-66 \quad -66$

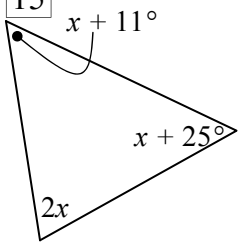
$2a = 114$

$\div 2 \quad \div 2$

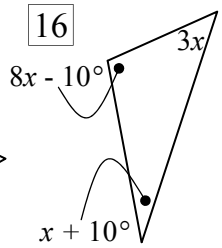
$a = 57°$

These are more complicated. Find all angles in the triangles.

15



16



$x + 11 + x + 25 + 2x = 180$

$4x + 36 = 180$

$-36 \quad -36$

$4x = 144$

$\div 4 \quad \div 4$

$x = 36°$

$2x = 72°$ $x+11° = 45°$ $x+25° = 61°$

16 →

$x + 10 + 3x + 8x - 10 = 180$

$12x = 180$

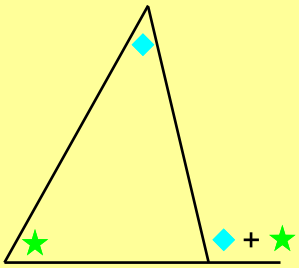
$\div 12 \quad \div 12$

$x = 15°$

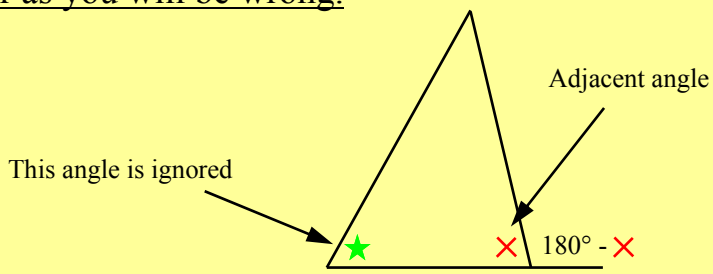
$3x = 45°$ $x+10° = 25°$ $8x-10° = 110°$

Exterior Angles of a Triangle

There is a relationship between the exterior angle of a triangle and the 2 opposite interior angles, the sum of the 2 opposite interior angles = the exterior angle. In other words when you add the 2 opposite interior angles you get the exterior angle. The diagram below shows this graphically. It is important that you realise that the two opposite angles aren't adjacent to (don't touch) the exterior angle.



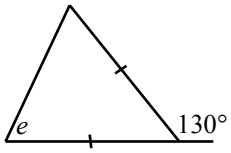
Column 1 Q.1 - 5 require you to add the two interior angles together to get the exterior angle. The adjacent angle is kept out of these questions. An example is at the top of the column. The next 3 questions show that if you have the adjacent internal angle you just take the supplement to get the external angle (subtract from 180°). So if the adjacent angle is one of the 2 angles, then just take the supplement (subtract it from 180°) of the adjacent angle. This is where the most common mistake is made, if the adjacent angle is given don't add it to the other angle to get your answer as you will be wrong.



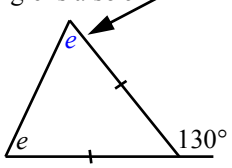
Column 2 works in reverse, you are given the exterior angle and have to calculate the missing interior angle. Do these by subtracting the given interior angle from the exterior angle, see the example at the top of the column.

The third column is challenging as it requires you to use your skills with isosceles and equilateral triangles as well as algebra. There is an example below.

Example : Find the angle



Because the triangle is isosceles the other base angle is also e



Solution:

$2e = 130°$ (opposite angle sum = exterior)

$e = 65°$

Exterior Angles of a Triangle

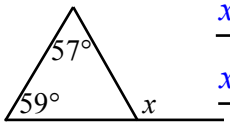
Exterior Angles of a Triangle

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the exterior angle for the following triangles.

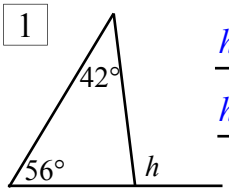
Example



$x = 57 + 59$

$x = 116°$

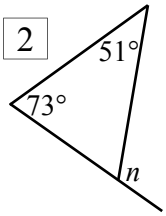
1



$h = 56 + 42$

$h = 98°$

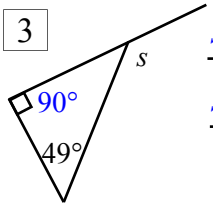
2



$n = 51 + 73$

$n = 124°$

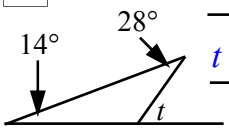
3



$s = 90 + 49$

$s = 139°$

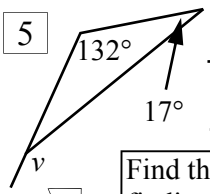
4



$t = 14 + 28$

$t = 42°$

5

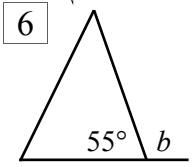


$v = 132 + 17$

$v = 149°$

Find the exterior angle by finding the supplement, ignore any extra angles.

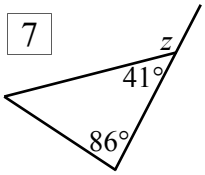
6



$b = 180 - 55$

$b = 125°$

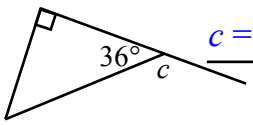
7



$z = 180 - 41$

$z = 139°$

8

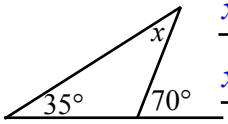


$c = 180 - 36$

$c = 144°$

Now the exterior angle is given, use subtraction to find the unknown angle.

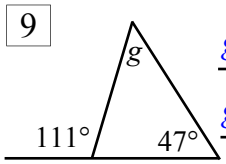
Example



$x = 70 - 35$

$x = 35°$

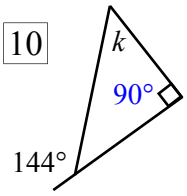
9



$g = 111 - 47$

$g = 64°$

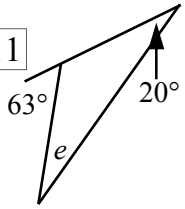
10



$k = 144 - 90$

$k = 54°$

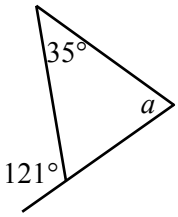
11



$e = 63 - 20$

$e = 43°$

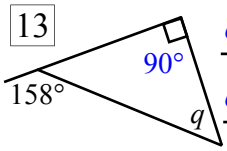
12



$a = 121 - 35$

$a = 86°$

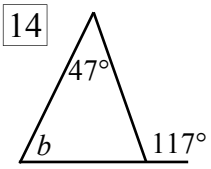
13



$q = 158 - 90$

$q = 68°$

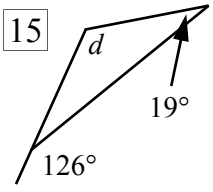
14



$b = 117 - 47$

$b = 70°$

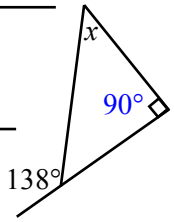
15



$d = 126 - 19$

$d = 107°$

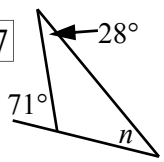
16



$x = 138 - 90$

$x = 48°$

17

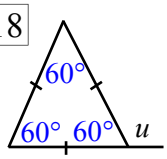


$n = 71 - 28$

$n = 43°$

Use your knowledge of triangle properties to find the value of the angles

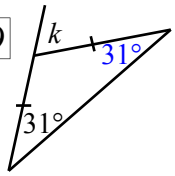
18



$u = 60 + 60$

$u = 120°$

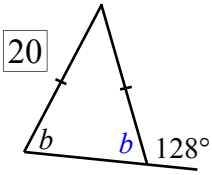
19



$k = 31 + 31$

$k = 62°$

20



$b = 180 - 128$

$b = 52°$

21 Hint: Find a then b then c

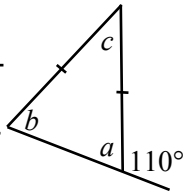
$a = 180 - 110$

$a = 70°$

$b = 70°$ (isos)

$c = 110 - 70$

$c = 40°$



22

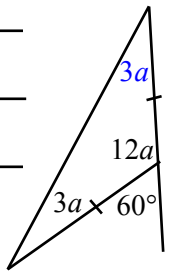
$3a + 3a = 6a$

$6a = 60$

$a = 10°$

$3a = 30°$

$12a = 120°$



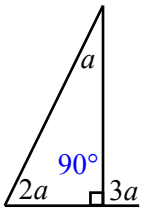
23

$3a = 180 - 90$

$3a = 90$

$a = 30°$

$2a = 60°$



Angles in Quadrilaterals

The angle sum of a quadrilateral is 360°, this means that when all the angles inside the shape are added, they total 360°. If you are given 3 angles then to find the missing angle subtract the 3 angles from 360° and what is left is the your answer.

In column 1 through to question 11 the exercises are all done the same way, you are given 3 angles (remember a right angle is 90°), subtract these from 360°. If you write in '90°' in the space next to the right angle sign you have less chance of forgetting it in your calculations. The question at the top of the 1st column shows the setting out for the exercises.

The rest of column 2 involves a small amount of algebra. The exercises are done in the same way as the first column in that the angles total 360°. But a 2-step equation is to be solved.

Column 3 is the same as the first column only one of the angles given is an exterior angle. To change the exterior angle to an interior angle subtract it from 360°. Then you have 3 interior angles which subtracted from 360° gives you the missing angle. The most common mistake is forgetting to change the exterior angle it to an interior angle in these questions.

RATES & RATIOS

Ratios - Introduction

Ratios are a comparison. For example the number of steps to the height of the stairs. This sheet will deal with comparing lengths, numbers of objects etc. So you will measure or count and write the number in the box. So the numbers in the ratio will match the amount counted or measured, once you learn about simplifying ratios you will learn that the ratio doesn't necessarily match the amount. So this sheet is just an introduction.

Column 1 starts with counting squares that make a shape. There are shaded, unshaded and the total number of both that build the shape. Count the squares and write the answer in the box in the same order as the 'worded' ratio, ratios can have a larger first number and smaller second number, or the reverse. Ratios aren't limited to two numbers, they can compare an unlimited amount of items. Measure the lines in column 1, write the length in the box then compare using ratios.

The rest of the sheet is answered in the same way. The last questions in column 3 ask you to write ratios in fraction form. The first number in the ratio is the numerator, the second number the denominator.

There is a similarity between fractions and ratios. Both are simplified in the same way, and equivalence also is found using the same method.

Ratios can also be expressed as fractions. Express as fractions.

Kwa's pencil case has 5 blue pens, 2 red pens, 4 black pens and a green pen. Complete these ratios:

27 Blue : Black = $\frac{5}{4}$

28 Blue : Red = $\frac{5}{2}$

29 Green : Red = $\frac{1}{2}$

30 Blue : All = $\frac{5}{12}$

31 Green & Red : All = $\frac{3}{12}$

32 Blue : Green & Blue = $\frac{5}{6}$

33 Not Blue : Not Green = $\frac{7}{11}$

Simplifying Ratios - No Decimals/Fractions

There are two sheets in this topic, the second sheet being more complex.
It is suggested that only sheet should be chosen as the first column is similar in both.

Ratios compare two (or more) values. Simplifying ratios is important because ratios could be applied to other amounts and applying a complicated ratio makes things harder. So how do you simplify a ratio? Ratios can be simplified using the same process as with fractions. Pick the HCF (Highest Common Factor) and divide through.

Example - Simplifying Ratios

$$9 : 15 \quad \underbrace{\boxed{3}}_{\text{HCF}} = \underbrace{\boxed{3} : \boxed{5}}_{\substack{9 \div \text{HCF} = 9 \div 3 \\ 15 \div \text{HCF} = 15 \div 3}}$$

Column 1 starts with questions that ask you to find the HCF. Look at the two numbers and ask yourself what is the largest number that divides into both numbers. Q.14 onwards asks you to find the HCF and then divide through, the process is shown above. This is how you simplify ratios. Note that ratios can have more than two numbers, ratios with three numbers are shown in the last column.

Column 2 introduces use of the ratios with shapes and line measurement. Count the shaded squares, that is the first number in the ratio. Then count the squares that make the shape, both shaded and unshaded. This is the second number in the ratio. Then simplify.

With the line measurement, measure the lines with a ruler and record the length (in whole cm) in the box on the line. Then use the line lengths to create ratios in the spaces provided, these can all be simplified.

Column 3 introduces calculator use. There are three outcomes when using a calculator's fraction key to solve ratios. You could get a proper fraction answer, a mixed numeral or a whole number. If you get a proper fraction, this is the answer, using ':' rather than a ⌟ .

If you get a whole number write the answer ': 1'. For example the answer 6 would be written down as '6 : 1'.

If you get a mixed numeral then use 'SHIFT' or the '2nd F' key with the fraction key to convert it to an improper fraction then write that as your answer.

Note that the calculator can only be used to solve ratios with two numbers. If there are more than two numbers then you need to use the HCF method and solve them mentally.

Simplifying Ratios - No Decimals/Fractions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the HCF for these numbers, which is the largest number that will divide into both numbers.

Examples

4, 6. = 2 9, 12. = 3

1 3, 6. = 2 2, 8. =

3 9, 12. = 4 5, 20. =

5 12, 14. = 6 9, 15.=

7 6, 12. = 8 15, 30.=

Now use the HCF to simplify these ratios. Use division.

9 15 : 10 5 HCF = (15÷5 : 10÷5)

10 8 : 12 4 HCF = (8÷4 : 12÷4)

11 14 : 35 7 HCF =

12 24 : 18 6 HCF =

13 10 : 100 10 HCF =

Find the HCF then use it to simplify these ratios.

14 4 : 8 HCF =

15 9 : 6 HCF =

16 12 : 20 HCF =

17 30 : 15 HCF =

18 12 : 24 HCF =

19 100 : 50 HCF =

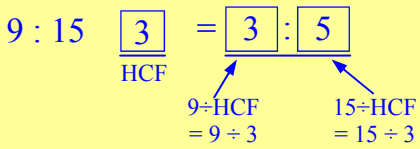
Simplifying Ratios

Ratios compare two (or more) values. Simplifying ratios is important because ratios could be applied to other amounts and applying a complicated ratio makes things harder. So how do you simplify a ratio? Ratios can be simplified using the same process as with fractions. Pick the HCF (Highest Common Factor) and divide through.

Example - Simplifying Ratios



Column 1 starts with questions that ask you to find the HCF. Look at the two numbers and ask yourself what is the largest number that divides into both numbers. Q.9 onwards asks you to find the HCF and then divide through, the process is shown above. This is how you simplify ratios. Note that ratios can have more than two numbers, ratios with three numbers are shown lower in the column.

Column 2 introduces use of the calculator to solve ratios. Note that the calculator can only be used to solve ratios with two numbers. If there are more than two numbers then you need to use the HCF method and solve them mentally.

Decimals and fractions are also introduced, again these can be solved with a calculator if only two numbers (fractions/decimals) are involved. Calculator steps are shown at the top of the column.

Column 3 ends with comparing two quantities. If the units used are like then you can solve straight away using the HCF or calculator method. If the units are different though, you need to convert the measurements to the same unit. It doesn't matter which way you convert, either to the smaller or larger of the two units. Once you have converted …. simplify.

Simplifying Ratios

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the HCF for these numbers, which is the largest number that will divide into both numbers.

Examples

4, 6. = 2 9, 12. = 3

1 8, 12. = 2 9, 6. =

58 2 cm^2 : 40 mm^2 = 200 mm^2 : 40 mm^2 = 5 : 1

Further Simplifying Ratios

Ratios can be solved mentally and with a calculator. This worksheet concentrates on mentally solving ratios. You can still use a calculator to assist you, but the calculator can't be used to complete the whole process.

Column 1 starts with decimals. The method is to remove the decimal point completely, so you are working with whole numbers. So multiply by 10, 100 or 1 000 … whatever it takes to remove the decimal point from all the decimals. Then solve by finding the HCF (highest common factor). The ratios are triples so a calculator can't be used to solve them. There is an example at the top of the column.

Further in column 1 are some questions on changing ratios so that the first number is 1. This means 'If I have one of these how many of these do I have?' To solve these, divide the numbers in the ratio by the first number. That makes the first number '1' and the second number either a number or fraction or mixed numeral. There is an example above Q.6.

Column 2 involves fractions. To simplify these you need to make equivalent fractions by matching the denominators for all the fractions. The top row of numbers (the numerators) will become the ratio. Check that it can't be simplified.

Column 3 features ratios with different units, they are triples again so a calculator fraction key can't be used. Use the first line to rewrite the ratio so that the units match, so change the units to the most suitable unit. Your choice won't affect the answer but may not fit in the space provided, so keep this in mind. Once converted to the same unit, divide through by the HCF and simplify the ratios. Use a calculator to assist you with some of the divisions if required.

Further Simplifying Ratios

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Decimals in ratios are removed by moving the decimal point until integers remain. Simplify.

Example

$0.2 : 3 : 0.8$ (×10 ×10 ×10)

$= 2 : 30 : 8$ (Rewrite - no decimals) $= 1 : 15 : 4$ (Simplify)

1 $0.6 : 0.09 : 3$

$= \_ : \_ : \_ = \_ : \_ : \_$ (Remove decimals (×100); Simplify)

2 $2.2 : 4 : 1.05$

$= \_ : \_ : \_ = \_ : \_ : \_$

3 $0.04 : 0.008 : 0.1$

$= \_ : \_ : \_ = \_ : \_ : \_$

4 $0.8 : 2 : 0.16$

$= \_ : \_ : \_ = \_ : \_ : \_$

5 $0.7 : 2.1 : 0.35$

$= \_ : \_ : \_ = \_ : \_ : \_$

A ratio may have to be expressed where one number is 1. Use division to change to 1 : x form.

Example

$\frac{1}{2} : \frac{2}{3} = 1 : 1\frac{1}{3}$ (½ ÷ ½; ⅔ ÷ ½)

Divide both fractions (or numbers) by the first fraction (or number).

6 $2 : 7 = 1 : \frac{\square}{\square}$

7 $\frac{1}{4} : 8 = \_ : \_$

8 $\frac{1}{3} : \frac{5}{6} = \_ : \frac{\square}{\square}$

9 Two geared wheels interconnect. One gear spins at 56 rpm the other spins at 136 rpm. If the first gear rotates once, how much has the other gear rotated?

$\_ : \_ = \_ : \frac{\square}{\square}$

Simplify these ratios. Make the denominators match, the numerators become the ratio.

Example

$\frac{1}{2} : \frac{2}{3} = \frac{3}{6} : \frac{4}{6} = 3 : 4$

10 $\frac{3}{4} : \frac{1}{3} = \frac{\square}{12} : \frac{\square}{12} = \_ : \_$

11 $\frac{3}{5} : \frac{7}{10} = \frac{\square}{10} : \frac{\square}{10} = \_ : \_$

12 $\frac{1}{4} : \frac{2}{5} = \frac{\square}{\square} : \frac{\square}{\square} = \_ : \_$

13 $\frac{3}{8} : \frac{5}{6} = \frac{\square}{\square} : \frac{\square}{\square} = \_ : \_$

14 $\frac{3}{4} : \frac{1}{2} : \frac{2}{3} = \frac{\square}{\square} : \frac{\square}{\square} : \frac{\square}{\square}$

$= \_ : \_ : \_$

15 $\frac{4}{5} : \frac{1}{3} : \frac{1}{4} = \frac{\square}{\square} : \frac{\square}{\square} : \frac{\square}{\square}$

$= \_ : \_ : \_$

16 $3\frac{1}{2} : \frac{2}{5} : \frac{9}{10} = \frac{\square}{\square} : \frac{\square}{\square} : \frac{\square}{\square}$

Change mixed numerals to improper fractions first

$= \frac{\square}{\square} : \frac{\square}{\square} : \frac{\square}{\square}$

$= \_ : \_ : \_$

17 $2\frac{3}{4} : \frac{1}{3} : 1\frac{5}{6} = \frac{\square}{\square} : \frac{\square}{\square} : \frac{\square}{\square}$

$= \frac{\square}{\square} : \frac{\square}{\square} : \frac{\square}{\square}$

$= \_ : \_ : \_$

18 $2\frac{1}{2} : 1\frac{2}{5} : 3\frac{1}{4} = \frac{\square}{\square} : \frac{\square}{\square} : \frac{\square}{\square}$

$= \frac{\square}{\square} : \frac{\square}{\square} : \frac{\square}{\square}$

$= \_ : \_ : \_$

Convert units so they match and then simplify the ratios.

Further Simplifying Ratios

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Decimals in ratios are removed by moving the decimal point until integers remain. Simplify.

Example

$0.2 : 3 : 0.8$ (×10 ×10 ×10)

$= 2 : 30 : 8 = 1 : 15 : 4$

Rewrite - no decimals; Simplify

1 $0.6 : 0.09 : 3$

$= 60 : 9 : 300 = 20 : 3 : 100$

Remove decimals (×100); Simplify

2 $2.2 : 4 : 1.05$

$= 220 : 400 : 105 = 44 : 80 : 21$

3 $0.04 : 0.008 : 0.1$

$= 40 : 8 : 100 = 10 : 2 : 25$

4 $0.8 : 2 : 0.16$

$= 80 : 200 : 16 = 10 : 25 : 2$

5 $0.7 : 2.1 : 0.35$

$= 70 : 210 : 35 = 2 : 6 : 1$

A ratio may have to be expressed where one number is 1. Use division to change to 1 : x form.

Example

$\frac{1}{2} : \frac{2}{3} = 1 : 1\frac{1}{3}$ (½ ÷ ½; ⅔ ÷ ½)

Divide both fractions (or numbers) by the first fraction (or number).

6 $2 : 7 = 1 : 3\frac{1}{2}$

7 $\frac{1}{4} : 8 = 1 : 32$

8 $\frac{1}{3} : \frac{5}{6} = 1 : 2\frac{1}{2}$

9 Two geared wheels interconnect. One gear spins at 56 rpm the other spins at 136 rpm. If the first gear rotates once, how much has the other gear rotated?

$56 : 136 = 1 : 2\frac{3}{7}$

It has rotated $2\frac{3}{7}$ revolutions.

Simplify these ratios. Make the denominators match, the numerators become the ratio.

Example

$\frac{1}{2} : \frac{2}{3} = \frac{3}{6} : \frac{4}{6} = 3 : 4$

10 $\frac{3}{4} : \frac{1}{3} = \frac{9}{12} : \frac{4}{12} = 9 : 4$

11 $\frac{3}{5} : \frac{7}{10} = \frac{6}{10} : \frac{7}{10} = 6 : 7$

12 $\frac{1}{4} : \frac{2}{5} = \frac{5}{20} : \frac{8}{20} = 5 : 8$

13 $\frac{3}{8} : \frac{5}{6} = \frac{9}{24} : \frac{20}{24} = 9 : 20$

14 $\frac{3}{4} : \frac{1}{2} : \frac{2}{3} = \frac{9}{12} : \frac{6}{12} : \frac{8}{12} = 9 : 6 : 8$

15 $\frac{4}{5} : \frac{1}{3} : \frac{1}{4} = \frac{48}{60} : \frac{20}{60} : \frac{15}{60} = 48 : 20 : 15$

16 $3\frac{1}{2} : \frac{2}{5} : \frac{9}{10} = \frac{7}{2} : \frac{2}{5} : \frac{9}{10} = \frac{35}{10} : \frac{4}{10} : \frac{9}{10} = 35 : 4 : 9$

Change mixed numerals to improper fractions first

17 $2\frac{3}{4} : \frac{1}{3} : 1\frac{5}{6} = \frac{11}{4} : \frac{1}{3} : \frac{11}{6} = \frac{66}{24} : \frac{8}{24} : \frac{44}{24} = 33 : 4 : 22$

18 $2\frac{1}{2} : 1\frac{2}{5} : 3\frac{1}{4} = \frac{5}{2} : \frac{7}{5} : \frac{13}{4} = \frac{50}{20} : \frac{28}{20} : \frac{65}{20} = 50 : 28 : 65$

Convert units so they match and then simplify the ratios.

19 15 cm : 0.6 m : 30 mm

$= 15\text{ cm} : 60\text{ cm} : 3\text{ cm}$

$= 5 : 20 : 1$ ← No units in final answer

20 2 m : 45 s : 1 m 25 sec

$= 120\text{ s} : 45\text{ s} : 85\text{ s}$

$= 600\text{ L} : 4\,200\text{ L} : 900\text{ L}$

$= 2 : 14 : 3$

23 \$3.60 : 45c : \$2.07

$= 360\text{ c} : 45\text{ c} : 207\text{ c}$

$= 40 : 5 : 23$

24 3 weeks : 6 days : June

$= 21\text{ days} : 6\text{ days} : 30\text{ days}$

$= 7 : 2 : 10$

25 6 000 mg : 12 g : 0.06 kg

$= 6\text{ g} : 12\text{ g} : 60\text{ g}$

$= 1 : 2 : 10$

26 $10\text{ cm}^2 : 200\text{ mm}^2 : 12\text{ cm}^2$

$= 10\text{ cm}^2 : 2\text{ cm}^2 : 12\text{ cm}^2$

$= 5 : 1 : 6$

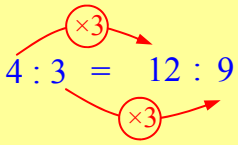
27 $600\text{ m}^2 : 2\text{ ha} : 0.8\text{ ha}$

$= 600\text{ m}^2 : 20\,000\text{ m}^2 : 8\,000\text{m}^2$

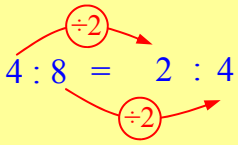
$= 3 : 100 : 40$

Equivalent Ratios (Sheet 1)

When a ratio is multiplied by a number, or divided by a number, an equivalent ratio is created. So to create an equivalent ratio, multiply a ratio by another number. Or you can divide by a number. Below are some examples.

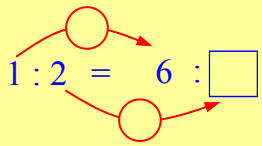


Multiplying: By multiplying the ratio 4 : 3 by 3, you get 12 : 9.

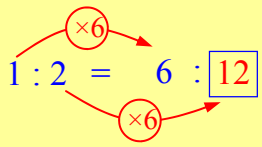


Dividing: By dividing the ratio 4 : 8 by 2, you get 2 : 4. Note that this may or may not be the same as simplifying.

Column 1 starts with 6 questions that ask you to multiply the ratio by a number. But from Q.7 you have to calculate the number you need to multiply by. For example:

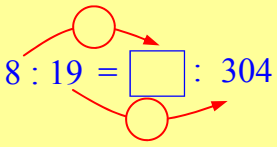


The first ratio has a '1' in the front position. The second ratio has a '6' in the front position. What did I multiply '1' by to get '6'? You multiplied by 6, so write a '×6' in both of the circles.

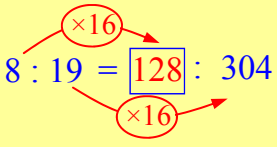


You now have a '×6' in both circles. So find the number in the second position by multiplying '2' by '6'. You get 12. Done.

You could be given the second number in the second ratio. If that is the case then you match the second numbers.



So in this case you match '19' and '304'. You probably don't know what 19 is multiplied by to get 304. So to find the answer divide '304' by '19', this gives '16'. Then multiply '8' by '16'.



You now have a '×16' in both circles. So find the number in the first position by multiplying '8' by '16'. You get 128. Done.

Column 3 introduces division. So when the second ratio is smaller than the first, use division to find the missing values. Again you can use your calculator to assist you, realise that you can also look at the questions backwards and they become multiplication. So if you don't like division …. grab a mirror.

Sheet 2 uses the same methods as above, it features worded questions to apply your skills to.

Equivalent Ratios (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Multiply these ratios by the given number to create equivalent ratios.

1 $3 : 4 = \square : \square$ (×5)

2 $2 : 7 = \square : \square$ (×3)

3 $5 : 1 = \square : \square$ (×6)

4 $15 : 4 = \square : \square$ (×2)

5 $3 : 8 : 2 = \square : \square : \square$ (×3)

6 $1 : 7 : 4 = \square : \square : \square$ (×6)

Find the value in the top circle, write it in the lower circle as well, then calculate the box.

7 $1 : 2 = 2 : \square$ (×)

8 $4 : 3 = 8 : \square$

9 $3 : 7 = 9 : \square$

10 $10 : 3 = 50 : \square$

Now the lower circle first.

11 $14 : 9 = \square : 27$ (×)

12 $8 : 5 = \square : 25$

13 $1 : 6 = \square : 42$

14 $10 : 9 = \square : 81$

Find the box values that make equivalent ratios.

15 $4 : 7 = 12 : \square$

16 $3 : 5 = \square : 30$

17 $8 : 1 = \square : 7$

18 $6 : 5 = 36 : \square$

19 $9 : 100 = \square : 1\,000$

20 $20 : 3 = 60 : \square$

21 $13 : 4 = 52 : \square$

22 $11 : 12 = \square : 60$

23 $15 : 4 = 165 : \square$

Instead of boxes, its algebra. There are also some triples.

24 $4 : 9 = x : 36$ $x =$ _____

25 $13 : 7 = y : 21$ $y =$ _____

26 $1 : 19 = 5 : j$ _____

27 $20 : 13 = d : 65$ _____

28 $5 : 2 : 10 = 20 : a : b$

$a =$ _____ $b =$ _____

29 $3 : 7 : 4 = k : 21 : h$

$k =$ _____ $h =$ _____

30 $5 : 9 : 1 = e : t : 8$

_____ _____

31 $2 : 7 : 7 = 14 : x : y$

_____ _____

32 $20 : 3 : 14 = b : a : 126$

_____ _____

33 $100 : 1 : 10 = w : 10 : x$

_____ _____

Now use division, because the RHS ratios are smaller than the LHS ratios. Circles then box.

34 $12 : 6 = 6 : \square$ (÷)

35 $24 : 32 = 6 : \square$

36 $64 : 16 = \square : 2$

37 $27 : 9 = \square : 3$

38 $36 : 18 = 4 : \square$

39 $100 : 125 = 20 : \square$

40 $60 : 48 = \square : 12$

41 $81 : 54 = \square : 2$

42 $144 : 64 = 18 : \square$

Now division & multiplication required. Find the unknowns for these ratios to be equivalent

43 $5 : 3 : x = 15 : b : 12$

$x =$ _____ $b =$ _____

44 $4 : 1 : a = 24 : y : 42$

$a =$ _____ $y =$ _____

45 $36 : c : 54 = q : 12 : 6$

_____ _____

46 $2 : d : e = 4 : e : 20$

_____ _____

47 $a : b : 12 = 100 : a : 60$

_____ _____

Equivalent Ratios (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Multiply these ratios by the given number to create equivalent ratios.

1 $3 : 4 = \boxed{15} : \boxed{20}$ (×5)

2 $2 : 7 = \boxed{6} : \boxed{21}$ (×3)

3 $5 : 1 = \boxed{30} : \boxed{6}$ (×6)

4 $15 : 4 = \boxed{30} : \boxed{8}$ (×2)

5 $3 : 8 : 2 = \boxed{9} : \boxed{24} : \boxed{6}$ (×3)

6 $1 : 7 : 4 = \boxed{6} : \boxed{42} : \boxed{24}$ (×6)

Find the value in the top circle, write it in the lower circle as well, then calculate the box.

7 $1 : 2 = 2 : \boxed{4}$ (×2)

8 $4 : 3 = 8 : \boxed{6}$ (×2)

9 $3 : 7 = 9 : \boxed{21}$ (×3)

10 $10 : 3 = 50 : \boxed{15}$ (×5)

Now the lower circle first.

11 $14 : 9 = \boxed{42} : 27$ (×3)

12 $8 : 5 = \boxed{40} : 25$ (×5)

13 $1 : 6 = \boxed{7} : 42$ (×7)

14 $10 : 9 = \boxed{90} : 81$ (×9)

Find the box values that make equivalent ratios.

15 $4 : 7 = 12 : \boxed{21}$

16 $3 : 5 = \boxed{18} : 30$

17 $8 : 1 = \boxed{56} : 7$

18 $6 : 5 = 36 : \boxed{30}$

19 $9 : 100 = \boxed{90} : 1\,000$

20 $20 : 3 = 60 : \boxed{9}$

21 $13 : 4 = 52 : \boxed{16}$

22 $11 : 12 = \boxed{55} : 60$

23 $15 : 4 = 165 : \boxed{44}$

Instead of boxes, its algebra. There are also some triples.

24 $4 : 9 = x : 36$ $x = 16$

25 $13 : 7 = y : 21$ $y = 39$

26 $1 : 19 = 5 : j$ $j = 95$

27 $20 : 13 = d : 65$ $d = 100$

28 $5 : 2 : 10 = 20 : a : b$

$a = 8$ $b = 40$

29 $3 : 7 : 4 = k : 21 : h$

$k = 9$ $h = 12$

30 $5 : 9 : 1 = e : t : 8$

$e = 40$ $t = 72$

31 $2 : 7 : 7 = 14 : x : y$

$x = 49$ $y = 49$

32 $20 : 3 : 14 = b : a : 126$

$b = 180$ $a = 27$

33 $100 : 1 : 10 = w : 10 : x$

$w = 1\,000$ $x = 100$

Now use division, because the RHS ratios are smaller than the LHS ratios. Circles then box.

34 $12 : 6 = 6 : \boxed{3}$ (÷2)

35 $24 : 32 = 6 : \boxed{8}$ (÷4)

36 $64 : 16 = \square : 2$ (÷8)

37 $27 : 9 = \boxed{9} : 3$ (÷3)

38 $36 : 18 = 4 : \boxed{2}$

39 $100 : 125 = 20 : \boxed{25}$

40 $60 : 48 = \boxed{15} : 12$

41 $81 : 54 = \boxed{3} : 2$

42 $144 : 64 = 18 : \boxed{8}$

Now division & multiplication required. Find the unknowns for these ratios to be equivalent

43 $5 : 3 : x = 15 : b : 12$

$x = 4$ $b = 9$

44 $4 : 1 : a = 24 : y : 42$

$a = 7$ $y = 6$

$b =$ _____ $d =$ _____

Use equivalent ratios to solve these.

13 Sam's birthday balloons are coloured silver and gold in the ratio 3 : 5. If there are 27 silver balloons, how many gold balloons are there?

□ : □ = □ : □

Write your answer in words

14 How many balloons were there altogether?

15 Two-stroke fuel for a lawn mower requires an oil : petrol ratio of 1: 40. How much petrol is added to 50 mL of oil?

□ : □ = □ : □

Write your answer showing units

16 How much fuel is there? Give your answer in litres.

17 Sandra is an experienced electrician. She can install 7 light fittings while her apprentice fits 2 in the same time. If Sandra installs 125 lights, how many has the apprentice installed?

□ : □ = □ : □

18 A street directory has a scale of 1 : 20 000. If a street is 9.2 cm long in the directory, give its actual length in metres.

19 If a street was 720 m in length, how long would the street be in the directory. Give your answer in cm.

Rangers use 'Capture & Release' techniques and ratios to calculate animal numbers. Use tag results to estimate animal populations.

20 Wildlife rangers catch 48 deer, tag them and release them. Two months later 29 deer are caught of which 3 have tags. Estimate the park's deer population, 'n'.

1st Capture:		2nd Capture:	
48	n	3	29
Tag	Pop	Tag	Pop

21 Lake Scaley rangers catch 100 trout, tag them, then release them back into the lake. Three weeks later they catch 55 trout of which 4 are tagged. Estimate the number of trout in the lake.

1st Capture:		2nd Capture:	
Tag	Pop	Tag	Pop

22 Mount Bugs National Park rangers are monitoring rabbits. They catch 205, tag and release them. Later they catch 320 rabbits of which 8 are tagged. Estimate the rabbit population.

1st Capture:		2nd Capture:	
Tag	Pop	Tag	Pop

Equivalent Ratios (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the missing values.

1 3 : 6 = 12 : 24

2 6 : 15 = 2 : 5

3 8 : 28 = 42 : 147

4 4 : 12 = 18 : 54

5 30 : 20 = 9 : 6

6 6 : 8 = 63 : 84

7 12 : 3 = 172 : 43

8 5 : 20 = 36 : 144

9 $12 : 8 : 4 = 39 : a : b$

$a = 26$ $b = 13$

10 $3 : 12 : n = q : 78 : 26$

$n = 4$ $q = 19.5$

11 $16 : x : 4 = e : 225 : 45$

$e = 180$ $x = 20$

12 $b : 45 : b = d : 6 : 100$

$b = 750$ $d = 100$

Use equivalent ratios to solve these.

13 Sam's birthday balloons are coloured silver and gold in the ratio 3 : 5. If there are 27 silver balloons, how many gold balloons are there?

3 : 5 = 27 : g

There are 45 gold balloons.

Write your answer in words

14 How many balloons were there altogether?

27 + 45 = 72

There are 72 balloons.

15 Two-stroke fuel for a lawn mower requires an oil : petrol ratio of 1: 40. How much petrol is added to 50 mL of oil?

1 : 40 = 50 : p

2 000 ml of petrol is added.

Write your answer showing units

16 How much fuel is there? Give your answer in litres.

2 000 + 50 = 2 050 mL

There is 2.05 L of fuel.

17 Sandra is an experienced electrician. She can install 7 light fittings while her apprentice fits 2 in the same time. If Sandra installs 125 lights, how many has the apprentice installed?

7 : 2 = 125 : a

Apprentice has fitted 35.7 (1 dp)

lights, so 35 lights installed.

18 A street directory has a scale of 1 : 20 000. If a street is 9.2 cm long in the directory, give its actual length in metres.

$1 : 20\,000 = 9.2 : l$

Length = 184 000 cm

Length of street is 1 840 m.

19 If a street was 720 m in length, how long would the street be in the directory. Give your answer in cm.

$1 : 20\,000 = l : 720$

Length = 0.036 m

Length in book is 3.6 cm.

Rangers use 'Capture & Release' techniques and ratios to calculate animal numbers. Use tag results to estimate animal populations.

20 Wildlife rangers catch 48 deer, tag them and release them. Two months later 29 deer are caught of which 3 have tags. Estimate the park's deer population, 'n'.

1st Capture:		2nd Capture:	
48	n	3	29
Tag	Pop	Tag	Pop

$16 \times 29 = 464$ deer.

There are approximately 464 deer in the park.

21 Lake Scaley rangers catch 100 trout, tag them, then release them back into the lake. Three weeks later they catch 55 trout of which 4 are tagged. Estimate the number of trout in the lake.

1st Capture:		2nd Capture:	
100	n	4	55
Tag	Pop	Tag	Pop

$25 \times 55 = 1\,375$ trout.

There are approximately 1 375 trout in the lake.

22 Mount Bugs National Park rangers are monitoring rabbits. They catch 205, tag and release them. Later they catch 320 rabbits of which 8 are tagged. Estimate the rabbit population.

1st Capture:		2nd Capture:	
205	n	8	320
Tag	Pop	Tag	Pop

$25.625 \times 320 = 8\,200$ rabbits.

There are approximately 8 200 rabbits in the park.

Further Equivalent Ratios

Ratios compare one quantity against another. This sheet deals with problems that feature three or four different measurements that all affect each other. Normally with equivalent ratios the entire ratio is multiplied by the same amount, or divided by the same amount. This sheet picks out two quantities and depending on their affect on each other, may see opposite operations applied.

There is an example at the top of the first column which shows how these questions are solved. Below is an explanation on using your calculator to convert time.

If you get an answer like '$^{7}/_{9}$' (in hours) how do you convert that to minutes?

Using your calculator	Calculator Display:	So you answer is
7 $a^b/_c$ 9 = ° ' ''	0° 46° 40	46 min 40 s (the hours are 0)

If you get an answer like '$3^{4}/_{5}$' (in hours) how do you convert that to minutes (or hours/min)?

Using your calculator	Calculator Display:	So you answer is
3 $a^b/_c$ 4 $a^b/_c$ 5 = ° ' ''	3° 48° 0	3 h 48 min

If you want to convert this to minutes:

Using your calculator	Calculator Display:	So you answer is
× 6 0 =	228	228 min

Further Equivalent Ratios

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Alter these ratios step by step to answer the question. Make sense? Follow the first example. Increased work means increased time. This is the critical issue.

Example It takes 3 plumbers 2 hours to install 5 toilets. How long would it take 2 plumbers to install 9 toilets, operating at the same work rate?

$3 : 5 : 2$ — Write out ratio, show time last

$\times {}^{9}/_{5}$ $\times {}^{9}/_{5}$

$3 : 9 : {}^{18}/_{5}$ — Change 5 → 9 toilets. Time will increase with more installations.

$\times {}^{2}/_{3}$ $\times {}^{3}/_{2}$

$2 : 9 : {}^{27}/_{5}$ — Change 3 → 2 plumbers. Time will increase with less plumbers.

${}^{27}/_{5}$ h = 324 min or 5 h 24 min.

---

1 It takes 6 trucks of 15 tonne capacity 3 hours to remove rocks from a quarry blast. How long would it take 4 trucks with a 18 tonne capacity to remove the same amount?

Trucks	Capacity	Time
$\times {}^{4}/_{6}$		$\times {}^{6}/_{4}$
	$\times {}^{18}/_{15}$	$\times {}^{15}/_{18}$

Less trucks = more time

More capacity = less time

2 It takes 3 bakers 6 hours to make 1 200 loaves of bread. How long would it take 5 bakers to bake 1 500 loaves working at the same rate?

Bakers	Loaves	Time

3 Two graders can smooth 700 m of road in 5 hours. How long would it take for 5 graders to smooth out 2.6 km of road, working at the same rate?

Now 4 variables. Did you see where my sandwich went?

4 It takes 2 700 ants 4 hours to carry 2 jam sandwiches 37 metres. How long would it take 8 100 ants to transport 6 jam sandwiches 16 m?

Ants	S'wiches	Distance	Time

---

5 It takes 3 hours for 2 conveyor belts with a velocity of 4 m/s to transport the coal from 3 trains. If three new belts replaced the two, and operate at 10 m/s, how long would it take to unload 10 trains?

---

6 If three tugs travel 6 M to dock 4 freighters in 7 hours, how long would it take 6 tugs to travel 11 M and dock 9 freighters? (M = nautical mile).

Further Equivalent Ratios

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Alter these ratios step by step to answer the question. Make sense? Follow the first example. Increased work means increased time. This is the critical issue.

Example It takes 3 plumbers 2 hours to install 5 toilets. How long would it take 2 plumbers to install 9 toilets, operating at the same work rate?

3 : 5 : 2 — Write out ratio, show time last

(×9/5) (×9/5)

3 : 9 : 18/5 — Change 5 → 9 toilets. Time will increase with more installations.

(×2/3) (×3/2)

2 : 9 : 27/5 — Change 3 → 2 plumbers. Time will increase with less plumbers.

27/5 h = 324 min or 5 h 24 min.

---

1 It takes 6 trucks of 15 tonne capacity 3 hours to remove rocks from a quarry blast. How long would it take 4 trucks with a 18 tonne capacity to remove the same amount?

Trucks	Capacity	Time	
6	15	3	Less trucks = more time; More capacity = less time
(×4/6)		(×6/4)	
4	15	9/2	15/4 h = 225 min = 3 h 45 min
		(×15/18)	
4	18	15/4	

2 It takes 3 bakers 6 hours to make 1 200 loaves of bread. How long would it take 5 bakers to bake 1 500 loaves working at the same rate?

Bakers	Loaves	Time	
3	1 200	6	More bakers = less time; More loaves = more time
(×5/3)		(×3/5)	
5	1 200	18/5	9/2 h = 270 min = 4 h 30 min
1 500/1 200 = 5/4 (×5/4)		(×5/4)	
5	1 500	9/2	

3 Two graders can smooth 700 m of road in 5 hours. How long would it take for 5 graders to smooth out 2.6 km of road, working at the same rate?

Graders	Distance	Time	
2	700	5	More graders = less time; More distance = more time
(×5/2)		(×2/5)	
5	700	2	52/7 h = 445 5/7 min
2 600/700 = 26/7 (×26/7)		(×26/7)	
5	2 600	52/7	7 h 26 min (nearest minute)

(7 h 25 min 42.9 s)

Now 4 variables. Did you see where my sandwich went?

4 It takes 2 700 ants 4 hours to carry 2 jam sandwiches 37 metres. How long would it take 8 100 ants to transport 6 jam sandwiches 16 m?

Ants	S'wiches	Distance	Time	
2 700	2	37	4	More ants less time
(×3)			(÷3)	
8 100	2	37	4/3	More sand more time
	(×3)		(×3)	
8 100	6	37	4	Less dist less time
		(×16/37)	(×16/37)	
8 100	6	16	64/37	

64/37 h = 103 29/37 min or 1 h 44 min. (nearest min)

---

5 It takes 3 hours for 2 conveyor belts with a velocity of 4 m/s to transport the coal from 3 trains. If three new belts replaced the two, and operate at 10 m/s, how long would it take to unload 10 trains?

Belts	Velocity	Trains	Time	
2	4	3	3	More belts less time
(×5/3)			(×3/5)	
3	4	3	9/5	More speed less time
	(×5/2)		(×2/5)	
3	10	3	18/25	More trains more time
		(×10/3)	(×10/3)	
3	10	10	12/5	

12/5 h = 144 min or 2 h 24 min.

---

6 If three tugs travel 6 M to dock 4 freighters in 7 hours, how long would it take 6 tugs to travel 11 M and dock 9 freighters? (M = nautical mile).

Tugs	Distance	Freighter	Time	
3	6	4	7	More tugs less time
(×2)			(÷2)	
6	6	4	7/2	More dist more time
	(×11/6)		(×11/6)	
6	11	4	77/12	More ships more time
		(×9/4)	(×9/4)	
6	11	9	231/16	

231/16 h = 866 1/4 min or 14 h 26 min. (nearest min)

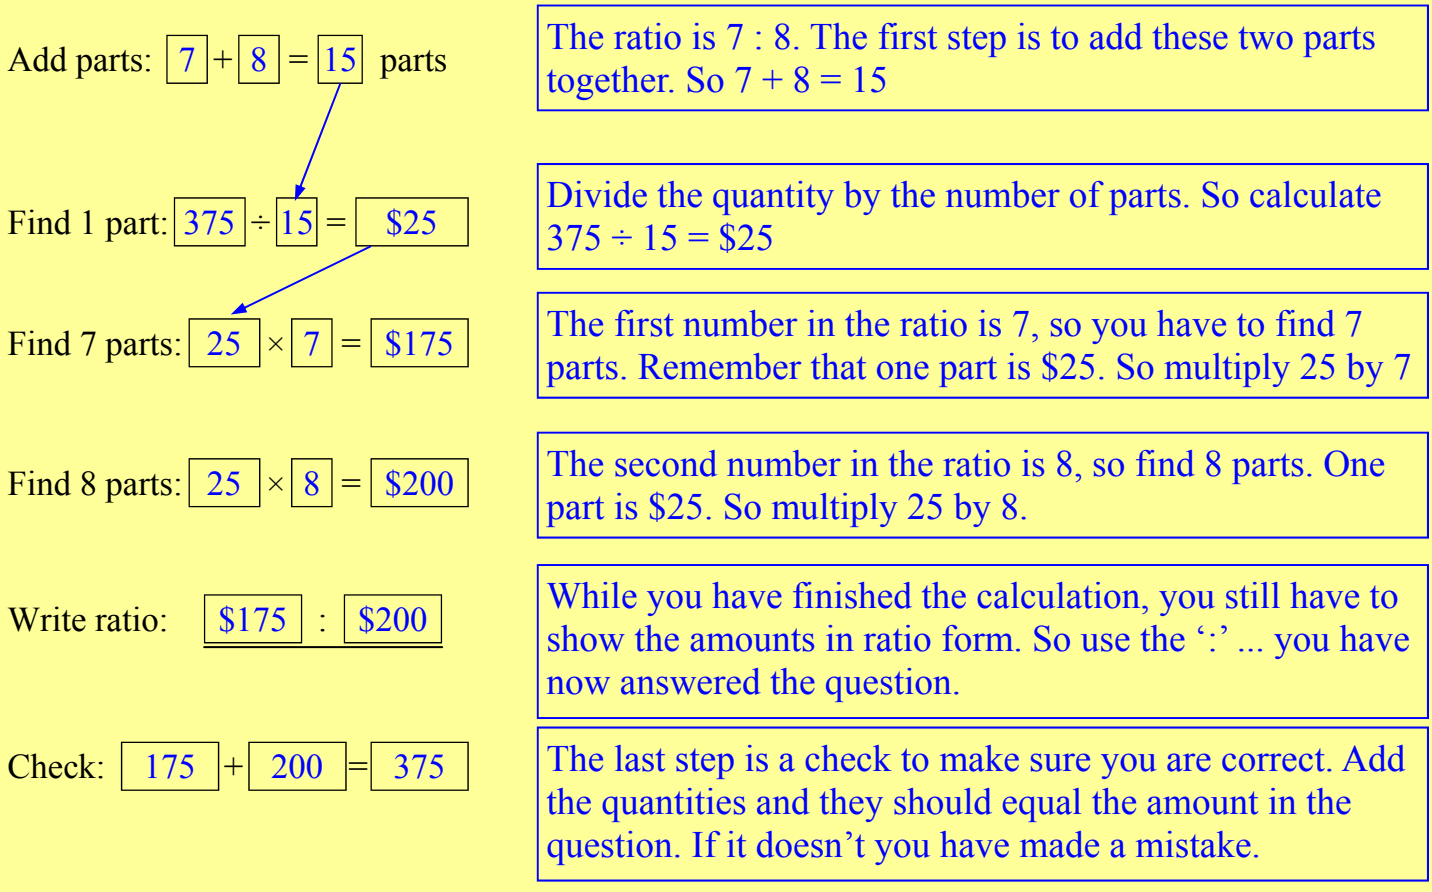
Ratio of a Quantity - Method 1

You can break something in two and share it, but what about sharing things in unequal amounts? Ratios are used to break up a quantity into more complicated portions. There are two common ways of applying a ratio to a quantity, this is Method 1, which uses a unitary method approach. Finding the value of one part then using that to calculate the ratio.

Column 1 starts with some straight forward questions. Questions 1 to 4 ask you to divide a quantity up into equal pieces. All you have to do is divide the quantity by the given number of pieces. The next three questions give you what one 'part' is and then asks you to find 5 parts, or 6 parts etc., so multiply the amount by the number of parts.

At the bottom of column 1 (Q.8) is the first question on dividing quantities by a ratio, these questions are the same for the rest of the sheet. Below is an example.

Divide \$375 in the ratio 7 : 8.



There are two sheets for this topic, the first sheet involves questions shown in the same style as that above. The second sheet are worded questions that use the same method to solve but may include an additional step.

Ratio of a Quantity - Method 1 (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Divide these quantities into the number of equal parts specified.

1 Divide 558 m into 6 equal parts. ☐ ÷ ☐ = ☐ m

2 Divide $172.40 into 4 equal parts.

3 Divide 1 125 g into 12 equal parts.

4 Divide 6.32 L into 8 equal parts. Give your answer in mL.

These will use multiplication. Given 1 part, find the quantity.

5 If 1 part is 18 kg, find the mass for 15 parts.

6 If 1 part is 42 s, find the time (min/s) made from 6 parts.

7 If 1 part is 26 cm, find the length (m) made from 38 parts.

Now ratios, follow the steps to find 1 part then the divided quantity.

8 Divide $168 in the ratio 5 : 3.

Add parts: 5 + 3 = ☐ parts

Find 1 part: 168 ÷ ☐ = $☐

Find 5 parts: ☐ × 5 = $☐

Find 3 parts: ☐ × 3 = $☐

Write ratio: $☐ : $☐

Check: ☐ + ☐ = 168

9 Divide 798 kg in the ratio 3 : 4.

Add parts: ☐ + ☐ = ☐ parts

Find 1 part: ☐ ÷ ☐ = ☐

Find 3 parts: ☐ × ☐ = ☐

Find 4 parts: ☐ × ☐ = ☐

Write ratio: ☐ kg : ☐ kg

Check: ☐ + ☐ = 798

10 Divide 1 590 mL in the ratio 11 : 4.

Add parts: ☐ + ☐ = ☐ parts

1 part: ☐ ÷ ☐ = ☐

11 parts: ☐ × ☐ = ☐

4 parts: ☐ × ☐ = ☐

Ratio: ☐ : ☐

Check: ☐ + ☐ = 1 590

11 Divide 3.4 T in the ratio 2 : 3. Answer in kg.

Add parts: ☐ + ☐ = ☐ parts

1 part: ☐ ÷ ☐ = ☐

2 parts: ☐ × ☐ = ☐

3 parts: ☐ × ☐ = ☐

Ratio: ☐ : ☐

Check: ☐ + ☐ = ☐

12 Divide $49.05 into the ratio 7 : 2.

Add parts:

1 part:

7 parts:

2 parts:

Ratio:

Check:

Now three valued ratios.

13 Divide 7.28 kg into the ratio 3 : 7 : 4. Answer in grams.

Add parts:

1 part:

3 parts:

7 parts:

4 parts:

Ratio:

Check

14 Divide 97.5 cm into the ratio 6 : 3 : 4. Answer in mm.

15 Divide 1.06 km into the ratio 2 : 5 : 1. Answer in m.

Ratio of a Quantity - Method 1 (Sheet 1)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Divide these quantities into the number of equal parts specified.

1 Divide 558 m into 6 equal parts. 558 ÷ 6 = 93 m

2 Divide $172.40 into 4 equal parts. 172.40 ÷ 4 = $43.10

3 Divide 1 125 g into 12 equal parts. 1 125 ÷ 12 = 93.75 g

4 Divide 6.32 L into 8 equal parts. Give your answer in mL.

6 320 ÷ 8 = 790 mL

These will use multiplication. Given 1 part, find the quantity.

5 If 1 part is 18 kg, find the mass for 15 parts.

18 × 15 = 270 kg

6 If 1 part is 42 s, find the time (min/s) made from 6 parts.

42 × 6 = 252 s = 4 min 12 s

7 If 1 part is 26 cm, find the length (m) made from 38 parts.

26 × 38 = 988 cm = 9.88 m

Now ratios, follow the steps to find 1 part then the divided quantity.

8 Divide $168 in the ratio 5 : 3.

Add parts: 5 + 3 = 8 parts

Find 1 part: 168 ÷ 8 = $21

Find 5 parts: 21 × 5 = $105

Find 3 parts: 21 × 3 = $63

Write ratio: $105 : $63

Check: 105 + 63 = 168

9 Divide 798 kg in the ratio 3 : 4.

Add parts: 3 + 4 = 7 parts

Find 1 part: 798 ÷ 7 = 114 kg

Find 3 parts: 114 × 3 = 342 kg

Find 4 parts: 114 × 4 = 456 kg

Write ratio: 342 kg : 456 kg

Check: 342 + 456 = 798

10 Divide 1 590 mL in the ratio 11 : 4.

Add parts: 11 + 4 = 15 parts

1 part: 1 590 ÷ 15 = 106 mL

11 parts: 106 × 11 = 1 166 mL

4 parts: 106 × 4 = 424 mL

Ratio: 1 166 mL : 424 mL

Check: 1 166 + 424 = 1 590

11 Divide 3.4 T in the ratio 2 : 3. Answer in kg.

Add parts: 2 + 3 = 5 parts

1 part: 3 400 ÷ 5 = 680 kg

2 parts: 680 × 2 = 1 360 kg

3 parts: 680 × 3 = 2 040 kg

Ratio: 1 360 kg : 2 040 kg

Check: 1 360 + 2 040 = 3 400

12 Divide $49.05 into the ratio 7 : 2.

Add parts: 7 + 2 = 9 parts

1 part: 49.05 ÷ 9 = $5.45

7 parts: 5.45 × 7 = $38.15

2 parts: 5.45 × 2 = $10.90

Ratio: $38.15 : $10.90

Check: 38.15 + 10.90 = 49.05

Now three valued ratios.

13 Divide 7.28 kg into the ratio 3 : 7 : 4. Answer in grams.

Add parts: 3 + 7 + 4 = 14 parts

1 part: 7 280 ÷ 14 = 520 g

3 parts: 520 × 3 = 1 560 g

7 parts: 520 × 7 = 3 640 g

4 parts: 520 × 4 = 2 080 g

Ratio: 1 560 g:3 640 g:2080 g

Check: 1 560 + 3 640 + 2080 = 7 280 g

14 Divide 97.5 cm into the ratio 6 : 3 : 4. Answer in mm.

Add parts: 6 + 3 + 4 = 13 parts

1 part: 975 ÷ 13 = 75 mm

6 parts: 75 × 6 = 450 mm

3 parts: 75 × 3 = 225 mm

4 parts: 75 × 4 = 300 mm

450 mm : 225 mm : 300 mm

Check: 450 + 225 + 300 = 975

15 Divide 1.06 km into the ratio 2 : 5 : 1. Answer in m.

Add parts: 2 + 5 + 1 = 8 parts

1 part: 1 060 ÷ 8 = 132.5 m

2 parts: 132.5 × 2 = 265 m

5 parts: 132.5 × 5 = 662.5 m

265 m : 662.5 m : 132.5 m

Check: 265 + 662.5 + 132.5 = 1 060 m

Ratio of a Quantity - Method 1 (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use ratios to answer these.

1 The "Treerific Dew-O" are landscape gardeners. On a job, Paul worked 7 h, while Grace worked 11 h. Paid $954 total, how much should each receive?

Add:

1 part:

Paul:

Grace:

Check:

2 Two pylons support a beam. If the 7 000 kg load is shared in the ratio 3 : 5 by Pylon 1 and Pylon 2, find the load in each.

3 Dave saves money from his pay by splitting his income. He divides his pay as spendable and savings in the ratio 7 : 2. Find the amount he spends and saves from his net pay of $1 098.

Now ratios with 3 values

4 A stadium is painted gold, blue and red in the ratio 5 : 4 : 2. If it is estimated that the stadium has a paintable area of 445.5 m^2. If 1 litre of paint covers 15 m^2, find the amount required of each paint colour. (in whole litres)

5 Groucho the cat sleeps 75% of the day. The rest of his day is spent eating, hissing and growling in the ratio 1 : 9 : 2. Find the amount of time spent on each of his 4 activities.

6 A cruise ship operator notes that its passenger balance is children : adults : retirees in the ratio 2 : 9 : 20. The ship has a total capacity of 2 945 people, which has a crew : passengers ratio of 1 : 4. Find the number of crew and of each passenger category on board of a full ship.

7 A town's population ratio of males : females is 49 : 51. If the town has a current population of 17 600, estimate the increase in males and females in 10 years time if the town's population is expected to increase by 30%.

Ratio of a Quantity - Method 1 (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use ratios to answer these.

1 The "Treerific Dew-O" are landscape gardeners. On a job, Paul worked 7 h, while Grace worked 11 h. Paid $954 total, how much should each receive?

Add: 7 + 11 = 18 parts

1 part: 954 ÷ 18 = $53

Paul: 7 × 53 = $371

Grace: 11 × 53 = $583

Check: 371 + 583 = 954

2 Two pylons support a beam. If the 7 000 kg load is shared in the ratio 3 : 5 by Pylon 1 and Pylon 2, find the load in each.

Add: 3 + 5 = 8 parts

1 part: 7 000 ÷ 8 = 875 kg

Pylon 1: 3 × 875 = 2 625 kg

Pylon 2: 5 × 875 = 4 375 kg

Check: 2 625 + 4 375 = 7 000

3 Dave saves money from his pay by splitting his income. He divides his pay as spendable and savings in the ratio 7 : 2. Find the amount he spends and saves from his net pay of $1 098.

Add: 7 + 2 = 9 parts

1 part: 1 098 ÷ 9 = $122

Spendable: 7 × 122 = $854

Savings: 2 × 122 = $244

Check: 854 + 244 = 1 098

Now ratios with 3 values

4 A stadium is painted gold, blue and red in the ratio 5 : 4 : 2. If it is estimated that the stadium has a paintable area of 445.5 m^2. If 1 litre of paint covers 15 m^2, find the amount required of each paint colour. (in whole litres)

Paint = 445.5 ÷ 15 = 29.7 L

Add: 5 + 4 + 2 = 11 parts

1 part: 29.7 ÷ 11 = 2.7 L

Gold: 5 × 2.7 = 13.5 L

= 14 L (whole L)

Blue: 4 × 2.7 = 10.8 L

= 11 L (whole L)

Red: 2 × 2.7 = 5.4 L

= 6 L (whole L)

5 Groucho the cat sleeps 75% of the day. The rest of his day is spent eating, hissing and growling in the ratio 1 : 9 : 2. Find the amount of time spent on each of his 4 activities.

Sleep time = 0.75 × 24 = 18 h

Awake time = 24 - 18 = 6 h

Add: 1 + 9 + 2 = 12 parts

1 part: 6 ÷ 12 = 30 min

Eating: 30 min

Hissing: 9 × 30 = 4 h 30 min

Growling: 2 × 30 = 1 h

Check: 18 + 30 min + 4 h 30 min

+ 1 h = 24 h

6 A cruise ship operator notes that its passenger balance is children : adults : retirees in the ratio 2 : 9 : 20. The ship has a total capacity of 2 945 people, which has a crew : passengers ratio of 1 : 4. Find the number of crew and of each passenger category on board of a full ship.

Add: 1 + 4 = 5 parts

1 part: 2 945 ÷ 5 = 589

Crew: 589 staff

Passengers: 4 × 589 = 2 356

Add: 2 + 9 + 20 = 31 parts

1 part: 2 356 ÷ 31 = 76 pass'gers

Children: 2 × 76 = 152 pas'gers

Adults: 9 × 76 = 684 pas'gers

Retirees: 20 × 76 = 1 520 ppl.

Check: 589+152+684+1 520 = 2 945

7 A town's population ratio of males : females is 49 : 51. If the town has a current population of 17 600, estimate the increase in males and females in 10 years time if the town's population is expected to increase by 30%.

0.3 × 17 600 = 5 280 increase

Add: 49 + 51 = 100 parts

1 part: 5 280 ÷ 100 = 52.8

Males: 49 × 52.8 = 2 587.2

≈ 2 587 males

Females: 51 × 52.8 = 2 692.8

≈ 2 693 females

Ratio of a Quantity - Method 2

This method uses fractions rather than finding the value of a single 'part' in a ratio. The process is also quicker that the unitary method. Below is an example, there is also an example in the first column, the entire sheet uses the one method to solve the questions.

Example: Divide 550 m in the ratio 2 : 9.

Add parts: 2 + 9 = 11 parts

The ratio is 2 : 9. The first step is to add these two parts together. So 2 + 9 = 11

2 parts: $\frac{2}{11} \times 550 = 100$ m

First the 2 in the ratio. Using the 11 calculated above, form a fraction using 11 as the denominator. So $^{2}/_{11} \times 550$.

9 parts: $\frac{9}{11} \times 550 = 450$ m

Next the 9 in the ratio. Solve as with the previous step. So $^{9}/_{11} \times 550$. Remember the units.

Ratio: 100 m : 450 m

Rewrite your answers above in ratio form, this fully answers the question.

Check: 100 + 450 = 550

A check can be performed at the end to verify your answers are correct.

Ratio of a Quantity - Method 2

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Divide these quantities by the ratio given. Here is an example.

Divide 549 mL in the ratio 2 : 7.

Add parts: 2 + 7 = 9 parts

2 parts: $\frac{2}{9} \times 549 = 122$ mL

The 9 parts becomes the denomintor

7 parts: $\frac{7}{9} \times 549 = 427$ mL

Ratio: 122 mL : 427 mL

Check: 122 + 427 = 549

1 Divide \$750 in the ratio 5:1

Add parts: ☐ + ☐ = ☐ parts

5 parts: $\frac{\square}{\square} \times \square = \square$

1 part: $\frac{\square}{\square} \times \square = \square$

Ratio: ☐ : ☐

Check: ☐ + ☐ = ☐

2 Divide 6.1 m in the ratio 3 : 2

Add parts: ☐ + ☐ = ☐ parts

3 parts: $\frac{\square}{\square} \times \square = \square$

2 parts: $\frac{\square}{\square} \times \square = \square$

Ratio: ☐ : ☐

Check: ☐ + ☐ = ☐

3 Divide 984 g in the ratio 7:5

Add parts: ☐ + ☐ = ☐ parts

7 parts: $\frac{\square}{\square} \times \square = \square$

5 parts: $\frac{\square}{\square} \times \square = \square$

Ratio: ☐ : ☐

Check: ☐ + ☐ = ☐

4 Divide 4.23 km into the ratio 7 : 2. Answer in m.

5 Divide 9.1 T into the ratio 3 : 10. Answer in kg.

6 Divide 67 cm into the ratio 22: 13. Answer in mm to 1 d.p.

7 Divide 19 km into the ratio 1 : 5 : 3. Round to 2 d.p.

8 Pam's Petworld finds that clients with dogs outnumber those with cats in the ratio 5 : 3. If she sees 27 animals, how many would you expect of each?

9 Prize money of \$12 000 is shared between Ben, Sarah and Jess in the ratio 2 : 5 : 8. Find each person's share.

10 Shade this rectangle in the ratio 2 : 3, shaded : unshaded.

Ratio of a Quantity - Method 2

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Divide these quantities by the ratio given. Here is an example.

Divide 549 mL in the ratio 2 : 7.

Add parts: 2 + 7 = 9 parts

2 parts: $\frac{2}{9} \times 549 = 122$ mL

The 9 parts becomes the denomintor

7 parts: $\frac{7}{9} \times 549 = 427$ mL

Ratio: 122 mL : 427 mL

Check: 122 + 427 = 549

1 Divide \$750 in the ratio 5:1

Add parts: 5 + 1 = 6 parts

5 parts: $\frac{5}{6} \times 750 = \$625$

1 part: $\frac{1}{6} \times 750 = \$125$

Ratio: \$625 : \$125

Check: 625 + 125 = 750

2 Divide 6.1 m in the ratio 3 : 2

Add parts: 3 + 2 = 5 parts

3 parts: $\frac{3}{5} \times 6.1 = 3.66$ m

2 parts: $\frac{2}{5} \times 6.1 = 2.44$ m

Ratio: 3.66 m : 2.44 m

Check: 3.66 + 2.44 = 6.1

3 Divide 984 g in the ratio 7:5

Add parts: 7 + 5 = 12 parts

7 parts: $\frac{7}{12} \times 984 = 574$ g

5 parts: $\frac{5}{12} \times 984 = 410$ g

Ratio: 574 g : 410 g

Check: 574 + 410 = 984

4 Divide 4.23 km into the ratio 7 : 2. Answer in m.

Add parts: 7 + 2 = 9

7 parts: $^7/_9 \times 4\,230 = 3\,290$ m

2 parts: $^2/_9 \times 4\,230 = 940$ m

3 290 m : 940 m

Check: 3 290 + 940 = 4 230

5 Divide 9.1 T into the ratio 3 : 10. Answer in kg.

Add parts: 3 + 10 = 13

3 parts: $^3/_{13} \times 9\,100 = 2\,100$ kg

10 parts: $^{10}/_{13} \times 9\,100 = 7\,000$ kg

2 100 kg : 7 000 kg

Check: 2 100 + 7 000 = 9 100

6 Divide 67 cm into the ratio 22: 13. Answer in mm to 1 d.p.

Add parts: 22 + 13 = 35

22 parts: $^{22}/_{35} \times 670 = 421.1$ mm

13 parts: $^{13}/_{35} \times 670 = 248.9$ mm

421.1 mm : 248.9 mm

Check: 421.1 + 248.9 = 670

7 Divide 19 km into the ratio 1 : 5 : 3. Round to 2 d.p.

Add parts: 1 + 5 + 3 = 9

1 part: $^1/_9 \times 19 = 2.11$ km

5 parts: $^5/_9 \times 19 = 10.56$ km

3 parts: $^3/_9 \times 19 = 6.33$ km

2.11 km : 10.56 km : 6.33 km

Check: 2.11 + 10.56 + 6.33 = 19

8 Pam's Petworld finds that clients with dogs outnumber those with cats in the ratio 5 : 3. If she sees 27 animals, how many would you expect of each?

Add parts: 5 + 3 = 8

Dogs: $^5/_8 \times 27 = 17$ dogs (0 d.p.)

Cats: $^3/_8 \times 27 = 10$ cats (0 d.p.)

She should see 17 dogs & 10 cats

Check: 17 + 10 = 27

9 Prize money of \$12 000 is shared between Ben, Sarah and Jess in the ratio 2 : 5 : 8. Find each person's share.

Add parts: 2 + 5 + 8 = 15

Ben: $^2/_{15} \times 12\,000 = \$1\,600$

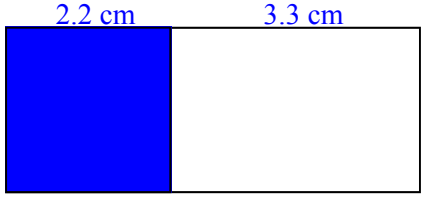
Sarah: $^5/_{15} \times 12\,000 = \$4\,000$

Jess: $^8/_{15} \times 12\,000 = \$6\,400$

Ben \$1 600, Sarah \$4 000 and Jess \$6 400.

Ck:1 600+4 000+6 400 = 12 000

10 Shade this rectangle in the ratio 2 : 3, shaded : unshaded.



Length is 5.5 cm

Add parts: 2 + 3 = 5

Shaded: $^2/_5 \times 5.5 = 2.2$ cm

Unshaded: $^3/_5 \times 5.5 = 3.3$ cm

Check: 2.2 + 3.3 = 5.5

Scale Drawing

Scale drawings allow us to use images to measure distances. By multiplying by the scale any length on a scale diagram can be used to determine the actual length.

Column 1 features diagrams and images of animals/insects in nature and man-made objects, as well as the scale ratio applied to the image. How do you find the actual length? Measure the length in mm, then multiply by the second number in the ratio, then divide by the first number.

If the first number is larger than the second then the actual length is smaller than the image. That means the image was an enlargement.

If the first number is smaller than the second then the actual length is larger than the image. That means the image was an reduction.

Write the measured length in the table at the base of the column, using mm. Apply the scale and write the actual length in the RHS of the table. Again use mm, but if the column asks you to convert this to cm or m, then divide by 10 or 1 000, and rewrite in the units requested.

Column 2 involves travel between two wharves. One person drives on land, the other uses a ferry. Use the scale to measure the distance between the two points requested in km. Then using the speed of the ferry complete a timetable for its operation.

Further down Column 2 is a map with roads connecting towns. Measure the straight line distances between the points, then apply the scale. You should notice a quick way to apply the scale rather than multiplying and dividing by the large numbers. The lengths aren't exact in mm, sometimes they are slightly out, so answers will vary by small amounts. Write the distances in the boxes.

Scale Drawing

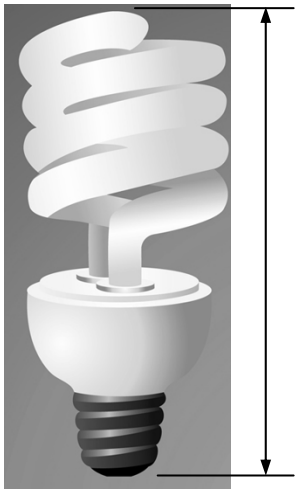
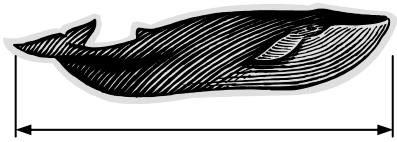
Measure the lengths in mm, using the arrowed length. Write the length in the 'image' box below. Apply the scale to find the actual length. Multiply by the second number in the ratio, divide by the first.

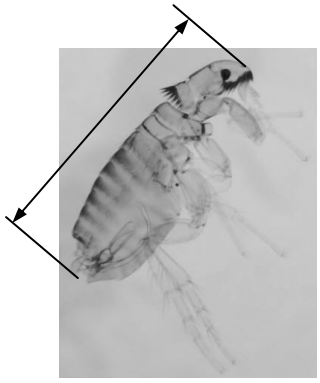
1 Scale = 1 : 2



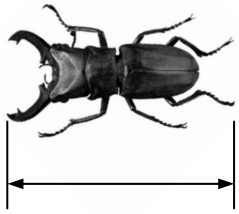
2 Scale = 1 : 660



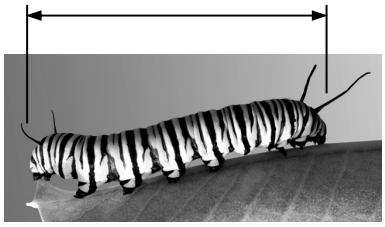
3 Scale = 9 : 1



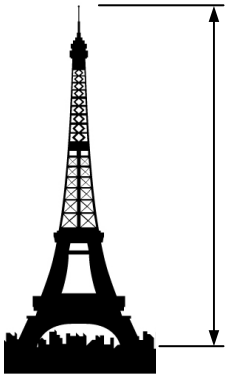
4 Scale = 3 : 2



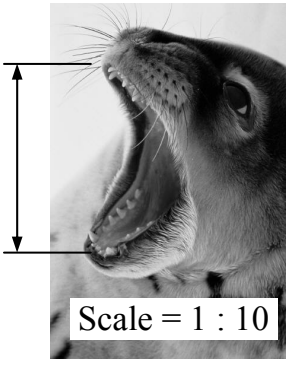
5 Scale = 5 : 3



6 Scale = 1 : 7 200

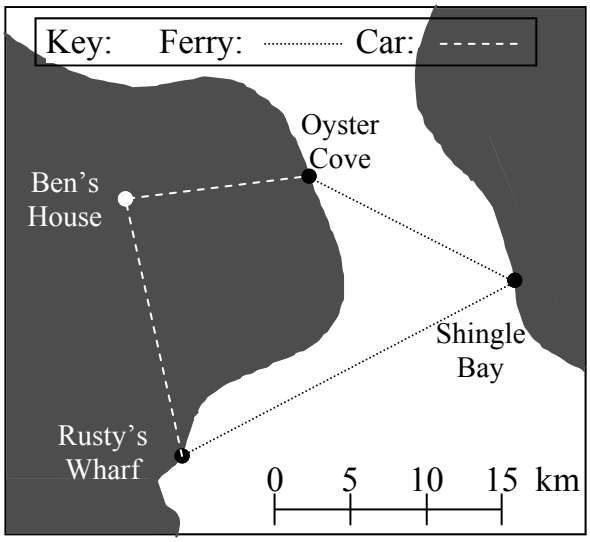


7



Q	Image Length (mm)	Actual Length (mm)
1		
2		mm = m
3		
4		
5		mm = cm
6		mm = m
7		mm = cm

Ben drove from Rusty's Wharf to Oyster Cove, while Tim caught the ferry. Use the scale to answer these questions.



Find the distance in km between:

8 Rusty's Wharf and Shingle Bay _____

9 Shingle Bay and Oyster Cove _____

10 Rusty's Wharf and Ben's House _____

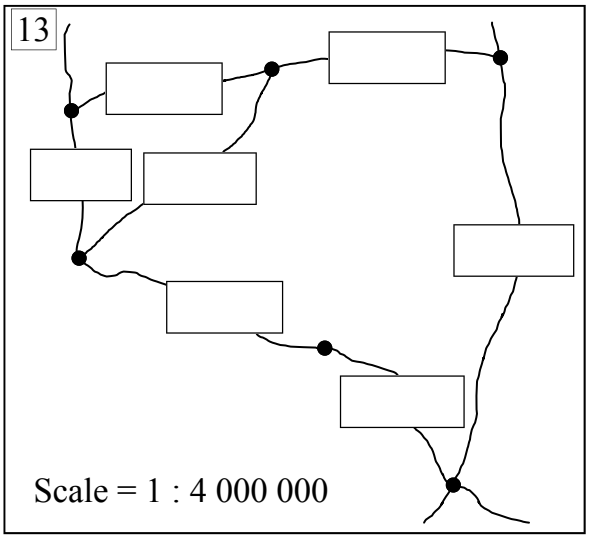
11 Ben's house and Oyster Cove _____

12 The ferry averages 20 km/h (5 km in 15 min), and it stops at all wharves for 10 min. Complete the time table below.

Location	Arrives	Departs
Rusty's Wharf	12.25 pm.	
Shingle Bay		
Oyster Cove		

Measure straight lengths in mm (ignore curves). Use the scale, then write the distances (km) in the boxes.

13



mm → m → km = ÷ 1 000 ÷ 1 000

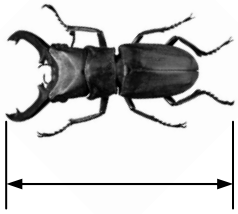
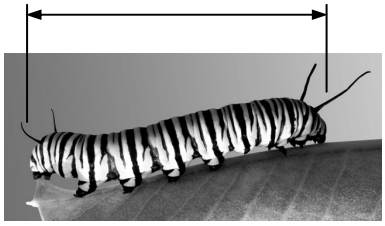
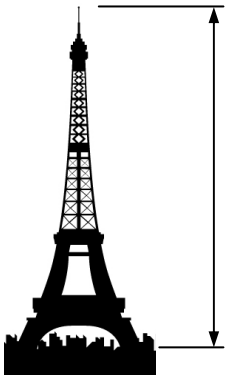
4 Scale = 3 : 2



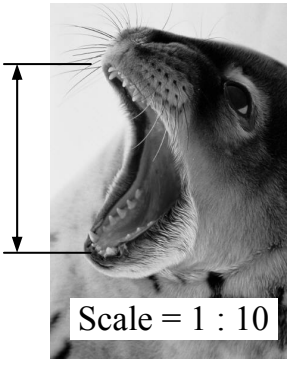
5 Scale = 5 : 3



6 Scale = 1 : 7 200

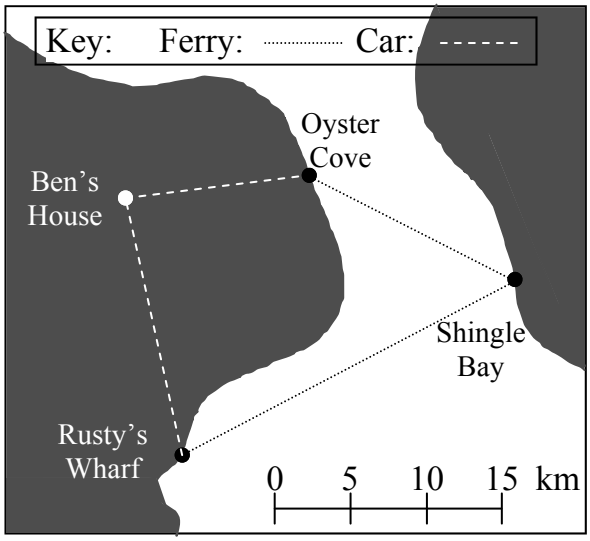


7



Q	Image Length (mm)	Actual Length (mm)
1	62 mm	124 mm
2	50 mm	33 000 mm = 33 m
3	36 mm	4 mm
4	30 mm	20 mm
5	40 mm	24 mm = 2.4 cm
6	45 mm	324 000 mm = 324 m
7	25 mm	250 mm mm = 25 cm

Ben drove from Rusty's Wharf to Oyster Cove, while Tim caught the ferry. Use the scale to answer these questions.



Find the distance in km between:

8 Rusty's Wharf and Shingle Bay 25 km

9 Shingle Bay and Oyster Cove 15 km

10 Rusty's Wharf and Ben's House 17.5 km

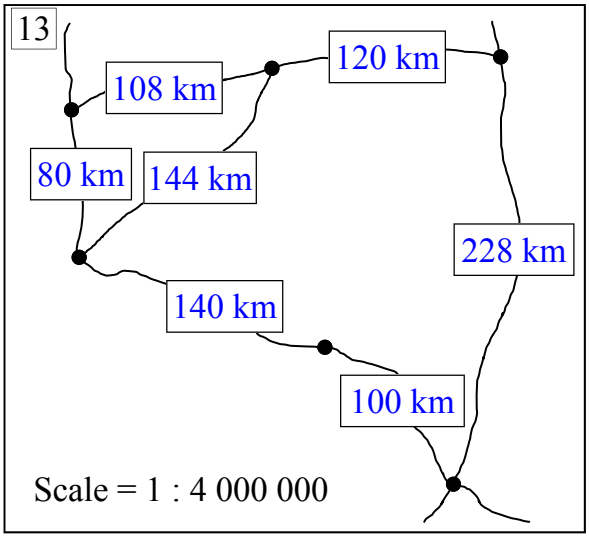
11 Ben's house and Oyster Cove 12.5 km

12 The ferry averages 20 km/h (5 km in 15 min), and it stops at all wharves for 10 min. Complete the time table below.

Location	Arrives	Departs
Rusty's Wharf	12.25 pm.	12.35 pm.
Shingle Bay	1.50 pm.	2.00 pm.
Oyster Cove	2.45 pm.	2.55 pm.

Measure straight lengths in mm (ignore curves). Use the scale, then write the distances (km) in the boxes.

13



mm → m → km = ÷ 1 000 ÷ 1 000

Scale Diagrams - Construction Plan Views

When a building is designed it is shown in two dimensional views. It can be shown from the sides (elevation and end elevation) or from above, which is called the plan view. This sheet deals with scale drawing diagrams in plan view.

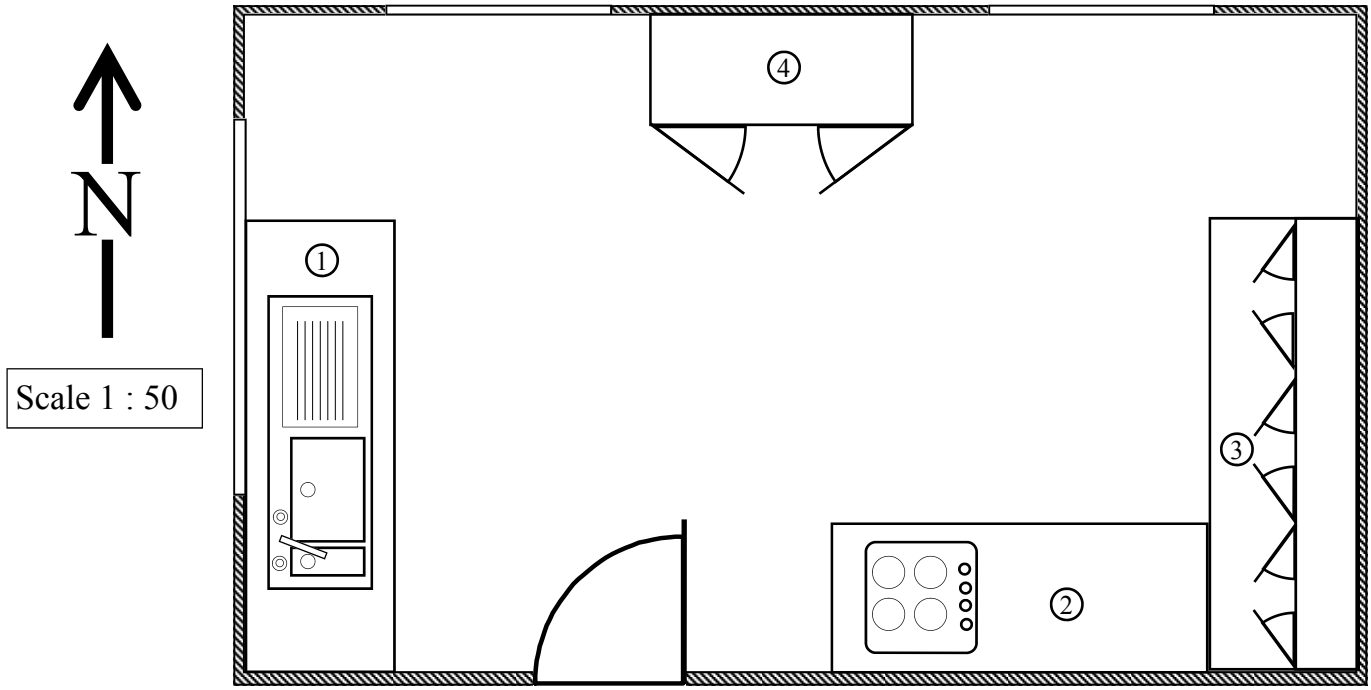
So the roof has been ripped off and you are like a giant bent over the room looking down. The kitchen shown on the worksheet contains a pantry cupboard, a sink (wet area), a cooking area and other cupboards. While you can't see how tall they are, you can measure them and find their length and width.

The scale of this diagram is 1 : 50. So every measurement you make has to be multiplied by 50. Once you do that, change the length from cm to m. All the lengths on the sheet are either exact cm lengths, or 0.5 cm lengths.

So measure the lengths, make the conversion using the scale and answer the questions. You should notice an easier way to convert than using your calculator all the time. Nothing that a giant couldn't manage, as long as they have a ruler of course.

Scale Diagrams - Construction Plan Views

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE



Get out your ruler and measure lengths in cm, to the nearest 0.5 cm. Then use the scale to find the actual length and answer the questions. Round to 2 d.p.

1 The length of the eastern wall (in m). _____

2 The length of the northern wall (in m). _____

3 The floor area (empty) of the room (m^2).

Length = ☐ m Breadth = ☐ m

$A = lb$

$= ☐ \times ☐$

$A = ☐ m^2$

4 The length, breadth and floor area of the pantry ④

Length = ☐ m _____

Breadth = ☐ m _____

_____

5 The length, breadth and floor area of the sink bench ①

Length = ☐ m _____

Breadth = ☐ m _____

_____

6 The length, breadth and floor area of the cook-top bench ②

_____

Length = ☐ m _____

Breadth = ☐ m _____

7 The length, breadth and floor area of the cupboards ③

Length = ☐ m _____

Breadth = ☐ m _____

_____

8 Find the total covered floor area. = ① + ② + ③ + ④

_____

9 Find the total uncovered floor area.

_____

10 Estimate the cost of tiling the uncovered floor area when tiles cost \$35/m^2. Available in whole m^2 only.

_____

11 If the pantry ④ is 2 m tall, calculate the wall area it occupies.

Height = ☐ m _____

Width = ☐ m _____

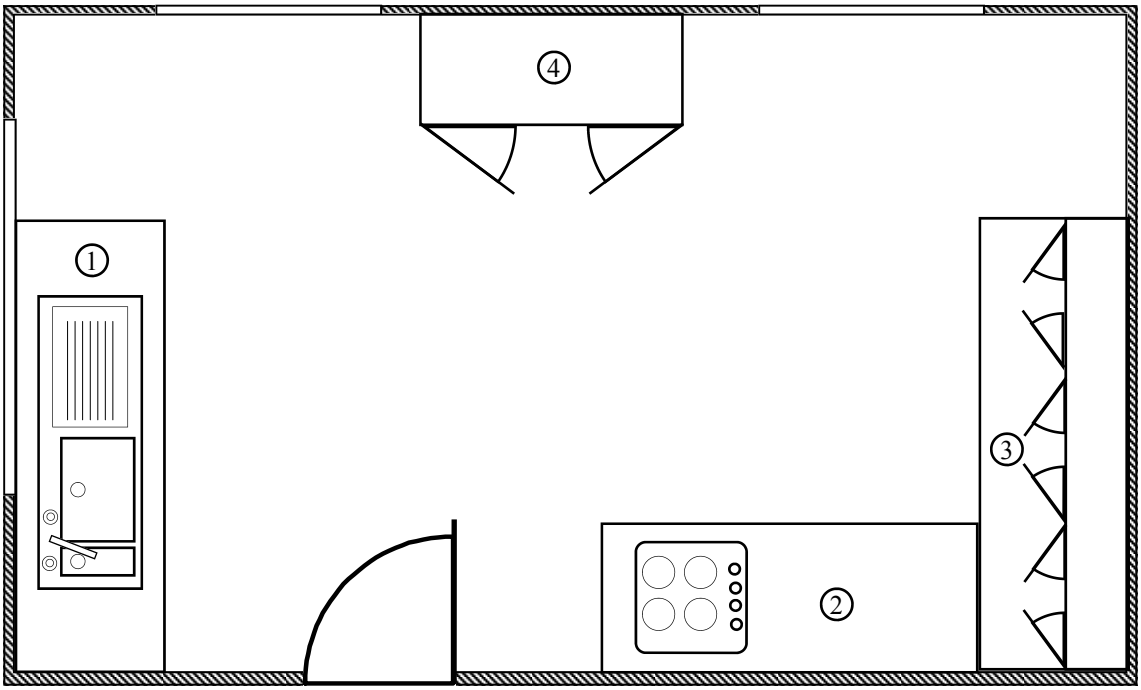
_____

12 There are three windows in the plan, if they are all 1.2 m high, find the total window area in the room.

Sink Window	Northern Wall Windows	Total

Scale Diagrams - Construction Plan Views

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE



Get out your ruler and measure lengths in cm, to the nearest 0.5 cm. Then use the scale to find the actual length and answer the questions. Round to 2 d.p.

1 The length of the eastern wall (in m). 4.5 m

2 The length of the northern wall (in m). 7.5 m

3 The floor area (empty) of the room (m^2).

Length = 7.5 m Breadth = 4.5 m

$A = lb$

$= 7.5 \times 4.5$

$A = 33.75\ m^2$

4 The length, breadth and floor area of the pantry ④

Length = 1.75 m

Breadth = 0.75 m

$A = lb$

$= 1.75 \times 0.75$

$A = 1.31\ m^2$ (2 d.p.)

5 The length, breadth and floor area of the sink bench ①

Length = 3 m

Breadth = 1 m

$A = lb$

$= 3 \times 1$

$A = 3\ m^2$

6 The length, breadth and floor area of the cook-top bench ②

Length = 2.5 m

Breadth = 1 m

$A = lb$

$= 2.5 \times 1$

$A = 2.5\ m^2$

7 The length, breadth and floor area of the cupboards ③

Length = 3 m

Breadth = 1 m

$A = lb$

$= 3 \times 1$

$A = 3\ m^2$

8 Find the total covered floor area. = ① + ② + ③ + ④

$A = 1.31 + 3 + 2.5 + 3 = 9.81\ m^2$

9 Find the total uncovered floor area.

$A = 33.75 - 9.81 = 23.94\ m^2$

10 Estimate the cost of tiling the uncovered floor area when tiles cost \$35/m^2. Available in whole m^2 only.

$Cost = 24 \times 35 = \$840$

11 If the pantry ④ is 2 m tall, calculate the wall area it occupies.

Height = 2 m

Width = 1.75 m

$A = lb$

$= 2 \times 1.75$

$A = 3.5\ m^2$

12 There are three windows in the plan, if they are all 1.2 m high, find the total window area in the room.

Sink Window	Northern Wall Windows	Total
$A = lb$	$A = lb$	Area = 2 × 1.8
$= 2.5 \times 1.2$	$= 1.5 \times 1.2$	+ 3 = 6.6 m^2
$A = 3\ m^2$	$A = 1.8\ m^2$	

Finding the Scale

Scale drawings are used on maps, construction diagrams and scientific diagrams amongst other applications. The scale can be written on these diagrams as a ratio, such as 1 : 4 000 or a measured scale where a length on the image (diagram or map) represents the actual length. Converting this scale to a ratio is the aim of these worksheet.

Column 1 starts with a review on simplifying ratios, use your calculator's fraction key to simplify these ratios.

Column 2 then deals with measured lengths on a diagram with the actual length. These are again answered with the fraction key of the calculator. Write the image : actual ratio, then simplify. Later in the column the units of these two measurements are different. So convert them to match and then repeat the calculator's fraction key process to simplify.

Column 3 is the same as column 2 except that a ruler is used first. Measure the length of the scale line, then compare that with the actual length. Change the units and solve by the same method as above.

Finding the Scale

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Simplify the ratios below by using your calculator's fraction key

Example 25:65 = 5:13

2 5 $a^b/_c$ 6 5 =

1 20 : 110 = ☐ : ☐

2 72 : 189 = ☐ : ☐

3 86 : 168 =

4 200 : 1 400 =

5 75 : 350 =

6 45 : 270 =

7 24 : 56 =

8 12 : 63 =

9 10 : 1 000 =

10 15 : 650 =

These give mixed or whole number answers. Convert them to improper fractions.

3 6 $a^b/_c$ 2 1 = SHIFT $a^b/_c$

11 36 : 21 = :

12 200 : 75 =

13 350 : 75 =

14 600 : 125 =

15 550 : 120 =

16 900 : 320 =

17 1 500 : 6 =

18 55 : 15 =

19 340 : 85 =

20 10 000 : 20 =

Find the scale given both the scaled or 'image' size and the actual size.

21 Image size 25 mm

Actual size 200 mm

Scale = ☐ : ☐ (image, actual) = ☐ : ☐ (simplify)

22 Image size 3 cm

Actual size 72 cm

Scale = ☐ : ☐ (image, actual) = ☐ : ☐ (simplify)

23 Image size 35 cm

Actual size 12 cm

Scale = ☐ : ☐ = ☐ : ☐

Change the larger unit to match the smaller unit and calculate the scale.

24 Image size 15 cm

Actual size 1.2 m = cm

Scale = ☐ : ☐ (image, actual) = ☐ : ☐ (simplify)

25 Image size 32 mm

Actual size 2.06 m = mm

Simplify the ratios below by using your calculator's fraction key

Example 25:65 = 5:13

2 5 $a^b/_c$ 6 5 =

1 20 : 110 = 2 : 11

2 72 : 189 = 8 : 21

3 86 : 168 = 43 : 84

4 200 : 1 400 = 1 : 7

5 75 : 350 = 3 : 14

6 45 : 270 = 1 : 6

7 24 : 56 = 3 : 7

8 12 : 63 = 4 : 21

9 10 : 1 000 = 1 : 100

10 15 : 650 = 3 : 130

These give mixed or whole number answers. Convert them to improper fractions.

3 6 $a^b/_c$ 2 1 = SHIFT $a^b/_c$

11 36 : 21 = 12 : 7

12 200 : 75 = 8 : 3

13 350 : 75 = 14 : 3

14 600 : 125 = 24 : 5

15 550 : 120 = 55 : 12

16 900 : 320 = 45 : 16

17 1 500 : 6 = 250 : 1

18 55 : 15 = 11 : 3

19 340 : 85 = 4 : 1

20 10 000 : 20 = 500 : 1

Find the scale given both the scaled or 'image' size and the actual size.

21 Image size 25 mm

Actual size 200 mm

Scale = 25 (image) : 200 (actual) = 1 : 8 (simplify)

22 Image size 3 cm

Actual size 72 cm

Scale = 3 (image) : 72 (actual) = 1 : 24 (simplify)

23 Image size 35 cm

Actual size 12 cm

Scale = 35 : 12 = 35 : 12

Change the larger unit to match the smaller unit and calculate the scale.

24 Image size 15 cm

Actual size 1.2 m = 120 cm

Scale = 15 (image) : 120 (actual) = 1 : 8 (simplify)

25 Image size 32 mm

Actual size 2.06 m = 2 060 mm

Scale = 32 : 2 060 = 8 : 515

26 Image size 5 cm

Actual size:

175 km = 17 500 000

Scale = 1 : 3 500 000

Just write simplified ratio

27 Image size 18 cm

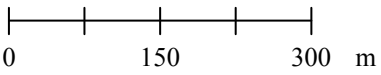
Actual size:

54 km = 5 400 000

Scale = 1 : 300 000

Rewrite the scale below as a ratio in its simplest form

28

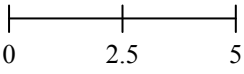


3 cm = 300 m

3 cm = 30 000 cm

1 : 10 000

29

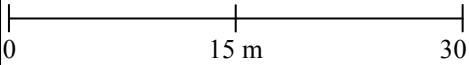


4 cm = 5 km

4 cm = 500 000 cm

1 : 125 000

30

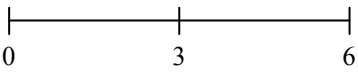


6 cm = 30 m

6 cm = 3 000 cm

1 : 500

31

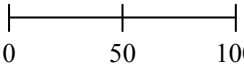


4.5 cm = 6 mm

45 mm = 6 mm

15 : 2

32



2 cm = 100 km

2 cm = 10 000 000 cm

1 : 5 000 000

Rates

Rates compare quantities with each other. This rate can be simplified, it can also be applied to larger quantities.

For example, if you can sharpen four pencils in 2 minutes, then you can sharpen 2 pencils in one minute. And if you sharpen pencils for 8 minutes you can apply the rate to calculate how many pencils you have sharpened. A forward slash separates rate quantities so pencils/min or m/s or kg/min etc. are how rates are shown.

Column 1 starts with simplifying ratios. Divide the first quantity by the second, then show your rate with a '/'. Q.7 - 12 you are supplied the rate, but instead are asked to change the rates units. So this requires you to multiply or divide by the appropriate conversion amount.

Example. Convert 15 T/min to T/s

15 T/min [T/s]

$15 \div 60 = 0.25$ T/s ← There are 60 seconds in a minute. And with less time there will be less weight, so divide by 60.

Column 2 is like the above question but there are two or more conversions to be made. The above example will be attempted again, but this time the answer is to be in kg/s.

Example. Convert 15 T/min to kg/s

15 T/min [kg/s]

$15 \times 1\,000 = 15\,000$ kg/min ← If you have to multiply, complete the multiplication first. So convert T to kg.

$15\,000 \div 60 = 250$ kg/s ← Now complete the second conversion, from min to s. So divide by 60.

The rest of Column 2 and Column 3 are questions that require you to apply a ratio to a given problem. These questions will mostly require either division or multiplication. Look at the question and ask yourself "After the conversion will I have more of less of them?" then use that answer to help you to decide on division or multiplication.

Rates

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use division to express these rates in their simplest form.

Example

12 truckloads in 3 hours

12 ÷ 3 = 4 truckloads/h

1 85 cm in 5 seconds

□ ÷ □ = □ cm/s

2 285 shells in 19 m^2

3 871 people in 13 entrances

4 $132 for 8 hours work

5 112 nails in 7 m

6 381 km in 5 hours

Express in the given units.

7 8.4 T/h [kg/h]

□ × □ = □ kg/h

8 2.5 km/s [km/min]

9 936 people/year [people/week]

10 9 m/day [m/h]

11 0.8 kg/m^2 [kg/ha]

1 ha = 10 000 m^2 rpm = rev/min

12 504 rpm [rev/s]

Convert these rates to the bracketed units. Multiple conversions required!

13 12 cm/s [m/min]

= □ × □ = □ cm/min

= □ ÷ □ = □ m/min

14 3.4 kg/min [T/h]

= □ × □ = □ kg/h

= □ ÷ □ = □ T/h

15 72 km/h [m/s]

m/h

m/min

m/s

16 15 m/s [km/h]

Apply these rates in these questions.

17 Jerry can fit a car tyre in 5 min. How many can he fit in 20 min?

18 In 1 hour?

19 How long would he take to fit 40 tyres?

20 Sara is paid $942/week. How much would she be paid in a year?

21 After how many complete weeks has she been paid $6 000?

22 A block of cheese costs $13/kg. How much would 2.2 kg cost?

23 What amount of cheese, in kg, could be purchased for $20. (to 2 d.p.)

24 A car emits 109g/km of CO_2. How much CO_2 is emitted in kg when the car has travelled 85 km.

25 If the average distance covered by a motorist is 20 000 km p.a. Find the amount of CO_2 emitted in T, in a year.

25 100 g of toothpaste contains 0.1 g of fluoride. How much fluoride is there in a 225 g tube?

26 SlateFence make toothpaste. They produce a new tube every 0.08 s. How many tubes are produced in a minute?

27 A medicine guidelines are 10 mL, plus 2 mL for every 10 kg of body weight. What amount of this medicine should be taken by a 90 kg person?

Rates

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use division to express these rates in their simplest form.

Example

12 truckloads in 3 hours

12 ÷ 3 = 4 truckloads/h

1 85 cm in 5 seconds

85 ÷ 5 = 17 cm/s

2 285 shells in 19 m^2

285 ÷ 19 = 15 shells/m^2

3 871 people in 13 entrances

871 ÷ 13 = 67 people/entrance

4 $132 for 8 hours work

132 ÷ 8 = $16.50/h

5 112 nails in 7 m

112 ÷ 7 = 16 nails/m

6 381 km in 5 hours

381 ÷ 5 = 76.2 km/h

Express in the given units.

7 8.4 T/h [kg/h]

8.4 × 1 000 = 8 400 kg/h

8 2.5 km/s [km/min]

2.5 × 60 = 150 km/min

9 936 people/year [people/week]

936 ÷ 52 = 18 people/week

10 9 m/day [m/h]

9 ÷ 24 = 0.375 m/day

11 0.8 kg/m^2 [kg/ha]

0.8 × 10 000 = 8 000 kg/ha

1 ha = 10 000 m^2 rpm = rev/min

12 504 rpm [rev/s]

504 ÷ 60 = 8.4 rev/s

Convert these rates to the bracketed units. Multiple conversions required!

13 12 cm/s [m/min]

= 12 × 60 = 720 cm/min

= 720 ÷ 100 = 7.2 m/min

14 3.4 kg/min [T/h]

= 3.4 × 60 = 204 kg/h

= 204 ÷ 1 000 = 0.204 T/h

15 72 km/h [m/s]

= 72 × 1 000 = 72 000 m/h

= 72 000 ÷ 60 = 1 200 m/min

= 1 200 ÷ 60 = 20 m/s

16 15 m/s [km/h]

= 15 × 60 = 900 m/min

= 900 × 60 = 54 000 m/h

= 54 000 ÷ 1 000 = 54 km/h

Apply these rates in these questions.

17 Jerry can fit a car tyre in 5 min. How many can he fit in 20 min?

$^{20}/_{5}$ = 4 tyres

18 In 1 hour? $^{60}/_{5}$ = 12 tyres

19 How long would he take to fit 40 tyres? 40 × 5 = 200 min (3 h 20 min)

20 Sara is paid $942/week. How much would she be paid in a year?

942 × 52 = $48 984

21 After how many complete weeks has she been paid $6 000?

$^{6\,000}/_{942}$ = 6.36 … = 7 weeks

22 A block of cheese costs $13/kg. How much would 2.2 kg cost?

Cost = 2.2 × 13

Cost = $28.60

23 What amount of cheese, in kg, could be purchased for $20. (to 2 d.p.)

Cheese = $^{20}/_{13}$

Cheese = 1.53 kg (2 d.p.)

24 A car emits 109g/km of CO_2. How much CO_2 is emitted in kg when the car has travelled 85 km.

CO_2 = 109 × 85

CO_2 = 9 265 g = 9.265 kg

25 If the average distance covered by a motorist is 20 000 km p.a. Find the amount of CO_2 emitted in T, in a year.

CO_2 = 20 000 × 109

= 2 180 000 g/year

CO_2 = 2.18 T/year

25 100 g of toothpaste contains 0.1 g of fluoride. How much fluoride is there in a 225 g tube?

Fluoride = $^{225}/_{100}$ × 0.1

Fluoride = 0.225 g

26 SlateFence make toothpaste. They produce a new tube every 0.08 s. How many tubes are produced in a minute?

Tubes = $^{60}/_{0.08}$

Tubes = 750 tubes/s

27 A medicine guidelines are 10 mL, plus 2 mL for every 10 kg of body weight. What amount of this medicine should be taken by a 90 kg person?

Medicine = 10 + $^{90}/_{10}$ × 2

Medicine = 28 mL

Conversion of Speed

Speed can be measured in a variety of units, like cm/h, km/s etc. The most commonly used metric speeds are km/h and m/s. It is important that you are able to convert speed measurements between these two units, this sheet shows you how.

Column 1 starts with using a methodical step-by-step approach to change between units. This method changes one unit at a time and takes three steps, there is an example at the top of the column but there is also one below.

Example - Change 16 m/s to km/h

16 m/s

m/s → m/min

m/min → m/h

m/h → km/h

16 × 60 = 960 m/min

960 × 60 = 57 600 m/h

57 600 ÷ 1 000 = 57.6 km/h

First change m/s to m/min, because there are 60 seconds in a minute multiply the 16 by 60.

Now change m/min to m/h, because there are 60 minutes in an hour, multiply the 960 by 60.

Now change m/h to km/h, because there are 1 000 m in a km, divide the 57 600 by 1 000.

The second column of the sheet answers the questions in a faster process. Rather than changing one unit at a time, it does the lot in one go. There are 1 000 m in a km and there are 60 × 60 (3 600) seconds in an hour, these are used altogether to make the conversion. There is an example above Q.8, while Q.11 and Q.12 help you get started.

The last part of Column 2 involves speed conversion to applying the brakes in a car. When a hazard or emergency arises in a car, the driver has to move their foot from the accelerator pedal to the brake pedal. This can be done in less than a second by racing drivers or drivers with fast reactions, but it is considered that 2.5 seconds will cover 90% of drivers. By converting the speed from km/h you get a speed in m/s. That will tell you how far the car is travelling each second. So multiply that by 2.5 and you get an idea of how far a car travels before it starts to break, let alone the breaking distance.

Notice the difference in distance between a car travelling at 60 km/h and 80 km/h and you cab see why authorities try to reduce speed around schools and built-up areas.

Conversion of Speed

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use a step by step approach to change these speeds from km/h to m/s. Round to 1 d.p. when needed.

Example: Convert 50 km/h to m/s.

km/h → m/h
m/h → m/min
m/min → m/s

$50 \times 1\,000 = 50\,000$ m/h

$50\,000 \div 60 = 833.\dot{3}$ m/min

$833.\dot{3} \div 60 = 13.9$ m/s (1 d.p.)

1 36 km/h

2 140 km/h

3 4.6 km/h

Now the reverse, change these speeds in m/s to km/h

4 27 m/s

m/s → m/min
m/min → m/h
m/h → km/h

□ × 60 = □ m/min

□ × 60 = □ m/h

□ ÷ 1 000 = □ km/h

5 11 m/s

6 6.3 m/s

7 225 m/s

Now convert the 'Speedy' way. By converting all in one line. Change these to m/s. (1 d.p.)

Example: Convert 70 km/h to m/s.

$$70 \text{ km/h} = \frac{(70 \times 1\,000)}{(60 \times 60)} = 19.4 \text{ m/s (1 d.p.)}$$

8 85 km/h $= \dfrac{(\square \times 1\,000)}{(60 \times 60)} = \square$ m/s (1 d.p.)

9 65 km/h = _____ = _____

10 860 km/h = _____ = _____

Now convert from m/s to km/h. (1 d.p.)

11 14 m/s $= \dfrac{(\square \div 1\,000)}{(1 \div 60 \div 60)} = \square$ km/h

12 343 m/s Speed of Sound $= \dfrac{(\square \div 1\,000)}{(1 \div 60 \div 60)} =$ _____

13 464 m/s = _____ = _____
Earth Rotation Equator

14 1.2 m/s = _____ = _____
Walking speed

How far have these vehicles travelled during the 'reaction time' of the driver. Find the speed in m/s then multiply by 2.5 for the distance travelled.

Brake reaction time, is the time that elapses between when a hazard is seen and the brakes of a vehicle are applied by the driver. It is assumed to be an average of 2.5 seconds.

15 Find the distance travelled at 60 km/h.

60 km/h = _____ = _____ (1 d.p.)
Change km/h to m/s

Distance = □ × 2.5 = □ m (1 d.p.)

16 Find the distance travelled at 80 km/h.

80 km/h = _____ = _____ (1 d.p.)
Change km/h to m/s

Distance = □ × 2.5 = □ m (1 d.p.)

Conversion of Speed

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use a step by step approach to change these speeds from km/h to m/s. Round to 1 d.p. when needed.

Example: Convert 50 km/h to m/s.

km/h → m/h
m/h → m/min
m/min → m/s

50 × 1 000 = 50 000 m/h

50 000 ÷ 60 = 833.3̇ m/min

833.3̇ ÷ 60 = 13.9 m/s (1 d.p.)

1 36 km/h

km/h → m/h
m/h → m/min
m/min → m/s

36 × 1 000 = 36 000 m/h

36 000 ÷ 60 = 600 m/min

600 ÷ 60 = 10 m/s

2 140 km/h

km/h → m/h
m/h → m/min
m/min → m/s

140 × 1 000 = 140 000 m/h

140 000 ÷ 60 = 2 333.3̇ m/min

2 333.3̇ ÷ 60 = 38.9 m/s (1 d.p.)

3 4.6 km/h

4.6 × 1 000 = 4 600 m/h

4 600 ÷ 60 = 76.6̇ m/min

76.6̇ ÷ 60 = 1.3 m/s (1 d.p.)

Now the reverse, change these speeds in m/s to km/h

4 27 m/s

m/s → m/min
m/min → m/h
m/h → km/h

27 × 60 = 1 620 m/min

1 620 × 60 = 97 200 m/h

97 200 ÷ 1 000 = 97.2 km/h

5 11 m/s

m/s → m/min
m/min → m/h
m/h → km/h

11 × 60 = 660 m/min

660 × 60 = 39 600 m/h

39 600 ÷ 1 000 = 39.6 km/h

6 6.3 m/s

6.3 × 60 = 378 m/min

378 × 60 = 22 680 m/h

22 680 ÷ 1 000 = 22.7 km/h (1 d.p.)

7 225 m/s

225 × 60 = 13 500 m/min

13 500 × 60 = 810 000 m/h

810 000 ÷ 1 000 = 810 km/h

Now convert the 'Speedy' way. By converting all in one line. Change these to m/s. (1 d.p.)

Example: Convert 70 km/h to m/s.

$$70 \text{ km/h} = \frac{(70 \times 1\,000)}{(60 \times 60)} = 19.4 \text{ m/s (1 d.p.)}$$

8 85 km/h $= \frac{(85 \times 1\,000)}{(60 \times 60)} =$ 23.6 m/s (1 d.p.)

9 65 km/h $= \frac{(65 \times 1\,000)}{(60 \times 60)} = 18.1$ m/s (1 d.p.)

10 860 km/h $= \frac{(860 \times 1\,000)}{(60 \times 60)} = 238.9$ m/s (1 d.p.)

Now convert from m/s to km/h. (1 d.p.)

11 14 m/s $= \frac{(14 \div 1\,000)}{(1 \div 60 \div 60)} =$ 50.4 km/h

12 343 m/s (Speed of Sound) $= \frac{(343 \div 1\,000)}{(1 \div 60 \div 60)} = 1\,234.8$ km/h

13 464 m/s (Earth Rotation Equator) $= \frac{(464 \div 1\,000)}{(1 \div 60 \div 60)} = 1\,670.4$ km/h

14 1.2 m/s (Walking speed) $= \frac{(1.2 \div 1\,000)}{(1 \div 60 \div 60)} = 4.3$ km/h (1 d.p.)

How far have these vehicles travelled during the 'reaction time' of the driver. Find the speed in m/s then multiply by 2.5 for the distance travelled.

Brake reaction time, is the time that elapses between when a hazard is seen and the brakes of a vehicle are applied by the driver. It is assumed to be an average of 2.5 seconds.

15 Find the distance travelled at 60 km/h.

60 km/h (Change km/h to m/s) $= \frac{(60 \times 1\,000)}{(60 \times 60)} = 16.7$ m/s (1 d.p.) (1 d.p.)

Distance = 16.7 × 2.5 = 41.8 m (1 d.p.)

16 Find the distance travelled at 80 km/h.

80 km/h (Change km/h to m/s) $= \frac{(80 \times 1\,000)}{(60 \times 60)} = 22.2$ m/s (1 d.p.) (1 d.p.)

Distance = 22.2 × 2.5 = 55.5 m (1 d.p.)

Rates and Food

When you buy fruit, vegetables and meat you use rates. How much you pay for an item is a rate involving cost and weight, for example $4.98/kg. This sheet deals with rates and food and the three ways that rates can be used with food.

Column 1 deals with the most common use of rates:

If it costs this much per kg, how much will I pay if I buy this much?

This column uses multiplication to solve these. So if Ham costs $19.95/kg, how much will 1.8 kg of ham cost? An example is below:

Ham costs $19.95/kg, find the price paid for 1.8 kg.

Cost = $1.8 \times 19.95 = \$35.91$

Column 2 calculates the amount of an item that was purchased:

If it costs this much per kg, and I spent this much …. how much did I buy?

This column uses division to solve these. So if Ham costs $19.95/kg, how much ham have you bought if you spent $23? An example is below:

Ham costs $19.95/kg, find the amount purchased, to 2 d.p., if $23 was spent.

$23 \div 19.95 = 1.15$ (2 d.p.)

1.15 kg of ham was purchased

Column 3 calculates the cost of an item that was purchased:

If I paid this much, and I received this much…. how much did I pay per kg?

This column uses division to solve these. So if you bought 350 g of Ham and it cost $8.55, how much did the ham cost per kg? An example is below:

350 g of Ham costs $8.55, find the price per kg.

$8.55 \div 0.35 = 24.43$ (2 d.p.)

If given a weight in grams, you have to convert it to kg.

Ham costs $24.43/kg.

Rates and Food

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use multiplication to calculate the cost of the food below.

Example - One banana costs $1.30, how much would 5 cost?

Cost = $5 \times 1.30 = \$6.50$ ← Money is always 2 d.p.

1 One can of salmon is $6.40, how much would 7 cans cost?

Cost = ☐ × ☐ = $ ☐

2 A loaf of bread costs $3.20, how much is paid for 3 loaves?

Cost =

3 Carrots cost $3.65/kg, find the price paid for 4 kg.

4 Apples cost $5.95/kg, how much would 1.6 kg cost?

Rounding required now! Money rounds to 2 d.p.

5 Potatoes cost $6.99/kg. Find the price of 0.8 kg of potatoes.

6 Beans cost $7.19/kg, how much would 0.235 kg cost?

7 Prawns cost $29.97/kg, how much you pay for 400 g?

8 Onions cost $7.67/kg. Find the cost for 328 g of onions.

Now given the cost, find the weight or number of items you can buy. Use division this time.

9 BBQ sauce $4.45/ bottle. If $13.35 was spent, how many bottles were purchased?

☐ ÷ ☐ = ☐

☐ Bottles were purchased.

10 Plum jam $4.15/jar. If $20.75 was spent, how many jars were bought?

11 Calamari rings cost 75c each. If $8.25 was spent, how many were purchased?

12 Tomatoes cost $4.98/kg. If $7.84 was spent, what weight was purchased?

13 Ham costs $18.50/kg. If $10.36 was spent, what amount was purchased? Answer in g.

14 Mince costs $12.95/kg. If a pack costs $15.09, what amount of mince is in the pack? Answer in kg to 2 decimal places.

Use division to find the cost per item, or the price per kg ($/kg) for these products.

15 3 hamburgers cost $15.75. How much are they each?

☐ ÷ ☐ = ☐

Each hamburger costs ☐

16 6 bottles of chlorine cost $52.62. How much is one bottle?

17 2.6 kg of grapes cost $9.23. Find the amount paid per kg.

18 1.4 kg of sausages costs $12.59. Find the cost per kg.

19 775 g of peas cost $6.15. Find the amount paid per kg.

20 905 g of beans cost $6.43. Find the cost per kg.

21 220 g pack of walnuts cost $3.39. Find the cost paid per kg.

Rates and Food

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use multiplication to calculate the cost of the food below.

Example - One banana costs $1.30, how much would 5 cost?

Cost = $5 \times 1.30 = \$6.50$ ← Money is always 2 d.p.

1 One can of salmon is $6.40, how much would 7 cans cost?

Cost = 7 × 6.40 = $44.80

2 A loaf of bread costs $3.20, how much is paid for 3 loaves?

Cost = $3 \times 3.20 = \$9.60$

3 Carrots cost $3.65/kg, find the price paid for 4 kg.

$\text{Cost} = 4 \times 3.65 = \$14.60$

4 Apples cost $5.95/kg, how much would 1.6 kg cost?

$\text{Cost} = 1.6 \times 5.95 = \$9.52$

Rounding required now! Money rounds to 2 d.p.

5 Potatoes cost $6.99/kg. Find the price of 0.8 kg of potatoes.

$\text{Cost} = 0.8 \times 6.99 = \$5.59$

6 Beans cost $7.19/kg, how much would 0.235 kg cost?

$\text{Cost} = 0.235 \times 7.19 = \$1.69$

7 Prawns cost $29.97/kg, how much you pay for 400 g?

$\text{Cost} = 0.4 \times 29.97 = \$11.99$

8 Onions cost $7.67/kg. Find the cost for 328 g of onions.

$\text{Cost} = 0.328 \times 7.67 = \$2.52$

Now given the cost, find the weight or number of items you can buy. Use division this time.

9 BBQ sauce $4.45/ bottle. If $13.35 was spent, how many bottles were purchased?

13.35 ÷ 4.45 = 3

3 Bottles were purchased.

10 Plum jam $4.15/jar. If $20.75 was spent, how many jars were bought?

$20.75 \div 4.15 = 5$

5 jars of jam were purchased.

11 Calamari rings cost 75c each. If $8.25 was spent, how many were purchased?

$8.25 \div 0.75 = 11$

11 calamari rings were bought.

12 Tomatoes cost $4.98/kg. If $7.84 was spent, what weight was purchased?

$7.84 \div 4.98 = 11$

11 calamari rings were bought.

13 Ham costs $18.50/kg. If $10.36 was spent, what amount was purchased? Answer in g.

$10.36 \div 18.50 = 0.56$

560 g of ham was bought.

14 Mince costs $12.95/kg. If a pack costs $15.09, what amount of mince is in the pack? Answer in kg to 2 decimal places.

$15.09 \div 12.95 = 1.17$ (2 d.p.)

1.17 kg of mince is in the pack.

Use division to find the cost per item, or the price per kg ($/kg) for these products.

15 3 hamburgers cost $15.75. How much are they each?

15.75 ÷ 3 = 5.25

Each hamburger costs $5.25

16 6 bottles of chlorine cost $52.62. How much is one bottle?

$52.62 \div 6 = 8.77$

One bottle of chlorine costs $8.77

17 2.6 kg of grapes cost $9.23. Find the amount paid per kg.

$9.23 \div 2.6 = 3.55$

Grapes cost $3.55/kg.

18 1.4 kg of sausages costs $12.59. Find the cost per kg.

$12.59 \div 1.4 = 8.99$ (2 d.p.)

Sausages cost $8.99/kg.

19 775 g of peas cost $6.15. Find the amount paid per kg.

$6.15 \div 0.775 = 7.94$ (2 d.p.)

Peas cost $7.94/kg.

20 905 g of beans cost $6.43. Find the cost per kg.

$6.43 \div 0.905 = 7.10$ (2 d.p.)

Beans cost $7.10/kg.

21 220 g pack of walnuts cost $3.39. Find the cost paid per kg.

$3.39 \div 0.22 = 15.41$ (2 d.p.)

Pack of walnuts cost $15.41/kg.

Best Buy and Unit Pricing

When you go into a shop to buy eggs it is easy to compare the price if all the eggs are in packs of a dozen. But goods are in different sized packs and sometimes the cheaper product may appear more expensive simply because of its weight. So it is important that you able to judge the best value, of course realise that the quality of the product has to be considered in making a choice, but this sheet deals with the mathematics side only.

There is a push for retailers to display 'unit pricing' which converts everything to a price 'per kg', or 'per 100 g' so that you can compare easily. This sheet shows you how to compare goods by creating your own unit pricing model.

Column 1 starts with questions on best buys, that is, making the best value purchase. To solve these questions convert the money to cents and divide by the weight (or volume). That will give you an answer of 'c/g' or 'c/mL'. You can then compare, the lowest price being the best buy. There is an example in the first column. Why change the $ to cents? Because it stops you being confused with decimals.

Column 2 continues on the same way except the units are different between the goods. One may be in grams, the other a larger pack, may be in kg. Change kg → g, so that they can be compared, then the process is the same.

Column 3 is different, it introduces unit pricing. In this case you are asked to convert the prices from c/g to c/ 100g. Why the need? Again it removes decimals and so it is less confusing to shoppers. All you have to do is multiply your price of c/g or c/mL by 100 to convert to the unit pricing model. Answers are in cents, without any decimal places.

Best Buy and Unit Pricing

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Ignoring quality, the best product is the cheapest. Use Unit Pricing to choose the best buy.

Example: Pick the best buy

500 g frozen peas costs $7.95

or 770 g frozen peas costs $9.60

500g: 795 ÷ 500 = 1.59 c/g

Divide cost in cents by the weight or volume. Round to 2 d.p. for comparison

770g: 960 ÷ 770 = 1.25 c/g

The best buy is the 770 g pack.

1 450 g Corn kernels for $2.35

or

375 g Corn kernels for $1.82

450g: ☐ ÷ ☐ = ☐ c/g

375g: ☐ ÷ ☐ = ☐ c/g

The best buy is the ☐ g can

2

$4.85

$6.30

1.25 L:

2 L:

3 150 g Peanuts for $2.59

or

375 g Peanuts for $6.77

4 12 Oysters for $15.50

or

9 Oysters for $11

These product weights and volumes must be changed to like units, then find the best buy.

5 650 mL Olive Oil for $5.52

or

1.5 L Olive Oil for $16.10

6 300 g Mushrooms for $4.14

or

1.3 kg Mushrooms for $18.62

7 350 g Carrots for $2.10

or

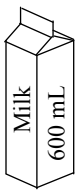
2.6 kg Carrots for $13.84

or

1.04 kg Carrots for $5.12

8

$6.50



$1.75

$8.30

Some stores supply unit pricing, but it is usually in amounts like 100 g or 100 mL. Convert these prices to c/100 g or c/100 mL.

Example: Change to c/100g

445 g Marshmallows for $5.30

Cost: 530 ÷ 445 = 1.191…..

Don't clear your calculator screen. Multiply by 100 and round to nearest cent.

Cost: 119 c/100 g (nearest cent)

9 Bleach 750 mL for $8.68

10 Lettuce Mix 150 g for $3.95

Convert both products to c/100 g then find the best buy.

11 250 g Cheese Puffs for $3.40

or

90 g Cheese Puffs for $1.20

12 400 g Sliced Ham for $11.20

or

560 g Sliced Ham for $14.85

Best Buy and Unit Pricing

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Ignoring quality, the best product is the cheapest. Use Unit Pricing to choose the best buy.

Example: Pick the best buy

500 g frozen peas costs $7.95

or 770 g frozen peas costs $9.60

500g: 795 ÷ 500 = 1.59 c/g

Divide cost in cents by the weight or volume. Round to 2 d.p. for comparison

770g: 960 ÷ 770 = 1.25 c/g

The best buy is the 770 g pack.

1 450 g Corn kernels for $2.35

or

375 g Corn kernels for $1.82

450g: 235 ÷ 450 = 0.52 c/g

375g: 182 ÷ 375 = 0.49 c/g

The best buy is the 375 g can

2

$4.85

$6.30

1.25 L: 485 ÷ 1.25 = 388 c/L

2 L: 630 ÷ 2 = 315 c/L

The best buy is the 2 L bottle.

3 150 g Peanuts for $2.59

or

375 g Peanuts for $6.77

150 g: 259 ÷ 150 = 1.73 c/g

375 g: 677 ÷ 375 = 1.81 c/g

The best buy is the 150 g pack.

4 12 Oysters for $15.50

or

9 Oysters for $11

12 : 1 550 ÷ 12 = 129 c/oyster

9 : 1 100 ÷ 9 = 122 c/oyster

The best buy is the 9 oysters.

These product weights and volumes must be changed to like units, then find the best buy.

5 650 mL Olive Oil for $5.52

or

1.5 L Olive Oil for $16.10

650 mL: 552 ÷ 650 = 0.85 c/g

1.5 L: 1 610 ÷ 1 500 = 1.07 c/g

Best buy is the 650 mL bottle.

6 300 g Mushrooms for $4.14

or

1.3 kg Mushrooms for $18.62

300 g: 414 ÷ 300 = 1.38 c/g

1.3 kg: 1 862 ÷ 1 300 = 1.43 c/g

Best buy is the 300 g pack.

7 350 g Carrots for $2.10

or

2.6 kg Carrots for $13.84

or

1.04 kg Carrots for $5.12

350 g: 210 ÷ 350 = 0.60 c/g

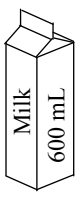
2.6 kg: 1 384 ÷ 2 600 = 0.53 c/g

1.04 kg: 512 ÷ 1 040 = 0.49 c/g

Best buy is the 1.04 kg pack.

8

$6.50



$1.75

$8.30

2 L: 650 ÷ 2 000 = 0.33 c/mL

600 mL: 175 ÷ 600 = 0.29 c/mL

3 L: 830 ÷ 3 000 = 0.28 c/mL

Best buy is the 3 L bottle.

Some stores supply unit pricing, but it is usually in amounts like 100 g or 100 mL. Convert these prices to c/100 g or c/100 mL.

Example: Change to c/100g

445 g Marshmallows for $5.30

Cost: 530 ÷ 445 = 1.191…..

Don't clear your calculator screen. Multiply by 100 and round to nearest cent.

Cost: 119 c/100 g (nearest cent)

9 Bleach 750 mL for $8.68

Bleach: 868 ÷ 750 = 1.157…..

Bleach: 116 c/100 mL

10 Lettuce Mix 150 g for $3.95

Lettuce: 395 ÷ 150 = 2.633…..

Lettuce: 263 c/100 g

Convert both products to c/100 g then find the best buy.

11 250 g Cheese Puffs for $3.40

or

90 g Cheese Puffs for $1.20

250 g: 340 ÷ 250 = 1.36

250 g: 136 c/100 g

90 g: 120 ÷ 90 = 1.333….

90 g: 133 c/100 g

Best buy is the 90 g pack.

12 400 g Sliced Ham for $11.20

or

560 g Sliced Ham for $14.85

400 g: 1 120 ÷ 400 = 2.8

400 g: 280 c/100 g

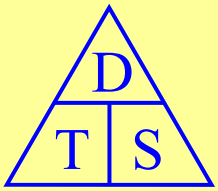
560 g: 1 485 ÷ 560 = 2.65…..

560 g: 265 c/100 g

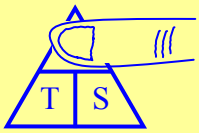
Best buy is the 400 g pack.

Speed - Distance - Time

There are three formulae to remember with these but you can also remember a stupid sentence and a triangle. The sentence is : "Dad sits on the Toilet Seat". So in the triangle shown left, the D, which stands for distance is on top (like Dad). The T and S which are Time and Speed are below the D, like the toilet seat.

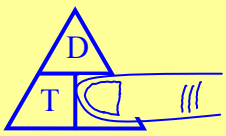


So after you draw the triangle … how do you use it? You place your finger over what you are after and build the formula. Here goes …



Cover the 'D' to find the distance formula. Because T and S are next to each other, write the formula with the letters next to each other.

$D = TS$ or Distance = Time × Speed



Cover the 'S' to find the speed formula. Because D is on top of T, write the formula with D over T.

$S = {}^{D}/_{T}$ or Speed = Distance ÷ Time

Cover the 'T' to find the time formula. Because D is on top of S, write the formula with D over S.

$T = {}^{D}/_{S}$ or Time = Distance ÷ Speed

There are two sheets for this exercise. The first sheet has the skills separated into three columns, Fizzle gives you the formulae to use at the top of each column. The second worksheet are worded problems, are mixed up and are more complicated.

These sheets require you to use time periods that aren't in exact hours. To use time mathematically you have two options.

Use the fraction key: 57 min = ${}^{57}/_{60}$, 2 h 35 min = $2\ {}^{35}/_{60}$.
Or
Use the DMS or 'Bubble Button', (whichever your calculator features)

57 min = 0 DMS ° ' '' 5 7 DMS ° ' ''

2 h 35 min = 2 DMS ° ' '' 3 5 DMS ° ' ''

Example: Terri walks for 35 min at 4.5 km/h. Find the distance walked in metres.

$D = TS$
$= {}^{35}/_{60} \times 4.5$ (you can write time as a fraction)
$D = 2.625$ km = 2 625 m.

Speed - Distance - Time

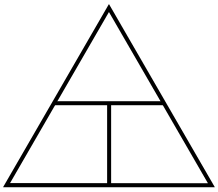
Speed - Distance - Time (Worded Questions)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use the DTS triangle to answer these. Round to 1 d.p. if needed, round time to nearest minute.

1 Complete



S = $\frac{\square}{\square}$

D = $\square$

T = $\frac{\square}{\square}$

2 A car is travelling at an average speed 86 km/h. How far has it travelled after 2 h 25 min?

D = TS

= $\square \times \square$

D = $\square$ km (1 d.p.)

The car has travelled $\square$

3 How long will it take a bicyclist to travel 25 km when she maintains an average speed of 14 km/h?

4 Pete walks at 5 km/h for 20 min then jogs at 9 km/h for 5 min. How far has he travelled?

5 What is his average speed for the 25 min?

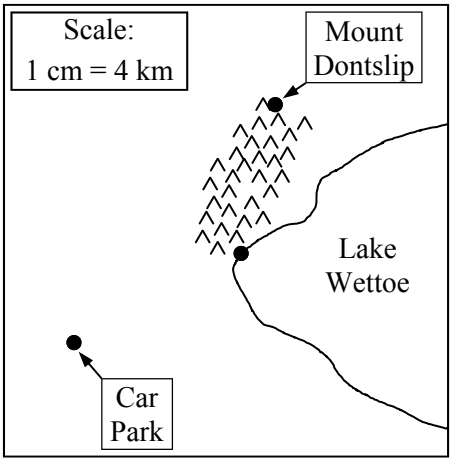
6 It took Anne 8 min to walk around a square paddock. If she is walking at an average speed of 4.2 km/h, find the width of the paddock in metres.

7 Jamie drives for 4 h 10 min at an average speed of 86 km/h. Liam finishes the same trip in 4 h 35 min, find Liam's average speed.

8 A car delivers fuel economy of 6.2 L/100 km on the highway. If the car has used 32.8 L while driving for 5 h 45 min on the highway, find its average speed.

9 Phil and Dave are the drivers in two cars, both driving to the snow from Dave's house. Phil leaves first. Dave leaves 8 min later and catches up to Phil in 48 min. If Dave averages 65 km/h, calculate Phil's average speed.

10 Steve is going for a bush walk. He plans to park his car and walk at 5 km/h to the lake, stop for an hour then walk to Mount Dontslip at 3 km/h. If he leaves the car park at 10.30 a.m., at what time does he reach Mount Dontslip?

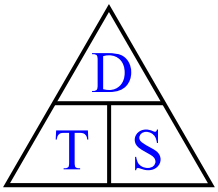


Speed - Distance - Time (Worded Questions)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Use the DTS triangle to answer these. Round to 1 d.p. if needed, round time to nearest minute.

1 Complete



$S = \frac{D}{T}$

$D = TS$

$T = \frac{D}{S}$

2 A car is travelling at an average speed 86 km/h. How far has it travelled after 2 h 25 min?

$D = TS$

$= 2\,{}^{25}/_{60} \times 86$

$D = 207.8$ km (1 d.p.)

The car has travelled 207.8 km.

3 How long will it take a bicyclist to travel 25 km when she maintains an average speed of 14 km/h?

$T = {}^{D}/_{S}$

$= 25 \div 14$

$T = 1$ h 47 min (nearest min)

The car has travelled 207.8 km.

4 Pete walks at 5 km/h for 20 min then jogs at 9 km/h for 5 min. How far has he travelled?

$D = TS$

$= {}^{20}/_{60} \times 5 + {}^{5}/_{60} \times 9$

$D = 2.4$ km (1 d.p.)

Pete has travelled 2.4 km.

5 What is his average speed for the 25 min?

$S = {}^{D}/_{T}$

$= 2.4 \div {}^{25}/_{60}$

$S = 5.8$ km/h (1 d.p.)

Pete's average speed is 5.8 km/h

6 It took Anne 8 min to walk around a square paddock. If she is walking at an average speed of 4.2 km/h, find the width of the paddock in metres.

$D = TS$

$= {}^{8}/_{60} \times 4.2$

$D = 0.28$ km $= 280$ m

$P = 4l$

$280 = 4l$ (÷4) (÷4)

$l = 70$ m

The paddock is 70 m wide.

7 Jamie drives for 4 h 10 min at an average speed of 86 km/h. Liam finishes the same trip in 4 h 35 min, find Liam's average speed.

$D = TS$

$= 4\,{}^{10}/_{60} \times 86$

$D = 358.3$ km (1 d.p.)

$S = {}^{D}/_{T}$

$= 358.3 \div 4\,{}^{35}/_{60}$

$S = 78.2$ km/h (1 d.p.)

Liam's ave speed is 78.2 km/h

8 A car delivers fuel economy of 6.2 L/100 km on the highway. If the car has used 32.8 L while driving for 5 h 45 min on the highway, find its average speed.

$D = 32.8 \div 6.2 \times 100$

$= 529$ km (1 d.p.)

$S = {}^{D}/_{T}$

$= 529 \div 5\,{}^{45}/_{60}$

$S = 92$ km/h

Car's average speed is 92 km/h

9 Phil and Dave are the drivers in two cars, both driving to the snow from Dave's house. Phil leaves first. Dave leaves 8 min later and catches up to Phil in 48 min. If Dave averages 65 km/h, calculate Phil's average speed.

$D = TS$

$= {}^{48}/_{60} \times 65$

$D = 52$ km

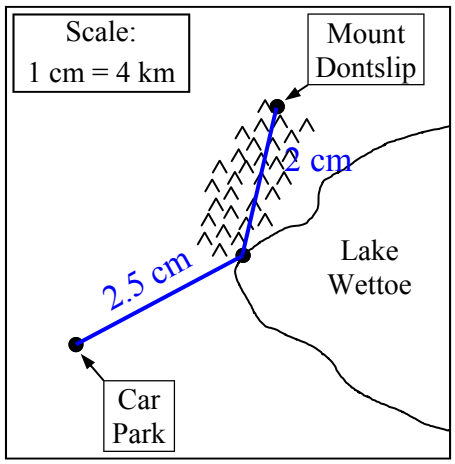
$S = {}^{D}/_{T}$

$= 52 \div {}^{56}/_{60}$

$S = 55.7$ km/h (1 d.p.)

Phil's ave speed is 55.7 km/h

10 Steve is going for a bush walk. He plans to park his car and walk at 5 km/h to the lake, stop for an hour then walk to Mount Dontslip at 3 km/h. If he leaves the car park at 10.30 a.m., at what time does he reach Mount Dontslip?



Dist $= 2.5 \times 4 = 10$ km

$T = {}^{D}/_{S} = 10 \div 5$

$T = 2$ h

Dist $= 2 \times 4 = 8$ km

$T = {}^{D}/_{S} = 8 \div 3$

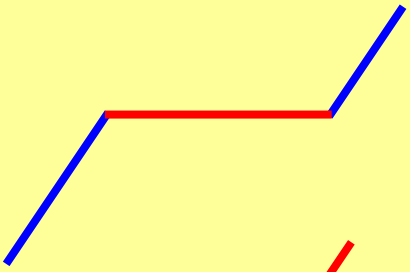
$T = 2$ h 40 min

10.30 + 2 + 1 + 2 h 40 = 4.10 pm.

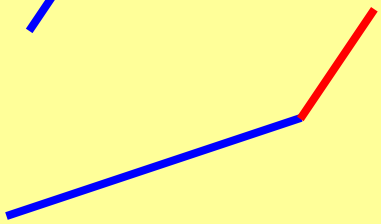
He should arrive at 4.10 pm.

Travel Graphs

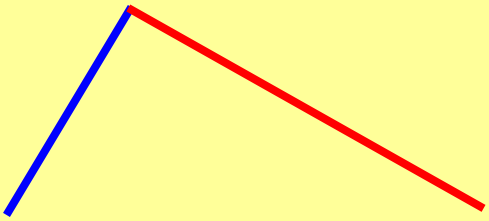
Travel graphs represent travel just like a line graph. Key features are:



A Flat line means that you are not moving, or aren't changing your distance from your starting point.



A Steep line means that you have increased speed. It doesn't mean you are going up a hill.



A line with a downward slope doesn't mean that you are going down a hill. It means you are travelling back toward your starting point. In this example you are returning at a slower rate as the line is less steep.

Column 1 starts with a travel graph that is fully constructed. You have to extract information from the graph. At the base of the column are question involving speed. The formula for speed is:

$$\text{Speed} = \frac{\text{Distance}}{\text{Time}}$$

This sheet uses time intervals of 15 min. So if you have a time like 2 h 15 min, it becomes 2.25 when using your calculator. 1 h 45 would become 1.75.

The other way of using time is to use the DMS key or ° ' '' (bubble) button. For example if you travelled 100 km in 1 h 45 min.

Using your calculator:

1 0 0 ÷ 1 DMS ° ' '' 4 5 DMS ° ' '' = DMS ° ' ''

Calculator screen:

57.14285714 Rounding to 1 decimal place: 57.1 km/h

Travel Graphs

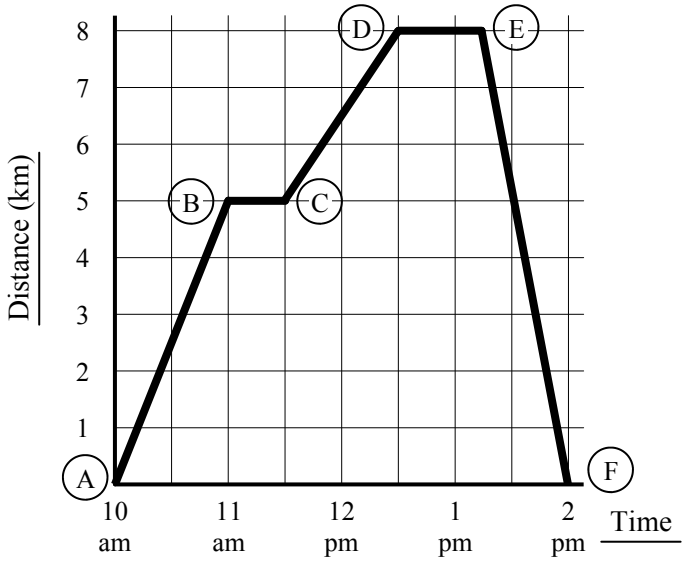
The travel graph below outlines Red's travel from her home at A to the basket shop and then to Granny's house for lunch, then home again.



1 What is the distance from Red's home to the basket shop?

2 What was the total distance Red covered for the entire journey?

3 At what time did Red arrive at Granny's house?

4 Why is the line BC flat?

5 What was the total time Red was stopped?

6 How far apart are the shop and Granny's house?

7 Red bought a basket of goodies. How did this affect her travel?

8 Red left Granny's house in a hurry, how long did it take her to get home?

Calculate Red's average speed for these parts of her journey. Use Speed = Distance ÷ Time. (1 d.p.)

9 AB: Speed $= \frac{D}{T} = \frac{\square}{\square}$

Speed = ____ km/h

10 AD: Speed $= \frac{D}{T} = \frac{\square}{\square}$

Speed = ____ km/h

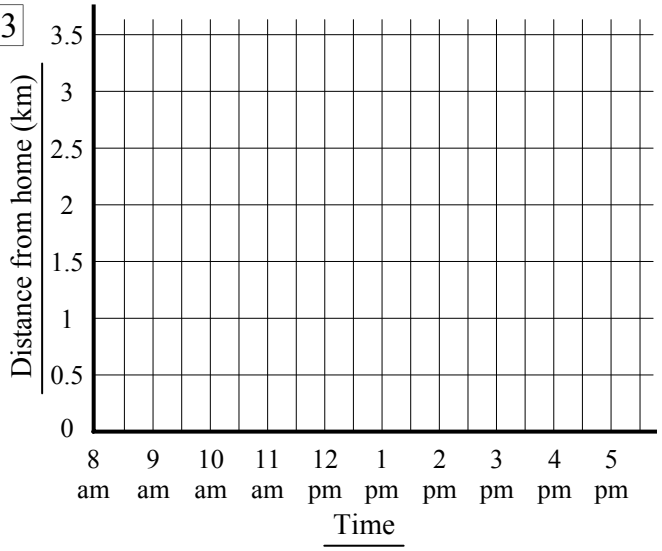
11 AF: Speed $= \frac{\square}{\square} = \frac{\square}{\square} =$ ____

12 EF: Speed $= \frac{\square}{\square} = \frac{\square}{\square} =$ ____

Display Tom's travel on a travel graph.

Details: Leaves home at 8 am., walks 45 min to school, which is 2.5 km away. Leaves school at 3.30 pm. Walks to the soccer oval which is 1 km back towards home, in 15 min. Stays at soccer for 1 hr 15 min. Then he is driven home, which takes 10 min.

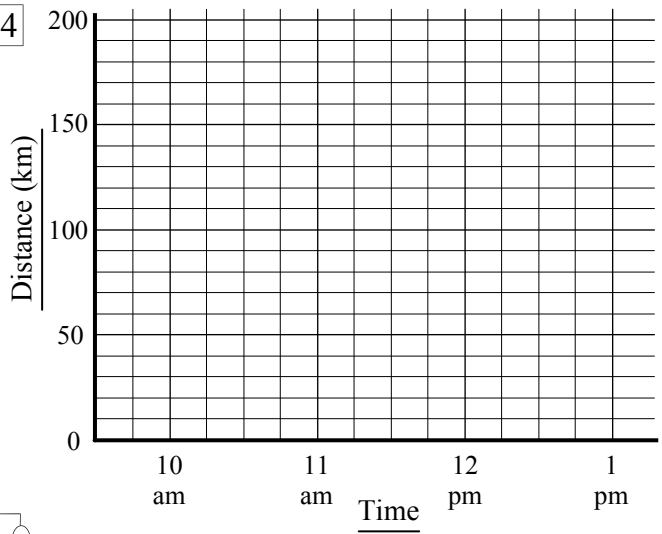
13



A car is tested by a reporter over a 200 km distance, in both city and country driving. It is a one way trip. Display the results in a travel graph.

Details: Leaves at 9.30 am. Travels 50 km in 45 min. Stops for 15 min. Travels next 140 km in 1 h 30 min. Stops for 30 min. Travels 10 km in 30 min. Stops.

14



Calculate the average speed (1 d.p.) for the ……

15 Entire trip

Speed $= \frac{\square}{\square} = \frac{\square}{\square}$

Speed = ____

16 Driving legs of trip

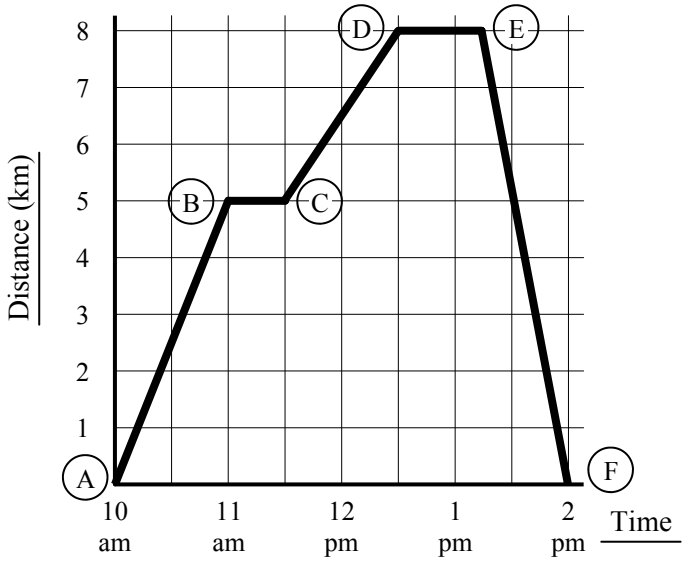
Speed $= \frac{\square}{\square} = \frac{\square}{\square}$

Speed = ____

Travel Graphs

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

The travel graph below outlines Red's travel from her home at A to the basket shop and then to Granny's house for lunch, then home again.



1 What is the distance from Red's home to the basket shop?

5 km

2 What was the total distance Red covered for the entire journey?

8 + 8 = 16 km

3 At what time did Red arrive at Granny's house?

D: 12.30 pm.

4 Why is the line BC flat? She is shopping, so she is stopped.

5 What was the total time Red was stopped?

30 + 45 = 1 h 15 min

6 How far apart are the shop and Granny's house?

8 - 5 = 3 km

7 Red bought a basket of goodies. How did this affect her travel? She walked 5 km in 1 h to the shop. Then she walked 3 km in 1 h. So she is slower.

8 Red left Granny's house in a hurry, how long did it take her to get home? 45 min.

Calculate Red's average speed for these parts of her journey. Use Speed = Distance ÷ Time. (1 d.p.)

9 AB: Speed $= \frac{D}{T} = \frac{5}{1}$

Speed = 5 km/h

10 AD: Speed $= \frac{D}{T} = \frac{8}{2.5}$

Speed = 3.2 km/h

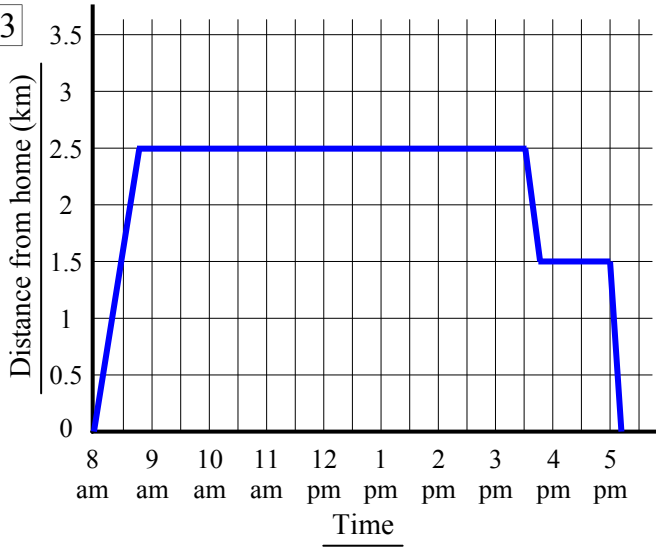
11 AF: Speed $= \frac{D}{T} = \frac{16}{4} =$ 4 km/h

12 EF: Speed $= \frac{D}{T} = \frac{8}{0.75} =$ 10.7 km/h (1 d.p.)

Display Tom's travel on a travel graph.

Details: Leaves home at 8 am., walks 45 min to school, which is 2.5 km away. Leaves school at 3.30 pm. Walks to the soccer oval which is 1 km back towards home, in 15 min. Stays at soccer for 1 hr 15 min. Then he is driven home, which takes 10 min.

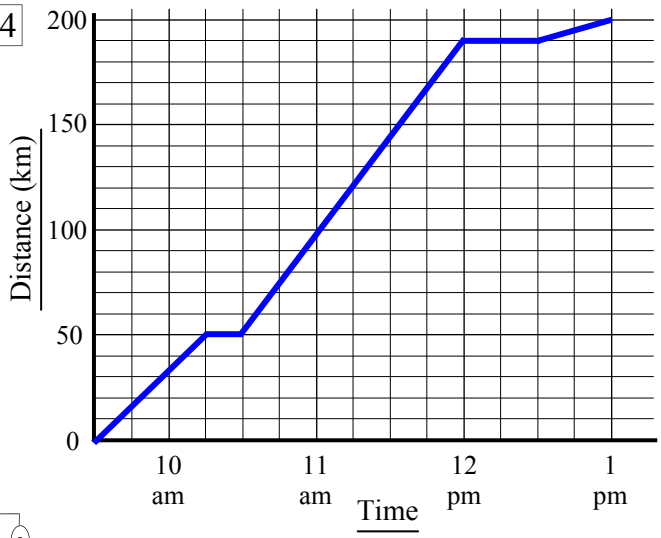
13



A car is tested by a reporter over a 200 km distance, in both city and country driving. It is a one way trip. Display the results in a travel graph.

Details: Leaves at 9.30 am. Travels 50 km in 45 min. Stops for 15 min. Travels next 140 km in 1 h 30 min. Stops for 30 min. Travels 10 km in 30 min. Stops.

14



Calculate the average speed (1 d.p.) for the ……

15 Entire trip

Speed $= \frac{D}{T} = \frac{200}{3.5}$

Speed = 57.1 km/h (1 d.p.)

16 Driving legs of trip

Speed $= \frac{D}{T} = \frac{200}{2.75}$

Speed = 72.7 km/h (1 d.p.)

Rates and Ratio - Find A Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don't colour it in too dark (using a texta for example) so that you can still read it.

ALTITUDE

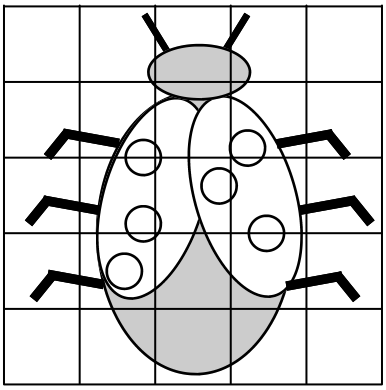
CONGRUENCE & SIMILARITY

Enlargements - Drawing Exercises

There are two worksheets for this exercise. The first is a simplified sketch of a ladybird beetle (or ladybug). This is an easier exercise, the second drawing is of King Tutankhamun's Death Mask. This sketch is more complicated.

Enlargements - Drawing Exercise (Sheet 1)

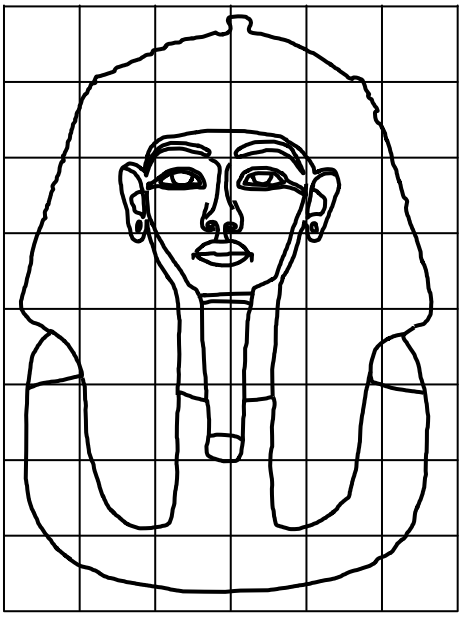
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE



Reproduce the Ladybird beetle in the space below. Once you are done colour the wings red and the body and spots black.

Enlargements - Drawing Exercise (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

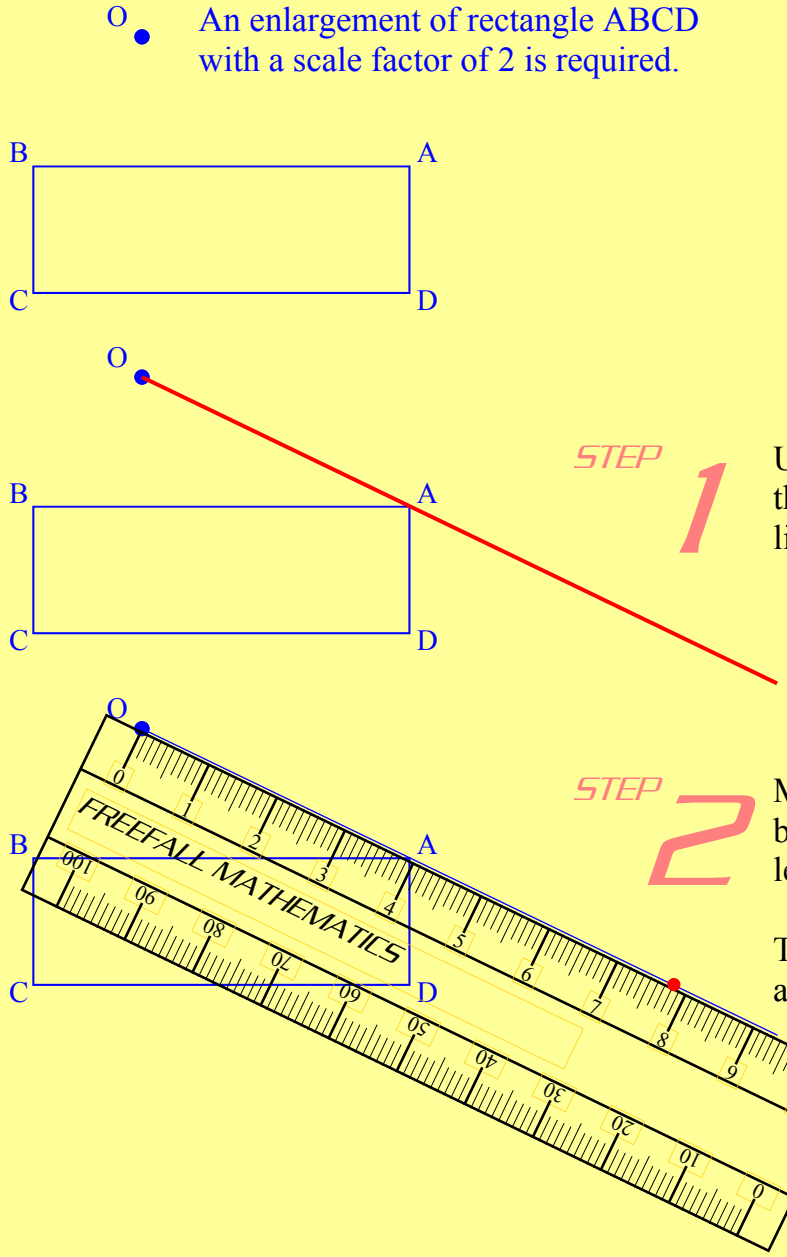


Reproduce the Death Mask of King Tutankhamun in the space below. Once you are done perform an image search on the web to colour it in correctly.

Enlargements (Sheet 1)

One way to make a similar figure is to create an enlargement of the shape. A point called a centre of enlargement (CoE) is used by drawing lines from it to all the vertices (corners) of the shape. The length from the CoE is measured then multiplied by the scale factor to move that point along the line. The scale factors on this sheet are all more than 1, that means that the enlarged shape will be bigger than the original shape.

The CoE can be placed anywhere. It can be inside the shape (Q.2) and outside the shape. It can also be on one of the lines that make the shape. Below are the steps to follow to make an enlargement.



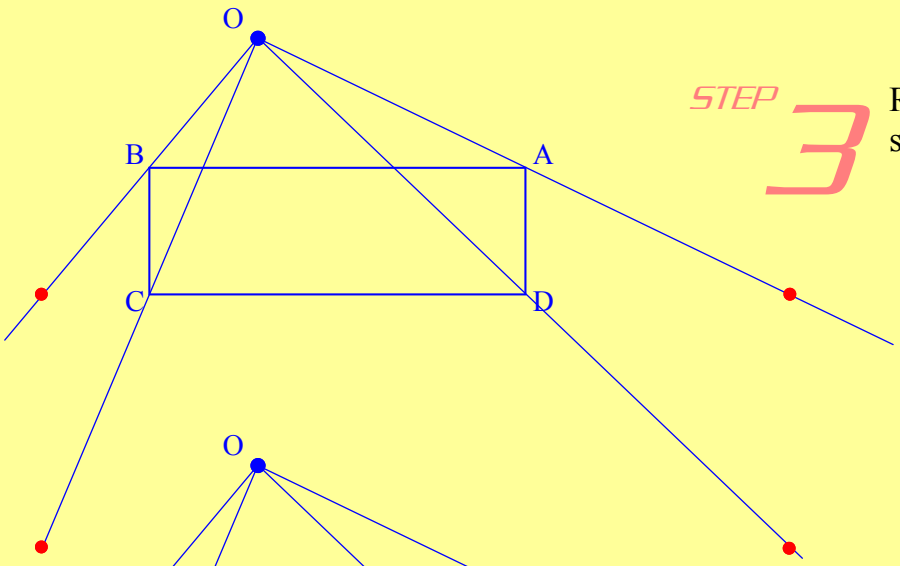
STEP 1

Use a ruler to draw a line from the CoE through one point. In this case it is the red line from O through A.

STEP 2

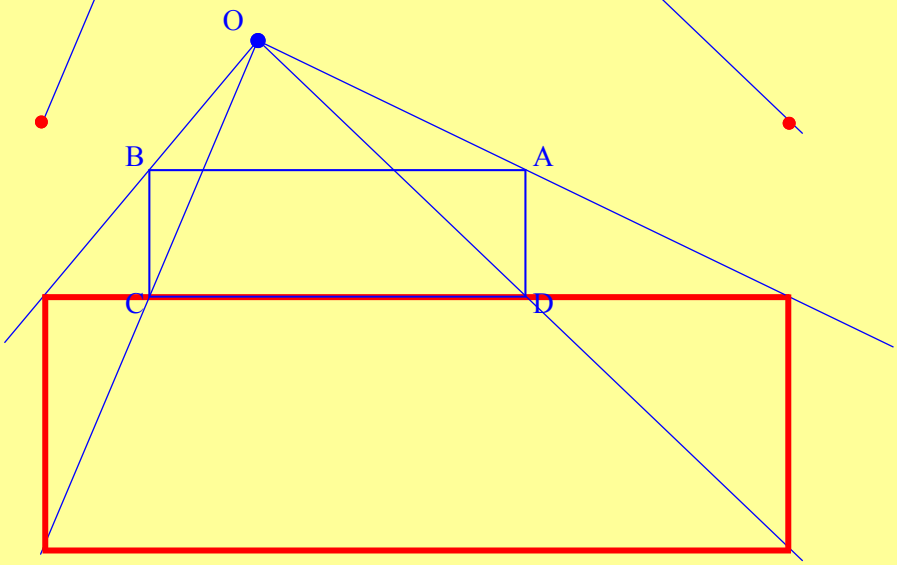
Measure the length OA and then double it, because the scale factor is 2. Mark the length on the constructed line.

The length was 3.9 cm, so a mark is placed at 7.8 cm.



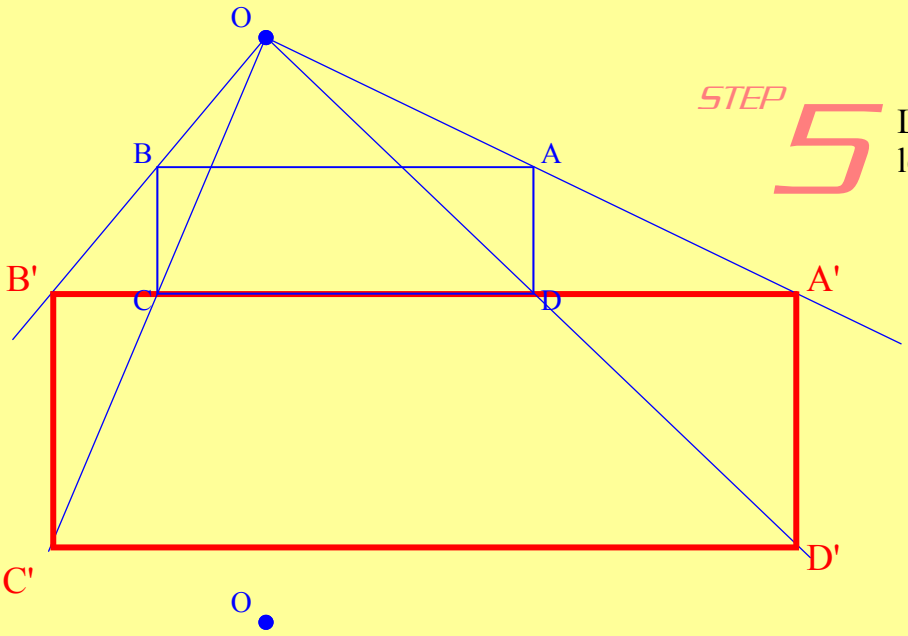
STEP 3

Repeat for the three other corners of the shape.



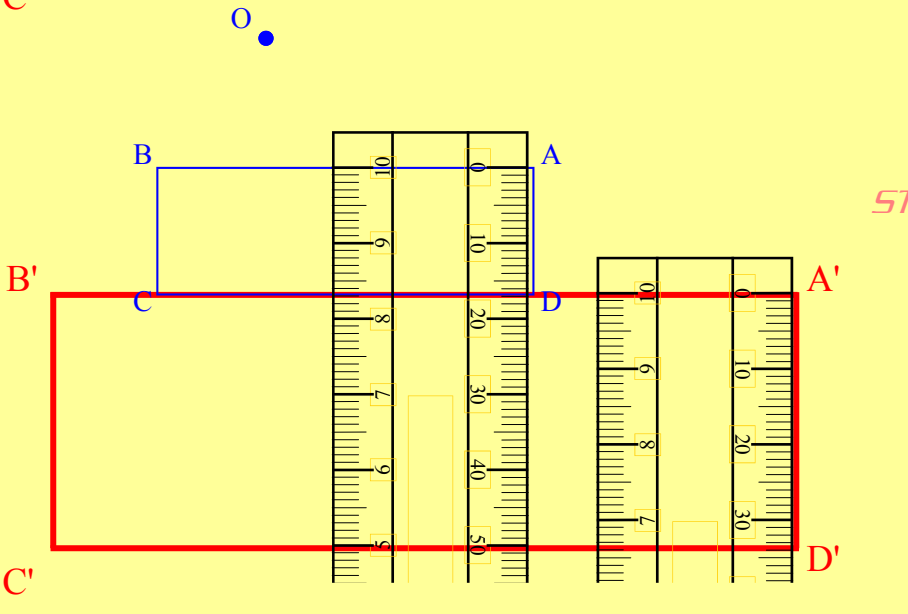
STEP 4

Draw the lines to make the shape.



STEP 5

Label the sides of the shape, use the same letters and add a dash. You are all done!



STEP 6

Measure matching sides, one should be double the other.

AD = 1.7 cm

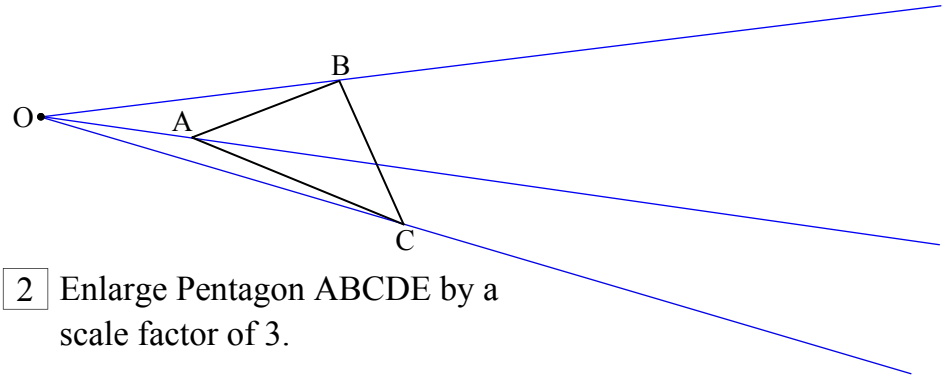
A'D' = 3.4 cm Looks good.

Enlargements (Sheet 1)

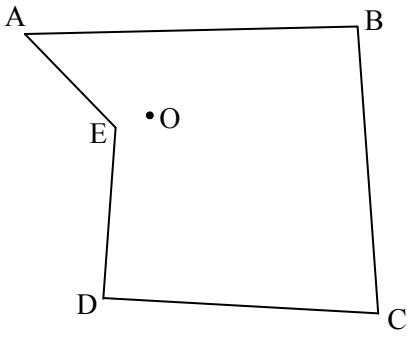
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Enlarge the shapes shown using 'O' as the centre of enlargement. Label the enlarged shape as A'B'C', and so on.

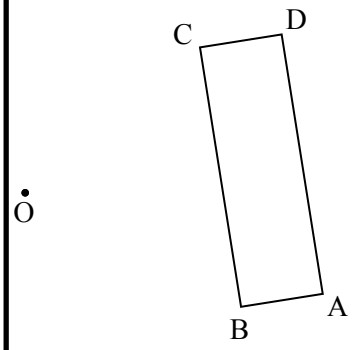
1 Enlarge Triangle ABC by a scale factor of 2.



2 Enlarge Pentagon ABCDE by a scale factor of 3.



3 Enlarge Rectangle ABCD by a scale factor of 2.5.



Enlargements (Sheet 1)

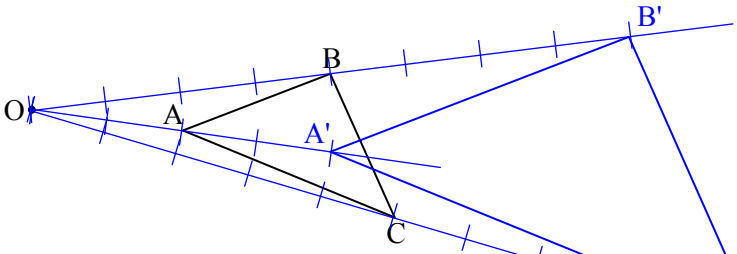
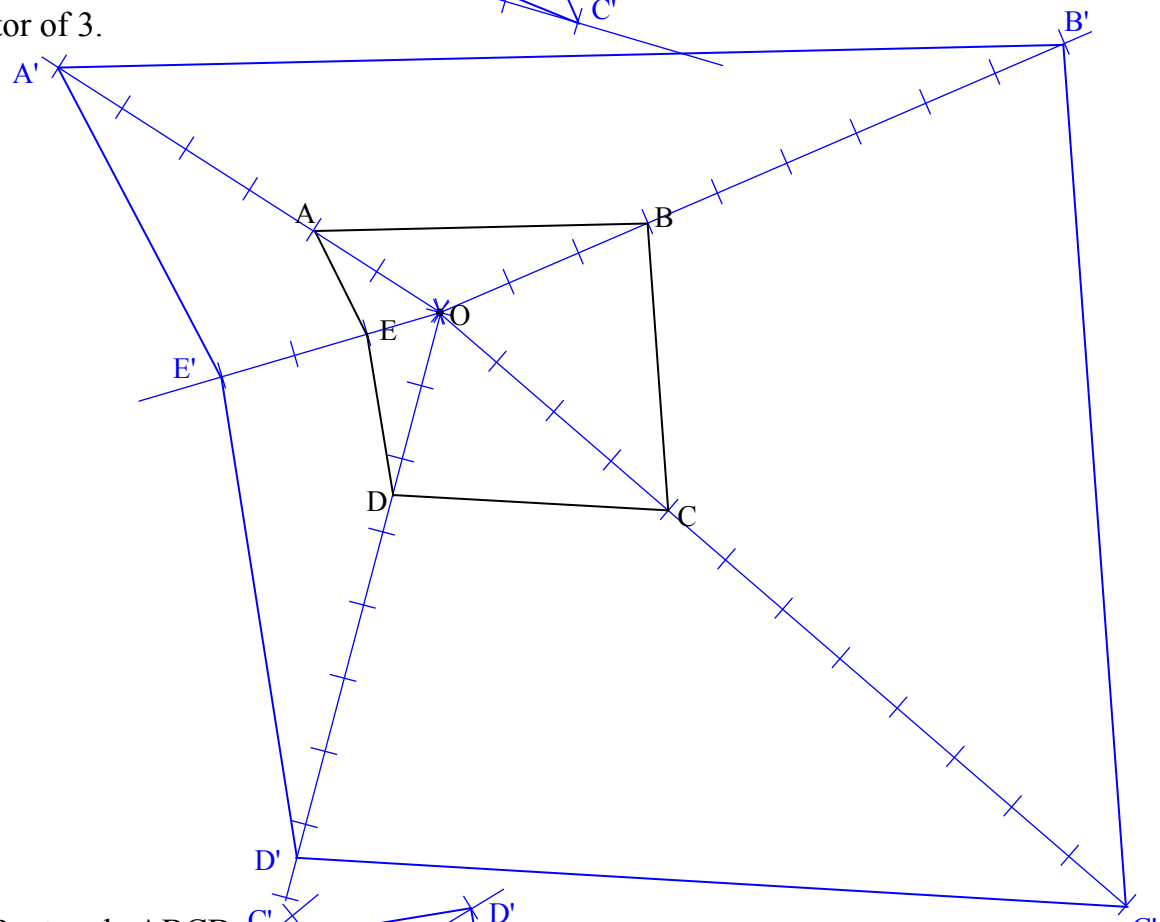
1 Enlarge Triangle ABC by a scale factor of 2.

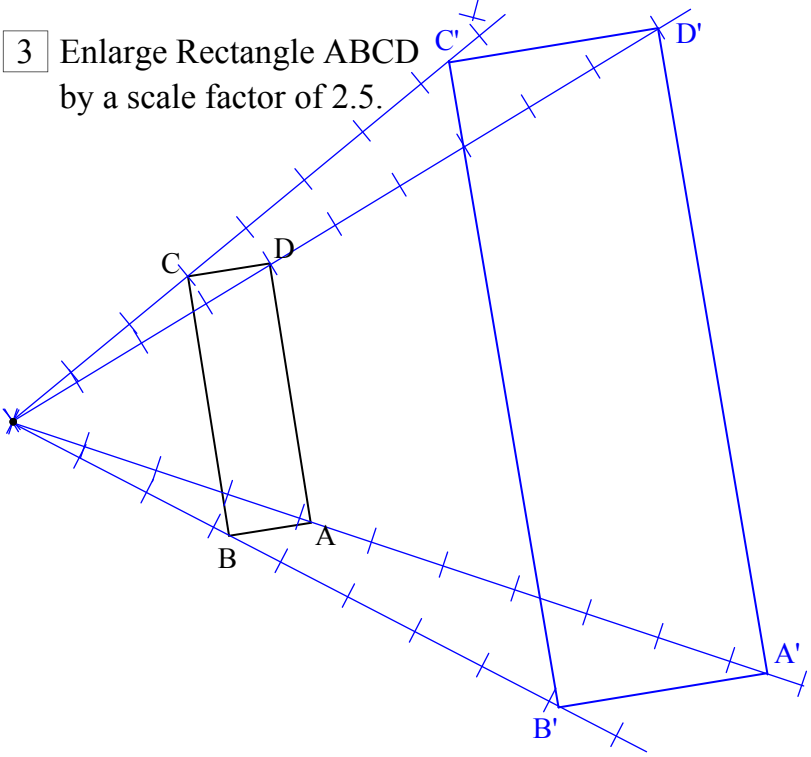


Enlarge the shapes shown using 'O' as the centre of enlargement. Label the enlarged shape as A'B'C', and so on.

2 Enlarge Pentagon ABCDE by a scale factor of 3.



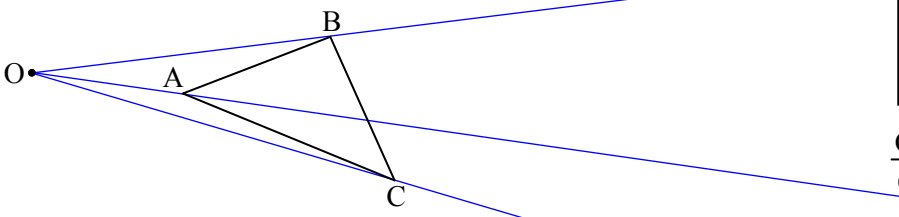
3 Enlarge Rectangle ABCD by a scale factor of 2.5.



Enlargements (Sheet 1) - With Ratios

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

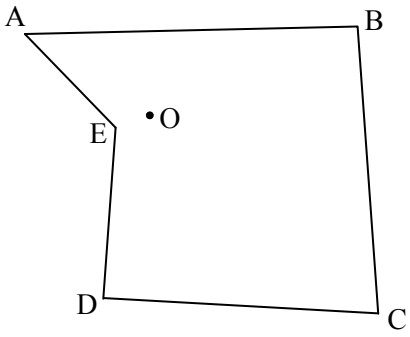
1 Enlarge Triangle ABC by a scale factor of 2.



Enlarge the shapes shown using 'O' as the centre of enlargement. Label the enlarged shape as A'B'C', and so on. Then complete the ratios to verify scale factor properties.

$\frac{OB'}{OB} = \frac{\square}{\square} = \square$ $\frac{A'B'}{AB} = \frac{\square}{\square} = \square$

2 Enlarge Pentagon ABCDE by a scale factor of 3.

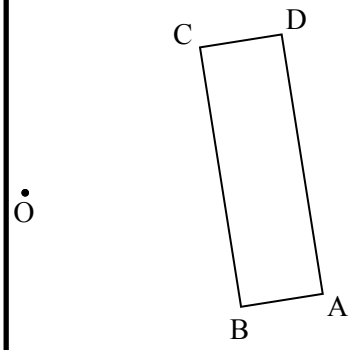


$\frac{OA'}{OA} = \frac{\square}{\square} = \square$

$\frac{B'C'}{BC} = \frac{\square}{\square} = \square$

$\frac{C'D'}{CD} = \frac{\square}{\square} = \square$

3 Enlarge Rectangle ABCD by a scale factor of 2.5.



$\frac{OD'}{OD} = \frac{\square}{\square} = \square$

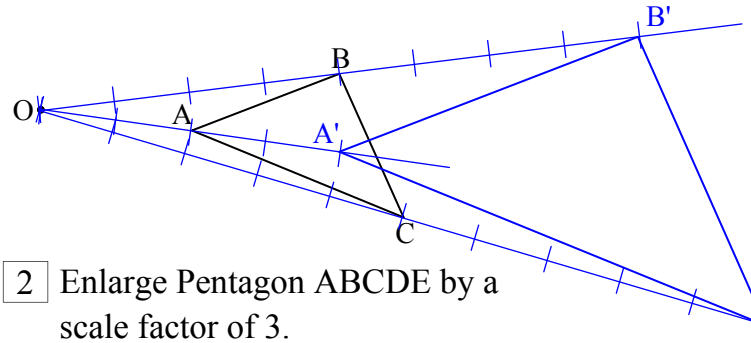
$\frac{A'D'}{AD} = \frac{\square}{\square} = \square$

$\frac{B'D'}{BD} = \frac{\square}{\square} = \square$

Enlargements (Sheet 1) - With Ratios

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

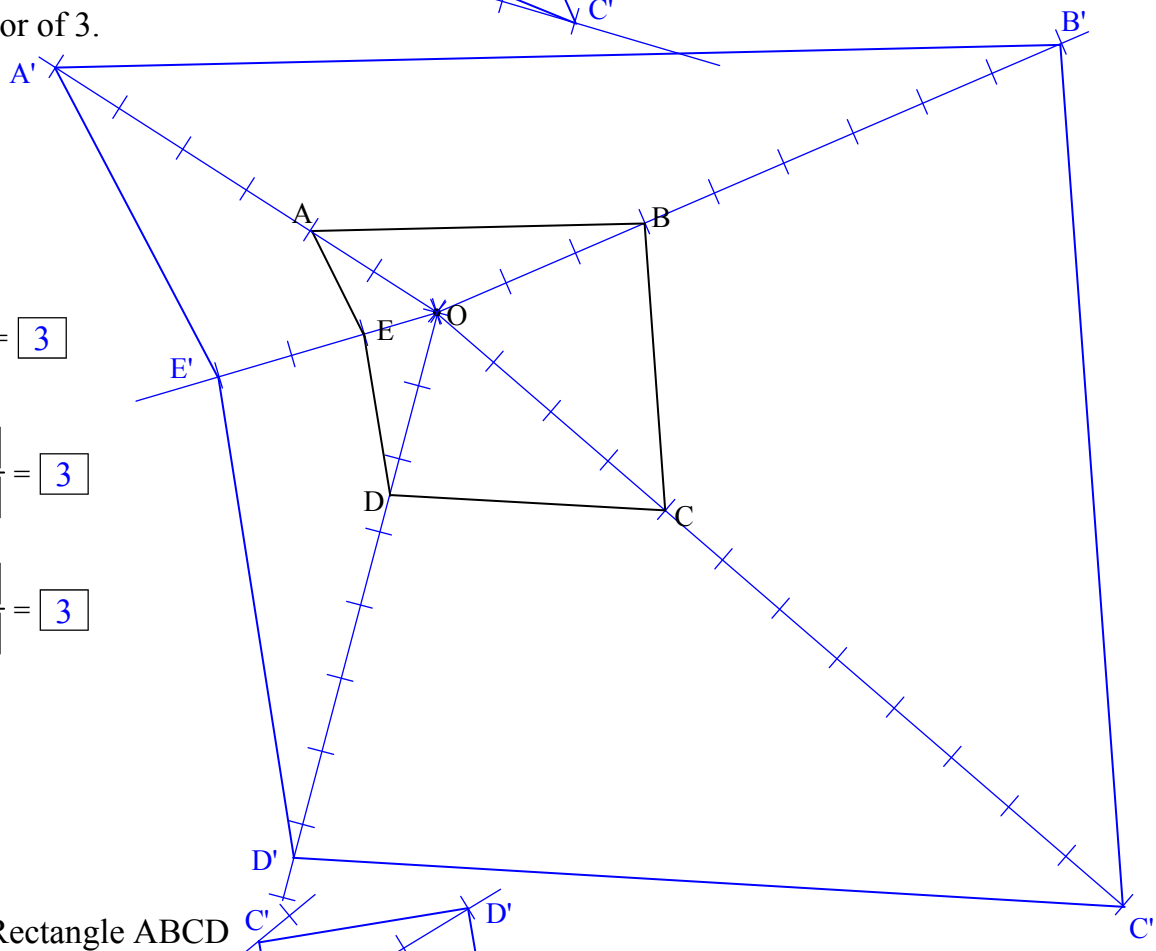
1 Enlarge Triangle ABC by a scale factor of 2.



Enlarge the shapes shown using 'O' as the centre of enlargement. Label the enlarged shape as A'B'C', and so on. Then complete the ratios to verify scale factor properties.

$\frac{OB'}{OB} = \frac{80}{40} = 2$ $\quad \frac{A'B'}{AB} = \frac{42}{21} = 2$

2 Enlarge Pentagon ABCDE by a scale factor of 3.

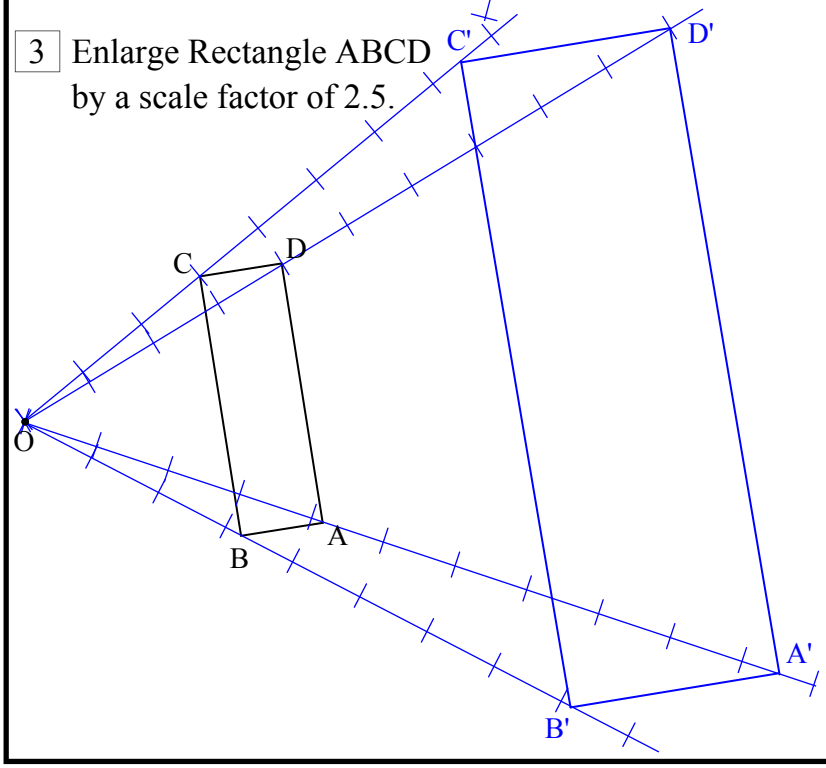


$\frac{OA'}{OA} = \frac{6}{2} = 3$

$\frac{B'C'}{BC} = \frac{114}{38} = 3$

$\frac{C'D'}{CD} = \frac{110}{36.5} = 3$

3 Enlarge Rectangle ABCD by a scale factor of 2.5.



$\frac{OD'}{OD} = \frac{100}{40} = 2.5$

$\frac{A'D'}{AD} = \frac{86}{34} = 2.5$

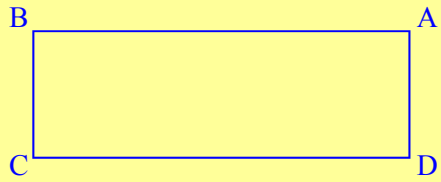
$\frac{B'D'}{BD} = \frac{90}{36} = 2.5$

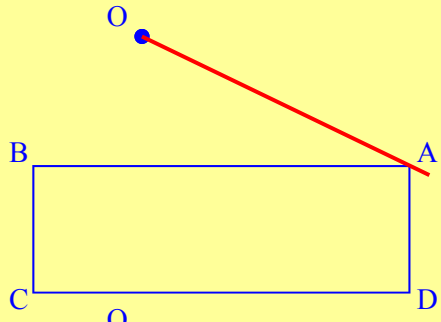
Enlargements (Sheet 2)

This sheet uses the same process as the previous sheet, the difference is that the scale factor is less than 1, so instead of the enlargement resulting in a bigger shape, it results in a smaller shape. Below is an example, the method is much the same as the previous sheet.

O

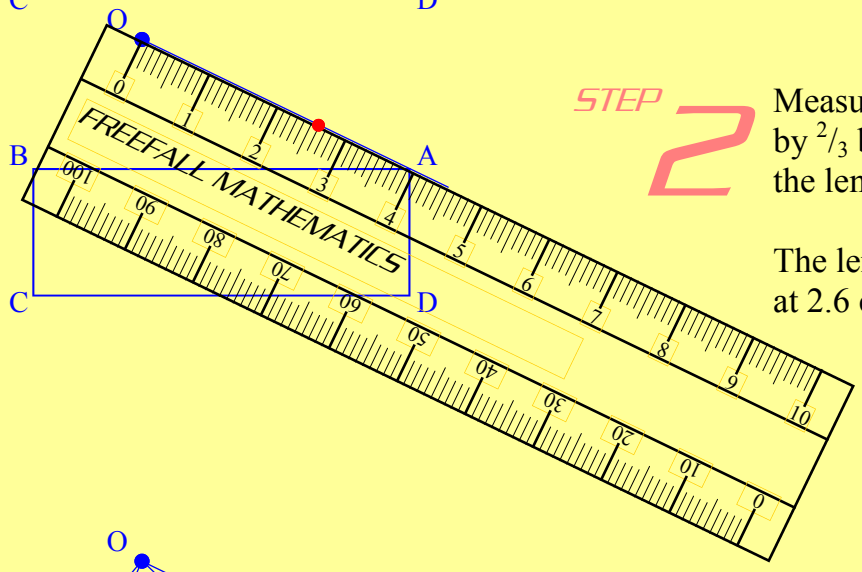
An enlargement of rectangle ABCD with a scale factor of $^2/_3$ is required.





STEP 1

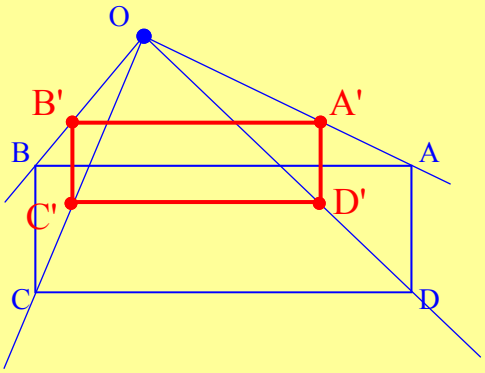
Use a ruler to draw a line from the CoE through one vertex. In this case it is the red line from O through A.



STEP 2

Measure the length OA and then multiply it by $^2/_3$ because the scale factor is $^2/_3$. Mark the length on the constructed line.

The length was 3.9 cm, so a mark is placed at 2.6 cm. Expect to round decimal answers



STEP 3

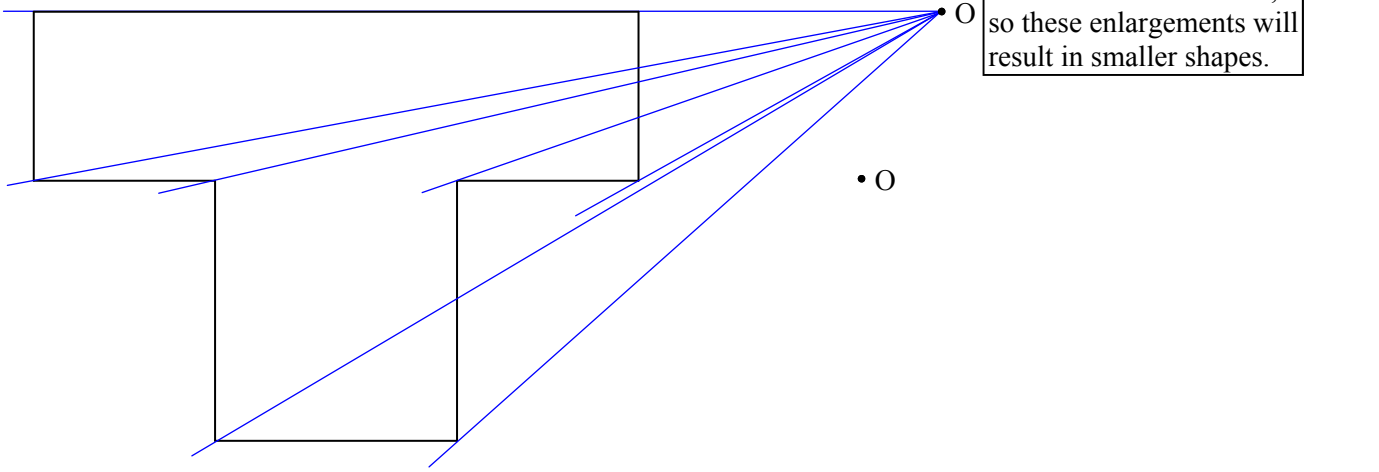
Repeat for all other vertices and join to make the similar shape.

Label the sides and compare lengths of matching sides to check.

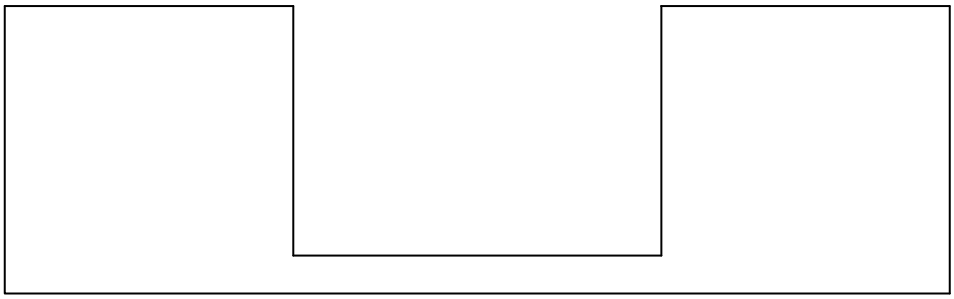
Enlargements (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

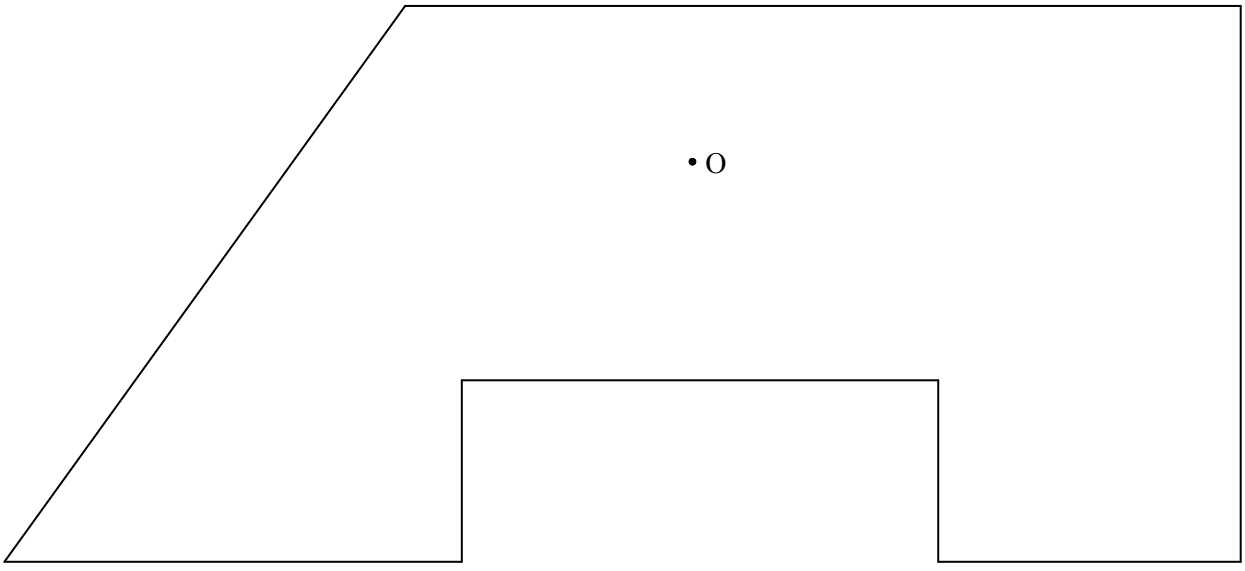
1 Enlarge the shape below by a scale factor of ½.



2 Enlarge this shape by a scale factor of ⅓.



3 Enlarge this shape by a scale factor of ¾.

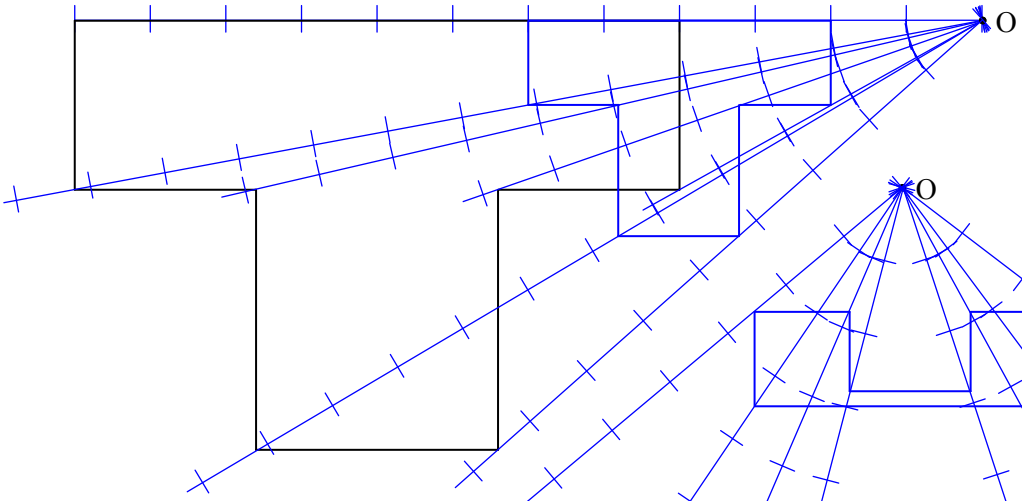


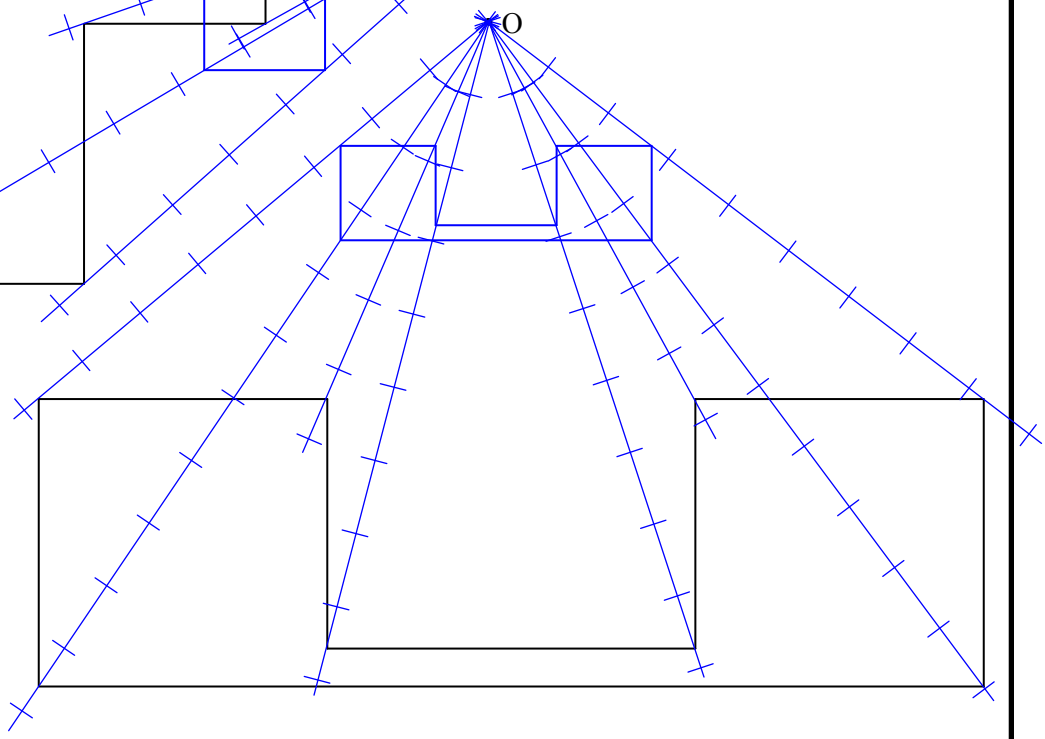
Enlargements (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

1 Enlarge the shape below by a scale factor of ½.

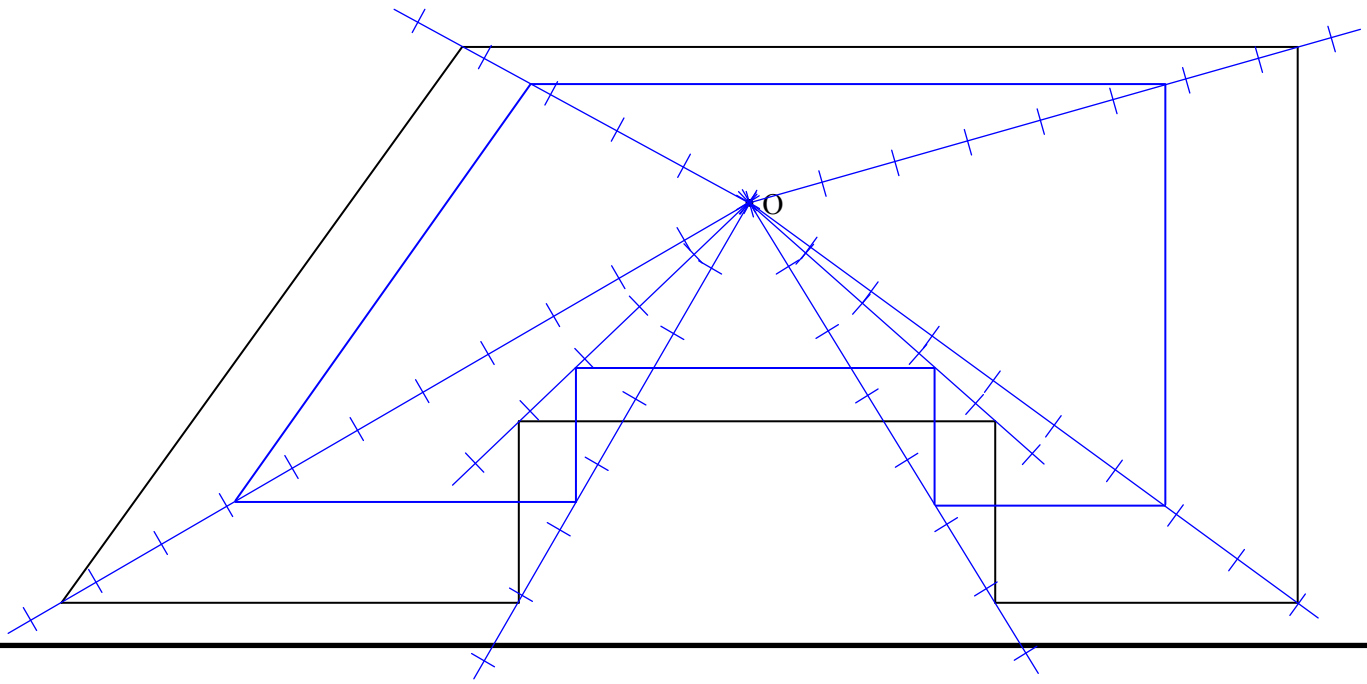
Enlarge the shapes shown using 'O' as the centre of enlargement. The scale factors are less than one, so these enlargements will result in smaller shapes.





2 Enlarge this shape by a scale factor of ⅓.

3 Enlarge this shape by a scale factor of ¾.



Similar Figures & Similarity Statements

Similar figures and shapes are the same shape only a scale factor has been applied to enlarge one of the shapes. Angles inside the shape are identical, but the side lengths are different by a scale factor. Similarity is stated by using three vertical strokes, ||| .

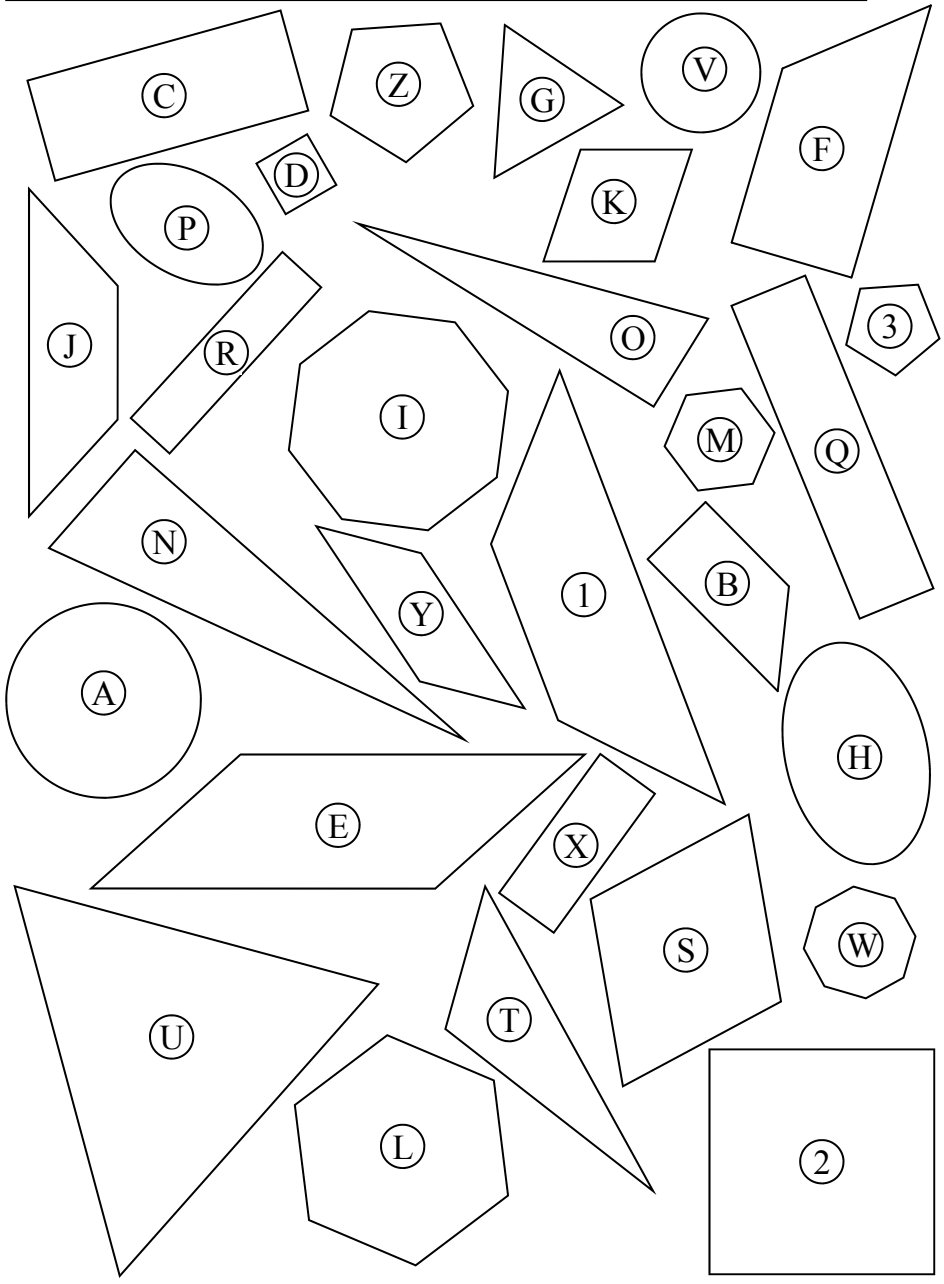
Column 1 starts with pairs of similar shapes scattered around the column. Find the similar pairs, that is, identical shapes just one is larger than the other. When you have found them, write the answer in the boxes at the base of the column. Strike each shape out with a lead pencil that you can rub out later, because you can colour the matching pairs the same colour. There is one shape that doesn't have a match, write its letter/number in the box at the bottom of the column.

Column 2 requires you to write similarity statements. When you name a shape you start at one vertex (corner) of the shape and go around it either in a clockwise or anti-clockwise direction. With similarity (and later congruence) statements you must start at matching vertices and move around the shape always matching vertices. Because angles match in similar figures, you can check that the angles are the same when identifying matching vertices. So check that the internal angles are the same to make sure you are listing the letters the correct way.

Similar Figures & Similarity Statements

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Similar figures have matching internal angles but have a scale factor applied to their side lengths. In other words, one is an enlargement of the other. Find all the similar pairs below, there is one non-paired shape.



Write your matches below, once you are finished colour the similar shapes the same colour.

☐ & ☐	☐ & ☐	☐ & ☐	☐ & ☐
☐ & ☐	☐ & ☐	☐ & ☐	☐ & ☐
☐ & ☐	☐ & ☐	☐ & ☐	☐ & ☐
	☐ & ☐	☐ & ☐	

There is one unmatched shape, it is: ☐

Write similarity statements for these similar shapes. Start at the same vertex and maintain order, or you could end up in here.

Example

4 Angles:

∠V = ∠L ∠C = ∠E

∠Z = ∠B ∠P = ∠R

5 Sides:

VC & LE CZ & EB

ZP & BR PV & RL

Similarity - Finding Sides Using Scale Factor

Similar figures are created by applying a scale factor to get the same shape only its larger or smaller. The internal angles are the same in both shapes. By comparing matching sides of the shapes a scale factor can be calculated, then once you have the scale factor you can apply this to all lengths on the shapes.

Column 1 starts with equivalent ratios. Sides are found using equivalent ratios, so this is a refresher on calculating them. Use multiplication or division to find the value of the pronumeral. Questions 7 - 9 involve finding the scale factor between two similar figures. Divide the second shape's side by the first. There are two measurements given on some shapes, make sure you use the one's that match. You can double check by using the other measurement as well. Note that scale factors are larger than 1 when the shape is enlarged, when it is reduced in size the scale factor will be a fraction.

Column 2 doesn't ask you to find the scale factor, but you need to do it anyway. So divide matching sides to get the scale factor, then multiply using the scale factor to get all missing sides.

Column 3 carries on with the same process, but the triangles are created by parallel lines. So parallel line theory questions are also in the column. Triangles are similar when all internal angles are the same, all of these questions feature this quality. Question 19 and 21 are different as the triangle is within the other triangle. Question 21 is also more difficult because you may have to calculate a second scale factor to solve for b.

Similarity - Finding Sides Using Scale Factor

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Lets start with a quick review of equivalent ratios. Find the value of the pronumerals in the ratios.

1 $5 : 1 = 30 : x$ (×6, ×6)

$x =$ ☐

2 $4 : 3 = 16 : y$

$y =$ ☐

3 $3 : 2 = k : 22$

$k =$ ☐

4 $a : 24 = 10 : 3$

$a =$ ☐

5 $20 : 7 : 13 = x : 35 : y$

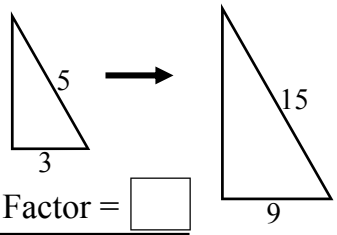
$x =$ ☐ $y =$ ☐

6 $b : 4 : 36 = 4 : 1 : f$

$b =$ ☐ $f =$ ☐

Find the scale factor applied to the first shape to get the second.

7



Scale Factor = ☐

8

Lets start with a quick review of equivalent ratios. Find the value of the pronumerals in the ratios.

1 $5 : 1 = 30 : x$ (×6, ×6)

$x =$ 6

2 $4 : 3 = 16 : y$

$y =$ 12

3 $3 : 2 = k : 22$

$k =$ 33

4 $a : 24 = 10 : 3$

$a =$ 80

5 $20 : 7 : 13 = x : 35 : y$

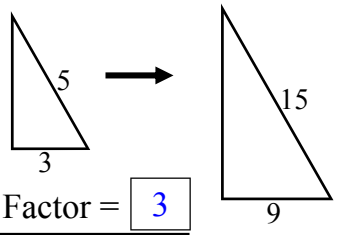
$x =$ 100 $y =$ 65

6 $b : 4 : 36 = 4 : 1 : f$

$b =$ 16 $f =$ 9

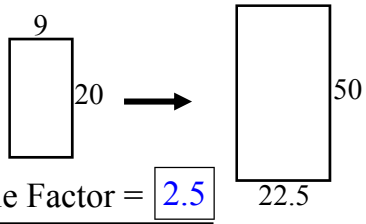
Find the scale factor applied to the first shape to get the second.

7



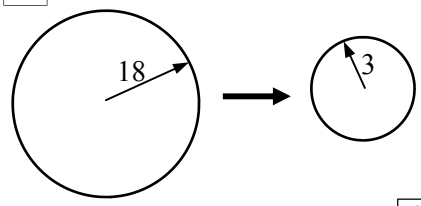
Scale Factor = 3

8



Scale Factor = 2.5

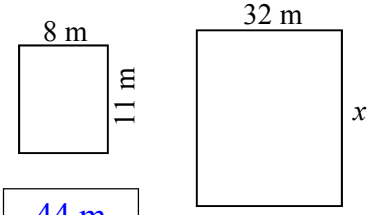
9



Scale Factor = $\frac{1}{6}$

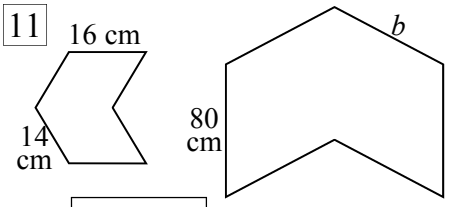
Use your ratio skills to find the unknown sides on these similar figures. Drawings not to scale.

10



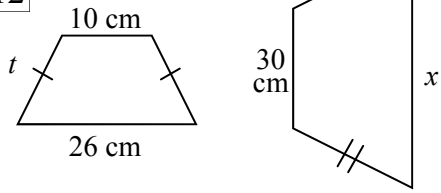
$x =$ 44 m

11



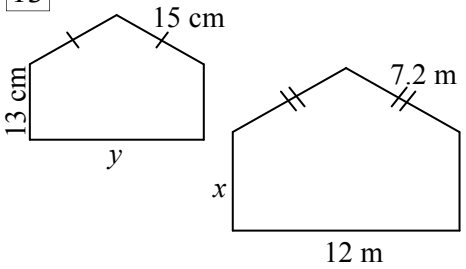
$b =$ 70 cm

12



$x =$ 78 cm $t =$ 17 cm

13



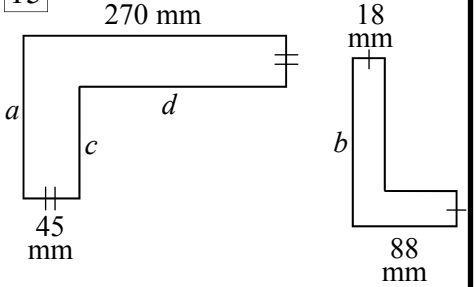
$x =$ 6.24 m $y =$ 25 cm

Find the perimeter of the larger shape

14 $P = 2 \times 6.24 + 2 \times 7.2 + 12$

$P = 38.88$ m

15

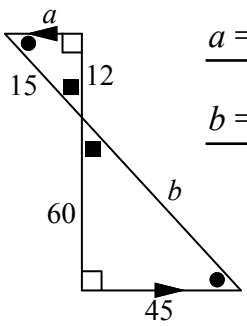


$a =$ 220 mm $b =$ 108 mm

$c =$ 175 mm $d =$ 225 mm

These triangles are similar. Find the value of a and b and give some angle theory reasoning.

16



$a =$ 9 units

$b =$ 75 units

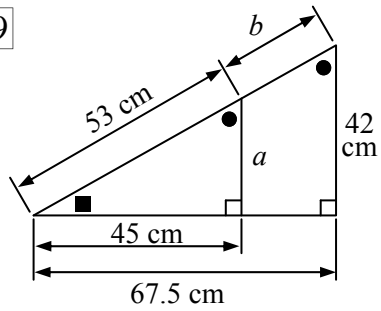
17 What angle property exists between the angles marked with a ● ?

They are alternate angles.

18 What angle property exists between the angles marked with a ■ ?

They are vertically opposite.

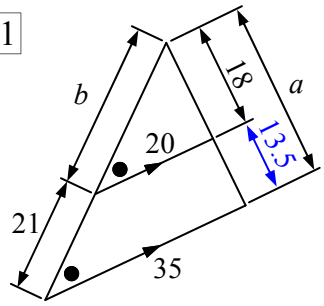
19



$a =$ 28 cm $b =$ 26.5 cm

20 Why are the angles marked with a ● equal? Because they are corresponding angles. or angle sum of Δ = 180°

21



$a =$ 31.5 cm $b =$ 28 cm

22 Why are the angles marked with a ● equal? Because they are corresponding angles.

Tessellations

Tessellations are patterns made by the repeated use of a shape, without leaving gaps.

Question 1 in the first column features tessellated triangles. Colour the adjacent triangles (that share a common side) to build the shapes shown. Then colour the square in front of the shape's name the same colour. Like a key or legend in a map.

Column 1 then has three tessellated diagrams, complete the patterns. If you want to use different colours then print the second worksheet, which is unpainted.

Column 2 consists of irregular tessellations. This is when two or more different shapes are used. Colour them to form patterns.

The final tessellation requires you to complete it by using the dots as guides. Once you have drawn it colour in the stars that have been formed.

Tessellations

Axis of Symmetry

An axis of symmetry is a line which divides a shape into two congruent (identical) shapes. To complete this sheet on paper cut the shapes out and fold the shape on top of itself, the crease made by the fold is the axis of symmetry, count the creases and write the number in the box inside the shape.

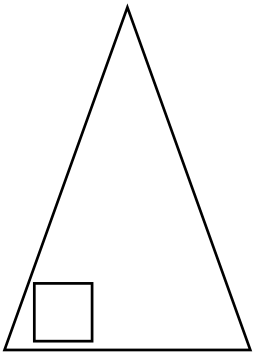
If working on screen, imagine a line cutting the shape and check whether the shape either side of the imaginary line is an identical image.

Axis of Symmetry

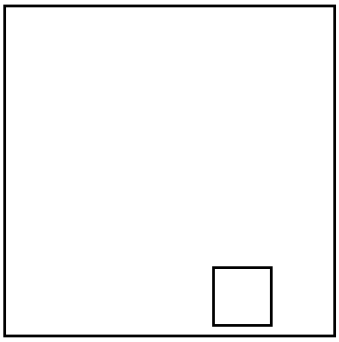
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Cut the shapes out and fold them. If the shape doubles back on itself so that the fold mark creates two shapes that are the same, then that is an axis of symmetry. Repeat until all are found. Then write the number found in the square of the shape and stick the shape and its name in your book.

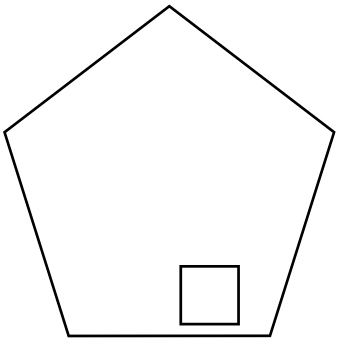
1 Isosceles triangle



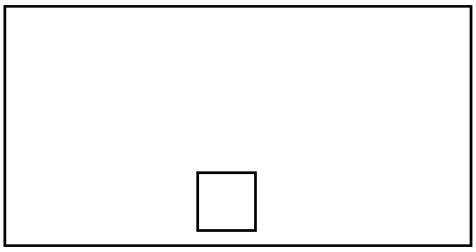
2 Square



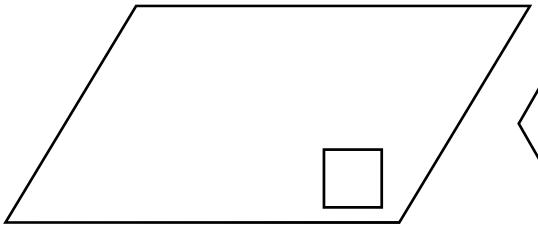
3 Pentagon



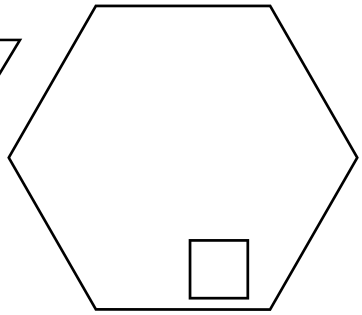
4 Rectangle



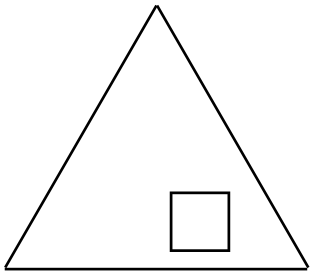
5 Parallelogram



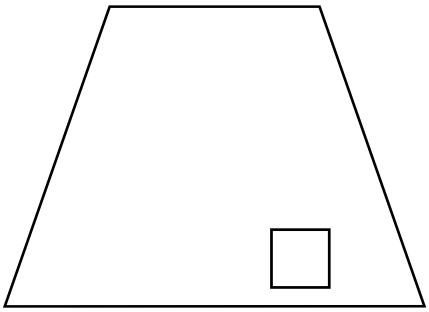
6 Hexagon



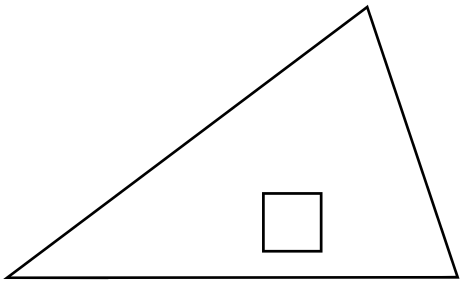
7 Equilateral triangle



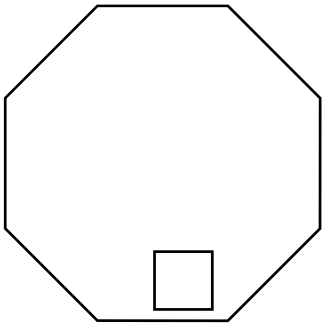
8 Trapezium



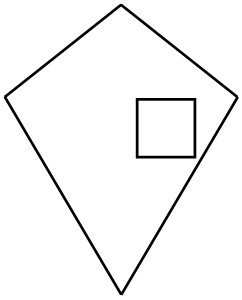
9 Scalene triangle



10 Octagon



11 Kite



12 Irregular Decagon

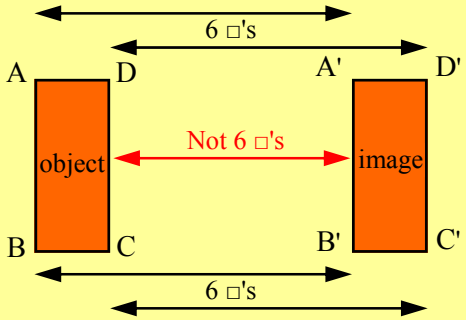
Transformations

When something is transformed it is changed in some way. In mathematics there are 3 different ways to transform a shape.

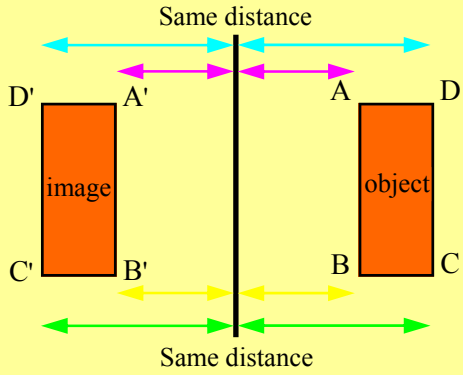
- Translation - this simply means to move, on the worksheet the shapes are on a grid and you are asked to move the object a certain number of squares on the grid.
- Refection - this is like a mirror image, the shape is reflected across a plane (line). The new shape will be the same distance away from the plane as the original, only upside-down or back-to-front.
- Rotation means to spin around a point, the point could be on the shape or away from the shape, this type of transformation requires the most thought.

With positioning the letters on the shape, the letters stay in the same position with translation, reversed in reflection and will be rotated in rotation, look at the examples below.

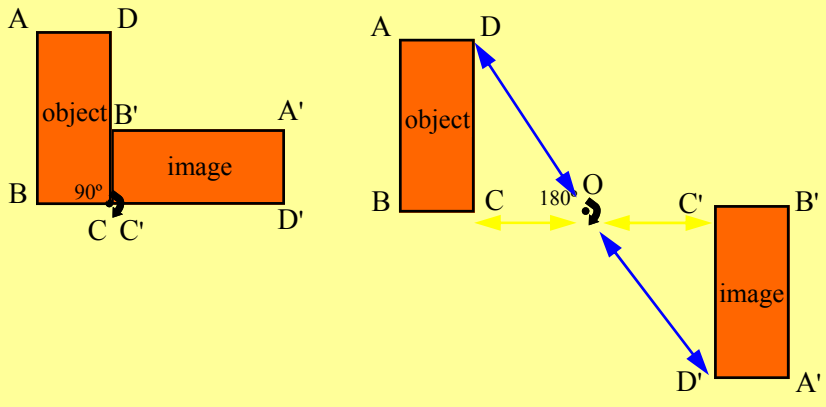
Translation means to move, the letters stay in the same position on the image. If you move the shape 6 □'s to the left then the distance between the same points is 6 □'s. The gap between the object and its image isn't 6 □'s, the most frequent mistake made.



Reflection means to copy back-to-front across a plane, the letters stay the same distance from the plane which means they appear to be reversed.



Rotation means to spin around a point, the point can be on the object or away from the object. The direction of rotation is given as either clockwise or anticlockwise. The distance of a point on the object from the rotation point remains the same once rotated.



Transformations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Create congruent shapes by completing the following transformations.

1 Reflect shape (1) in the line AB.

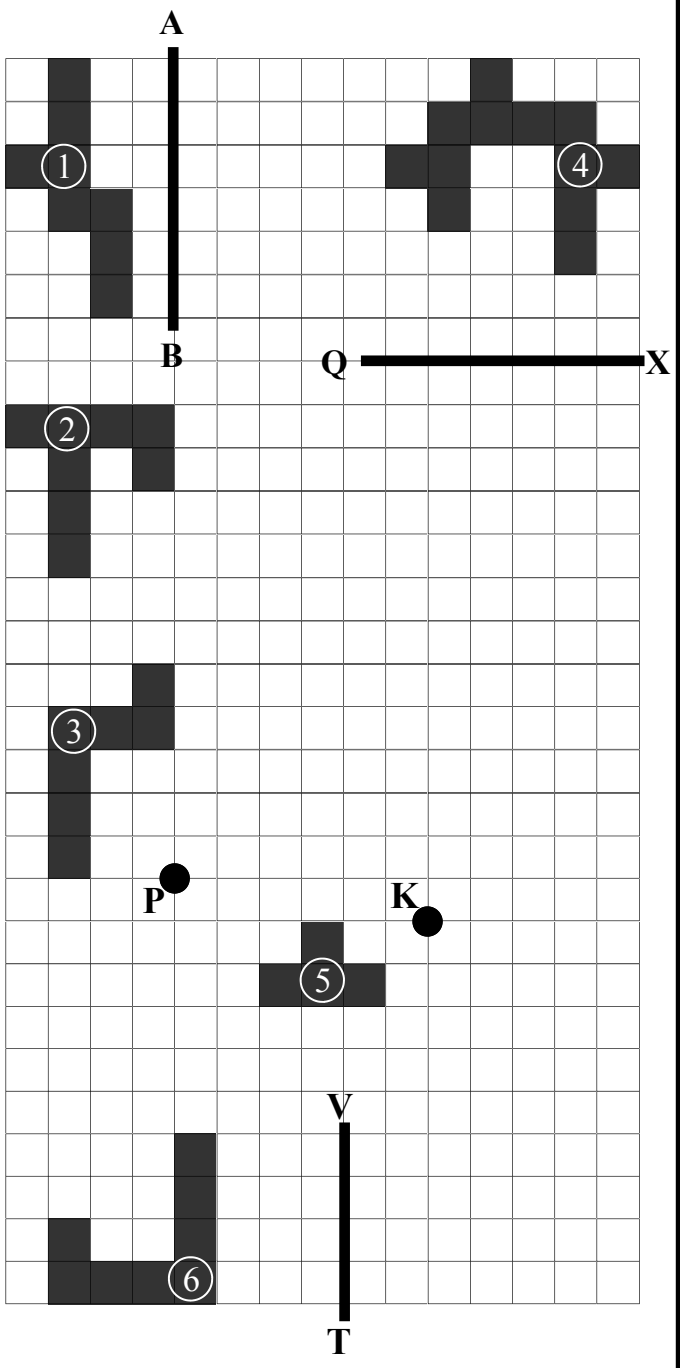
2 Translate shape (2) 5 squares right.

3 Rotate shape (3) 90° clockwise at P.

4 Reflect shape (4) in the line QX.

5 Rotate shape (5) 180° clockwise at K.

6 Translate shape (6) 2 squares right, then reflect the translated shape in the line VT.



These solid shapes have had two transformations applied to them to create a congruent shape, write 'translation', 'reflection' or 'rotation' in the spaces

Matching Congruent Shapes

This sheet compares shapes and asks you if they are congruent. When shapes are congruent they are identical, same internal angles and same side lengths. Note that a congruent shape can be formed by reflection.

Column 1 starts with three questions and asks you to use a ruler and write down all the side lengths. Once you do this if all the sides match, and are in the same position, then the shapes are congruent. Fill in the yes circle if they are.

Column 2 has a number of shapes labeled, A to Z and 1 - 9. So there are 35 shapes. There are 17 pairs of matching shapes and one ‘non-matching shape’. Some shapes are easy as there is only one possible match, but others aren’t so straight forward. With slight variations and rotation as well it is difficult to tell. You have three options:

- Reach for your ruler.
- Use a piece of tracing paper to trace the more difficult shapes, then move the trace over the possible matching shapes.
- Or you teacher may give you a transparency which has all the shapes on it. Use the transparency to check for congruence.

Once you have found your pairs write them in the boxes below the shapes. After you have found all the matches there will be one shape left, write that at the base of the page. Your last step is to colour the shapes that match the same colour.

Matching Congruent Shapes

Congruence Statements

If two shapes are identical then they are congruent. This worksheet doesn't require you to prove that the shapes are congruent … they all are. So you may ask why do you need to say they are congruent when they are? Because you are showing that you can identify the properties of congruent shapes. If a shape is congruent then this angle must equal that angle, or this side must equal that side.

Column 1 starts with a series of matching shapes. You just need to name them. This seems straight forward but there is one problem. When you make a congruence statement that one shape is congruent to another you have to name the vertices in the same order and start at the same matching vertex (or corner). Note that the symbol for congruence is $\equiv$, it can also be $\cong$. The column has shapes to assist you in naming the shapes the correct way.

Column 2 asks you to show which angles are equal and which sides are equal and make a congruence statement.

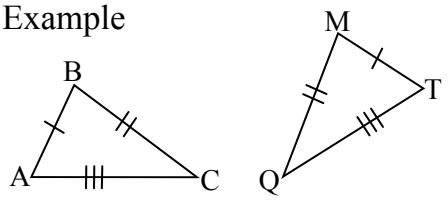
Column 3 continues with similar questions then asks you to find values for pronumerals. This is again matching one piece of data on one triangle with its position on the other, you may also need to perform a calculation.

Congruence Statements

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

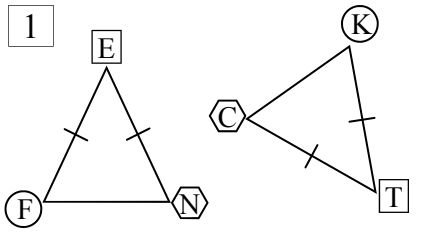
A congruence statement has the matching vertices named in the same order. Write a congruence statement for these.

Example



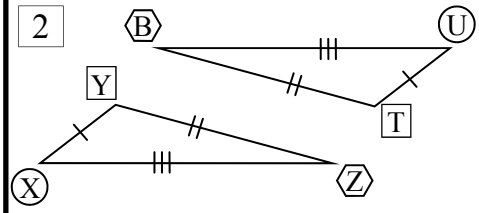
$\triangle ABC \equiv \triangle TMQ$

1



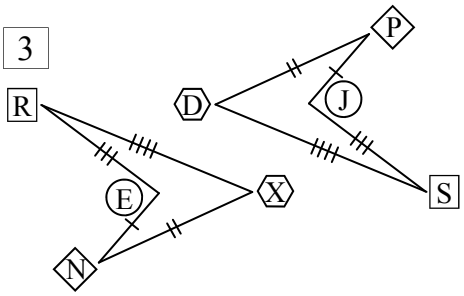
$\triangle\bigcirc\square\hexagon \equiv \triangle\bigcirc\square\hexagon$

2



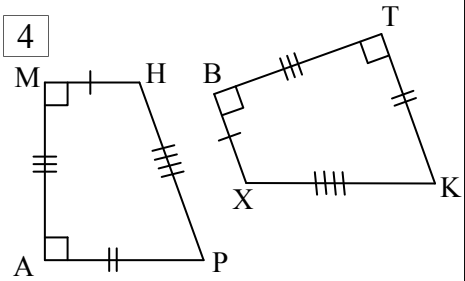
$\triangle\bigcirc\square\hexagon \equiv \triangle\bigcirc\square\hexagon$

3

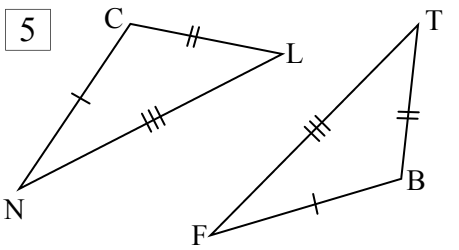


$\bigcirc\square\hexagon\diamond \equiv \bigcirc\square\hexagon\diamond$

4

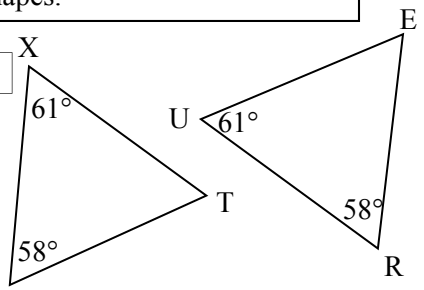


5



State which angles and sides are equal & complete congruence statements for these congruent shapes.

6



$\angle P = \angle R$ $\quad \angle X = \angle\square$

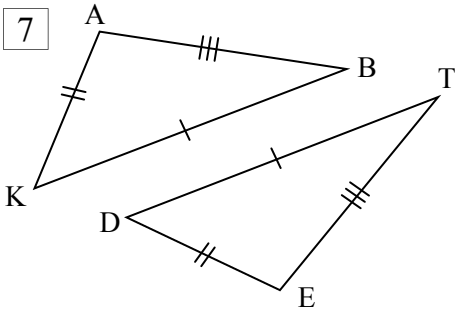
$\angle T = \angle\square$ $\quad XP = \square$

$PT = \square$ $\quad XT = \square$

$\triangle\square \equiv \triangle\square$

Remember same starting point & order.

7



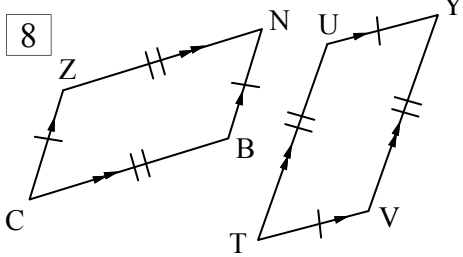
$\angle K = \angle\square$ $\quad \angle\square = \angle\square$

$\angle\square = \angle\square$ $\quad AK = \square$

$\square = \square$ $\quad \square = \square$

$\triangle\square \equiv \triangle\square$

8



$\angle\square = \angle\square = \angle\square = \angle\square$

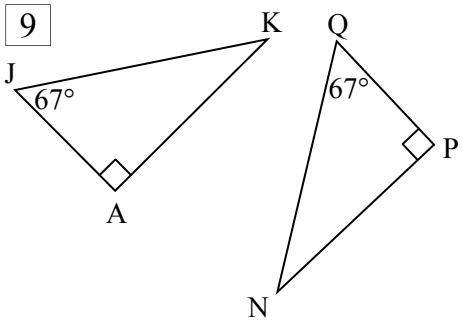
$\angle\square = \angle\square = \angle\square = \angle\square$

$\square = \square = \square = \square$

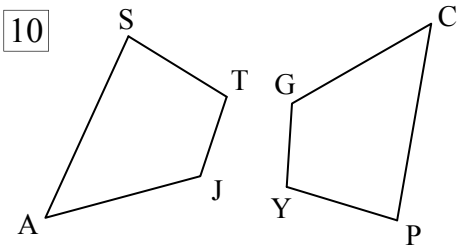
$\square = \square = \square = \square$

$\square \equiv \square$

9

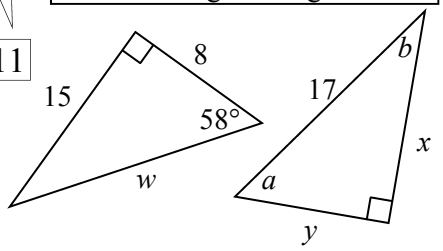


10



Find the value of all unknowns, for these congruent figures.

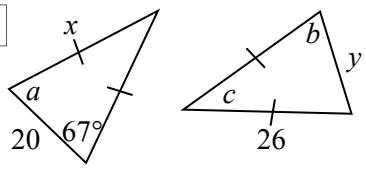
11



$a =$ $\quad b =$ $\quad w =$

$x =$ $\quad y =$

12



$a =$ $\quad b =$ $\quad c =$

$x =$ $\quad y =$

Congruence Statements

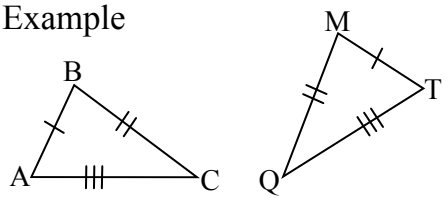
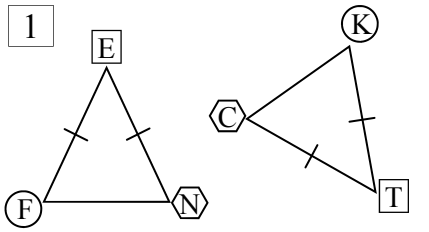
A congruence statement has the matching vertices named in the same order. Write a congruence statement for these.

Example



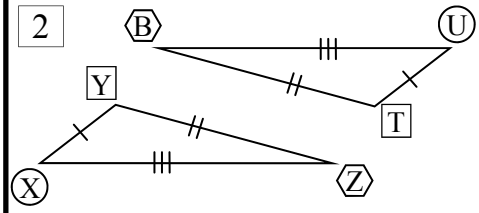
$\triangle ABC \equiv \triangle TMQ$

1



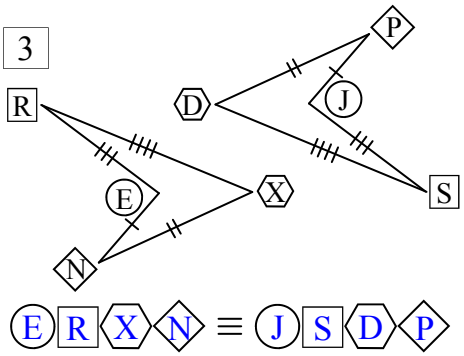
$\triangle FEN \equiv \triangle KTC$

2



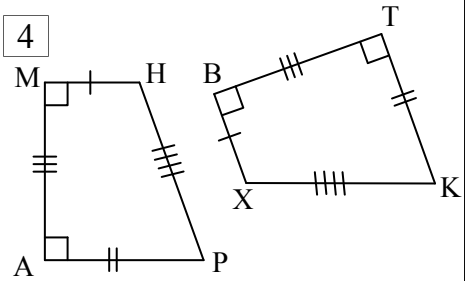
$\triangle XYZ \equiv \triangle UTB$

3



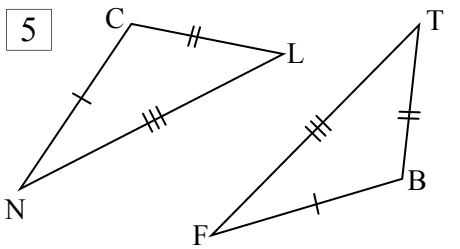
$ERXN \equiv JSDP$

4



$AMHP \equiv TBXK$

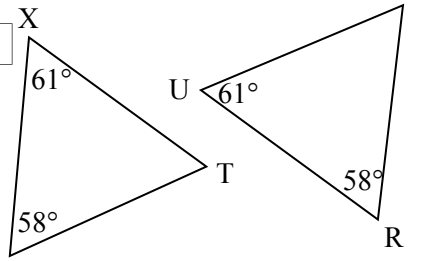
5



$\triangle CLN \equiv \triangle BTF$

State which angles and sides are equal & complete congruence statements for these congruent shapes.

6



$\angle P = \angle R$ $\quad \angle X = \angle U$

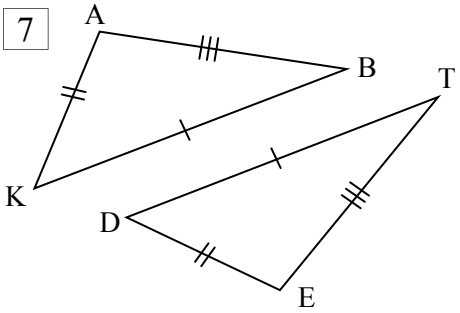
$\angle T = \angle E$ $\quad XP = UR$

$PT = RE$ $\quad XT = UE$

$\triangle PXT \equiv \triangle RUE$

Remember same starting point & order.

7



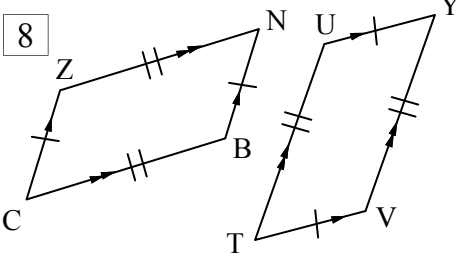
$\angle K = \angle D$ $\quad \angle A = \angle E$

$\angle B = \angle T$ $\quad AK = ED$

$AB = ET$ $\quad TD = BK$

$\triangle ABK \equiv \triangle ETD$

8



$\angle C = \angle N = \angle T = \angle Y$

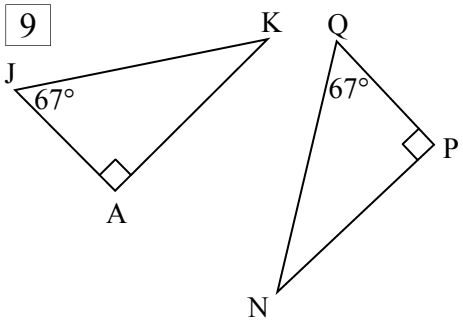
$\angle Z = \angle B = \angle U = \angle V$

$ZC = NB = YU = VT$

$ZN = CB = YV = UT$

$CZNB \equiv TUYV$

9



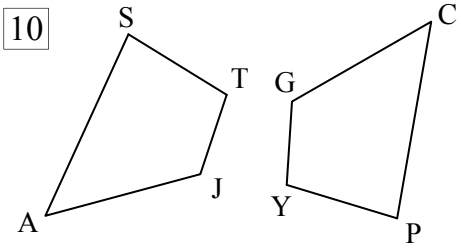
$\angle A = \angle P$ $\quad \angle N = \angle K$

$\angle J = \angle Q$ $\quad JA = QP$

$AK = QP$ $\quad QN = JK$

$\triangle AJK \equiv \triangle PQN$

10



$\angle A = \angle C$ $\quad \angle J = \angle G$

$\angle T = \angle Y$ $\quad \angle S = \angle P$

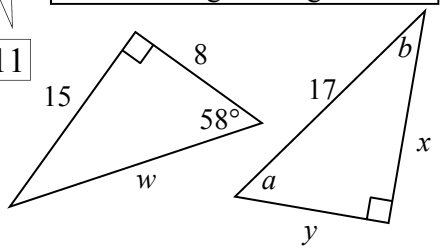
$AS = CP$ $\quad ST = PY$

$TJ = YG$ $\quad JA = GC$

$ASTJ \equiv CPYG$

Find the value of all unknowns, for these congruent figures.

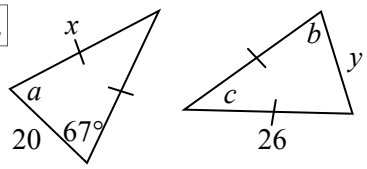
11



$a = 58°$ $\quad b = 32°$ $\quad w = 17$

$x = 15$ $\quad y = 8$

12



$a = 67°$ $\quad b = 67°$ $\quad c = 46°$

$x = 26$ $\quad y = 20$

Congruence & Similarity - Find A Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don’t colour it in too dark (using a texta for example) so that you can still read it.

REVIEW:

COORD GEOMETRY

Grid Reference - The Hidden Friend

A grid reference system is used to pinpoint locations on a map or diagram. This sheet uses grid referencing to plot diagrams of two hidden friends. Grid referencing gives a letter then a number, the letter being along the horizontal axis (the top and bottom) and the number being on the vertical axis, which are the two sides.

Some maps may use a zero, these maps start at 1. To plot the points move across to the letter required then up the column to the number, then colour the square. Then plot the next grid position, after the points are plotted your friends should be revealed.

The co-ordinates are all in the same colour except where you are told to change colour, but if you want to make a multi-coloured one go ahead! You should strike out each grid reference as you plot them incase you need to remember where you are up to.

Using a Street Map

A street map uses grid co-ordinates to specify the location of streets and points of interest. The reference system generally uses letters across its horizontal axis (top and bottom) and numbers on its vertical axis (sides). To give a co-ordinate you move across first, then up, so the letter first then the number.

For example D7 would be the green area. Note that some areas could be given more than one co-ordinate, due to its size it could cross into another reference area. If you are attempting this sheet on paper use a ruler or just the eye.

Column 1 asks for the co-ordinates for the black symbols on the map. Look at the map key (sometimes called a 'legend') so that you know what you are looking for. Then using the grid read off the locations.

Column 2 asks you to place buildings and points of interest on the map. So show that artistic talent!

Column 3 asks you to place post boxes, traffic lights and phone boxes in given locations.

You can print either a map with a grid over it, or a map with no grid.

Latitude and Longitude

Similar to the number plane, when you give locations on the globe you do so by using a pair of co-ordinates. Latitude lines are the horizontal or flat 'lines' (remember lat is flat). Longitude lines are the vertical lines (remember they aren't flat!).

Note that there are no negative numbers, instead direction is used, the equator is when the latitude is 0°. Then moving up (northerly), latitudes increase and are denoted by an N for north. Moving down (southwards) they are denoted by an S. Longitudes are measured from the 0° 'prime meridian' which matches GMT, Greenwich Meridian Time. Then when you move left (West) you denote the movement with a W, moving right (East) you use an E.

When you give these locations unlike a number plane you give the latitude first, you probably remember the compass points by saying 'North South East West' well this applies to the co-ordinates also, give the North or South co-ordinate first then the East or West co-ordinate. You also use a degree sign, separate the co-ordinates with a comma and put them in brackets.

If you look at the point N at the top left of the globe on the worksheet you would give its position as: (50°N, 120°W).

While the sheet differs from column to column the use of co-ordinates is all that is being dealt with on this sheet. The first column asks you to give the co-ordinates for the given point, open a bracket and write in the latitude, then a comma, then the longitude and close the brackets. Note that 0° latitude or longitude doesn't require a letter, just write it as 0°.

Column 2 is the reverse, given a co-ordinate find the point. Write in the letter.

Column 3 takes this one step further. A word (which will be a city) will be formed by using the co-ordinates to find each letter in order, write the letter as you locate the points. If the city is unrecognisable then you need to go back and check your points. Note that the letters are in order they aren't jumbled.

The most common mistake made apart from giving the co-ordinates reversed is with the longitude. Most people get the North or South right but some mix up their East with their West.

Latitude and Longitude

(20°S, 100°W)
(40°N, 140°E)
(50°N, 120°W)

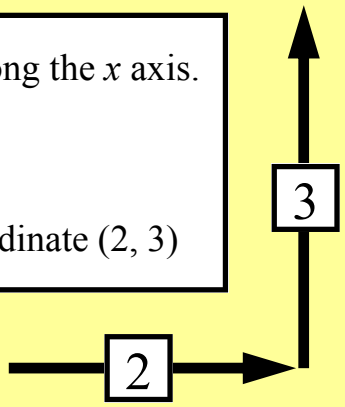
Plotting Points - Positive Quadrant

This sheet involves the plotting of Cartesian co-ordinates. When plotting points on a number plane you are given 2 numbers, referred to as an ordered pair. The first number tells you how much you move across and the second number tells you how much you move up or down. This sheet only moves across to the right and up, negative numbers (not on this sheet) move to the left and down.

Move across first along the *x* axis.

Then move up.

Eg. To plot the co-ordinate (2, 3)



Note that the plane consists of an *x*-axis (horizontal or across) and a *y*-axis which is vertical (up and down). The plural of axis is axes (pronounced ak-seas). The co-ordinate (0, 0) is commonly referred to as the 'origin', the place where measurement starts from. Teachers often ask for the co-ordinates of the origin.

The first column asks you to locate the points and write in their co-ordinates. This is done by opening a bracket writing the *x* co-ordinate, writing a comma, then the *y* co-ordinate and close bracket. You should always place the co-ordinates in brackets.

The second column asks you to plot points. Once the group of points are plotted draw a line between points (in alphabetical order) to form a shape. Then write in the name of the shape plotted in the space provided.

Drawing Animals - Positive Quadrant

This sheet uses your skills in plotting points from the previous sheet. The series of points makes a pair of animals when lines are joined between the points. The way you attempt this exercise is, for the first animal:

- Plot one point at a time and then draw a line between it and the previous point. Don't try to plot all the points and then draw the lines afterwards as the drawing is too complicated.
- When you reach stop, restart at the new position and start again, DON'T JOIN THE POINTS BETWEEN WHERE YOU STOPPED AND WHERE YOU RESTARTED.

For the next animal follow the same process except use 2 different colours.

Move across first along the *x* axis.

Then move up.

Eg. To plot the co-ordinate (2, 3)

Plotting Points - 4 Quadrants

This sheet involves the plotting of Cartesian co-ordinates. When plotting points on a number plane you are given two numbers. The first number tells you how much you move across and the second number tells you how much you move up or down. As the numbers are in order, across first, up/down second, these numbers can be referred to as 'ordered pairs', as their order is important. Positive numbers move across to the right if the first number, negative numbers move to the left if the first number. Positive numbers move up if the second number, negative numbers move down if the second number.

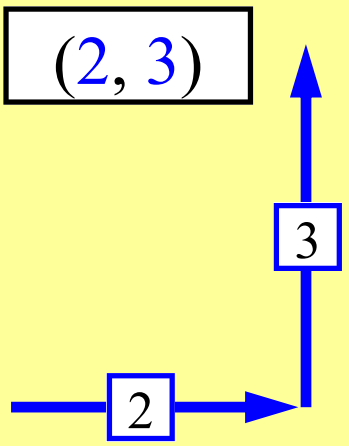
The first column asks you to locate the points and write in their co-ordinates. This is done by opening a bracket writing the *x* co-ordinate, a comma, then the *y* co-ordinate and close bracket. Always place co-ordinates in brackets.

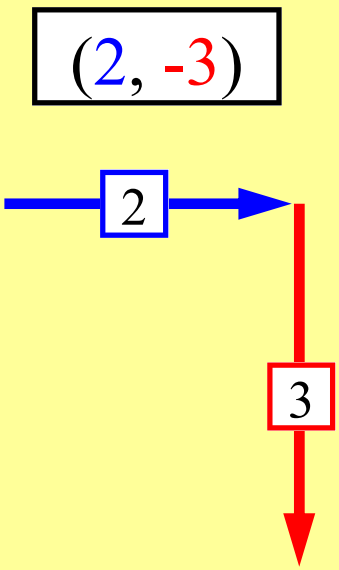
The second column asks you to plot points. Draw filled in circles at the given location and label them with the letter supplied in each question.

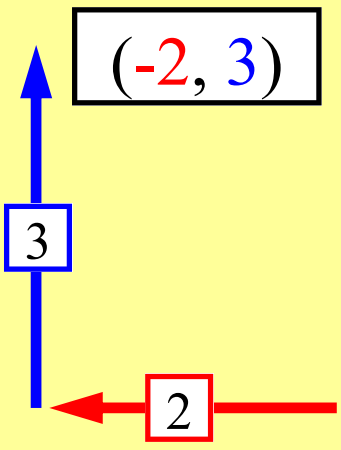
Once you plot the point record down which quadrant it is in. Quadrants start with the 1st Quadrant (top right) and then moving anti-clockwise, are called II (2nd), III (3rd) and IV (4th). If the point is on the axis then record it by filling in the oval around the word 'Axis'.

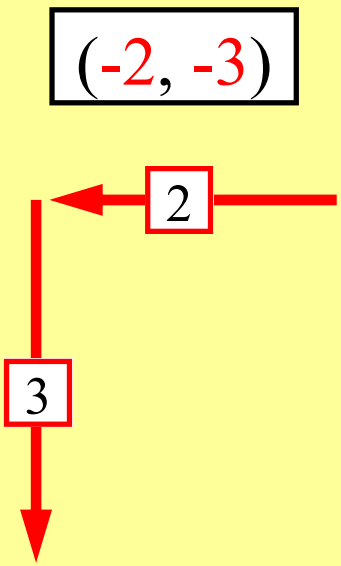
Move across first along the *x* axis.
Negative to the left, Positive to the right.

Then move up or down in the *y* direction.
Negative is down, Positive is up.









Plotting Points - 4 Quadrants

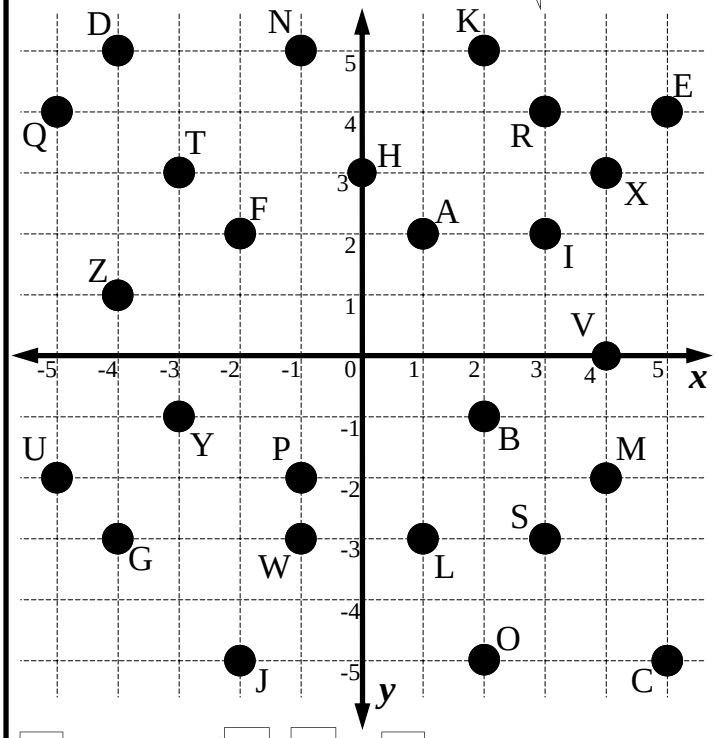
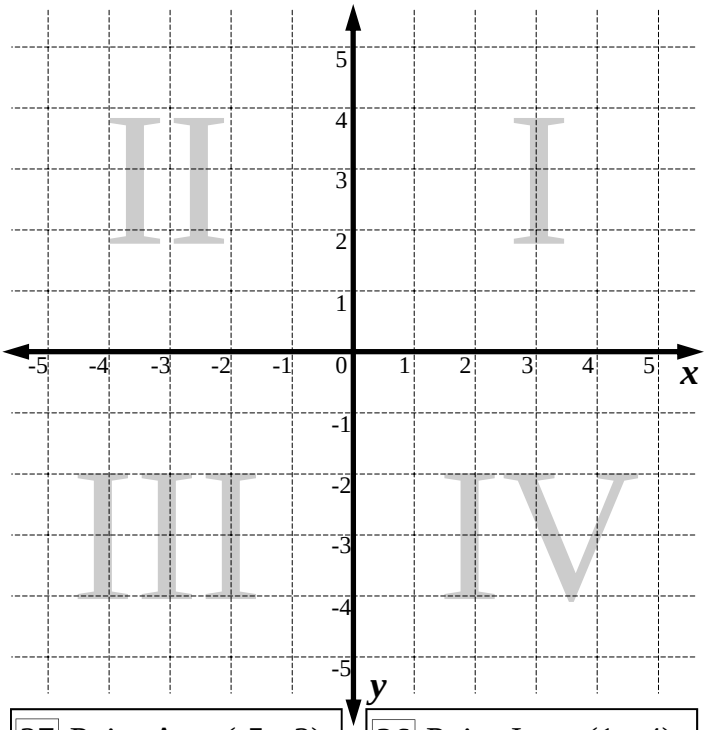
Give the co-ordinates for the points on the number plane below.



1 Point A (,)
2 Point B
3 Point C
4 Point D
5 Point E
6 Point F
7 Point G
8 Point H
9 Point I
10 Point J
11 Point K
12 Point L
13 Point M
14 Point N
15 Point O
16 Point P
17 Point Q
18 Point R
19 Point S
20 Point T
21 Point U
22 Point V
23 Point W
24 Point X
25 Point Y
26 Point Z

Plot the following points on the number plane below, label each point and give the quadrant that the point lies in.



27 Point A (-5, -2) Quadrant I II III IV Axis
28 Point B (2, 4) Quadrant I II III IV Axis
29 Point C (4, 0) Quadrant I II III IV Axis
30 Point D (3, -3) Quadrant I II III IV Axis
31 Point E (-3, 5) Quadrant I II III IV Axis
32 Point F (0, 0) Quadrant I II III IV Axis
33 Point G (5, -5) Quadrant I II III IV Axis
34 Point H (-2, 4) Quadrant I II III IV Axis
35 Point I (1, 2) Quadrant I II III IV Axis
36 Point J (1, -4) Quadrant I II III IV Axis
37 Point K (-3, -4) Quadrant I II III IV Axis
38 Point L (-1, 0) Quadrant I II III IV Axis
39 Point M (-4, 2) Quadrant I II III IV Axis
40 Point N (3, -5) Quadrant I II III IV Axis
41 Point O (0, -3) Quadrant I II III IV Axis
42 Point P (-5, -5) Quadrant I II III IV Axis
43 Point R (-2, 1) Quadrant I II III IV Axis
44 Point S (2, -2) Quadrant I II III IV Axis

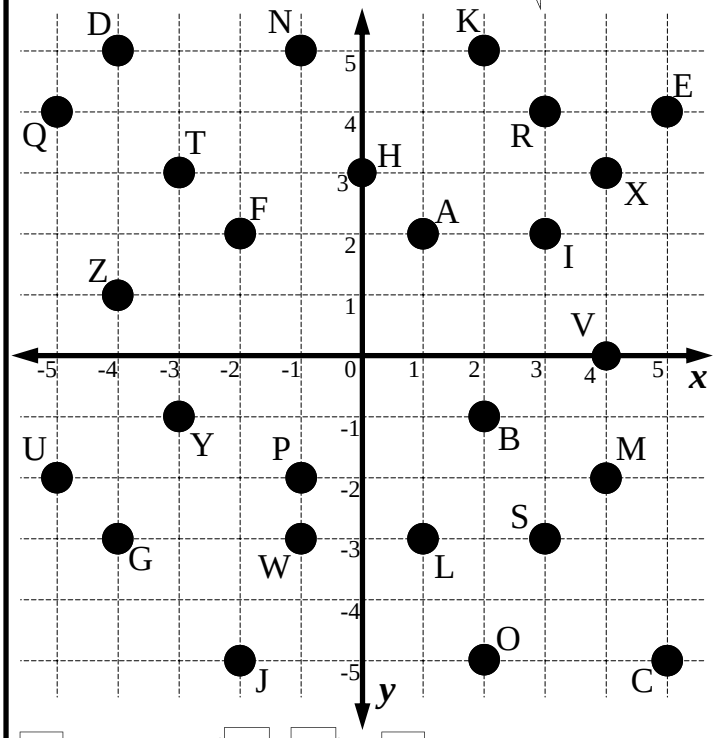
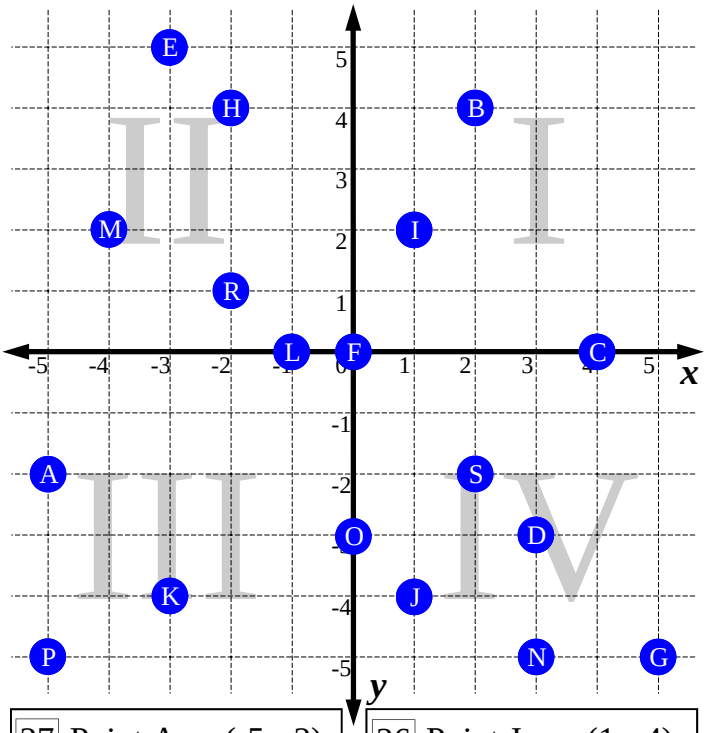
Give the co-ordinates for the points on the number plane below.



1	Point A	(1, 2)	14	Point N	(-1, 5)
2	Point B	(2, -1)	15	Point O	(2, -5)
3	Point C	(5, -5)	16	Point P	(-1, -2)
4	Point D	(-4, 5)	17	Point Q	(-5, 4)
5	Point E	(5, 4)	18	Point R	(3, 4)
6	Point F	(-2, 2)	19	Point S	(3, -3)
7	Point G	(-4, -3)	20	Point T	(-3, 3)
8	Point H	(0, 3)	21	Point U	(-5, -2)
9	Point I	(3, 2)	22	Point V	(4, 0)
10	Point J	(-2, -5)	23	Point W	(-1, -3)
11	Point K	(2, 5)	24	Point X	(4, 3)
12	Point L	(1, -3)	25	Point Y	(-3, -1)
13	Point M	(4, -2)	26	Point Z	(-4, 1)

Plot the following points on the number plane below, label each point and give the quadrant that the point lies in.



27 Point A (-5, -2) Quadrant I II **III** IV Axis

28 Point B (2, 4) Quadrant **I** II III IV Axis

29 Point C (4, 0) Quadrant I II III IV **Axis**

30 Point D (3, -3) Quadrant I II **III** IV Axis

31 Point E (-3, 5) Quadrant **II** III IV Axis

32 Point F (0, 0) Quadrant I II III IV **Axis**

33 Point G (5, -5) Quadrant I II **III** IV Axis

34 Point H (-2, 4) Quadrant **II** III IV Axis

35 Point I (1, 2) Quadrant **I** II III IV Axis

36 Point J (1, -4) Quadrant I II III **IV** Axis

37 Point K (-3, -4) Quadrant I II **III** IV Axis

38 Point L (-1, 0) Quadrant I II III IV **Axis**

39 Point M (-4, 2) Quadrant **II** III IV Axis

40 Point N (3, -5) Quadrant I II III **IV** Axis

41 Point O (0, -3) Quadrant I II III IV **Axis**

42 Point P (-5, -5) Quadrant I II **III** IV Axis

43 Point R (-2, 1) Quadrant **II** III IV Axis

44 Point S (2, -2) Quadrant I II III **IV** Axis

Drawing Animals - All Quadrants

This sheet uses your skills in plotting points from the previous sheet. The series of points makes a pair of animals when lines are joined between the points. The way you attempt this exercise is, for the first animal:

- Plot one point at a time and then draw a line between it and the previous point. Don't try to plot all the points and then draw the lines afterwards as the drawing is too complicated.
- When you reach stop, restart at the new position and start again, DON'T JOIN THE POINTS BETWEEN WHERE YOU STOPPED AND WHERE YOU RESTARTED.

Move across first along the *x* axis.
Negative to the left, Positive to the right.

Then move up or down in the *y* direction.
Negative is down, Positive is up.

43 Point R (-2, 1) Quadrant **II** III IV Axis

44 Point S (2, -2) Quadrant I II III **IV** Axis

Substitution & Table of Values

Substitution means replacing a pronumeral (letter) with a number. You are given the number to substitute, either in the question or in a table. Here are some examples.

Example - Substitution

If $a = 4$ and $b = 5$, find the value for:

$a + b = 4 + 5$
$= 9$

$3ab = 3 \times 4 \times 5$
$= 60$

$a^2b = 4^2 \times 5$
$= 80$

Example - Completing a table of values

$y = 3x + 2$

x	0	1	2	3	4
y	2	5	8	11	14

$y = 3 \times 0 + 2 = 2$
$y = 3 \times 1 + 2 = 5$
$y = 3 \times 2 + 2 = 8$
$y = 3 \times 3 + 2 = 11$
$y = 3 \times 4 + 2 = 14$

Completing a table of values is just like the substitution above except the value changes in steps.

So you replace the x with 0 for the first value. Then replace x with 1 for the second value.

Notice that there is a pattern, the y-values are increasing by three. You should use this as a check, if the numbers aren't increasing or decreasing in a regular pattern, then you have made a mistake.

The last column features questions that are different in appearance. Often these have x and y on the one side of the '=' sign. Here is an example.

$x + y = 15$

x	-2	-1	0	1	2
y	17	16	15	14	13

Ask yourself: What do I add to -2 to get to 15?

If I add 2 to -2 I get zero, then 15 more will be 15. So I add 17 to -2 to get 15. $y = 17$

Ask yourself: What do I add to -1 to get to 15?

If I add 1 to -1 I get zero, then 15 more will be 15. So I add 16 to -1 to get 15. $y = 16$

$-2 + y = 15$
$-1 + y = 15$
$0 + y = 15$
$1 + y = 15$
$2 + y = 15$

Substitution & Table of Values

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

If $a = 2$, $b = 3$ and $c = 5$, substitute the values into the expressions and solve.

Examples $c - a$ $= 5 - 2$ $= 3$

$2a + c$ $= 2 \times 2 + 5$ $= 9$

1 $4a$ $= \square \times \square$ $=$ _____

2 bc $= \square \times \square$ $=$ _____

3 $3c + 2$ $= \square \times \square + \square$ $=$ _____

4 $b^2 - a$ $= \square^2 - \square$ $=$ _____

5 $ac + bc$ = _____ = ___

6 $c - 3b$ = _____ = ___

7 $\frac{5b + c}{a} = \frac{\square}{\square}$ = ___

8 $a^2 - b^2$ = _____ = ___

9 $a(a - c)$ = _____ = ___

10 $10 - ac$ = _____ = ___

Use $x = 0, 1, 2, \ldots$ And so on to complete these.

Using $y = 2x$, find y when:

10 $x = 0$: $2 \times \square$ = ___

11 $x = 1$: $\square \times \square$ = ___

12 $x = 2$: $\square \times \square$ = ___

13 $x = 3$: $\square \times \square$ = ___

Using $y = 3x + 2$, find y when:

14 $x = 0$: $\square \times \square + \square$ = ___

15 $x = 1$: $\square \times \square + \square$ = ___

16 $x = 2$: $\square \times \square + \square$ = ___

17 $x = 3$: $\square \times \square + \square$ = ___

18 $x = 4$: $\square \times \square + \square$ = ___

Complete these table of values.

19 $y = x + 5$

x	0	1	2	3	4
y					

20 $y = 2x + 3$

x	0	1	2	3	4
y					

21 $y = 5x - 1$

x	0	1	2	3	4
y					

22 $y = -x + 6$

x	0	1	2	3	4
y					

23 $y = 12 - 2x$

x	0	1	2	3	4
y					

Note that the x values have changed

24 $y = x + 10$

x	-2	-1	0	1	2
y					

25 $y = -x - 7$

x	-2	-1	0	1	2
y					

26 $y = -4x - 7$

x	-2	-1	0	1	2
y					

27 $y = 3x - 9$

x	-4	-2	0	2	4
y					

28 $y = -5x + 11$

Substitution & Table of Values

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

If $a = 2$, $b = 3$ and $c = 5$, substitute the values into the expressions and solve.

Examples $c - a$ $= 5 - 2$ $= 3$ $\qquad$ $2a + c$ $= 2 \times 2 + 5$ $= 9$

1 $4a$ $= 4 \times 2$ $= 8$

2 bc $= 3 \times 5$ $= 15$

3 $3c + 2$ $= 3 \times 5 + 2$ $= 17$

4 $b^2 - a$ $= 3^2 - 2$ $= 7$

5 $ac + bc = 2 \times 5 + 3 \times 5 = 25$

6 $c - 3b = 5 - 3 \times 3 = -4$

7 $\frac{5b + c}{a} = \frac{5 \times 3 + 5}{2} = 10$

8 $a^2 - b^2 = 2^2 - 3^2 = -5$

9 $a(a - c) = 2 \times (2 - 5) = -6$

10 $10 - ac = 10 - 2 \times 5 = 0$

Use $x = 0, 1, 2, \ldots$ And so on to complete these.

Using $y = 2x$, find y when:

10 $x = 0$: $2 \times 0 = 0$

11 $x = 1$: $2 \times 1 = 2$

12 $x = 2$: $2 \times 2 = 4$

13 $x = 3$: $2 \times 3 = 6$

Using $y = 3x + 2$, find y when:

14 $x = 0$: $3 \times 0 + 2 = 2$

15 $x = 1$: $3 \times 1 + 2 = 5$

16 $x = 2$: $3 \times 2 + 2 = 8$

17 $x = 3$: $3 \times 3 + 2 = 11$

18 $x = 4$: $3 \times 4 + 2 = 14$

Complete these table of values.

19 $y = x + 5$

x	0	1	2	3	4
y	5	6	7	8	9

20 $y = 2x + 3$

x	0	1	2	3	4
y	3	5	7	9	11

21 $y = 5x - 1$

x	0	1	2	3	4
y	-1	4	9	14	19

22 $y = -x + 6$

x	0	1	2	3	4
y	6	5	4	3	2

23 $y = 12 - 2x$

x	0	1	2	3	4
y	12	10	8	6	4

Note that the x values have changed

24 $y = x + 10$

x	-2	-1	0	1	2
y	8	9	10	11	12

25 $y = -x - 7$

x	-2	-1	0	1	2
y	-5	-6	-7	-8	-9

26 $y = -4x - 7$

x	-2	-1	0	1	2
y	1	-3	-7	-11	-15

27 $y = 3x - 9$

x	-4	-2	0	2	4
y	-21	-15	-9	-3	3

28 $y = -5x + 11$

x	-4	-2	0	2	4
y	31	21	11	1	-9

These are a bit different

29 $y - x = 5$

x	0	1	2	3	4
y	5	6	7	8	9

30 $x + y = 11$

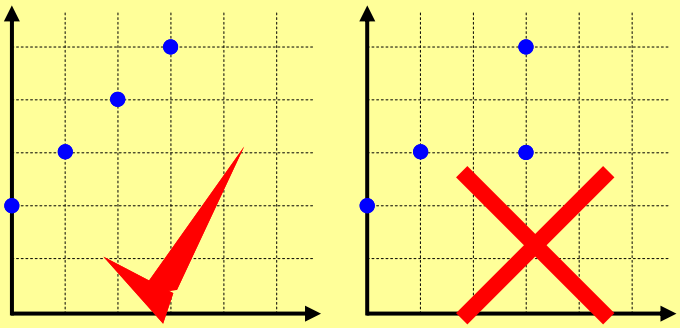
Plotting Points & Drawing Straight Lines

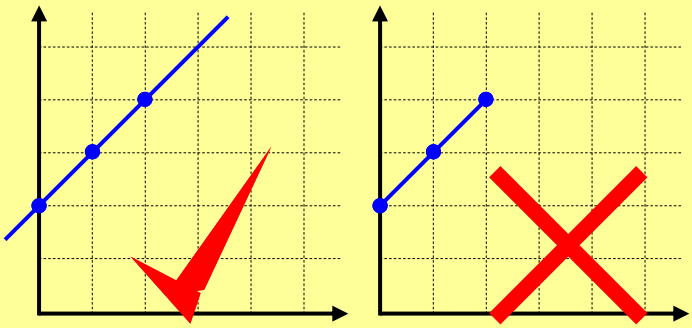
If you can plot points on a grid, drawing straight lines is just drawing a line through them. This sheet removes calculation from the process and just relies on you plotting points correctly and then drawing a line correctly.

There are three key features of drawing a straight line. These are:

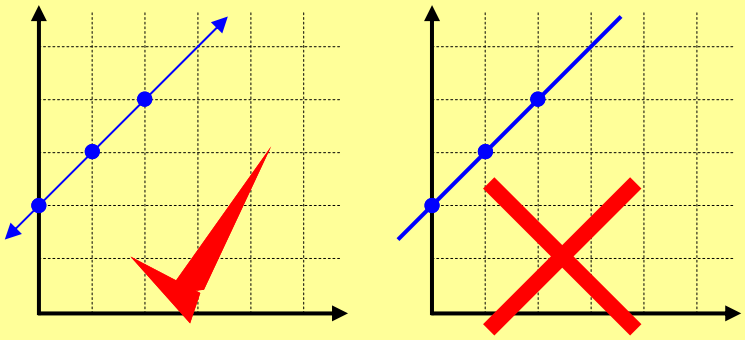
STEP 1 Make sure that your points are in a straight line.



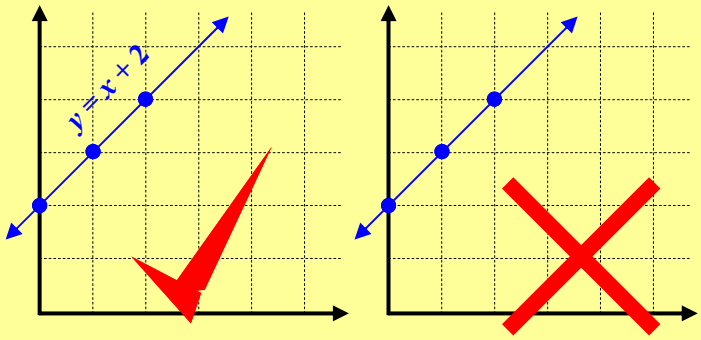
STEP 2 Draw a line the full size of the grid, not just between the first and last dot.



STEP 3 Put arrow heads on each end of the line.



STEP 4 Write the formula for the line on top of the line. Write it in pencil as another line may plot over it later and you will have to move the name.



Column 1 gives you the points to plot as ordered pairs (x co-ord, y co-ord). Plot the points then draw a line through them, keeping the above in mind. The second graph asks you to list all the points where an intersection of lines occurs.

Column 2 is the same except that rather than the points being given as ordered pairs they are in tables. The x value for the point is in the top row, the y value is in the bottom row.

Plotting Points & Drawing Straight Lines

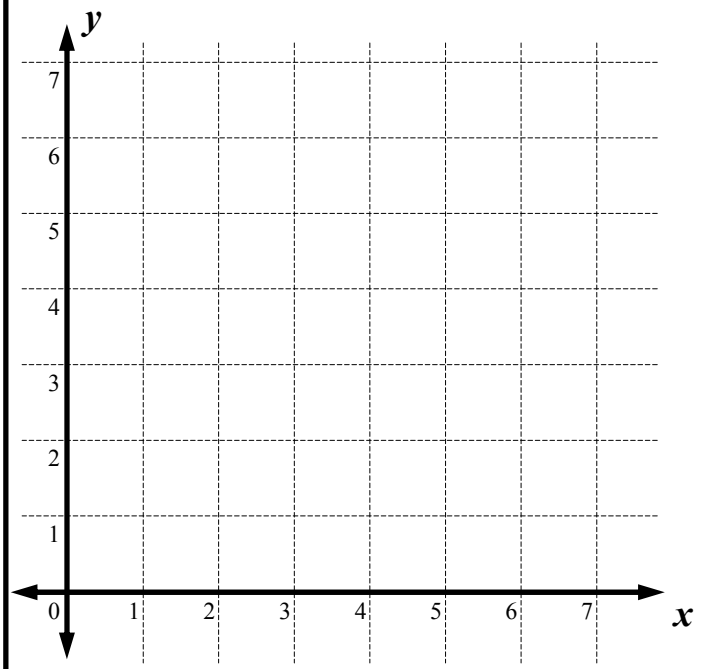
© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Plot the points then draw a line through them. Use a ruler, show arrow heads and write the equation of the line on the line. The line should be the full size of the graph, not stop at the last point.

1 $y = 2x + 1$ Plot Points: (0, 1), (1, 3), (2, 5).

2 $y = -x + 6$ Plot Points: (0, 6), (2, 4), (4, 2).

3 $y = x - 3$ Plot Points: (3, 0), (4, 1), (5, 2).

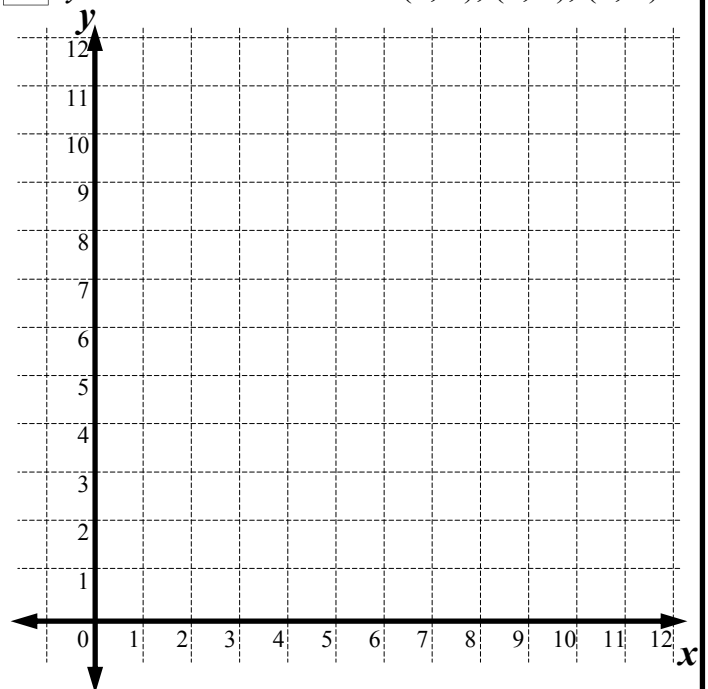


Use the lower grid for these

4 $y = 12 - x$ Plot Points: (0, 12), (2, 10), (4, 8)

5 $y = 3x$ Plot Points: (0, 0), (2, 6), (4, 12)

6 $y = x + 2$ Plot Points: (0, 2), (2, 4), (4, 6)



7 List 3 points where lines intersect.

(□, □), (□, □), (□, □).

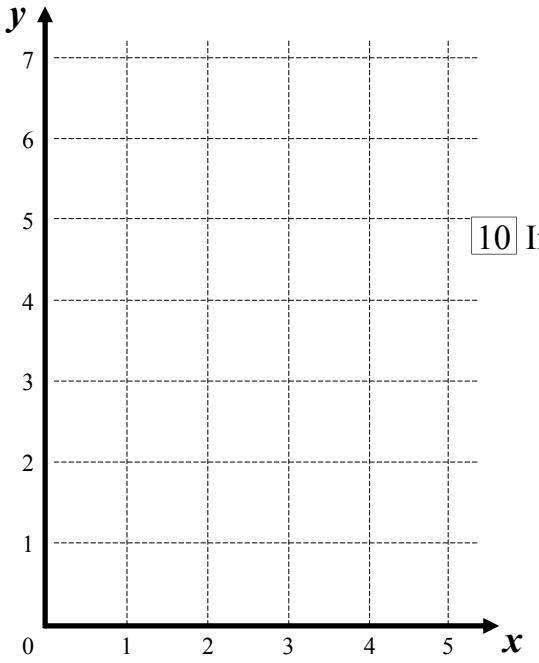
Now use the table of values to plot the lines. Go across 'x' and up 'y'.

8 $y = x + 2$

x	0	1	2	3	4
y	2	3	4	5	6

9 $y = -x + 6$

x	0	1	2	3	4
y	6	5	4	3	2



10 Intersection (□, □) Point

11 $x + y = 5$

x	0	1	2	3	4
y	5	4	3	2	1

12 $y = 2x - 4$

x	0	1	2	3	4
y	-4	-2	0	2	4

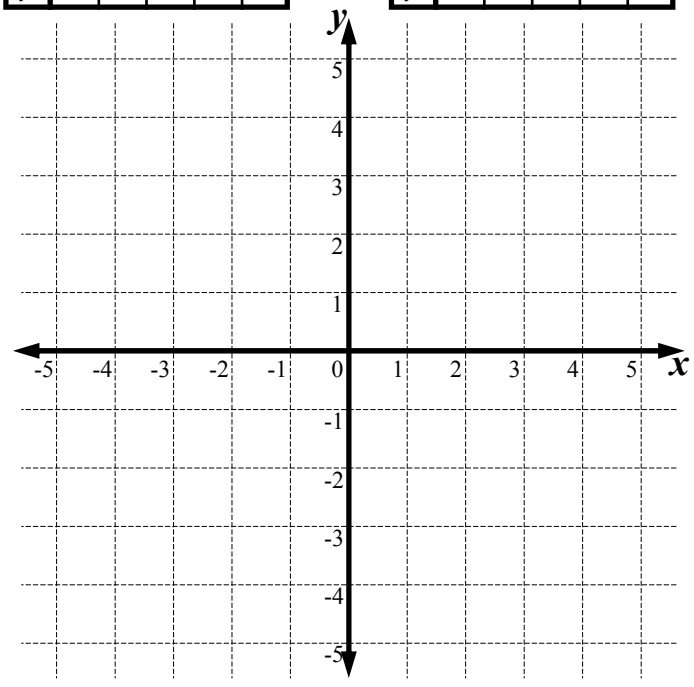
Use the lower grid for these

13 $y = ½x + 2$

x	-4	-2	0	2	4
y	0	1	2	3	4

14 $y = -x - 4$

x	-4	-3	-2	-1	0
y	0	-1	-2	-3	-4



15 List the 5 points where lines intersect.

(□, □), (□, □), (□, □), (□, □), (□, □).

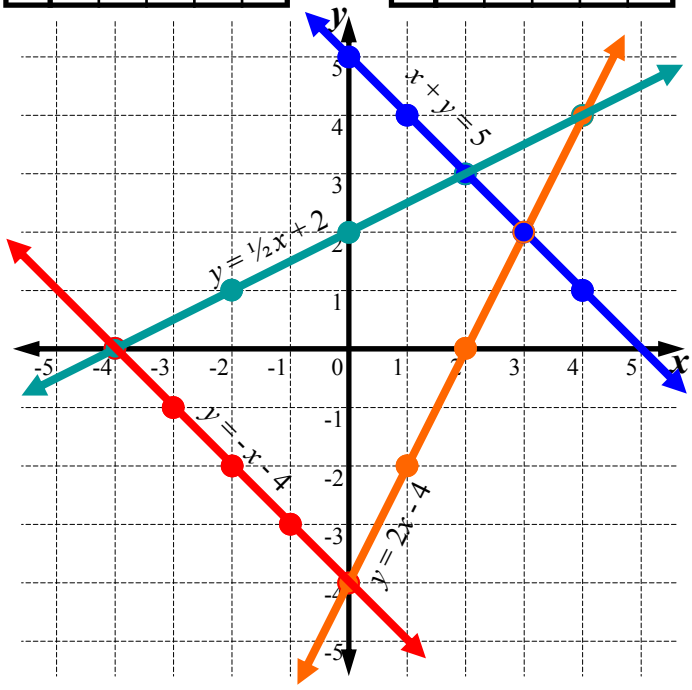
y	0	-1	-2	-3	-4



15 List the 5 points where lines intersect.

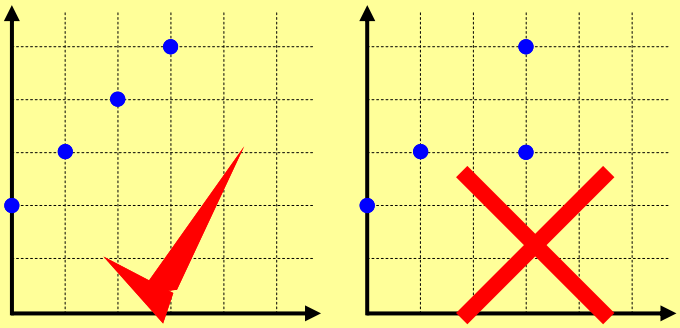
(4, 4), (2, 3), (3, 2), (0, -4), (-4, 0).

Straight Lines - Positive Quadrant & Cost Functions

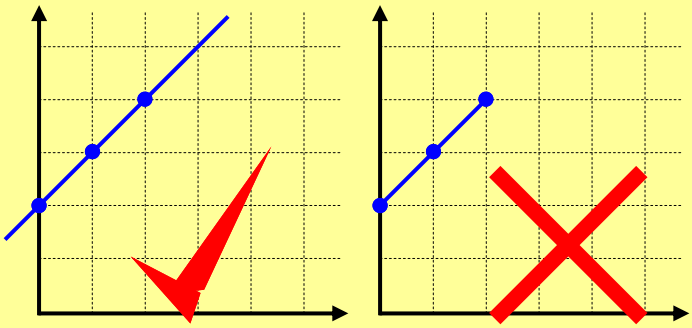
This sheet requires you to complete a table of values and then plot a straight line. Straight lines can represent a mathematical equation, they are also used in business to represent sales, costs and profit.

Column 1 asks you to plot the linear equations supplied. Complete the table of values by substituting *x* with the value from the table. Solve and write the answer as the *y* value. Then plot the points and complete the straight line. Remember the process shown below.

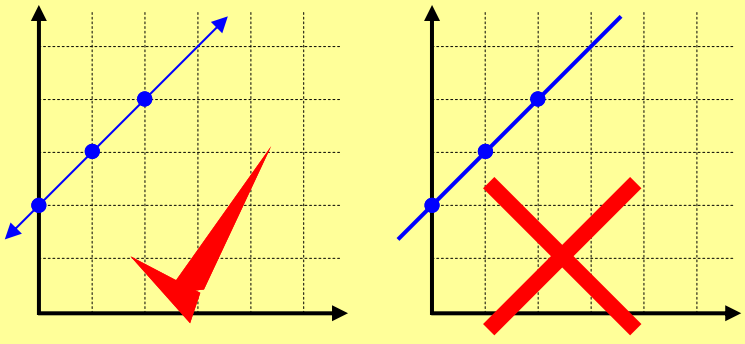
STEP 1 Make sure that your points are in a straight line.



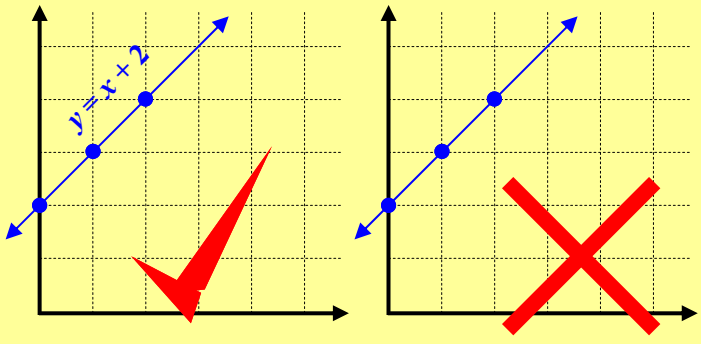
STEP 2 Draw a line the full size of the grid, not just between the first and last dot.



STEP 3 Put arrow heads on each end of the line.



STEP 4 Write the formula for the line on top of the line. Write it in pencil as another line may plot over it later and you will have to move the name.



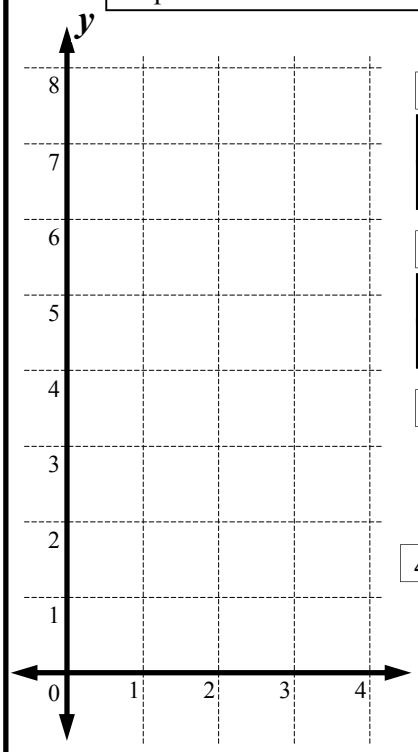
Column 2 is a cost function, plotting the results for a cricket bat manufacturer. This grid will have two lines on it, one for the cost of manufacture, the other for the income from the sales. Don't confuse income with profit. Profit is : Profit = Sales - Costs. The term 'break-even' is the amount of production required to start making a profit, or to recoup costs. If the sales don't result in the break-even point being met, the venture will result in a loss.

Complete the tables and the graph, plot the lines in different colours, you can use a broken line for the income and then make it solid after break-even. Match the line colour in the key. A cost function line doesn't necessarily require a label or arrow heads, but ask your teacher.

Straight Lines - Positive Quadrant & Cost Functions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Complete the table of values then plot the points. Draw the line and remember to show arrow heads and the name of the line. List the coordinates for the points of intersection when required.



1 $y = 2x$

x	0	1	2	3	4
y					

2 $y = x + 3$

x	0	1	2	3	4
y					

3 $y = 3 - x$

x	0	1	2	3
y				

4 Points of Intersection:

$(\square, \square), (\square, \square),$

$(\square, \square).$

Use the lower grid for these

5 $y = x - 3$

x	3	4	5	6	7
y					

6 $y = 3x - 5$

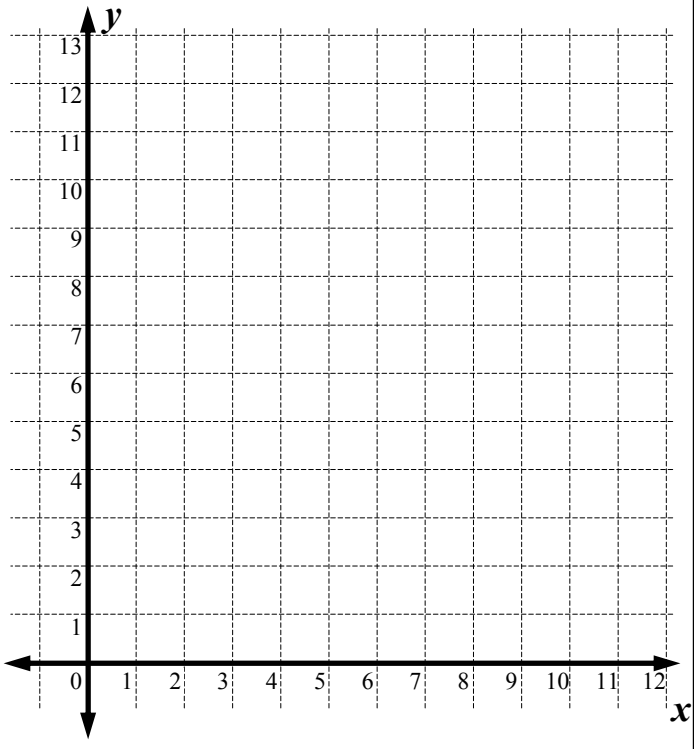
x	2	3	4	5	6
y					

7 $y = \frac{1}{2}x + 4$

x	0	2	4	6	8
y					

8 $x + y = 10$

x	0	2	4	6	8
y					



"Mite-e-Willow" manufacture cricket bats. The manufacture cost function and sales function are shown. Complete the table of values and plot the lines. The intersection is the break even point.

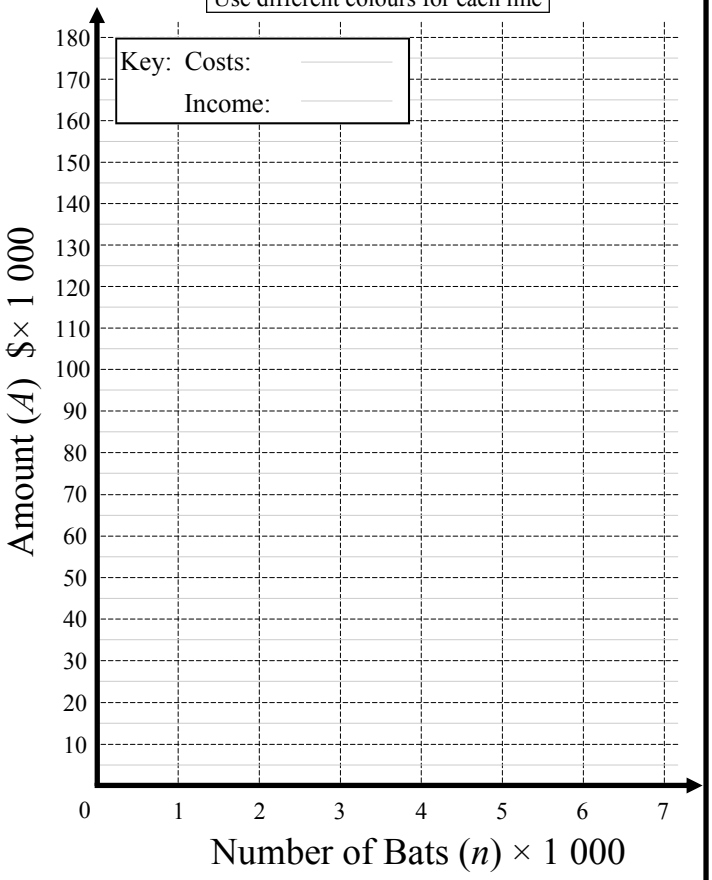
9 *Operation Costs:* $A = 10n + 90\,000$

n	1 000	2 000	3 000	4 000	5 000
A					

10 *Income Sales:* $A = 25n$

n	1 000	2 000	3 000	4 000	5 000
A					

Use different colours for each line



11 How many bats have to be sold to break even? _____

12 How much does it cost to make 2 500 bats? _____

13 What was the income on selling 7 000 bats? _____

14 What was the profit on selling 7 000 bats? _____

"Mite-e-Willow" sold 38 000 bats for the year, calculate:

15 The cost of production

$A = 10n + 90\,000$

$= 10 \times \square + 90\,000$

$A =$

16 The sales income

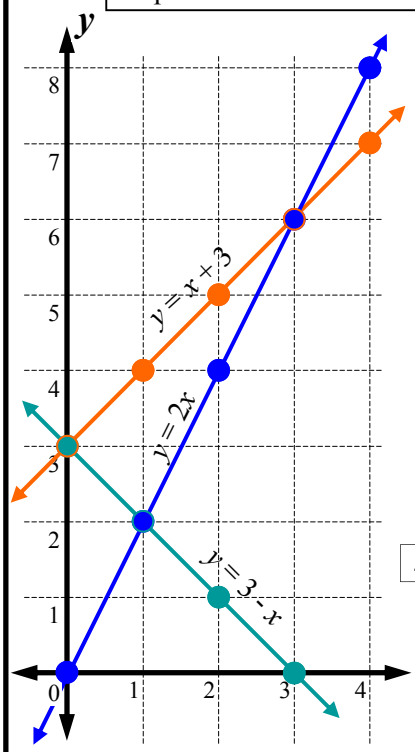
$A =$

17 The profit. _____

Straight Lines - Positive Quadrant & Cost Functions

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Complete the table of values then plot the points. Draw the line and remember to show arrow heads and the name of the line. List the coordinates for the points of intersection when required.



1 $y = 2x$

x	0	1	2	3	4

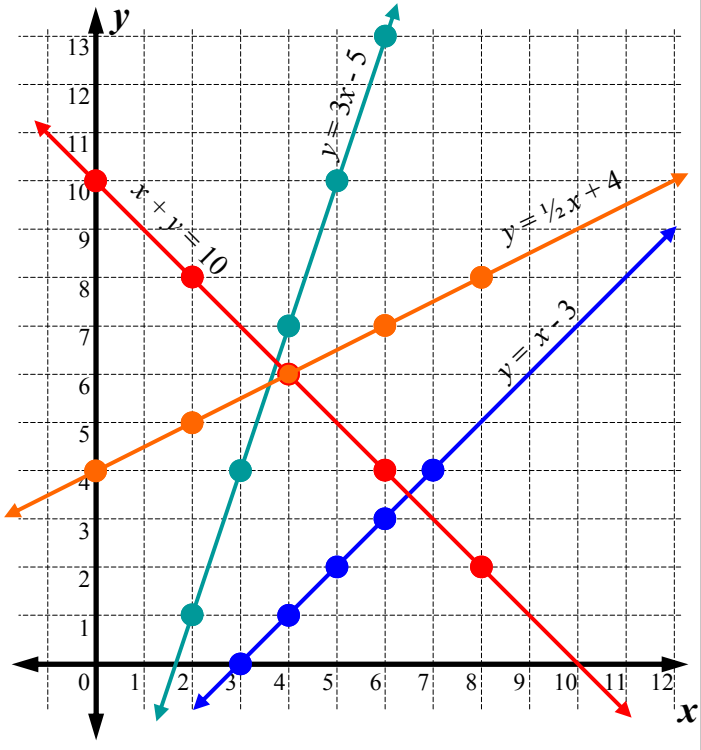
8 $x + y = 10$

x	0	2	4	6	8
y	10	8	6	4	2



"Mite-e-Willow" manufacture cricket bats. The manufacture cost function and sales function are shown. Complete the table of values and plot the lines. The intersection is the break even point.

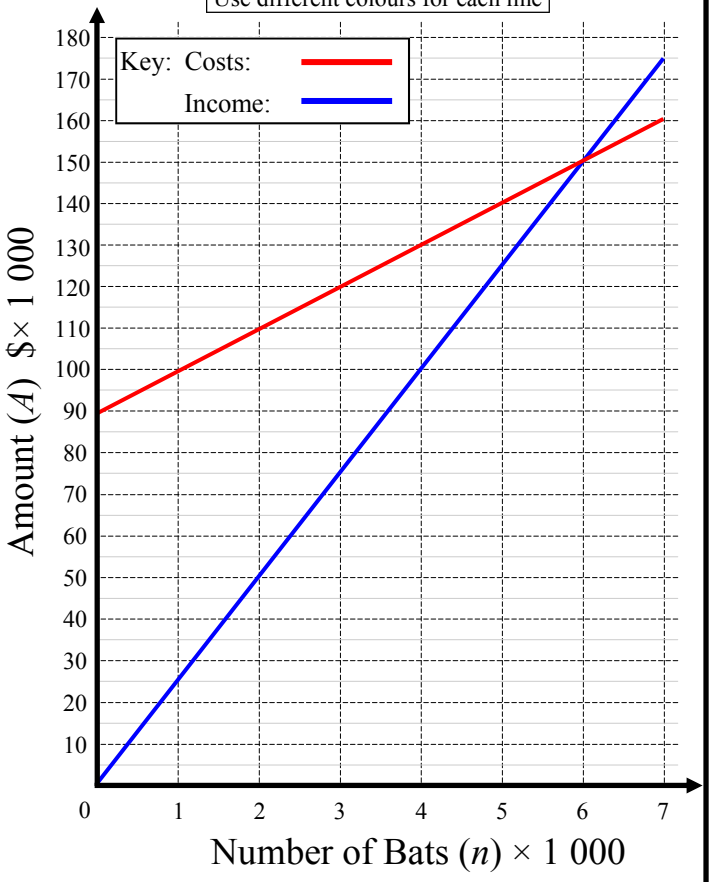
9 *Operation Costs:* $A = 10n + 90\,000$

n	1 000	2 000	3 000	4 000	5 000
A	100 000	110 000	120 000	130 000	140 000

10 *Income Sales:* $A = 25n$

n	1 000	2 000	3 000	4 000	5 000
A	25 000	50 000	75 000	100 000	125 000

Use different colours for each line



11 How many bats have to be sold to break even? 6 000

12 How much does it cost to make 2 500 bats? $115 000

13 What was the income on selling 7 000 bats? $175 000

14 What was the profit on selling 7 000 bats? $15 000

"Mite-e-Willow" sold 38 000 bats for the year, calculate:

15 The cost of production

$A = 10n + 90\,000$

$= 10 \times$ [38 000] $+ 90\,000$

$A =$ $470 000

16 The sales income

$A = 25n$

$= 25 \times 38\,000$

$A =$ $950 000

17 The profit. Profit = 950 000 - 470 000 = $480 000

Straight Lines - All Quadrants

This sheet deals with plotting straight lines with points being plotted in all quadrants. The most difficult aspect of this sheet is with the use of negative numbers. You have to remember that when you multiply numbers with a different sign that the answer is negative, or when the signs are both negative then the answer would be positive.

Example

$y = -2x + 3$

x	-4	-2	0	2	4
y	11	7	3	-1	-5

$-2 \times 4 + 3 = -8 + 3 = -5$

$-2 \times 2 + 3 = -4 + 3 = -1$

$-2 \times 0 + 3 = 0 + 3 = 3$

$-2 \times -2 + 3 = 4 + 3 = 7$

$-2 \times -4 + 3 = 8 + 3 = 11$

It is very easy to make a mistake with negative number operations. But remember that the y-values in the Table of Values increase or decrease in a pattern.

$y = -2x + 3$

x	-4	-2	0	2	4
y	11	7	3	-1	-5

-4 -4 -4 -4

The y-values decrease by 4, so if a point wasn't 4 less than the previous number, you know to check for an error.

IMPORTANT - It may be that you use the pattern to complete the table after you have used substitution for two values. If you do this the check system won't work.

Then plot the points and draw a line through them. Remember arrow heads and to label the line. Label the line in pencil so that you can rub it out later if another line gets in the way.

Important features of lines are:

Slope (or gradient) - is the line going up to the left or up to the right? Is the line more or less steep than the other lines?

y-intercept - where is the line cutting the y-axis, is this point visible in the line equation?

Straight Lines - All Quadrants

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Complete the table of values then plot the points. Draw the line with arrow heads and the equation on the line. With values in the table that can't be plotted, construct the line with the points that you can plot.

1 $y = -2x$

x	-4	-2	0	2	4

13 What do all the lines in the top grid have in common? All go up to the right. (or down to left)

14 What do all the lines in the lower grid have in common? All go up to the left. (or down to right)

15 Complete: A negative number in front of the x means that the line 'goes up' to the left.

16 Complete: A positive number in front of the x means that the line 'goes up' to the right.

17 Some lines are more steep than others. Which is more steep … $y = 4x$ or $y = 3x$? $y = 4x$

Finding the Equation of a Line

Imagine being given a table of values and you have to find the equation of the line. The process changes from a substitution process to an extraction process. In other words, the information is removed from the table.

Two values are required to form a straight line equation. The coefficient of the x is required (called the gradient) and the constant (number by itself) is also required, called the y-intercept. So two numbers needed and they can be either positive or negative. The process has examples on the worksheet but a step by step process is shown below.

Equation of a line is in the form:

Gradient y-intercept

$y = \square\, x + \square$

Example

STEP 1 A typical table of values. It is completed but has no equation.

x	0	1	2	3	4
y	5	7	9	11	13

STEP 2 Find the value of y, when $x = 0$.

x	0	1	2	3	4
y	5	7	9	11	13

At $x = 0$
$y =$ 5

STEP 3 Now find the co-efficient, the value written in front of the x. How much do the values increase by?

x	0	1	2	3	4
y	5	7	9	11	13

+2 +2 +2 +2

Gradient: +2

STEP 4 Write the equation.

$y =$ 2 x + 5

Column 1 asks you to find the value of y at $x = 0$, (called the y-intercept) and the x co-efficient called the gradient. Column 2 then has the extra step of finding the line equation itself.

Column 3 features a graph of the line rather than a table. Extract the co-ordinates of the points from the graph and write them in the table. The point furthest to the left (smallest x-value) should be the first point entered into the table, then work to the right. Once the points are in the table …. same process as before.

Finding the Equation of a Line

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the y-value at $x = 0$, then find the Gradient amount between y values.

Example

x	0	1	2	3	4
y	5	7	9	11	13

+2 +2 +2 +2

At $x = 0$ $y =$ +5 Gradient: +2

1

x	0	1	2	3	4
y	-2	1	4	7	10

At $x = 0$ $y =$ ____ Gradient: ____

2

x	0	1	2	3	4
y	0	5	10	15	20

At $x = 0$ $y =$ ____ Gradient: ____

3

x	0	1	2	3	4
y	-9	-10	-11	-12	-13

At $x = 0$ $y =$ ____ Gradient: ____

4

x	-2	-1	0	1	2
y	5	6	7	8	9

At $x = 0$ $y =$ ____ Gradient: ____

5

x	-2	-1	0	1	2
y	-2	-1	0	1	2

At $x = 0$ $y =$ ____ Gradient: ____

Now find the equations of the lines given the table of values.

Example

x	0	1	2	3	4
y	-1	-3	-5	-7	-9

-2 -2 -2 -2

At $x = 0$ $y =$ -1 Gradient: -2

The y-value goes at the back, including the sign.

Gradient goes in front of the x including the sign.

Equation: $y =$ -2 x − 1

Answer these using your Column 1 answers.

6 Equation: $y =$ ____ x +/- ____

For Q.6 Use Gradient and y-value from Q.1

7 Equation: $y =$ ____ x

For Q.7 Use Gradient and y-value from Q.2

8 Equation: $y =$ ____ x +/- ____

For Q.8 Use Gradient and y-value from Q.3

9 Equation: $y =$

For Q.9 Use Gradient and y-value from Q.4

10 Equation: $y =$

For Q.10 Use Gradient and y-value from Q.5

11

x	-3	-2	-1	0	1
y	32	22	12	2	-8

At $x = 0$ $y =$ ____ Gradient: ____

Equation: $y =$

12

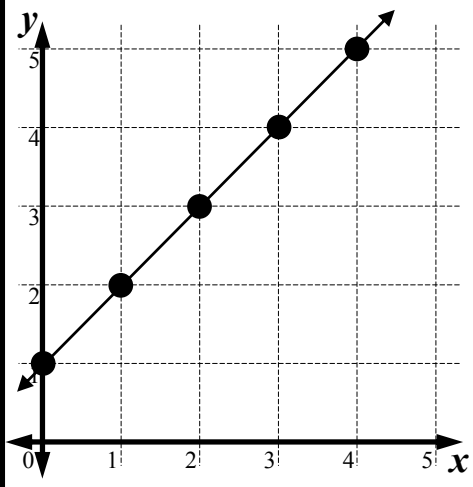
x	0	1	2	3	4
y	8	10	12	14	16

At $x = 0$ $y =$ ____ Gradient: ____

Equation: $y =$

Change the points on the graph to a table then find the line equation by the same method.

13

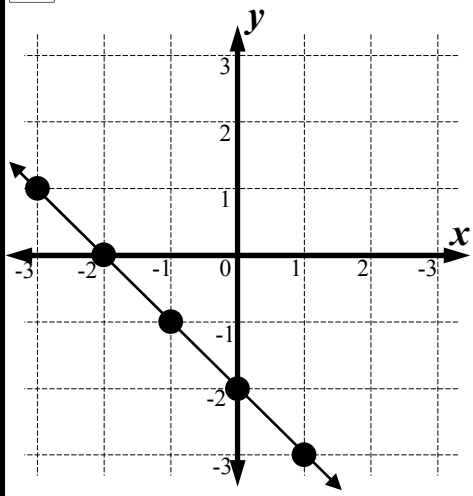


x						
y						

At $x = 0$ $y =$ ____ Gradient: ____

Equation: $y =$

14



x

At $x = 0$ $y =$ ____ Gradient: ____

Equation: $y =$

Finding the Equation of a Line

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the y-value at $x = 0$, then find the Gradient amount between y values.

Example

x	0	1	2	3	4
y	5	7	9	11	13

+2 +2 +2 +2

At $x = 0$ $y =$ +5 Gradient: +2

1

x	0	1	2	3	4
y	-2	1	4	7	10

+3 +3 +3 +3

At $x = 0$ $y =$ -2 Gradient: +3

2

x	0	1	2	3	4
y	0	5	10	15	20

+5 +5 +5 +5

At $x = 0$ $y =$ 0 Gradient: +5

3

x	0	1	2	3	4
y	-9	-10	-11	-12	-13

-1 -1 -1 -1

At $x = 0$ $y =$ -9 Gradient: -1

4

x	-2	-1	0	1	2
y	5	6	7	8	9

+1 +1 +1 +1

At $x = 0$ $y =$ 7 Gradient: +1

5

x	-2	-1	0	1	2
y	-2	-1	0	1	2

+1 +1 +1 +1

At $x = 0$ $y =$ 0 Gradient: +1

Now find the equations of the lines given the table of values.

Example

x	0	1	2	3	4
y	-1	-3	-5	-7	-9

-2 -2 -2 -2

At $x = 0$ $y =$ -1 Gradient: -2

The y-value goes at the back, including the sign.

Gradient goes in front of the x including the sign.

Equation: $y =$ -2 x − 1

Answer these using your Column 1 answers.

6 Equation: $y =$ 3 x − 2

For Q.6 Use Gradient and y-value from Q.1

7 Equation: $y =$ 5 x

For Q.7 Use Gradient and y-value from Q.2

8 Equation: $y =$ - x +/− 9

For Q.8 Use Gradient and y-value from Q.3

9 Equation: $y = x + 7$

For Q.9 Use Gradient and y-value from Q.4

10 Equation: $y = x$

For Q.10 Use Gradient and y-value from Q.5

11

x	-3	-2	-1	0	1
y	32	22	12	2	-8

-10 -10 -10 -10

At $x = 0$ $y =$ 2 Gradient: -10

Equation: $y = -10x + 2$

12

x	0	1	2	3	4
y	8	10	12	14	16

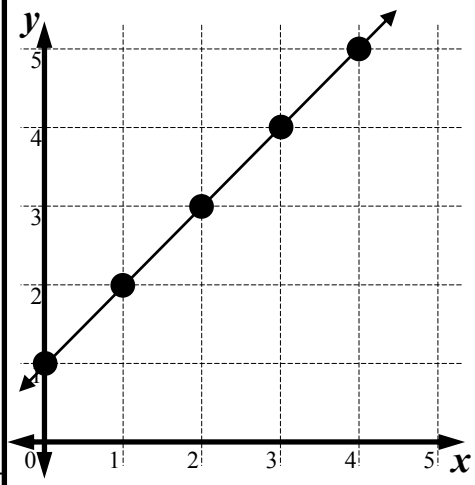
+2 +2 +2 +2

At $x = 0$ $y =$ 8 Gradient: +2

Equation: $y = 2x + 8$

Change the points on the graph to a table then find the line equation by the same method.

13



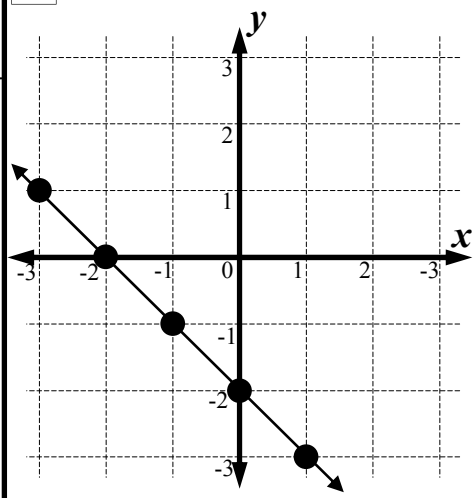
x	0	1	2	3	4
y	1	2	3	4	5

+1 +1 +1 +1

At $x = 0$ $y =$ 1 Gradient: +1

Equation: $y = x + 1$

14



x	-3	-2	-1	0	1
y	1	0	-1	-2	-3

-1 -1 -1 -1

At $x = 0$ $y =$ -2 Gradient: -1

Equation: $y = -x - 2$

Further Finding the Equation of a Line

This sheet builds on the previous sheet and shouldn't be attempted before the other sheet has been completed.

It may be that the table supplied in a question doesn't have '$x = 0$' featured in the top row of the table. If this is the case then the solution is to extend the table until '0' is featured. An example is below, which is the method used to solve Column 1.

Example

STEP 1 A typical table of values. It is completed but has no equation.

x	2	3	4	5	6
y	5	7	9	11	13

STEP 2 Extend the table to assist you to find the value of y, when $x = 0$.

0	1	x	2	3	4	5	6
		y	5	7	9	11	13

STEP 3 Now find the co-efficient, the value written in front of the x. How much do the values increase by?

0	1	x	2	3	4	5	6
		y	5	7	9	11	13

+2 +2 +2 +2

Gradient: +2

STEP 4 Now take the y-values back by subtracting by the gradient. This gives you y when $x = 0$.

0	1	x	2	3	4	5	6
1	3	y	5	7	9	11	13

-2 -2

At $x = 0$ $y =$ 1

STEP 5 Write the equation.

$y =$ 2 x + 1

Column 2 deals with questions that have x-values increasing in steps larger than 1. An example is below, which is the method used to solve Column 2.

Example

STEP 1 A typical table of values. It is completed but has no equation.

x	0	2	4	6	8
y	-1	9	19	29	39

STEP 2 Note that the x-values are going up in steps of 2. So calculate the gradient and divide by 2.

+2 +2 +2 +2

x	0	2	4	6	8
y	-1	9	19	29	39

STEP 3 To find the gradient, how much do the values increase by? Then divide by 2, due to Step 2.

x	0	2	4	6	8
y	-1	9	19	29	39

+10 +10 +10 +10

Gradient: [+10] ÷ [2]

Gradient: [+5]

STEP 4 Read off the y-value at $x = 0$.

x	0	2	4	6	8
y	-1	9	19	29	39

At $x = 0$

$y =$ [-1]

STEP 5 Write the equation.

$y =$ [5] x - [1]

Column 3 is a combination of both skills, so you have to extend the table of values and then also allow for the x-values being in steps and affecting the gradient.

Further Finding the Equation of a Line

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Extend the tables below so that $x = 0$ is shown. Then solve for the line equation.

Example

x	3	4	5	6	7
y	9	11	13	15	17

Rewrite taking x back to zero.

0	1	2	x	3	4	5	6	7
3	5	7	y	9	11	13	15	17

-2 -2 -2 +2 +2 +2 +2

At $x = 0$ Gradient: +2

$y =$ +3

Equation: $y = 2x + 3$

1

		x	2	3	4	5	6
		y	2	5	8	11	14

At $x = 0$ Gradient:

$y =$

Equation:

2

				x	4	5	6	7
				y	11	13	15	17

At $x = 0$ Gradient:

$y =$

Equation:

3

x	-6	-5	-4	-3			
y	-9	-6	-3	0			

At $x = 0$ Gradient:

$y =$

Equation:

These tables have x-values that increase in larger steps. So divide to find the gradient.

4

x	-4	-2	0	2	4
y	-19	-11	-3	5	13

At $x = 0$ Gradient: ÷

$y =$ Gradient:

Equation:

5

x	0	5	10	15	20

12

			x	15	20	25	30	35
			y	20	30	40	50	60

At $x = 0$ Gradient: ÷

$y =$ Gradient:

Equation:

Further Finding the Equation of a Line

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Extend the tables below so that $x = 0$ is shown. Then solve for the line equation.

Example

x	3	4	5	6	7
y	9	11	13	15	17

Rewrite taking x back to zero.

0	1	2	x	3	4	5	6	7
3	5	7	y	9	11	13	15	17

-2 -2 -2 +2 +2 +2 +2

At $x = 0$ Gradient: +2

$y =$ +3

Equation: $y = 2x + 3$

1

0	1	x	2	3	4	5	6
-4	-1	y	2	5	8	11	14

-3 -3 +3 +3 +3 +3

At $x = 0$ Gradient: +3

$y =$ -4

Equation: $y = 3x - 4$

2

0	1	2	3	x	4	5	6	7
3	5	7	9	y	11	13	15	17

-2 -2 -2 -2 +2 +2 +2

At $x = 0$ Gradient: +2

$y =$ 3

Equation: $y = 2x + 3$

3

x	-6	-5	-4	-3	-2	-1	0
y	-9	-6	-3	0	3	6	9

+3 +3 +3 +3 +3 +3

At $x = 0$ Gradient: +3

$y =$ 9

Equation: $y = 3x + 9$

These tables have x-values that increase in larger steps. So divide to find the gradient.

4

x	-4	-2	0	2	4
y	-19	-11	-3	5	13

+8 +8 +8 +8

At $x = 0$ Gradient: 8 ÷ 2

$y =$ -3 Gradient: 4

Equation: $y = 4x - 3$

5

x	0	5	10	15	20
y	-3	22	47	72	97

+5 +5 +5 +5

At $x = 0$ Gradient: 5 ÷ 5

$y =$ -3 Gradient: 1

Equation: $y = x - 3$

6

x	-6	-3	0	3	6
y	8	-1	-10	-19	-28

-9 -9 -9 -9

At $x = 0$ Gradient: -9 ÷ 3

$y =$ -10 Gradient: -3

Equation: $y = -3x - 10$

7

x	0	2	4	6	8
y	-2	-14	-26	-38	-50

-12 -12 -12 -12

At $x = 0$ Gradient: -12 ÷ 2

$y =$ -2 Gradient: -6

Equation: $y = -6x - 2$

8

x	-40	-30	-20	-10	0
y	195	155	115	75	35

-40 -40 -40 -40

At $x = 0$ Gradient: -40 ÷ 10

$y =$ 35 Gradient: -4

Equation: $y = -4x + 35$

These are harder, they require the table to be extended and the x-value steps to be considered.

9

0	2	x	4	6	8	10	12
5	11	y	17	23	29	35	41

-6 -6 +6 +6 +6 +6

At $x = 0$ Gradient: 6 ÷ 2

$y =$ 5 Gradient: 3

Equation: $y = 3x + 5$

10

0	3	6	9	x	12	15	18	21
-20	-11	-2	7	y	16	25	34	43

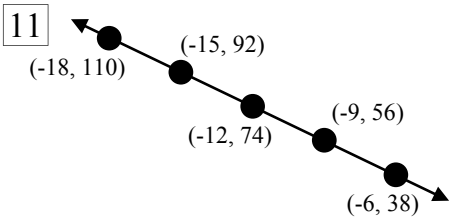
-9 -9 -9 -9 +9 +9 +9

At $x = 0$ Gradient: 9 ÷ 3

$y =$ -20 Gradient: 3

Equation: $y = 3x - 20$

11



x	-18	-15	-12	-9	-6	-3	0
y	110	92	74	56	38	20	2

-18 -18 -18 -18 -18 -18

At $x = 0$ Gradient: -18 ÷ 3

$y =$ 2 Gradient: -6

Equation: $y = -6x + 2$

12

0	5	10	x	15	20	25	30	35
-10	0	10	y	20	30	40	50	60

-10 -10 -10 +10 +10 +10 +10

At $x = 0$ Gradient: 10 ÷ 5

$y =$ -10 Gradient: 2

Equation: $y = 2x - 10$

Special Lines - Horizontal and Vertical Line Equations

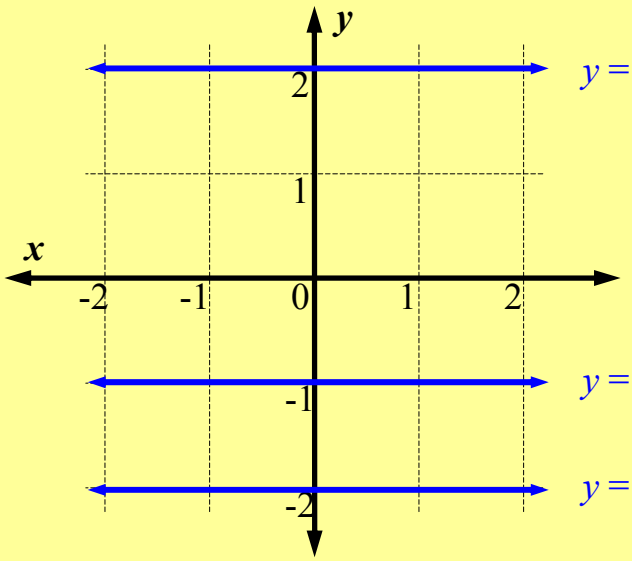
These lines are special because they are horizontal or vertical and only have one letter in them, instead of two. They are also unusual because they seem to be the opposite to what you think.

Special Lines are in the form:

$y = b$ where b is the number where the line cuts the y-axis

$x = a$ where a is the number where the line cuts the x-axis

Here are some examples, first $y = b$:



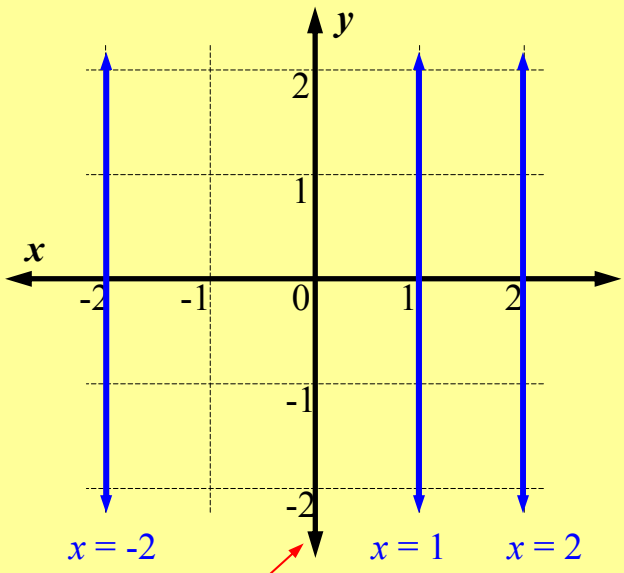
$y = 2$ (cuts the y-axis at 2)

$y = 0$ (cuts the y-axis at 0), so the equation for the x-axis is $y = 0$.

$y = -1$ (cuts the y-axis at -1)

$y = -2$ (cuts the y-axis at -2)

Here are some examples for $x = a$:



$x = -2$ $x = 1$ $x = 2$

$x = 0$ (cuts the x-axis at 0), so the equation for the y-axis is $x = 0$.

So these lines are simple to plot, the only problem is that they seem the opposite to what you would think.

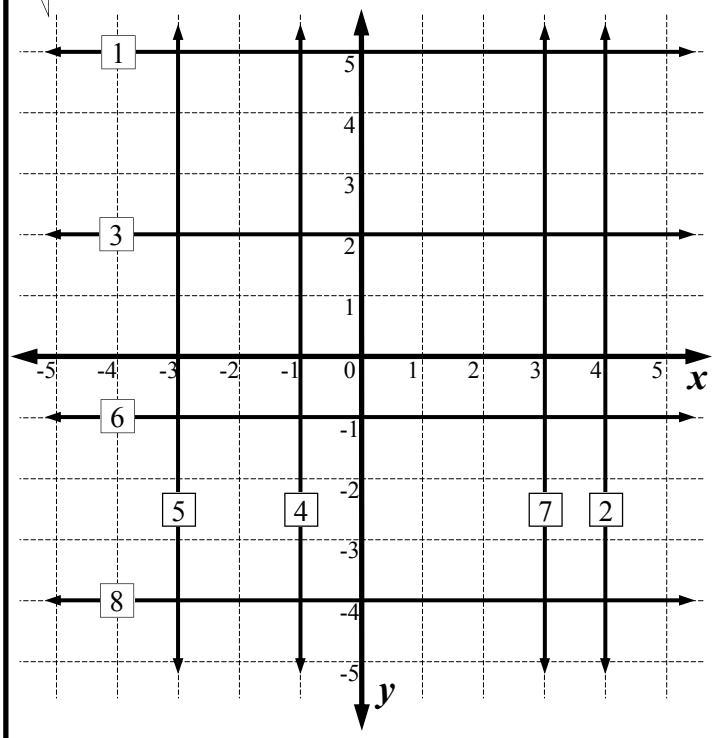
Lines parallel to the y-axis aren't in the format '$y =$' they are '$x =$'. Likewise for the lines parallel to the x-axis, being '$y =$'.

If you can remember this, these are the easiest lines to plot.

Special Lines - Horizontal and Vertical Line Equations

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Name the lines shown. Use the spaces below the number plane then label the lines on the plane also.



1 $y =$ ____ 2 $x =$ ____ 3 _____ 4 _____

5 _____ 6 _____ 7 _____ 8 _____

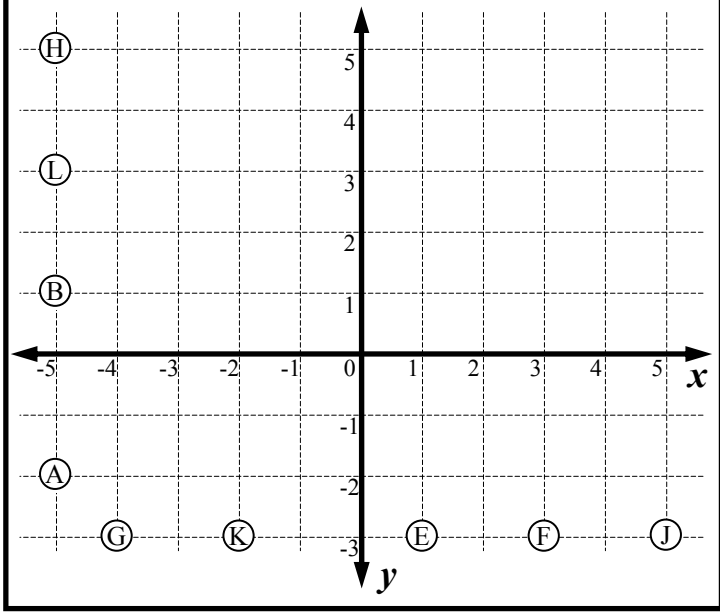
9 What is the equation for the y-axis? _____

10 What is the equation for the x-axis? _____

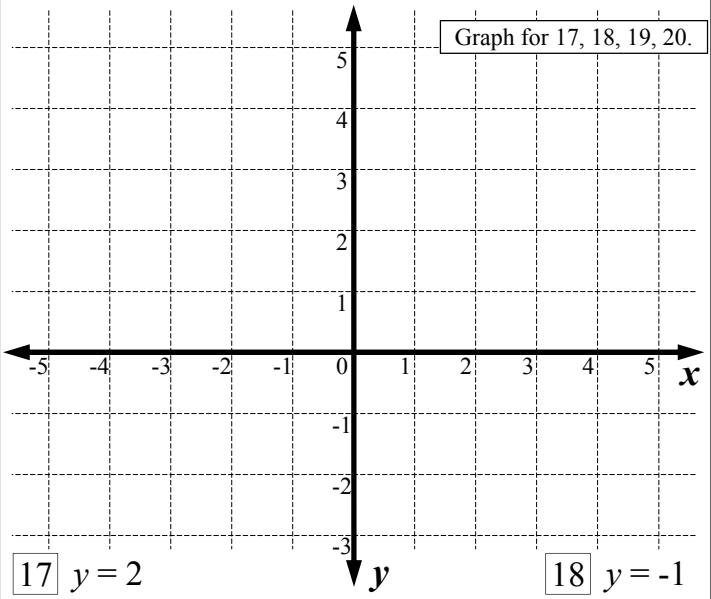
Draw these lines on the Cartesian plane, show arrow heads and labels. After you draw the line it will pass through a letter, write it in the box.

11 $y = -2$ ____ Letter 12 $x = 3$ ____ Letter 13 $x = -4$ ____ Letter

14 $y = 5$ ____ Letter 15 $x = 1$ ____ Letter 16 $y = 3$ ____ Letter



Draw the lines on the grid. Once drawn there will be five intersection points, give the coordinates for these points as well as the name of the two shapes formed.



17 $y = 2$ 18 $y = -1$

19 $y = x + 4$

x	-4	-3	-2	-1	0
y					

20 $x + y = 4$

x	-1	0	1	2	3
y

Linear Relationships - Find a Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don't colour it in too dark (using a texta for example) so that you can still read it.

Linear Relationships - Find a Word

DATA ANALYSIS

Census, Sampling and Questioning

Gathering information is done regularly. Businesses often wish to gather an opinion of their operation through the eyes of their customers. But asking everyone can be very costly or even impossible, so instead they question a smaller body of people whose responses are then considered to reflect the opinion of all the customers.

Some terms:

Population: means all people relevant to the survey
Sample: means a portion of the population being surveyed
Census: is a when the entire population is surveyed

Column 1 starts with questions asking you to identify when a type of survey is a census or a sample. If everyone connected is surveyed, then it is a census. If only some of the population are involved, it is a sample.

Questions can be open-ended, which means that the respondent can offer an opinion and lengthy response to a question. Closed-ended questions are either questions that are answered with a 'yes' or 'no' answer or are multiple choice. This allows results to be easily collected and analysed. The second part of column 1 gives you an open-ended question and asks you to suggest some closed-end questions.

Column 2 introduces Stratified sampling. This means that if groups of people are interviewed you can suggest how many people from each group should be surveyed. This is essentially the same as 'Relative Frequency' which you may have encountered already in the 'Probability' chapter.

Imagine 2 000 people are to be interviewed by an insurance company, represented in proportion to the size of the age groups below. How many from each group should be interviewed?

STEP 1 Find the total for the frequency column.

Client Age	*Frequency*	*No. of Clients Interviewed*
0 - 20	38 900	
20 - 40	145 618	
40 - 60	196 752	
60 - 80	76 513	
	457 783	

STEP 2 Create a fraction and multiply by the sample amount.

Client Age	*Frequency*	*No. of Clients Interviewed*
0 - 20	38 900	$\frac{38\,900}{457\,783} \times 2\,000 = 170$
20 - 40	145 618	$\frac{145\,638}{457\,783} \times 2\,000 = 636$
40 - 60	196 752	$\frac{196\,712}{457\,783} \times 2\,000 = 900$
60 - 80	76 513	$\frac{76\,533}{457\,783} \times 2\,000 = 334$
	457 783	Note that due to rounding the total of the above column may not be 2000.

Census, Sampling and Questioning

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Suggest whether the following are examples of a census or sample. Explain why.

1 The School Representative members survey every year 7 student about the school uniform policy.

2 Students arriving on Bus 3 are surveyed for their opinion on school bus services.

3 All ticket buyers to a "Budget Tuesday" movie screening are surveyed about ticket prices.

4 All school staff, students and parents are asked about the content of a new canteen menu.

Analysing open-ended question responses is difficult. Suggest "Yes" or "No" questions to make analysing the response data easier.

Example

Open-ended Question: What do you think of your school?

Alternatives: Do you like school?
Would you make changes to your school?
Do you prefer another school?

5 What is your opinion of fast food?

-
-

6 Where did you go on your last holiday?

-
-
-

7 How are young driver fatalities best avoided?

-
-

50 people are to be interviewed from Year 8 through to Year 11. How many people from each year should be interviewed using a stratified sampling approach?

8

Year	*No. of Students*	*No. of Students Interviewed*
8	108	$\frac{108}{\square} \times 50 = \square$
9	125	
10	140	
11	92	

A survey was completed by a radio station. If a 200 song marathon is to be played, suggest the number of songs from each music type to be played, according to the votes received.

9

Genre	*Votes*	*200 Song Marathon Content*
Rock	480	
Metal	238	
Rap	109	
Dance	137	
R & B	86	
Hip Hop	95	
Techno	55	

Sampling must be adequate to reflect the population, if the population is n, then sample size should be $\sqrt{n}$ at the least. Find the minimum sample size for these.

10 A school of 220 students

11 A town of 17 000 residents

12 A plane carrying 350 passengers

13 A magazine with 55 000 readers

Census, Sampling and Questioning

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Suggest whether the following are examples of a census or sample. Explain why.

1 The School Representative members survey every year 7 student about the school uniform policy. It is a sample, as other years weren't represented in a matter that affects them.

2 Students arriving on Bus 3 are surveyed for their opinion on school bus services.
Sample, as other bus travelers aren't included.

3 All ticket buyers to a "Budget Tuesday" movie screening are surveyed about ticket prices.
Sample. Only covers ticket buyers on one night and response will be biased.

4 All school staff, students and parents are asked about the content of a new canteen menu.
Census. All affected people are included in the process.

Analysing open-ended question responses is difficult. Suggest "Yes" or "No" questions to make analysing the response data easier.

Example

Open-ended Question: What do you think of your school?

Alternatives: Do you like school?
Would you make changes to your school?
Do you prefer another school?

5 What is your opinion of fast food?

- Is fast food a problem for a healthy society?
- Do you eat fast food too often?

6 Where did you go on your last holiday?

- Did you travel overseas on your last holiday?
- Did you travel domestically?
- Did you travel by plane?

7 How are young driver fatalities best avoided?

- Would introducing a curfew improve safety?
- Would increasing starting age improve safety?

50 people are to be interviewed from Year 8 through to Year 11. How many people from each year should be interviewed using a stratified sampling approach?

8

Year	*No. of Students*	*No. of Students Interviewed*
8	108	$\frac{108}{465} \times 50 = 12$
9	125	$\frac{125}{465} \times 50 = 13$
10	140	$\frac{140}{465} \times 50 = 15$
11	92	$\frac{92}{465} \times 50 = 10$
	$\Sigma = 465$	

A survey was completed by a radio station. If a 200 song marathon is to be played, suggest the number of songs from each music type to be played, according to the votes received.

9

Genre	*Votes*	*200 Song Marathon Content*
Rock	480	$\frac{480}{1\,200} \times 200 = 80$
Metal	238	$\frac{238}{1\,200} \times 200 = 40$
Rap	109	$\frac{109}{1\,200} \times 200 = 18$
Dance	137	$\frac{137}{1\,200} \times 200 = 23$
R & B	86	$\frac{86}{1\,200} \times 200 = 14$

Data Analysis - Range and Mode

The range of a data set is found by subtracting the smallest score from the largest score. So look through the data for the largest score, circle it if you like, then find the smallest score.

Example

Data: 15 , 33 , 21 , 18 , 11 , 15 .

Data: 15 , (33) , 21 , 18 , (11) , 15 .

Find the largest and the smallest scores. Circle them if you like.

Range = 33 - 11 = 22

Subtract them for the range.

Negative numbers can also occur in data sets, the same method is used but when you subtract then the two minus signs become a plus sign.

Example - Negative numbers

Data: -8 , 11 , -3 , 12 , -5 , 7.

Data: (-8) , 11 , -3 , (12) , -5 , 7.

Find the largest and the smallest scores. If circling them helps you, do it!

Range = 12 - -8 = 20

12 - - 8 becomes 12 + 8 which = 20.

Data can also be assembled in Stem and Leaf Plots

Example

Tens	Units
0	5 5 7 8
1	0 0 3 3
2	8 8 9

The smallest score is '05' which is 5

The largest score is '29' which is 29.

Range = 29 - 5 = 24

Calculate the range by the same method.

The mode is the score that occurs the most frequently in a data set. Note that the word 'mode' is similar to the word 'most'. If the data contains no numbers that are repeated then there is 'No Mode', note that you write 'No Mode' not Mode = 0. If one number occurs the most then the mode is that number. If two numbers occur the most and with the same frequency then list both numbers (this is called Bi-modal). However if there are three modes (or more) then the data set is said to have "No Mode". So it is either No mode, a single score, or two scores.

15, 17, 16, 3.	17, 3, 17, 3, 9, 9, 6.	17, 15, 17, 15, 17.	17, 11, 17, 15, 11.
Mode = No Mode	Mode = No Mode	Mode = 17.	Mode = 11, 17.
No score occurs more than once	3, 9, 17 occur the most … No Mode	17 occurs more frequently than 15	Bi-Modal as 11 and 17 both occur twice

Data Analysis - The Mean

The Mean is the mathematical term for "Average". So when you find the mean you are finding the average. The mean is found by adding all the scores then dividing the total by the number of scores. As a formula it is written:

The short way of writing the mean is $\bar{x}$. *'x bar'*

$$\bar{x} = \frac{\Sigma x}{n}$$

Σx means the sum of x. So the total of all the scores in the data set.

n means the number of scores in the data set.

Example - Round to 1 decimal place.

Data: 14, 19, 35

$$\bar{x} = \frac{68}{3} = 22.7$$

68 ← 14 + 19 + 35 = 68

3 ← Three scores

22.7 ← Round to 1 d.p.

Calculator Steps:

6 8 ÷ 3 =

Calculator Screen:

22.6666666….

Column 1 also includes questions involving units. These questions have to be in the same units so look at the question and check what units the answer must have, then change all the data to those units first. Then add and divide for the mean.

Column 2 features Stem and Leaf plots, remember that the scores are found by joining the tens column with the units column, an example is below.

Example - Stem and Leaf Plots

Tens	Units
0	3 5
1	0 5 6
2	2 2

$$\bar{x} = \frac{93}{7} = 13.3$$

93 ← 3 + 5 + 10 + 15 + 16 + 22 + 22 = 93

7 ← Seven scores.

13.3 ← Round to 1 d.p.

Column 2 then features a table showing the prices for 6 items purchased from 5 different stores. Total the price list for each store. One shop will be cheaper than the others, but does that mean it is the cheapest store to purchase goods from? To answer this the mean price for each product is calculated, then the store price is given a star for being under the average price. If the price is higher than the average price it is given a cross.

Comparing mean prices can give a different idea of which store is the better store for lower prices. Which is better to use, the total shopping cost or the mean price? I feel a class discussion coming.

Liam performs market research for supermarkets. He prices 6 products at 5 stores to base his research, shown in the table. Total each column.

Product	Shop A	Shop B	Shop C	Shop D	Shop E
Window Cleaner	$3.25	$3.07	$4.15	$3.35	$3.56
Baked Beans	$1.82	$1.96	$2.19	$1.75	$1.99
Eggs	$5.35	$4.83	$6.10	$5.25	$5.85
Laundry Powder	$14.60	$15.45	$14.95	$14.90	$10.75
Pasta	$3.11	$3.20	$3.55	$2.96	$3.87
BBQ Chicken	$9.00	$10.55	$12.17	$11.60	$10.85
13 Total	$37.13	$39.06	$43.11	$39.81	$36.87

Key: ✖ Price Above Store Average ★ Price Equal to, or Below Store Average

Find the average price for a product from all the shops. Then colour a star if the shop price equals or is less than the average price for the product. Colour the cross if the price is above the average shop price.

14 Window Cleaner

Add all shop prices for Window Cleaner

$\bar{x} = \frac{17.38}{5} = \$3.48$

15 Baked Beans

$\bar{x} = \frac{9.71}{5} = \$1.94$

16 Eggs

$\bar{x} = \frac{27.38}{5} = \$5.48$

17 Laundry Powder

$\bar{x} = \frac{70.65}{5} = \$14.13$

18 Pasta

$\bar{x} = \frac{16.69}{5} = \$3.34$

19 Barbequed Chicken

$\bar{x} = \frac{54.17}{5} = \$10.83$

20 Discuss Shop E result in class.

Data Analysis - Further Mean

The previous sheet is about calculating the mean from a data set. This sheet works backwards asking you to calculate a score given the mean of a set of scores. Below is an example.

Example - Finding a score given the mean

Data: 46, 75, 19, 55, x. $\bar{x} = 47$.

$5 \times 47 = 235$ ← Multiply the mean by the number of scores (including x)

$x = 235 - 46 - 75 - 19 - 55$

or

$x = 235 - 195$

← Subtract the given scores from the total, calculated above. Use either method, the bottom method is better when there is a larger numbers of scores.

$x = 40$ ← The missing score is 40, calculate the mean to check.

Column 2 onwards uses algebra to solve the questions. Two step equations are formed and solved to find the missing scores.

Example

If Tom scored 9% more than Rebecca and Sienna scored double Rebecca's score, find their scores if together they have an average of 65%.

If Rebecca's score is called 'x' and Tom scored 9% more, then Tom's score is '$x + 9$'.
If Sienna scored double Rebecca's score then Sienna scored $2x$.

$x + (x + 9) + 2x = 3 \times 65$ ← Add the scores and it is equal to the number of scores × the mean.

$4x + 9 = 195$ ← Collect like terms and simplify

-9 -9

$4x = 186$ ← Remove the '+ 9' by subtracting 9 from each side of the equation.

÷4 ÷4

$x = 46.5$ ← Divide both sides of the equation by 4 to get x. Remember x is Rebecca's score.

Rebecca 46.5% Tom 55.5% Sienna 93%

Tom is 46.5 + 9

Sienna is 2 × 46.5

Data Analysis - Further Mean

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Given the mean, find the missing score 'x'.

Example

Data: 16, 24, 27, x. $\bar{x} = 21$

$4 \times 21 = 84$

The sum of the scores = 84.

$x = 84 - 16 - 24 - 27$

$x = 17$

1 Data: 45, 25, x. $\bar{x} = 26$

2 Data: 105, 38, 64, x. $\bar{x} = 83$

3 Data: 78, 93, 31, 24, 16, x. $\bar{x} = 44$

4 Jane has finished her 4th test in English. Her earlier test results are 62%, 75% and 68%. What result does she need in her 4th test for an average of 75%?

5 After two tests Ron has an average of 86%. What mark is required in his last test to end with 90% overall.

It's time to solve questions using algebra. Call the unknown score x.

Example

Three consecutive scores have a mean of 144, find the scores.

$x + (x + 1) + (x + 2) = 3 \times 144$

$3x + 3 = 432$

-3 -3

$3x = 429$

$\div 3$ $\div 3$

$x = 143$

Scores are 143, 144 and 145.

6 Four consecutive even scores have a mean of 87, find the scores. Use x, $x + 2$, $x + 4$ ...

7 Five consecutive odd scores have a mean of 41, find the scores. Use x, $x + 2$, $x + 4$ ...

8 John scored x in his test, Ben scored 10 marks more, while Jodi scored 14 more than John. If the average score is 67% find each person's score.

John ☐ Ben ☐ Jodi ☐

9 Joe is 10 years younger than Ian, while Jess is twice as old as Joe. Liam is 20 years older than Ian. If the average age of all the group is 50, calculate each person's age.

Joe ☐ Ian ☐

Jess ☐ Liam ☐

Data Analysis - Further Mean

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Given the mean, find the missing score 'x'.

Example

Data: 16, 24, 27, x. $\bar{x} = 21$

$4 \times 21 = 84$

The sum of the scores = 84.

$x = 84 - 16 - 24 - 27$

$x = 17$

1 Data: 45, 25, x. $\bar{x} = 26$

$3 \times 26 = 78$

$x = 78 - 45 - 25$

$x = 8$

2 Data: 105, 38, 64, x. $\bar{x} = 83$

$4 \times 83 = 332$

$x = 332 - 105 - 38 - 64$

$x = 125$

3 Data: 78, 93, 31, 24, 16, x. $\bar{x} = 44$

$6 \times 44 = 264$

$x = 264 - 78 - 93 - 31 - 24 - 16$

$x = 22$

4 Jane has finished her 4th test in English. Her earlier test results are 62%, 75% and 68%. What result does she need in her 4th test for an average of 75%?

$4 \times 75 = 300$

$x = 300 - 62 - 75 - 68$

$x = 95\%$

5 After two tests Ron has an average of 86%. What mark is required in his last test to end with 90% overall.

$3 \times 90 = 270$

$x = 270 - 86 - 86$

$x = 98\%$

It's time to solve questions using algebra. Call the unknown score x.

Example

Three consecutive scores have a mean of 144, find the scores.

$x + (x + 1) + (x + 2) = 3 \times 144$

$3x + 3 = 432$

(-3) (-3)

$3x = 429$

$(\div 3)$ $(\div 3)$

$x = 143$

Scores are 143, 144 and 145.

6 Four consecutive even scores have a mean of 87, find the scores. Use x, $x + 2$, $x + 4$ ...

$x + x + 2 + x + 4 + x + 6 = 348$

$4x + 12 = 348$

(-12) (-12)

$4x = 336$

$(\div 4)$ $(\div 4)$

$x = 84$

Numbers are 84, 86, 88 & 90.

7 Five consecutive odd scores have a mean of 41, find the scores. Use x, $x + 2$, $x + 4$ ...

$x + x + 2 + x + 4 + x + 6 + x + 8$

$= 5x + 20$

$5 \times 41 = 205$

$5x + 20 = 205$

(-20) (-20)

$5x = 185$

$(\div 5)$ $(\div 5)$

$x = 37$

Numbers are 37, 39, 41, 43 & 45.

8 John scored x in his test, Ben scored 10 marks more, while Jodi scored 14 more than John. If the average score is 67% find each person's score.

$x + x + 10 + x + 14 = 3 \times 67$

$3x + 24 = 201$

(-24) (-24)

$3x = 177$

$(\div 3)$ $(\div 3)$

$x = 59$

John 59% Ben 69% Jodi 73%

9 Joe is 10 years younger than Ian, while Jess is twice as old as Joe. Liam is 20 years older than Ian. If the average age of all the group is 50, calculate each person's age.

$x + x + 10 + 2x + x + 30$

$= 5x + 40$

$5x + 40 = 4 \times 50$

$5x + 40 = 200$

(-40) (-40)

$5x = 160$

$(\div 5)$ $(\div 5)$

$x = 32$

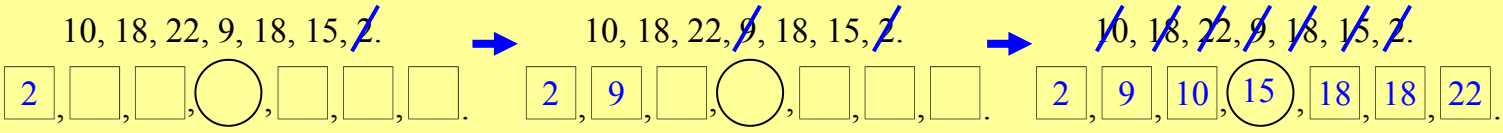
Joe	32	Ian	42
Jess	64	Liam	62

Data Analysis - The Median

The Median is the middle score in a data set. That is if there are an odd number of scores. Just imagine a see-saw pivoting on the median. Write the scores in order from lowest to highest and circle the middle number … that is the median.

Example - Finding the Median (Odd Number of Scores)

Data: 10, 18, 22, 9, 18, 15, 2.



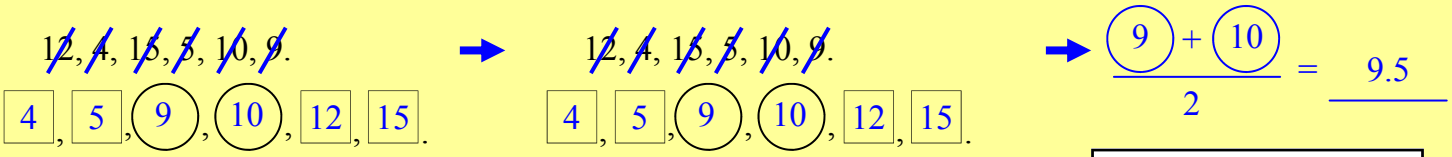
Find the smallest number in the data set and write it down first, then strike out the number to avoid mistakes.

Find the next smallest number and write it down.

Repeat the process until all the data is in ascending order. The middle score (circled) is the Median.

The above is for an odd number of scores. If there are an even number of scores then the Median is halfway between the two middle scores. So find the two middle scores and average them to find the Median.

Example - Finding the Median (Even Number of Scores)



Write the data in ascending order as with odd numbered data sets.

This time there are two middle numbers. Find the average, that is the median.

Calculator Steps:

9 + 1 0 = ÷ 2 =

Data can also be displayed in Ordered Stem and Leaf plots. These are easier to answer because there are already in ascending order. An example is below.

Example - Finding the Median in an Ordered Stem and Leaf Plot

Stem	Leaf
0	5 7 7
1	2 5 9
2	3 4 8

Cross out the first and last number.

Stem	Leaf
0	5 7 7
1	2 5 9
2	3 4 8

Now the 2nd and 2nd last numbers

Stem	Leaf
0	5 7 7
1	2 5 9
2	3 4 8

Repeat until left with one central number.

The median is 15.
(As the Stem is 1 and Leaf is 5).

If there are an even number of scores then you have to average the two middle scores, just like with a data set.

Data Analysis - The Median

The median is -6.

Data Analysis - Median Position

Crossing off the first and last score, then the 2nd and 2nd last score ….. and so on. This is the manual way to find the median. But the faster way, especially with larger amounts of data is to use the formula:

$$\text{Median Position} = \frac{n+1}{2}$$

Where n = number of scores in a data set. Note the answer can be a whole number or end with 0.5.

Example - Odd number of scores

Data: 1, 5, 7, 10, 14, 19, 23.

There are 7 scores

$$\text{Position} = \frac{7+1}{2} = 4^{th} \text{ score.}$$

So for the data above, the median is the 4th score.

Data: 1, 5, 7, 10, 14, 19, 23.

Median = 10

Example - Even number of scores

Data: 1, 5, 7, 10, 14, 19, 23, 37, 37, 40.

There are 10 scores

$$\text{Position} = \frac{10+1}{2} = 5.5^{th} \text{ score.}$$

So for the data above, the median is the 5.5th score. In other words it is between the 5th and 6th scores.

Data: 1, 5, 7, 10, 14, 19, 23, 37, 37, 40.

$$\text{Median} = \frac{14+19}{2} = 16.5$$

Example Stem and Leaf Plots

Tens	Units
0	1 7
1	0 0 5
2	1 8 8 8 9
3	3 3

There are 12 scores

$$\text{Position} = \frac{12+1}{2} = 6.5^{th} \text{ score.}$$

$$\text{Median} = \frac{21+28}{2} = 24.5$$

Data Analysis - Median Position

Data Analysis - Median Position

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the position of the median and the median itself, the data is in ascending order.

1 3, 4, 7, 12, 12, 15, 18, 25, 26, 30, 38, 38, 45, 48, 55, 63, 70.

Position = $\frac{17 + 1}{2}$ (Count the scores)

$= 9^{th}$ score.

The median is 26

2 63, 82, 83, 87, 88, 94, 96, 98, 99, 100, 104, 110, 115, 122, 122, 127, 129, 135, 142, 154, 179.

Position = $\frac{21 + 1}{2}$

$= 11^{th}$ score.

The median is 104

3 -19, -12, -5, -2, -2, 0, 0, 3, 4, 12, 13, 13, 18, 23, 24, 29, 29, 30, 31, 37, 39, 42, 46, 55, 57, 59, 94, 123, 128, 152.

Position = $\frac{30 + 1}{2}$

$= 15.5^{th}$ score

Median = $\frac{24 + 29}{2} = 26.5$

4 105, 127, 185, 209, 234, 276, 362, 368, 391, 412, 419, 438, 446, 502, 535, 572, 590, 590, 612, 616, 623, 655, 662, 720, 739, 750, 750, 773, 781, 782, 810, 834, 880, 881.

Position = $\frac{34 + 1}{2}$

$= 17.5^{th}$ score

Median = $\frac{590 + 590}{2}$

$= 590$

Arrange the data in ascending order then find both the position of the median and its value.

5 53, 26, 40, 45, 52, 31, 76, 42, 50, 64, 39, 43, 24, 33, 60, 59, 78, 25, 10, 18, 32, 40, 57, 62, 20, 25, 55, 19, 28.

10, 18, 19, 20, 24, 25, 25, 26, 28, 31, 32, 33, 39, 40, 40, 42, 43, 45, 50, 52, 53, 55, 57, 59, 60, 62, 64, 76, 78.

Position = $\frac{29 + 1}{2} = 15^{th}$ score

Median = 40.

Find the position and value for the median in the stem and leaf plots. For Q.8, 9 place the data in the raw and ordered S&L plots first.

Data Analysis - Mode, Median, Range and Mean.

These sheets are review sheets and so the method of finding the Mode, Mean, Range and Median won't be outlined below. But here is a reminder:

Mode - Is the score that occurs the most, there can be 1 mode, 2 modes (bi-modal) or No Mode. Write "No Mode" not "0" if there is no mode. If there are 3 or modes then the data is considered to have no mode.

Mean - Is the average of the scores. So add the scores then divide by the number of scores.

Range - Is the highest score minus the lowest score. If the lowest score is negative then when you subtract the two negative signs change to a plus '+'.

Median - Is the middle score when the scores are arranged in ascending order. If there are an odd number of scores it is the middle score. If there are an even number of scores then the median is the average of the two middle scores. So add them and divide by two.

The first worksheet is for Mean and Range and is designed to be completed with the second worksheet which is for Mode and Median.

The third worksheet is all four, Mode, Mean, Median and Range, being completed for each question.

Data Analysis - Mean and Range

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

The MEAN is the average of the scores. Add the scores and divide by the number of scores. Calculate the mean rounding to 1 d.p. if required.

Example

3, 2, 4, 1, 5. $\bar{x} = \frac{15}{5} = 3$ ← 3 + 2 + 4 + 1 + 5 = 15; 5 ← There are 5 scores

1 9, 3, 6, 1, 3. $\bar{x} = \frac{\square}{\square} = \_\_\_$

2 2, 6, 8, 3, 9, 7, 5. $\bar{x} = \frac{\square}{\square} = \_\_\_$

3 -5, 2, -4, 2. $\bar{x} = \frac{\square}{\square} = \_\_\_$

4 8, 2, 9, 4, 5, 3, 7, 6. $\bar{x} = \frac{\square}{\square} = \_\_\_$

5 895, 403, 89. $\frac{\square}{\square} = \_\_\_$

6 2, 3, 3, 8, 7, 8, 9, 10, 5. $\frac{\square}{\square} = \_\_\_$

7 1 056, 695. $\frac{\square}{\square} = \_\_\_$

8 2, 3, 3, 5, 8, 4, 7, 7, 1, 2. $\frac{\square}{\square} = \_\_\_$

9 56, 13, 11, 7. $\frac{\square}{\square} = \_\_\_$

10 306, 712, 36, 112, 377. $\frac{\square}{\square} = \_\_\_$

11 55, -81, 163. $\frac{\square}{\square} = \_\_\_$

12 1 166, 3 992, 2 001. $\frac{\square}{\square} = \_\_\_$

13 13, 30, 25, 19. $\frac{\square}{\square} = \_\_\_$

14 7, -16, 5, 24, -35, -48. $\frac{\square}{\square} = \_\_\_$

The MEAN is the average of the scores. Add the scores and divide by the number of scores. Calculate the mean rounding to 1 d.p. if required.

Example

3, 2, 4, 1, 5. $\bar{x} = \frac{15}{5} = 3$ ← 3 + 2 + 4 + 1 + 5 = 15; 5 ← There are 5 scores

1 9, 3, 6, 1, 3. $\bar{x} = \frac{22}{5} = 4.4$

2 2, 6, 8, 3, 9, 7, 5. $\bar{x} = \frac{40}{7} = 5.7$

3 -5, 2, -4, 2. $\bar{x} = \frac{-5}{4} = -1.3$ (1 d.p.)

4 8, 2, 9, 4, 5, 3, 7, 6. $\bar{x} = \frac{44}{8} = 5.5$

5 895, 403, 89. $\bar{x} = \frac{1\,387}{3} = 462.3$ (1 d.p.)

6 2, 3, 3, 8, 7, 8, 9, 10, 5. $\bar{x} = \frac{55}{9} = 6.1$ (1 d.p.)

7 1 056, 695. $\bar{x} = \frac{1\,751}{2} = 875.5$

8 2, 3, 3, 5, 8, 4, 7, 7, 1, 2. $\bar{x} = \frac{42}{10} = 4.2$

9 56, 13, 11, 7. $\bar{x} = \frac{87}{4} = 21.8$ (1 d.p.)

10 306, 712, 36, 112, 377. $\bar{x} = \frac{1\,543}{5} = 308.6$

11 55, -81, 163. $\bar{x} = \frac{137}{3} = 45.7$ (1 d.p.)

12 1 166, 3 992, 2 001. $\bar{x} = \frac{7\,159}{3} = 2\,386.3$ (1 d.p.)

13 13, 30, 25, 19. $\bar{x} = \frac{87}{4} = 21.8$ (1 d.p.)

14 7, -16, 5, 24, -35, -48. $\bar{x} = \frac{-63}{6} = -10.5$

15

Tens	Units
0	4 5
1	3 6 8 8
2	7 7 7

$\bar{x} = \frac{155}{9} = 17.2$ (1 d.p.)

16

Stem	Leaf
9	0 0 3 7
10	2 2
11	8 8 8 9

$\bar{x} = \frac{1\,047}{10} = 104.7$

The RANGE is the highest score minus the lowest score. Calculate the range.

Example

3, 2, 4, 1, 5 Range = 5 - 1 = 4 (Highest score is 5. Lowest score is 1.)

17 9, 3, 6, 1, 3. Range = 9 - 1 = 8

18 4, 5, 7, 7, 3, 2. Range = 7 - 2 = 5

19 9, 4, 1, 1, 0, 3. Range = 9 - 0 = 9

20 8, 3, -4, 7. Range = 8 - -4 = 12

21 -10, -5, -6, -8, -15. -5 - (-15) = 10

22 35 076, 887, 21 302. 35 076 - 887 = 34 189

23 45, 11, 9, 15, 5, 16. 45 - 5 = 40

24 167, 93, 205, 199. 205 - 93 = 112

25 -5, 2, 17, -4, 0, 10. 17 - (-5) = 22

26 8, 8, 8, 8, 8. 8 - 8 = 0

27

Stem	Leaf
5	0 1 3 3
6	2 4
7	5 5 6

76 - 50 = 26

28

Stem	Leaf
-0	7 9
0	3 5 7 8
1	1 1 3

13 - (-9) = 22

29 7.2, 2.7, 7.22, 2.72. 7.22 - 2.7 = 4.52

30 3, 0.3, 3.03, 0.03, 3.3. 3.3 - 0.03 = 3.27

31 $3\frac{1}{4}, 5\frac{2}{3}, 6\frac{5}{7}, 3\frac{2}{5}$. $6\frac{5}{7} - 3\frac{1}{4} = 3\frac{13}{28}$

32 $1\frac{1}{4}, 1\frac{3}{5}, 1\frac{1}{10}, 1\frac{3}{4}$. $1\frac{3}{4} - 1\frac{1}{10} = \frac{13}{20}$

Frequency Tables - The Mean

Larger amounts of data is often 'tabulated' (presented in a frequency table) rather than in data sets. Finding the mean from a frequency table is the focus of this sheet. The formula for the calculation is:

$$\bar{x} = \frac{\Sigma fx}{\Sigma f}$$

Where: $\bar{x}$ is the mean (or average) of the scores
Σfx is the sum of the fx column
Σf is the sum of the f column

Example - Finding the mean from a frequency table

STEP 1 Frequency table, find the mean.

Score (x)	*Frequency (f)*
0	6
2	2
4	5
6	8
8	15
10	7

STEP 2 Add an fx column and 'total' boxes at the base.

Score (x)	*Frequency (f)*	*fx*
0	6	
2	2	
4	5	
6	8	
8	15	
10	7	

STEP 3 Multiply the f and the x to get fx.

Score (x)		*Frequency (f)*		*fx*
0	×	6	=	0
2	×	2	=	4
4	×	5	=	20
6	×	8	=	48
8	×	15	=	120
10	×	7	=	70

STEP 4 Add the f column for Σf and the fx column for Σfx.

Score (x)	*Frequency (f)*	*fx*
0	6 +	0 +
2	2 +	4 +
4	5 +	20 +
6	8 +	48 +
8	15 +	120 +
10	7 =	70 =
	$\Sigma f = 43$	$\Sigma fx = 262$

STEP 5 Calculate the mean. (1 d.p.)

$$\bar{x} = \frac{\Sigma fx}{\Sigma f} = \frac{262}{43} = 6.1 \text{ (1 d.p.)}$$

Frequency Tables - The Mean

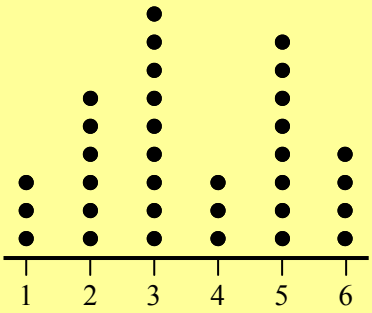
Graphs/Dot Plots - The Mean

This sheet builds on skills learned in the previous sheet, so it shouldn't be attempted unless the earlier sheet has been completed. This sheet shows a faster method of finding the mean when presented with data displayed in a dot plots, frequency histograms and cumulative frequency graphs.

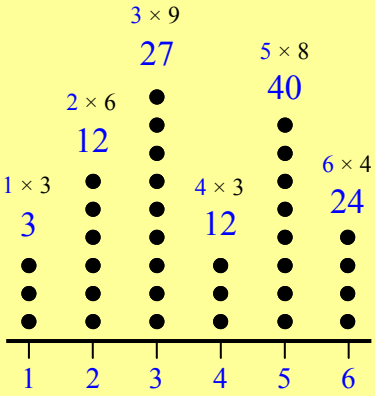
The value for *fx* is found by multiplying the score and the frequency directly on the graph.

Example - Dot Plots

STEP 1 Here is a dot plot, find the mean.



STEP 2 Calculate *fx* for each column by multiplying *f* & *x*.



STEP 3 Calculate Σ*fx* by adding all the column *fx* together.

3 + 12 + 27 + 12 + 40 + 24

Σ*fx* = 118

STEP 4 Calculate Σ*f* by counting all the dots.

3 + 6 + 9 + 3 + 8 + 4

Σ*f* = 33

STEP 5 Find $\bar{x}$ to 2 d.p.

$$\bar{x} = \frac{\Sigma fx}{\Sigma f}$$

$$\bar{x} = \frac{118}{33}$$

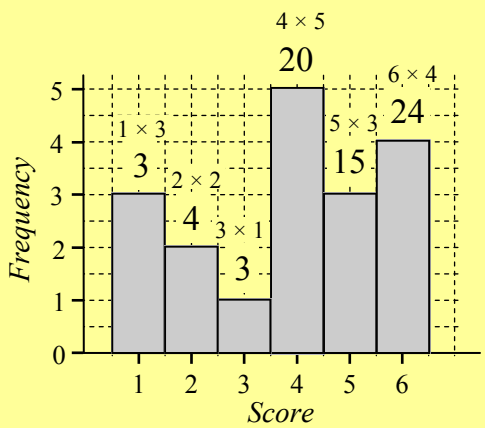
$\bar{x} = 3.58$ (2 d.p.)

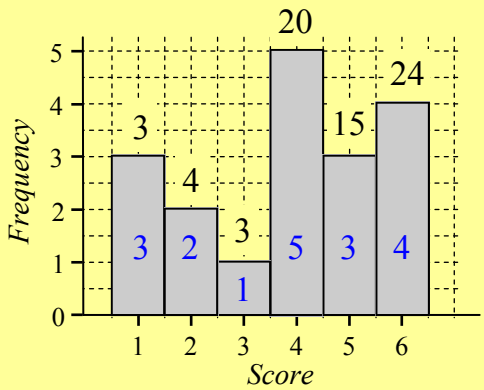
Example - Frequency Histograms

STEP 1 As with dot plots, multiply the frequency and score.

STEP 2 Write the frequency in each column, as they are easier to add.

STEP 3 Solve as with dot plots.





$$\bar{x} = \frac{\Sigma fx}{\Sigma f}$$

$$\bar{x} = \frac{69}{18}$$

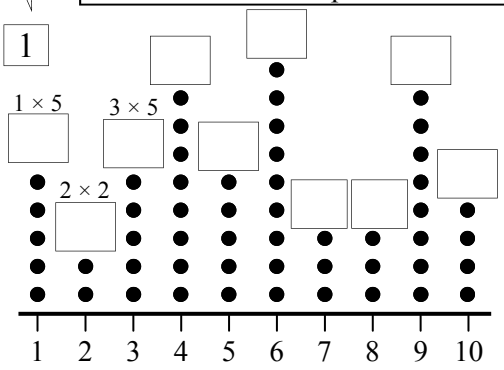
$\bar{x} = 3.83$ (2 d.p.)

Graphs/Dot Plots - The Mean

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Write the *fx* total at the top of each column of dots. Add the totals for Σfx. Count the dots for Σf. Now find the mean to 2 d.p. without a frequency table.

1



$\Sigma fx =$ ☐

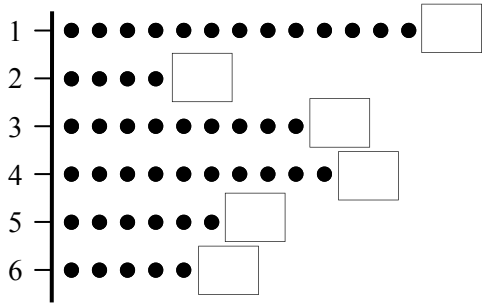
$\Sigma f =$ ☐

Count dots for Σf

$\bar{x} =$ ☐/☐

$\bar{x} =$ _____

2



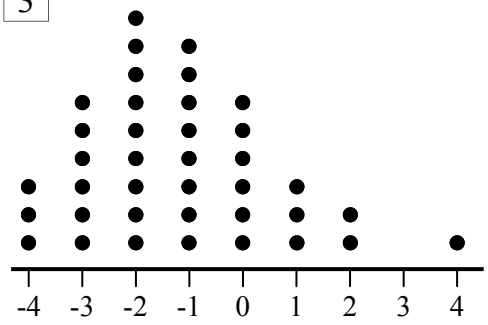
$\Sigma fx =$ ☐

$\Sigma f =$ ☐

$\bar{x} =$ ☐/☐

$\bar{x} =$ _____

3



$\Sigma fx =$ ☐

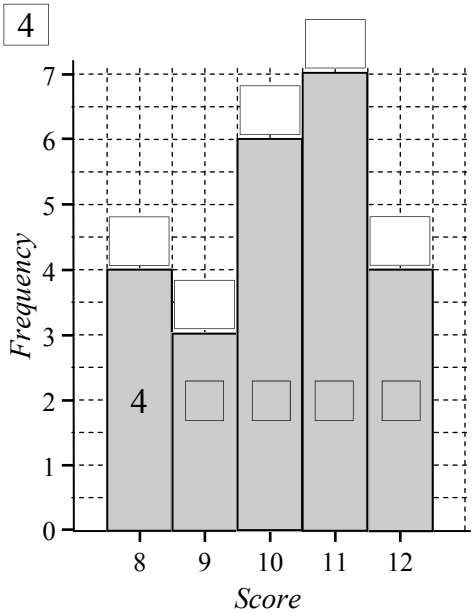
$\Sigma f =$ ☐

$\bar{x} =$ ☐/☐

$\bar{x} =$ _____

Use the same process but this time it is a frequency histogram. Mean to 1 d.p.

4



$\Sigma fx =$ ☐

$\Sigma f =$ ☐

$\bar{x} =$ ☐/☐

$\bar{x} =$ _____

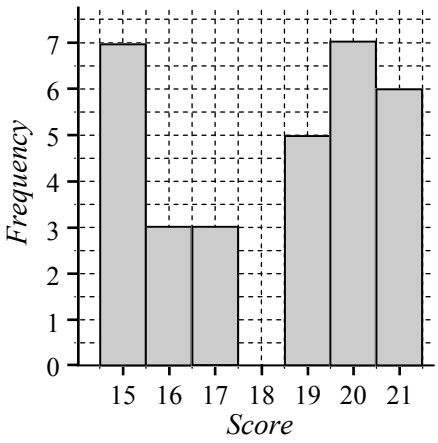
5

$\Sigma fx =$ ☐

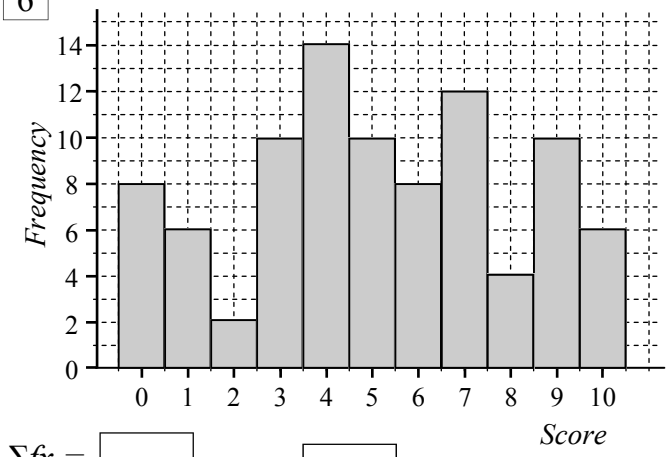
$\Sigma f =$ ☐

$\bar{x} =$ ☐/☐

$\bar{x} =$ _____



6



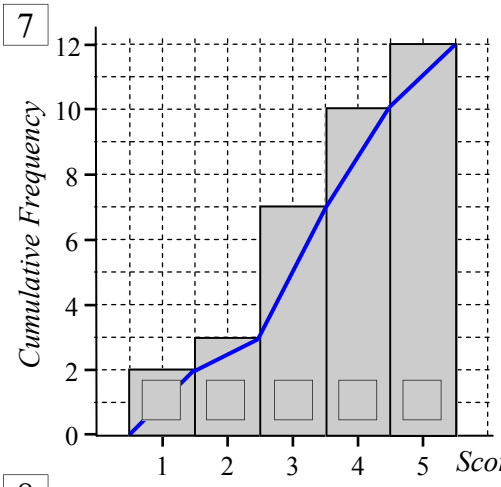
$\Sigma fx =$ ☐

$\Sigma f =$ ☐

$\bar{x} =$ ☐/☐ $=$ _____

These are cumulative frequency graphs. So calculate the frequency for each score **first**, then use the same method to find $\bar{x}$. (1 d.p.)

7



$\Sigma fx =$ ☐

$\Sigma f =$ ☐

$\bar{x} =$ ☐/☐

$\bar{x} =$ _____

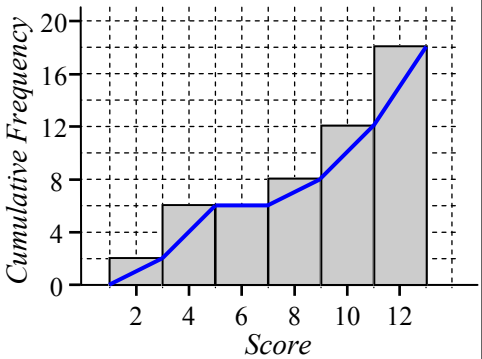
8

$\Sigma fx =$ ☐

$\Sigma f =$ ☐

$\bar{x} =$ ☐/☐

$\bar{x} =$ _____

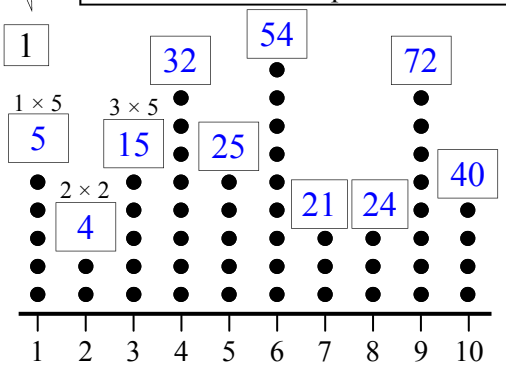


Graphs/Dot Plots - The Mean

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Write the *fx* total at the top of each column of dots. Add the totals for Σfx. Count the dots for Σf. Now find the mean to 2 d.p. without a frequency table.

1



$\Sigma fx =$ 292

$\Sigma f =$ 52

Count dots for Σf

$\bar{x} = \frac{292}{52}$

$\bar{x} = 5.62$ (2 d.p.)

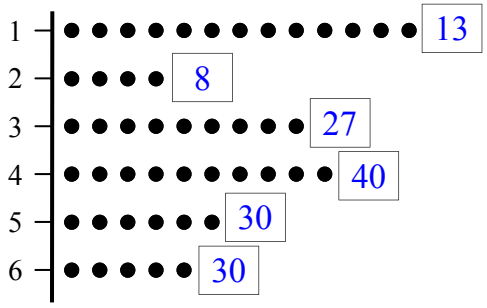
2

$\Sigma fx =$ 148

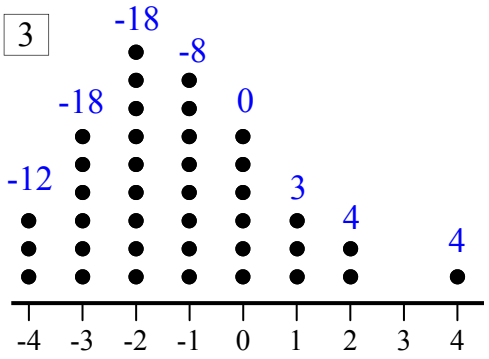
$\Sigma f =$ 47

$\bar{x} = \frac{148}{47}$

$\bar{x} = 3.15$ (2 d.p.)



3



$\Sigma fx =$ -45

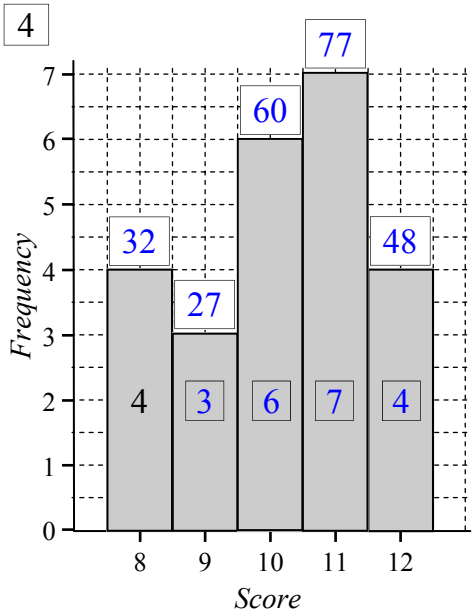
$\Sigma f =$ 38

$\bar{x} = \frac{-45}{38}$

$\bar{x} = -1.18$ (2 d.p.)

Use the same process but this time it is a frequency histogram. Mean to 1 d.p.

4



$\Sigma fx =$ 244

$\Sigma f =$ 24

$\bar{x} = \frac{244}{24}$

$\bar{x} = 10.17$ (2 d.p.)

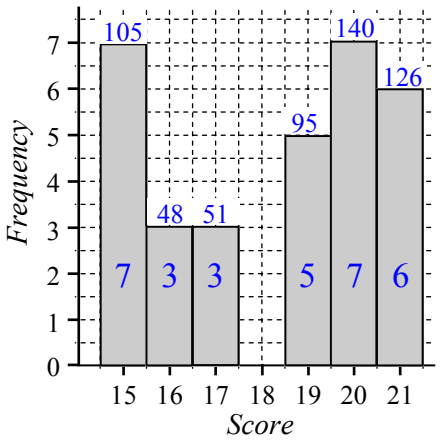
5

$\Sigma fx =$ 565

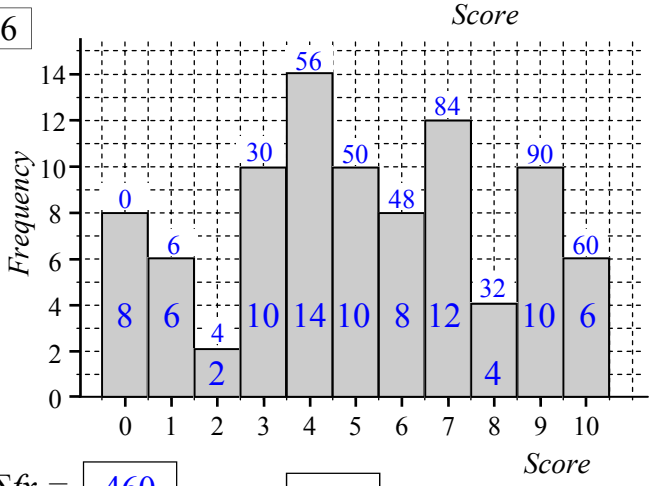
$\Sigma f =$ 31

$\bar{x} = \frac{565}{31}$

$\bar{x} = 18.23$ (2 d.p.)



6



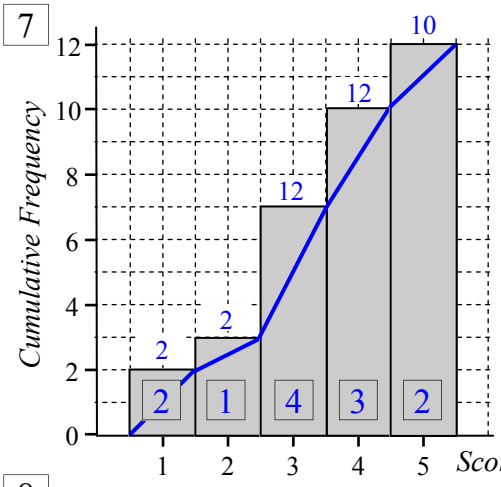
$\Sigma fx =$ 460

$\Sigma f =$ 90

$\bar{x} = \frac{460}{90} = 5.11$ (2 d.p.)

These are cumulative frequency graphs. So calculate the frequency for each score **first**, then use the same method to find $\bar{x}$. (1 d.p.)

7



$\Sigma fx =$ 38

$\Sigma f =$ 12

$\bar{x} = \frac{38}{12}$

$\bar{x} = 3.17$ (2 d.p.)

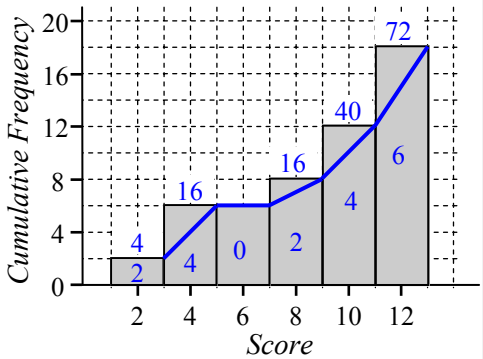
8

$\Sigma fx =$ 148

$\Sigma f =$ 18

$\bar{x} = \frac{148}{18}$

$\bar{x} = 8.22$ (2 d.p.)



Frequency Tables/Dot Plots - The Median

When data is arranged in ascending order the median is the middle, or average of the two middle scores. When data is displayed in a frequency table or dot plot, then the median is found in a different way.

Column 1 starts with two frequency tables, both of which contain a low number of scores. The median can be calculated by removing the data from the table, writing it in ascending order and solving like a data set. This is always an option if you forget the other skills outlined in this sheet.

A Cumulative Frequency (c.f.) column is added to the table, which allows you to find the median, steps are below.

Example - Finding the Median from a Frequency Table

STEP 1 Complete the *c.f.* column.

Score	*f*	*c.f.*
1	3	3
2	7	10
3	2	12
4	3	15
5	5	20

3 goes straight across

3 + 7 = 10

10 + 2 = 12

12 + 3 = 15

15 + 5 = 20

STEP 2 Sum the frequency column, it should match the last number in the *c.f.* column.

Score	*f*	*c.f.*
1	3	3
2	7	10
3	2	12
4	3	15
5	5	20
$\Sigma f =$	20	

check

STEP 3 Calculate the position of the median using:

$$\text{Position} = \frac{n + 1}{2}$$

$$= \frac{20 + 1}{2}$$

Position = 10.5^{th} score

STEP 4 Find the 10.5th score using the *c.f.* column. Find the 10th score, 11th score, then average them.

Score	*f*	*c.f.*
1	3	3
2	7	10
3	2	12
4	3	15
5	5	20
$\Sigma f =$	20	

1st, 2nd and 3rd scores are 1

4th - 10th scores are 2

11th & 12th scores are 3

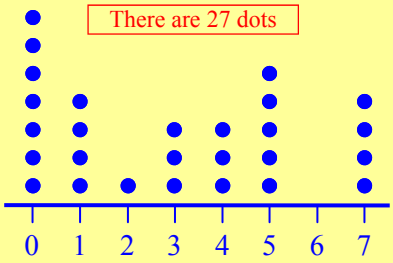
So the 10th score is 2
&
The 11th score is 3.

STEP 5 Calculate the median.

$$\text{Median} = \frac{2 + 3}{2} = 2.5$$

Example - Dot Plots, finding the Median.

STEP 1 Count the dots.

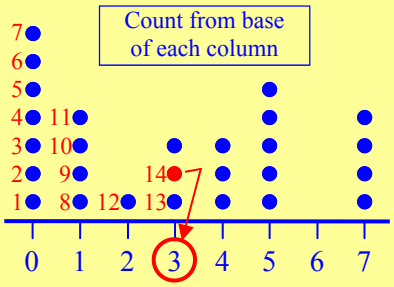


STEP 2 Position the median

$$\text{Position} = \frac{27 + 1}{2}$$

$$= 14^{th} \text{ score.}$$

STEP 3 Find the median



Median = 3

If the position of the median is between two dots then average the value of the two dots. If the dots are in the same score column, the value of the median is the same as both dots. If in different score columns then the median will be a halfway between the two scores.

Frequency Tables/Dot Plots - The Median

10

Position = $\frac{50 + 1}{2}$

= 25.5th score

Median = $\frac{24 + 25}{2}$

Count from base of eacn column

= 24.5

Frequency Tables - The Median (Graphical Solution)

The Median can be found from a Frequency Table using a Cumulative Frequency Histogram. The process is shown below.

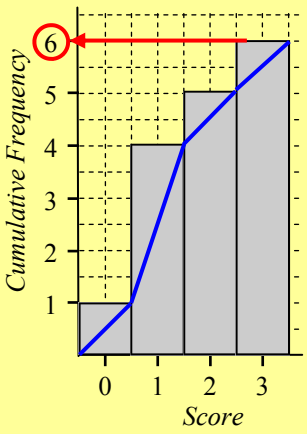
Example - Histogram Supplied

STEP 1 Read the height of the last column.

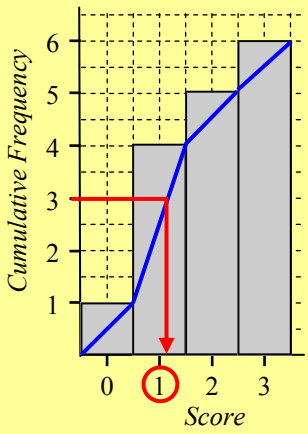
STEP 2 Calculate 50% of the column height

$0.5 \times 6 = 3$

STEP 3 Rule a line across to the ogive (from 3) and drop it down to the Score axis. Read off the median.



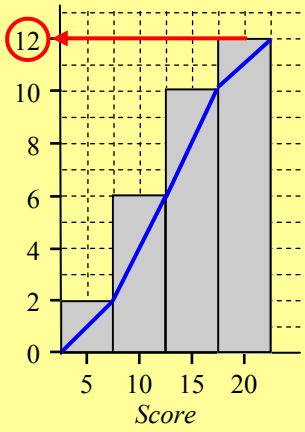
Column Height is 6



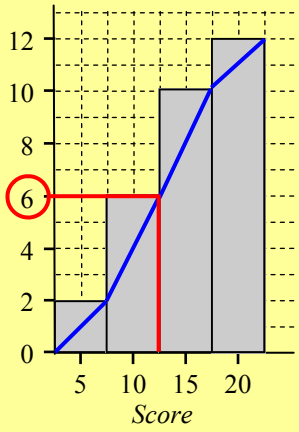
Median is 1

What happens if the 50% line hits the top of a block?

STEP 4 Below is another example. It shows the 50% line hitting the meeting point of two blocks. When this occurs the median is found by averaging the score of each of the blocks. Just like an even numbered data set.



Column Height is 12



50% line = 0.5 × 12 = 6

$$\text{Median} = \frac{10 + 15}{2} = 12.5$$

The other questions on the sheet are answered the same way as above, the difference being that you need to complete a cumulative frequency column first, then construct the Cumulative Frequency Histogram and Ogive yourself. The outline sheet is on the next page if you need a refresher.

Example - Adding a Cumulative Frequency Column (or *c.f.* for short)

Score	*f*	*c.f.*
0	4	4
1	2	6
2	7	13
3	4	17
$\Sigma f =$	17	check

BEFORE YOU START TOTAL THE *f* COLUMN

Write the '4' from the *f* column straight across into the *c.f.* column. This means so far there have been 4 scores.

A score of '1' occurs twice. So add '2' to the '4' from the *c.f.* column. This means so far there have been 6 scores.

A score of '2' occurs seven times. So add '7' to the '6' from the *c.f.* column. This means so far there have been 13 scores.

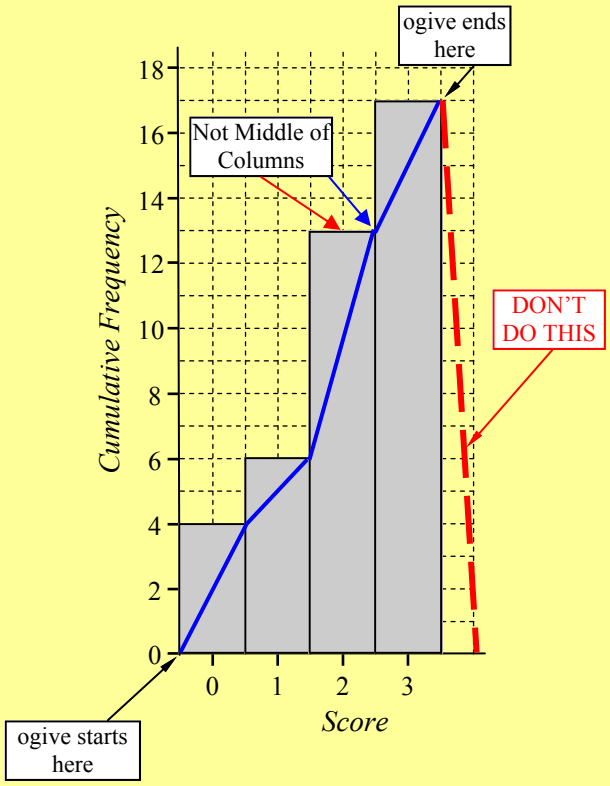
A score of '3' occurs four times. So add '4' to the '13' from the *c.f.* column. This means there has been 17 scores.

As a final check, make sure that Σf is equal to the last number in the *c.f.* column. If they don't match, look for an error in your calculation.

When you display a cumulative frequency graph, you use a 'Cumulative Frequency Histogram'. You also include a 'Cumulative Frequency Polygon', also known as an 'Ogive'.

There are a couple of differences between a Frequency Histogram/Polygon and a Cumulative Frequency Histogram and Ogive:

- A half column gap at the start isn't required, unlike the Frequency Histogram.
- The columns always increase or stay the same height, they never reduce in height.
- The ogive interconnects the top right hand corner of the columns, not their centres.
- The ogive stops at the top right hand corner of the last column. It doesn't drop down.



Frequency Tables - The Median (Graphical Solution)

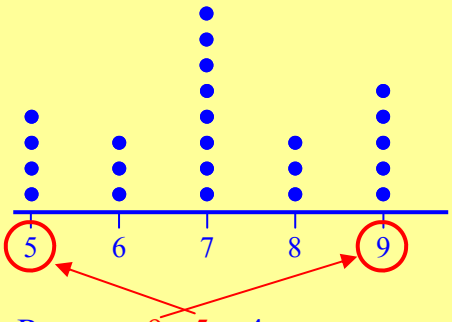
Frequency Tables/Dot Plots - Range and Mode

The range is the highest score minus the lowest score, the mode is the score that occurs the most (has the highest frequency).

Data can be displayed in dot plots, frequency tables and frequency histograms. Below are some examples.

Dot Plots



Range = 9 - 5 = 4

Mode is 7 (7 has most dots)

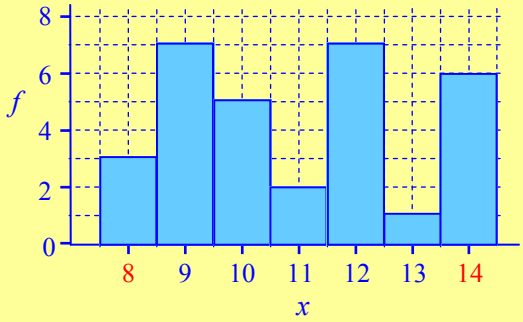
Frequency Tables

Score	*Frequency*
0	4
2	9
4	2
6	9
8	8
10	3

Range = 10 - 0 = 10

Mode is 2, 6 (highest frequency)

Frequency Histograms



Range = 14 - 8 = 6

Mode is 9, 12 (highest frequency)

Column 3 introduces Frequency Tables with Class Intervals. These questions are answered the same way except:

The Range is found by subtracting the lowest possible score from the highest possible score.

The **Modal class** is found by the class or classes with the highest frequency.

Example - find the Modal Class and the Range.

Class	*f*
1 - 20	15
21 - 40	27
41 - 60	16
61- 80	52
81 -100	18

Modal Class is 61- 80.
(Highest Frequency)

Range is 100 - 1 = 99

Frequency Tables - Mean, Mode, Range & Median

This sheet is a review sheet and so the method of finding the Mode, Mean, Range and Median won't be outlined below. But here is a reminder:

Mode - Is the score that occurs the most, the score with the highest frequency. There can be 1 mode, 2 modes (bi-modal) or No Mode. Write "No Mode" not "0" if there is no mode. If there are 3 or modes then the data is considered to have no mode.

Mean - Is the average of the scores. Found using: $x = \frac{\Sigma fx}{\Sigma f}$

Range - Is the highest score minus the lowest score.

Median - Is the middle score when the scores are arranged in ascending order. If there are an odd number of scores it is the middle score. If there are an even number of scores then the median is the average of the two middle scores. Use the cumulative frequency column to find the median, after finding its position using $\frac{n+1}{2}$

Frequency Tables - Mean, Mode, Range & Median

16	5	80	18
18	7	126	25
20	14	280	39
22	0	0	39
24	16	384	55
26	13	338	68
28	10	280	78
	$\Sigma f =$ 78	$\Sigma fx =$ 1 670	

Mode is 24

Range = 28 - 14 = 14

$\bar{x} = \frac{\Sigma fx}{\Sigma f} = \frac{1\,670}{78} = 21.4$ (1 decimal place)

Position $= \frac{78 + 1}{2} = 39.5^{\text{th}}$ score.

Median $= \frac{20 + 24}{2}$

Median = 22

Now its raw data. Use a tally column to enter the data, then complete as before. Mean to 1 d.p.

4 Data: 4, 9, 10, 7, 6, 8, 9, 9, 7, 6, 5, 4, 6, 4, 7, 8, 10, 7, 4, 6, 5, 7, 4, 8, 9, 8, 9, 8, 3, 9, 7, 5, 8, 6, 9, 7, 6, 8, 3, 6, 8, 3, 5.

x	*Tally*	*f*	*fx*	*c.f.*
3	|||	3	9	3
4	𝍸	5	20	8
5	𝍸|	4	20	12
6	𝍸 ||	7	42	19
7	𝍸 ||	7	49	26
8	𝍸 |||	8	64	34
9	𝍸 ||	7	63	41
10	||	2	20	43
	$\Sigma f =$ 43	$\Sigma fx =$ 287		

Mode is 8

Range = 10 - 3 = 7

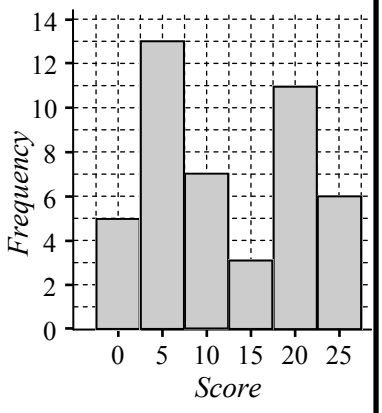
$\bar{x} = \frac{\Sigma fx}{\Sigma f} = \frac{287}{43} = 6.7$ (1d.p.)

Position $= \frac{43 + 1}{2} = 22^{\text{nd}}$ score.

Median = 7

5 Complete the Frequency Table, using the Frequency histogram. Then as before.

x	*f*	*fx*	*c.f.*
0	5	0	5
5	13	65	18
10	7	70	25
15	3	45	28
20	11	220	39
25	6	150	45
	$\Sigma f =$ 45	$\Sigma fx =$ 550	



Mode is 5

Range = 25 - 0 = 25

$\bar{x} = \frac{\Sigma fx}{\Sigma f} = \frac{550}{45} = 12.2$ (1 d.p.)

Position $= \frac{45 + 1}{2} = 23^{\text{rd}}$ score.

Median = 10

Frequency Tables with Classes - The Mean

When data is grouped into class intervals there is no score to use for calculations, instead an average is taken and a 'class centre' is created. This class centre is then used in calculations, the formula is:

$$\bar{x} = \frac{\Sigma f \times c.c.}{\Sigma f}$$

Where: $\bar{x}$ = the mean for the table
$\Sigma f \times c.c.$ = is the sum of the $f \times c.c.$ (frequency × class centre) column
Σf = is the sum of the f (frequency) column

Example - Finding the Mean for a Frequency Table with Classes

STEP 1 Calculate the class centre (*c.c.*), if not already in the column.

Class	*c.c.*	*f*	*f*×*c.c.*	
0 - 2	1	8		(0 + 2) ÷ 2 = 1
3 - 5	4	11		(3 + 5) ÷ 2 = 4
6 - 8	7	5		(6 + 8) ÷ 2 = 7
9 - 11	10	3		(9 + 11) ÷ 2 = 10
12 - 14	13	9		(12 + 14) ÷ 2 = 13
15 - 17	16	4		(15 + 17) ÷ 2 = 16
	Σf=		*Σf*×*c.c.*=	

STEP 2 Multiply the *c.c.* and *f* columns to calculate the *f* × *c.c.* column.

Class	*c.c.*	*f*	*f*×*c.c.*	
0 - 2	1	8	8	1 × 8 = 8
3 - 5	4	11	44	4 × 11 = 44
6 - 8	7	5	35	7 × 5 = 35
9 - 11	10	3	30	10 × 3 = 30
12 - 14	13	9	117	13 × 9 = 117
15 - 17	16	4	64	16 × 4 = 64
	Σf=		*Σf*×*c.c.*=	

STEP 3 Sum the *f* and *f* × *c.c.* columns. Sum means 'total', or 'add them up'.

Class	*c.c.*	*f*	*f*×*c.c.*
0 - 2	1	8	8
3 - 5	4	11	44
6 - 8	7	5	35
9 - 11	10	3	30
12 - 14	13	9	117
15 - 17	16	4	64
	Σf=	40	*Σf*×*c.c.*= 298

STEP 4 Calculate the mean.

$$\bar{x} = \frac{\Sigma f \times c.c.}{\Sigma f} = \frac{298}{40} = 7.45$$

Frequency Tables with Classes - The Mean

$$\bar{x} = \frac{\text{Total value of sales}}{\text{Number of Sales}} = \frac{1\,017\,374}{31} = \$32\,818.52$$

Frequency Table with Classes - The Median (Graphical Solution)

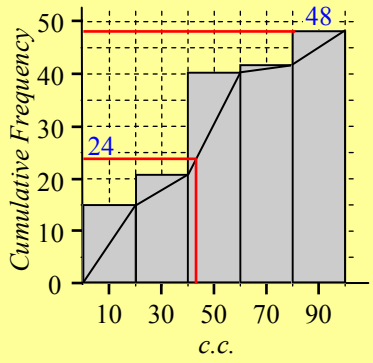
The process of finding the median from a frequency table with classes is very similar to that used with frequency tables (without classes). The differences being:

- you have to calculate a class centre
- The median is estimated from the horizontal scale using the class centres as a reference.
- The median class, is the class that contains the median. It can be found from the table using the *c.f.* column or using the median value itself to locate the class.

Column 1 starts with frequency histograms/polygons that are already constructed. Calculate 50% of the last column height rule across and drop the line down. Estimate the median value.

Example

STEP 1 Read off last column height and calculate 50%.

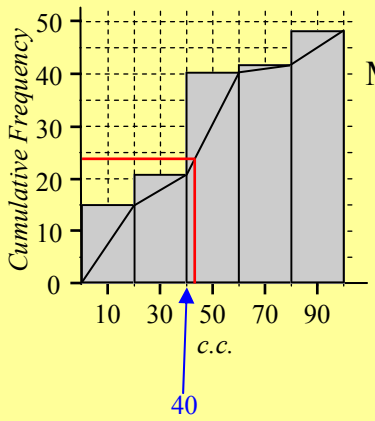


50% line:

$0.5 \times \boxed{48}$

$= \boxed{24}$

STEP 2 Estimate the median value



Median = 43

The second column of the sheet uses exactly the same method, but the frequency table has to be completed first. First step is to calculate the class centre, then the c.f. column. Once you have done that construct the graph and use the above method to calculate the median. The median class is found by finding the class that contains the median, otherwise use the *c.f.* column to locate the class that contains the median.

Frequency Table with Classes - The Median (Graphical Solution)

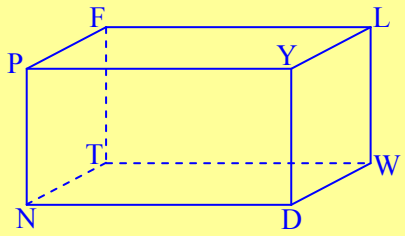
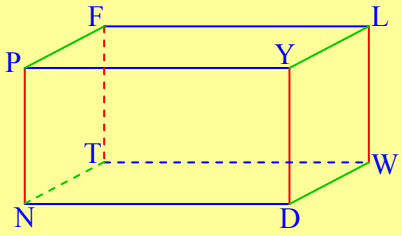
SURFACE AREA

Parallel, Perpendicular and Skew

Parallel means the same distance apart and not touching. This sheet deals with parallel faces and parallel edges. The rectangular prism shown below has three pairs of parallel faces.



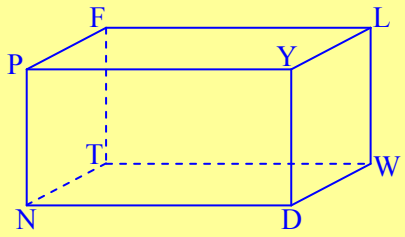
The top face PFLY is parallel to the bottom face NTWD.
The front face PYDN is parallel to the back face FLWT.
The LHS face PFTN is parallel to the RHS face YLWD.



There are parallel edges as well. On the diagram to the right, the edges that are the same colour are all parallel. You can show this using // :

PN // FT // LW // YD ND // PY // FL // TW PF // YL // DW // NT

Perpendicular means ‘at right angles to’ and touching. Again you can have perpendicular faces and also perpendicular edges. Faces first:

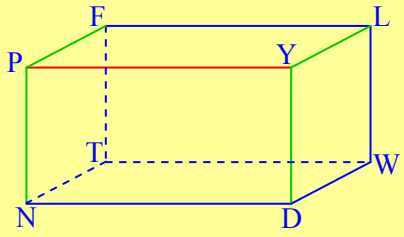


The top face PFLY and the bottom face NTWD are perpendicular to FLWT, YLWD, PYDN and PFTN.
The front face PYDN and the back face FLWT are perpendicular to PFLY, YLWD, WDNT and PFTN.
The side faces PFTN and YLWD are perpendicular to PFLY, FLWT, NTWD and PYDN.

Edges can also be parallel. With rectangular prisms and cubes there will be two perpendicular edges and the end of each edge.

So the edge PY (in red) has perpendicular edges (in green) YL, YD, PF and PN.

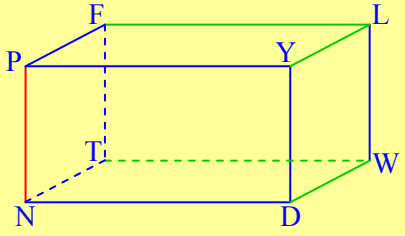
Not the perpendicular symbol is ⊥ .



Skew edges are edges that aren’t parallel and aren’t perpendicular. So if an edge is skew it won’t be parallel and it isn’t going to touch the given edge.

Name the skew edges to PN (shown in red).
The skew edges are shown in green and are FL, TW, YL and DW.

Note that none touch PN, and none are parallel to PN.



Parallel, Perpendicular and Skew

Name the face(s) that ….

1 Is shaded. GCDH

2 Is parallel to BFGC.

BFGC // AEHD

3 Is parallel to the shaded face.

GCDH // FBAE

4 Is parallel to ABCD.

ABCD // EFGH

5 Is parallel to AEFB.

AEFB // DHGC

6 Is perpendicular to ABCD & has an edge EH.

ABCD ⊥ AEHD

7 Are perpendicular to EHGF & have an edge BF, (2 faces).

EHGF ⊥ AEFB ⊥ BFGC

8 Are perpendicular to BFGC & perpendicular to AEFB.

ABCD, EHGF

9 Are perpendicular to the shaded face and have edge GF.

CDHG ⊥ CBFG ⊥ GFEH

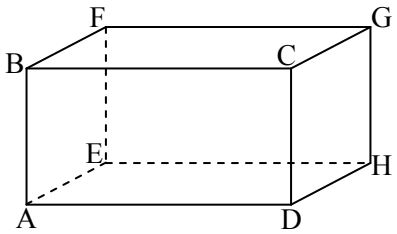
10 Is perpendicular to ABCD & has vertices C & F.

ABCD ⊥ CBFG

11 Is perpendicular to DAEH & has edge BC.

DAEH ⊥ ABCD

Name the edges that are parallel to, & perpendicular to, the edges on the rectangular prisms below.



12 3 edges parallel to AB are:

AB // EF // HG // DC

13 3 edges parallel to GC are:

GC // HD // EA // FB

14 3 edges parallel to EH are:

EH // AD // BC // FG

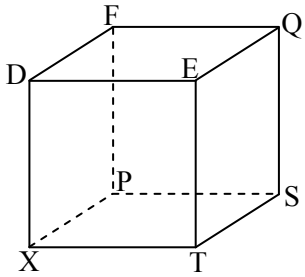
15 4 edges perpendicular to AB

AD , AE , BC , BF

16 4 edges perpendicular to GC

CB , CD , GH , GF

Now use the cube shown below.



17 Name the face parallel to QFPS. EDXT

18 Name the edges parallel to FP. FP // DX // ET // QS

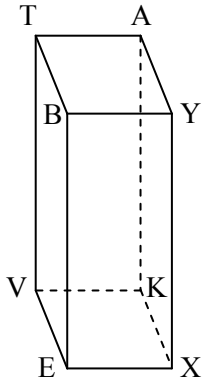
19 Name the horizontal faces perpendicular to DFPX.

DFQE, XPST

20 Name the vertical faces perpendicular to PFQS.

EQST, DFPX

What's skew with you? Name the skew edges in these questions.



21 Name 4 edges that are skew to YB: TV , AK , VE , KX .

22 Name 4 edges that are skew to VT: BY, EX, AY, KX.

23 Name 4 edges that are skew to KX: BY, TA, TV, BE.

24 Name two edges that are skew to EX and parallel to EB.

VT, KA.

25 Name two edges that are skew to AK and parallel to AT.

BY, EX.

26 Name an edge that is skew to VT and parallel to BY. EX

27 Name an edge that is skew to KV and parallel to YX. BE

28 Name an edge that is skew to EX and is on the face TBEV.

TB or TV

29 Name two edges that are skew to AK and perpendicular to VT. TB, VE.

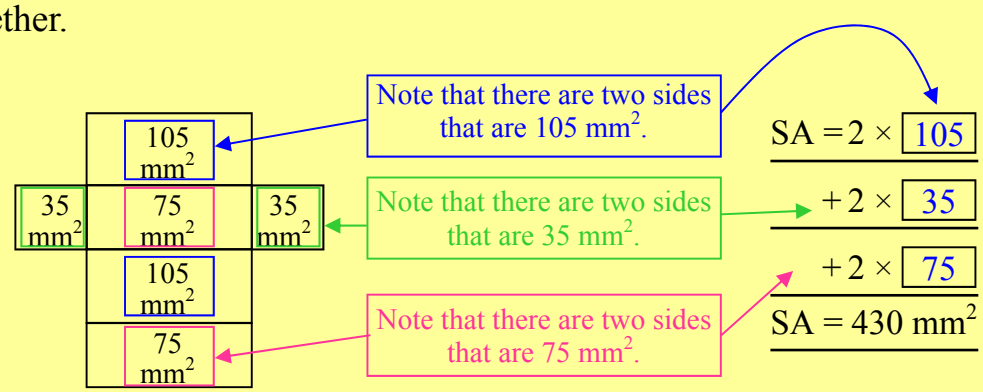
30 Name two edges that are skew to KV and perpendicular to EX. BE, YX.

31 Name two edges that are skew to XY and are on the face ATVK. VK, TA.

Surface Area of Prisms - Adding Face Areas

Surface area (S.A.) is the outside area of the faces/curved surfaces of a solid. So to calculate the S.A. of a solid you add all the areas of the individual shapes/surfaces that make up the solid. This sheet also shows the **nets** of popular solids. A net is like a solid that has been opened up, like it was constructed from paper and unfolded.

Column 1 starts with showing nets that have the area for each shape that makes the solid labeled with its area. Note that there are no side lengths … just areas. So the S.A. is found by adding all these areas together. But because some areas are repeated, these are gathered together.



Columns 2 and 3 show solids with the areas labeled on them. But they aren't shown as nets so you can't see all the faces of the solid. But the faces are repeated and you have all the numbers you need, just ask …. How many of each area is there? Then you solve the question just the same as Column 1.

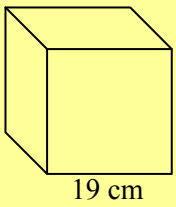
Surface Area - Cubes and Rectangular Prisms

The previous sheet gave you the areas of each face of a solid. This exercise gives you the length of the edges of the solids. So you have to calculate the areas yourself.

Column 1 asks you to find the S.A. of cubes. A cube has six identical square faces, so calculate the area of one square face, then multiply (times) by 6. But there is a formula as well and it is: S.A. = $6l^2$, where 'l' is the side length of the square face.

Example



$SA = 6l^2$ ← Write out the formula.

$= 6 \times 19^2$ ← Substitute the side length into the formula.

$SA = 2\ 166\ cm^2$ ← Use your calculator and write the answer showing the units, which are square units.

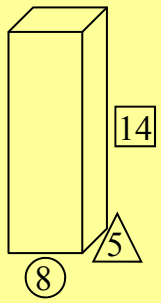
S.A. of a Cube Calculator Steps:

To Find 6×19^2

6 × 1 9 x^2 =

Column 2 deals with finding the S.A. of rectangular prisms. These are more complicated than cubes because they have 3 pairs of identical face areas. So you have to perform three separate calculations. This column assists you by putting shapes around the edge lengths, this matches the shapes in the working out area …. so just rewrite the number in the correct position and so on. The lengths are all cm, so your final answer should have cm^2 in it.

Example



$SA = 2 \times \boxed{14} \times \triangle 5$ ← The square is 14 and the triangle is 5.

$+ 2 \times \boxed{14} \times (8)$ ← The square is 14 and the circle is 8.

$+ 2 \times (8) \times \triangle 5$ ← The circle is 8 and the triangle is 5.

$SA = 444\ cm^2$ ← Use your calculator and write the answer showing the units, which are all cm^2.

S.A. of a Rectangular Prism Calculator Steps:

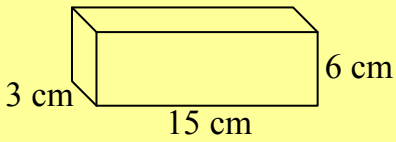
2 × 1 4 × 5 + 2 × 1 4 × 8 + 2 × 8 × 5 =

Column 3 is a mix of cubes and rectangular prisms. But this time the rectangular prisms don't have the shapes around the lengths. So you have to make sure that you use two of each number when you calculate the S.A.

A step-by step process is on the next page.

When you select the sides you are going to use, you can place a stroke through them. Once a number has a cross through it, you don't use it again.

Example



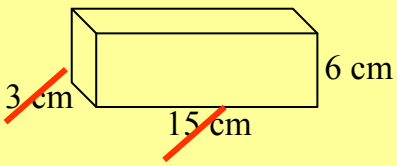
SA = 2 × ×
+ 2 × ×
+ 2 × ×
SA =

STEP 1

Write SA = 2 × ×
+ 2 × ×
+ 2 × ×
SA =

This is always the same, this sets you up to write the side lengths in.

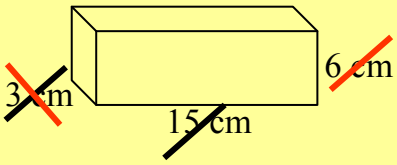
SA = 2 × **3** × **15**
+ 2 × ×
+ 2 × ×
SA =



STEP 2

Pick two side lengths, whichever two you like. Write them in the top line and put a stroke through the numbers on the diagram.

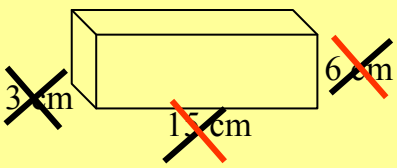
SA = 2 × 3 × 15
+ 2 × **3** × **6**
+ 2 × ×
SA =



STEP 3

Pick the side you haven't used (6 cm) and one side that you have (we used 3 cm). Write them in the second line and put a stroke through the numbers on the solid. Note that the 3 cm side has a cross through it, it is no longer able to be used.

SA = 2 × 3 × 15
+ 2 × 3 × 6
+ 2 × **15** × **6**
SA =



STEP 4

The sides with only one stroke are now used, so use 15 cm and 6 cm. Write these in the third line and you are now ready to calculate the answer.

2	×	3	×	1	5	+	2	×	3	×	6	+	2	×	1	5	×	6	=

SA = 306 cm^2

STEP 5

Calculate the answer and write the square units on the answer. You are done!

18 Cube

$SA = 6l^2$

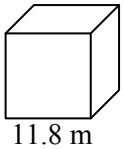
$= 6 \times 11.8^2$

$SA = 835.4\ m^2$



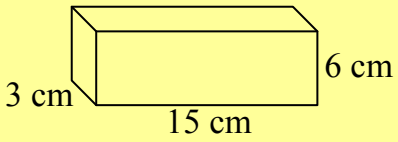
Surface Area - Rectangular Prisms

This sheet deals with calculating the surface area (S.A.) of a Rectangular Prism. The previous sheet should be completed before attempting this sheet.

The process for completing the sheet is shown below. Column 2 uses the same process as Column 1 but before you start you have to convert all the lengths into cm. Cross out the non-cm lengths and write them again, but in cm. Then away you go!

Example

When you select the sides you are going to use, you can place a stroke through them. Once a number has a cross through it, you don't use it again.



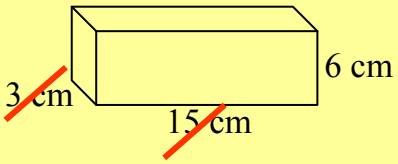
SA = 2 × ×
+ 2 × ×
+ 2 × ×
SA =

STEP 1

Write SA = 2 × ×
+ 2 × ×
+ 2 × ×
SA =

This is always the same, this sets you up to write the side lengths in.

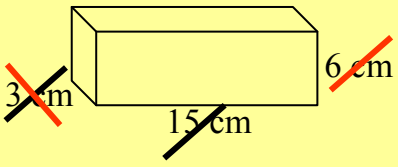
SA = 2 × **3** × **15**
+ 2 × ×
+ 2 × ×
SA =



STEP 2

Pick two side lengths, whichever two you like. Write them in the top line and put a stroke through the numbers on the diagram.

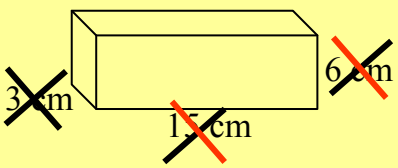
SA = 2 × 3 × 15
+ 2 × **3** × **6**
+ 2 × ×
SA =



STEP 3

Pick the side you haven't used (6 cm) and one side that you have (we used 3 cm). Write them in the second line and put a stroke through the numbers on the solid. Note that the 3 cm side has a cross through it, it is no longer able to be used.

SA = 2 × 3 × 15
+ 2 × 3 × 6
+ 2 × **15** × **6**
SA =



STEP 4

The sides with only one stroke are now used, so use 15 cm and 6 cm. Write these in the third line and you are now ready to calculate the answer.

2	×	3	×	1	5	+	2	×	3	×	6	+	2	×	1	5	×	6	=

STEP 5

Calculate the answer and write the square units on the answer. You are done!

SA = 306 cm^2

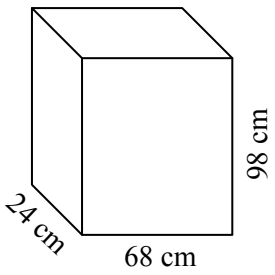
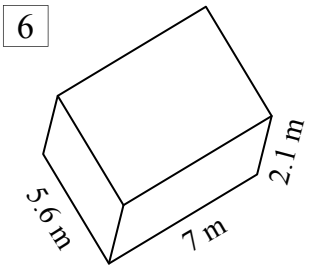
$+ 2 \times 68 \times 98$

$SA = 21\,296\ cm^2$



6



$SA = 2 \times 5.6 \times 2.1$

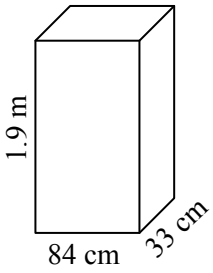
$+ 2 \times 5.6 \times 7$

$+ 2 \times 2.1 \times 7$

$SA = 131.32\ m^2$

Give the surface area in cm^2. So change all units to cm first, then perform the SA calculation. Round to 1 d.p. if needed.

7



$SA = 2 \times 190 \times 84$

$+ 2 \times 190 \times 33$

$+ 2 \times 84 \times 33$

$SA = 50\,0004\ cm^2$

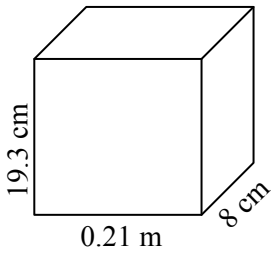
8

$SA = 2 \times 19.3 \times 21$

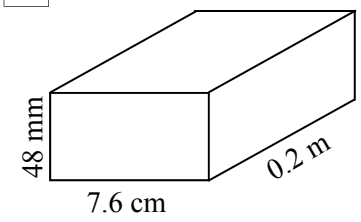
$+ 2 \times 19.3 \times 8$

$+ 2 \times 21 \times 8$

$SA = 1\,455.4\ cm^2$



9



$SA = 2 \times 4.8 \times 7.6$

$+ 2 \times 4.8 \times 20$

$+ 2 \times 7.6 \times 20$

$SA = 569\ cm^2$

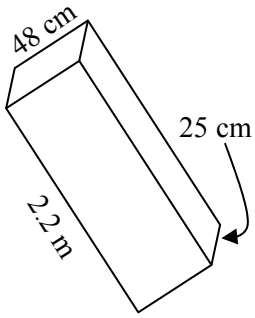
10

$SA = 2 \times 220 \times 48$

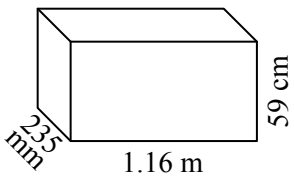
$+ 2 \times 220 \times 25$

$+ 2 \times 48 \times 25$

$SA = 34\,520\ cm^2$



11



$SA = 2 \times 23.5 \times 116$

$+ 2 \times 23.5 \times 59$

$+ 2 \times 116 \times 59$

$SA = 21\,193\ cm^2$

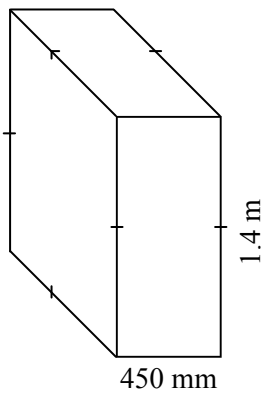
12

$SA = 2 \times 140 \times 45$

$+ 2 \times 140 \times 140$

$+ 2 \times 45 \times 140$

$SA = 64\,400\ cm^2$



Surface Area of Rectangular Prisms - Problems.

This worksheet takes your skills with finding the surface area of a rectangular prism and applies it to different situations.

Column 1 starts with constructing a steel tool box. The sides are then increased by 20%, and the SA is calculated again. Would a 20% increase on the side lengths result in a 20% increase in SA? If you can't remember how to increase by a percentage, below is an example of increasing 60 cm by 20%.

Example - Increasing 60 cm by 20%.

Using Decimals		Using Fractions
$60 \times 0.2 = 12$ cm	This is the amount of the increase	$60 \times \frac{20}{100} = 12$ cm
$60 + 12 = 72$ cm	This is the final length	$60 + 12 = 72$ cm

Column 2 has Bob renovating his bathroom. The room is shown with a doorway, the doorway size is shown in Question 8, where it is needed. First find the SA of the entire room, then calculate the individual areas that are tiled, painted or having laminated flooring installed. Each area has a different cost per m^2.

Column 3 starts with a question that is related to Bob's bathroom, this is essentially changing a fraction to a percentage. The theme then turns to toasters and how the rate of heat loss by a toaster casing increases as its SA increases.

There are two different toasters calculate the SA for both, then use an experimental formula created by the manufacturer to consider if a toaster's heat dissipation is considered safe.

$$T = 230 - 0.1 \times SA$$

where T = safety constant (must be below 50 to be considered safe)
SA = surface area of the rectangular prism shaped toaster in cm^2

Example - Applying the formula to a toaster that has an SA of 1 500 cm^2.

$T = 230 - 0.1 \times SA$	Write the formula
$= 230 - 0.1 \times 1500$	Substitute the SA into the formula
$T = 80$	Solve for the value of T
The toaster is unsafe.	As T = 80 the toaster is unsafe as 80 > 50.

Surface Area of Rectangular Prisms - Problems.

Find the SA of these tool boxes!

A steel rectangular shaped toolbox is 35 cm long, 20 cm high and 25 cm wide, draw a diagram and find the SA

Diagram

1

2 SA = $2 \times 35 \times 25$

$+ 2 \times 35 \times 20$

$+ 2 \times 25 \times 20$

SA = $4\,150\ cm^2$

Increase each of the sides of the tool box by 20%.

3 35: $35 \times 0.2 = 7$ cm

$35 + 7 = 42$ cm

20: $20 \times 0.2 = 4$ cm

$20 + 4 = 24$ cm

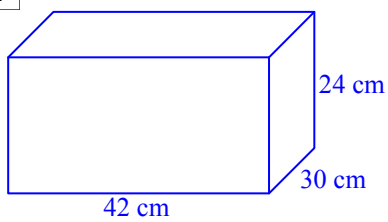
25: $25 \times 0.2 = 5$ cm

$25 + 5 = 30$ cm

Draw a diagram and then find the SA of the enlarged tool box.

Diagram

4



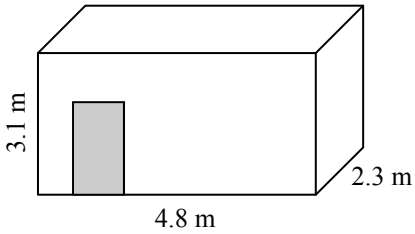
5 SA = $2 \times 42 \times 30$

$+ 2 \times 42 \times 24$

$+ 2 \times 30 \times 24$

SA = $5\,976\ cm^2$

Bob's bathroom is shown below, he's painting the ceiling, tiling the walls and fitting laminate to the floor. Find the SA and costs.



6 Find the SA of the room.

SA = $2 \times 4.8 \times 2.3$

$+ 2 \times 4.8 \times 3.1$

$+ 2 \times 3.1 \times 2.3$

SA = $66.1\ m^2$

7 Calculate the floor area and the cost to fit laminate, when it costs \$24/m^2.

A = $4.8 \times 2.3 = 11.04\ m^2$

Cost = 11.04×24

Cost = \$264.96 ($12\ m^2$ = \$288)

8 Calculate the tiled area and the cost to tile it, when tiles cost \$37/m^2. There is a doorway that is 2.1 m × 1.2 m, that isn't tiled.

SA = $2 \times 4.8 \times 3.1$

$+ 2 \times 3.1 \times 2.3$

SA = $44.02\ m^2$

Tiled Area = $44.02 - 2.1 \times 1.2$

Tiled Area = $41.5\ m^2$

Cost = 41.5×37 = \$1 535.50

Or 42×37 = \$1 554

9 If painting costs \$3.50/m^2 find the total cost for the ceiling.

Area = Floor = $11.04\ m^2$

Cost = 11.04×3.5

Cost = \$38.64 ($12\ m^2$ = \$42)

10 Calculate, as a percentage of the total SA, the area of the room that is tiled. (to 2 d.p.)

$\frac{41.5}{66.1} \times 100$

$= 62.78\%$

These toasters are all rectangular prisms.

A company finds toasters are safer if they cool faster. Cooling time is found by the formula:

$T = 230 - 0.1 \times SA$.

If T is less than 50 then they are safe.

12 Find the SA for a toaster of size 17 cm × 14 cm × 20 cm.

SA = $2 \times 17 \times 14$

$+ 2 \times 17 \times 20$

$+ 2 \times 14 \times 20$

SA = $1\,716\ cm^2$

13 Apply the formula to find if it is considered safe.

$T = 230 - 0.1 \times SA$ — Write formula

$= 230 - 0.1 \times 1\,716$ — Sub in SA value

$T = 58.4$ — Solve for T

The toaster is not safe. — Worded response

14 Repeat for a different model sized 18 cm × 23 cm × 16 cm.

SA = $2 \times 18 \times 23$

$+ 2 \times 18 \times 16$

$+ 2 \times 23 \times 16$

SA = $2\,140\ cm^2$

$T = 230 - 0.1 \times SA$

$= 230 - 0.1 \times 2\,140$

$T = 16$

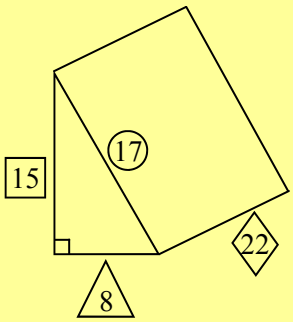
The toaster is safe.

Method Sheet - Surface Area of Triangular Prisms

Finding the surface area of a triangular prism can be confusing but this sheet is designed to introduce the method and make the process easier.

A triangular prism consists of two triangular ends and the three rectangles around the shape, all added together. Because there are four numbers and it is important which is multiplied by which, this sheet uses shapes around the numbers that match their correct position in the calculation. Just take the numbers off the shape and place them into the calculation and away you go!

Example - Finding the SA of the triangular prism shown below



The shape has a circle, square, triangle and rhombus around its dimensions. Place each into their correct position in the calculation below.

SA = $2 \times \frac{1}{2} \times$ 8 $\times$ 15

The shape has two identical triangles on the front and back. This line calculates their combined area. Remember that ½ = 0.5, easier on your calculator and maybe you know what 2 × 0.5 is? Is it necessary?

$+$ 8 $\times$ 22

This is calculating the rectangular base of the triangular prism.

$+$ 15 $\times$ 22

This is calculating the rectangular side of the triangular prism. (The vertical face on the left side of the shape).

$+$ 17 $\times$ 22

This is calculating the rectangular side of the triangular prism. (The slanted face on the right side of the shape).

SA = 1 000 cm^2

Stepped Procedure - Surface Area of Triangular Prisms

When you calculate the Surface Area of a Triangular Prism you are adding 5 areas together. There are the two triangular ends of the solid, then there are the three rectangles that wrap around the solid.

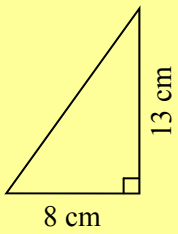
This sheet takes you through the procedure in parts to assist you to understand the steps involved in the process.

Column 1 deals with finding the area of a triangle. The formula for this is

$A = \frac{1}{2}bh$ (which is ½ × base length × perpendicular height of triangle)

There is an example at the top of the column, use the calculator fraction key to make the ½ or just use 0.5, which is the better choice otherwise you may get answers with fractions.

Example



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 8 \times 13$

$A = 52 \text{ cm}^2$

Using 0.5 : 0 . 5 × 8 × 1 3 =

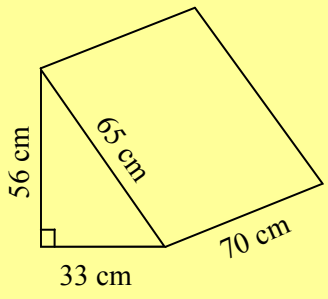
Using ½ : 1 $a^b/_c$ 2 × 8 × 1 3 = $a^b/_c$

Then use again if your answer contains a fraction.

Column 2 isn't finding the Surface Area, it is finding the area of the rectangular faces of the solid. So you are finding the area of three rectangles. Note that if the triangular face of the prism is isosceles then two of the triangles are identical. There is an example at the top of the column.

Column 3 is finding the surface area, so the two triangular faces plus the three rectangles added together. The first line is the two triangles, you should show 2×½ in the working out, but do you need to do this with the calculator? Then add the three rectangles and add get a total. Remember the square units and it is done.

Example



base and height of triangle

$SA = 2 \times \frac{1}{2} \times 33 \times 56$

$+ 33 \times 70$

$+ 56 \times 70$

$+ 65 \times 70$

Note the 'depth' of the solid is used three times

$SA = 12\,628 \text{ cm}^2$

Find the area of these triangles. Use A = ½*bh*, using either 0.5 or ½.

Example

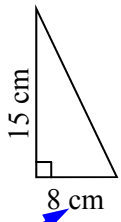
$A = \frac{1}{2}bh$

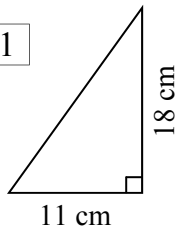
$= \frac{1}{2} \times 8 \times 15$

$A = 60 \text{ cm}^2$



units² must match

1

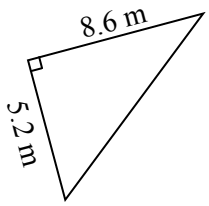


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times \boxed{11} \times \boxed{18}$

$A = 99 \text{ cm}^2$

2

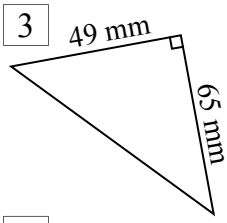


$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 5.2 \times 8.6$

$A = 22.36 \text{ m}^2$

3



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 49 \times 65$

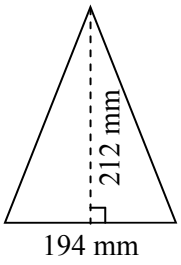
$A = 1\,592.5 \text{ mm}^2$

4

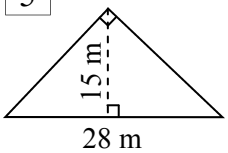
$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 194 \times 212$

$A = 20\,564 \text{ mm}^2$



5



$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 28 \times 15$

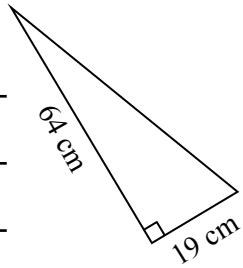
$A = 210 \text{ m}^2$

6

$A = \frac{1}{2}bh$

$= \frac{1}{2} \times 19 \times 64$

$A = 608 \text{ cm}^2$



Find the rectangular wall surface area for these triangular prisms.

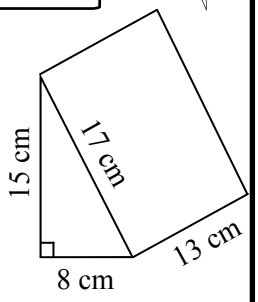
Example

$SA = 8 \times 13$

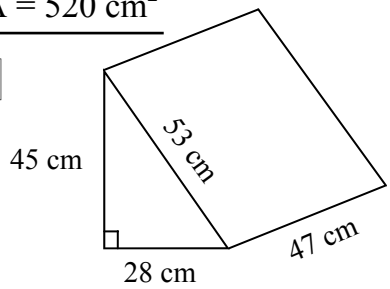
$+ 15 \times 13$

$+ 17 \times 13$

$SA = 520 \text{ cm}^2$



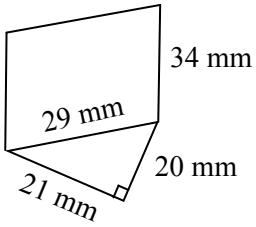
7



$SA = \boxed{28} \times \boxed{47} + \boxed{45} \times \boxed{47} + \boxed{53} \times \boxed{47}$

$SA = 5\,922 \text{ cm}^2$

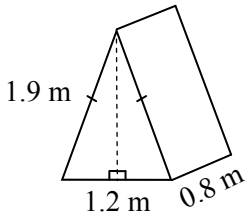
8



$SA = \boxed{20} \times \boxed{34} + \boxed{21} \times \boxed{34} + \boxed{29} \times \boxed{34}$

$SA = 2\,380 \text{ mm}^2$

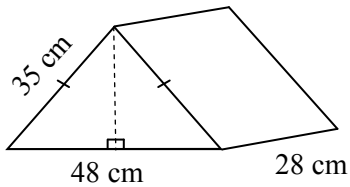
9



$SA = \boxed{1.2} \times \boxed{0.8} + 2 \times \boxed{1.9} \times \boxed{0.8}$

$SA = 4 \text{ m}^2$

10

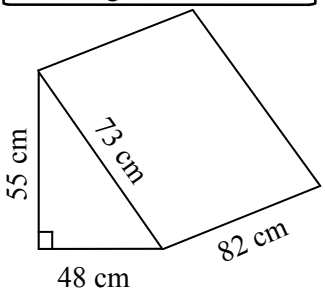


$SA = 48 \times 28 + 2 \times 35 \times 28$

$SA = 3\,304 \text{ cm}^2$

Now add two triangular faces and the rectangular walls to get the total SA.

11



$SA = 2 \times \frac{1}{2} \times \boxed{48} \times \boxed{55}$

$+ \boxed{48} \times \boxed{82}$

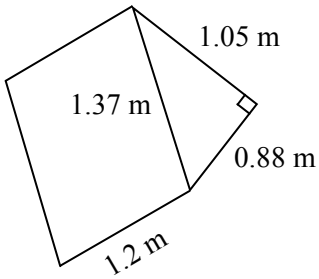
$+ \boxed{55} \times \boxed{82}$

$+ \boxed{73} \times \boxed{82}$

base and height of triangle

$SA = 17\,072 \text{ cm}^2$

12



$SA = 2 \times \frac{1}{2} \times \boxed{0.88} \times \boxed{1.05}$

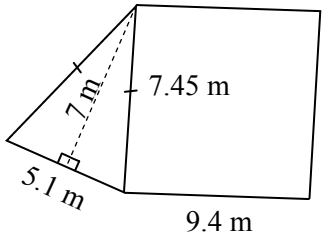
$+ \boxed{0.88} \times \boxed{1.2}$

$+ \boxed{1.37} \times \boxed{1.2}$

$+ \boxed{1.05} \times \boxed{1.2}$

$SA = 4.884 \text{ m}^2$

13



$SA = 2 \times \frac{1}{2} \times \boxed{5.1} \times \boxed{7}$

$+ \boxed{5.1} \times \boxed{9.4}$

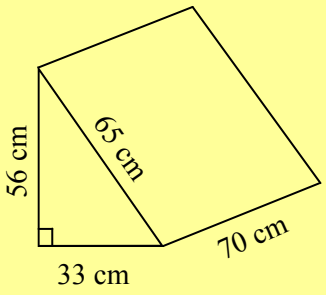
$+ 2 \times \boxed{7.45} \times \boxed{9.4}$

$SA = 223.7 \text{ m}^2$

Surface Area - Triangular Prisms

To calculate the surface area of a solid, the area of all the faces of the solid are calculated and added together. So with a triangular prism there are two triangular ends and three rectangles around the middle. If the triangular end is isosceles then two of the rectangles are the same size, the next sheet will deal with triangular prisms that feature equilateral triangle faces.

Example 1 - Scalene Triangular face



base and height of triangle

$SA = 2 \times \frac{1}{2} \times 33 \times 56$

$+ 33 \times 70$

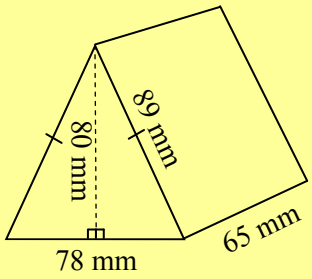
$+ 56 \times 70$

$+ 65 \times 70$

Note the 'depth' of the solid is used three times

$SA = 12\,628 \text{ cm}^2$

Example 2 - Isosceles Triangular face



base and height of triangle

$SA = 2 \times \frac{1}{2} \times 78 \times 80$

$+ 78 \times 65$

$+ 2 \times 89 \times 65$

Note the 'depth' of the solid is used three times, but two of the areas are the same

$SA = 12\,628 \text{ mm}^2$

The sheet is attempted as above for all questions, except for the last two questions being problems that require some additional steps.

Find the surface area of these triangular prisms.

Example

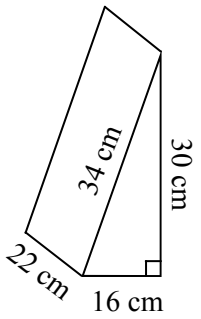
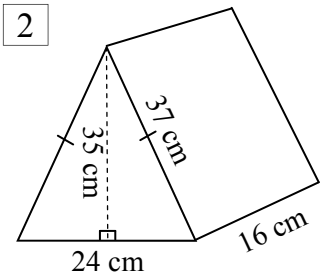
SA = 2 × ½ × 12 × 35
+ 12 × 50
+ 35 × 50
+ 37 × 50
SA = 4 620 mm^2

1 SA = 2 × ½ × 16 × 30
+ 16 × 22
+ 34 × 22
+ 30 × 22
SA = 2 240 cm^2

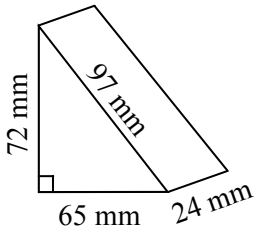


2

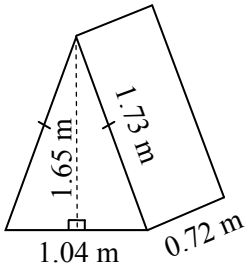


SA = 2 × ½ × 24 × 35
+ 24 × 16
+ 2 × 37 × 16
SA = 2 408 cm^2

3 SA = 2 × ½ × 65 × 72
+ 65 × 24
+ 72 × 24
+ 97 × 24
SA = 10 296 mm^2

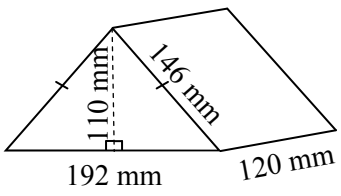


4

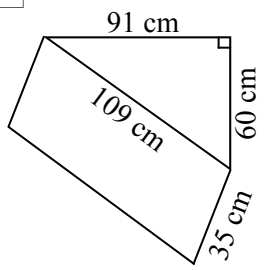


SA = 2×½× 1.04 × 1.65
+ 1.04 × 0.72
+2 × 1.73 × 0.72
SA = 4.956 m^2

5 SA = 2× ½ × 192 × 110
+ 192 × 120
+ 2 × 146 × 120
SA = 79 200 mm^2

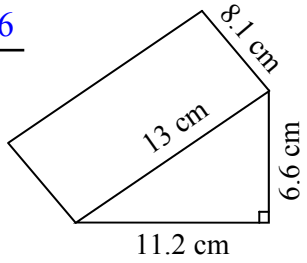


6



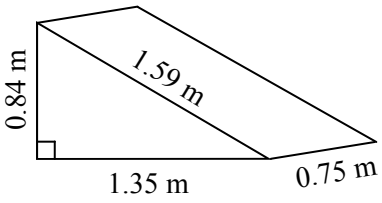
SA = 2 × ½ × 60 × 91
+ 60 × 35
+ 109 × 35
+ 91 × 35
SA = 14 560 cm^2

7 SA = 2× ½ × 11.2 × 6.6
+ 6.6 × 8.1
+ 11.2 × 8.1
+ 13 × 8.1
SA = 323.4 cm^2



8 A skateboard ramp is to be constructed from plate steel. If steel costs $28.20 per m^2, find the cost to build the skate ramp shown. The ramp has a steel base (no missing sides) and assume metal is supplied cut to size and charged to nearest m^2.

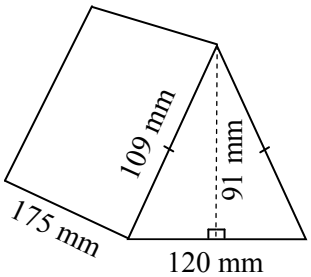
SA = 2×½×1.35×0.84
+ 0.84 × 0.75
+ 1.35 × 0.75
+ 1.59 × 0.75
SA = 3.969 m^2



Cost = 4 × 28.20 = $112.80

9 A chocolate box in the shape of a triangular prism is shown below. If the wrapper has a white area of 14 000 mm^2, with the rest being purple, calculate the percentage of the wrapper area that is purple. Answer to the nearest whole number.

SA = 2 × ½ × 120 × 91
+ 120 × 175
+ 2 × 109 × 175
SA = 70 070 mm^2



Purple area = 70 070 - 14 000 = 56 070 mm^2

$\frac{56\,070}{70\,070}$ × 100 = 80% (nearest whole number)

Surface Area - Triangular Prisms using Pythagoras Theorem

This sheet requires the ability to perform Pythagoras Theorem, if you haven't learned P. T. then don't attempt this worksheet. This worksheet covers finding the surface area of a triangular prism but you need to find either a missing side length or the perpendicular height first.

Column 1 has an example, note that this uses P. T. addition, some questions will use subtraction. This column features questions that don't require rounding, from Column 2 rounding to 2 d. p. is required.

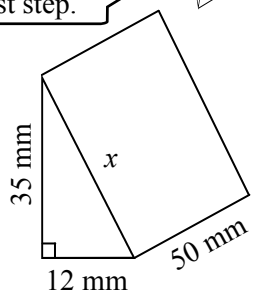
From Column 2 units may have to be converted. Some questions have units used that are different from the square units required in the final answer. So change the measurements **FIRST**, before you perform any calculations.

Surface Area - Triangular Prisms using Pythagoras Theorem

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the surface area of these triangular prisms. Pythagoras Theorem is required as a first step.

Example



$x^2 = 12^2 + 35^2$

$x^2 = 1\ 369$

$x = \sqrt{1\ 369}$

$x = 37$ mm

SA = 2 × ½ × 12 × 35

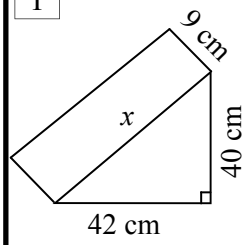
+ 12 × 50

+ 35 × 50

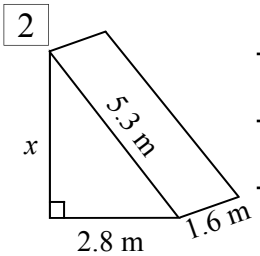
+ 37 × 50

SA = 4 620 mm^2

1

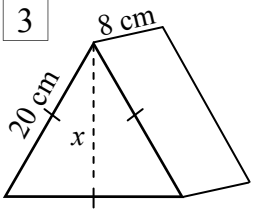


2

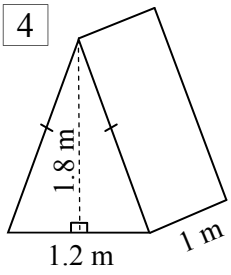


Round to 2 d.p when required.

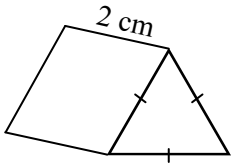
3



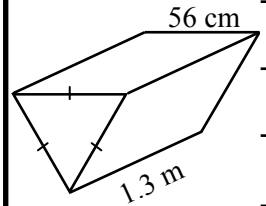
4



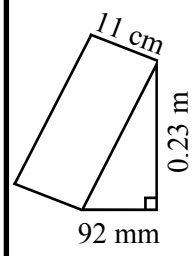
5 *Answer in mm^2



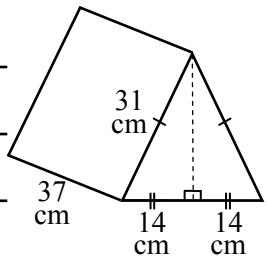
6 *Answer in m^2



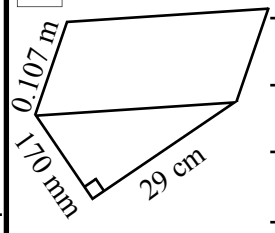
7 *Answer in cm^2



8



9 *Answer in cm^2

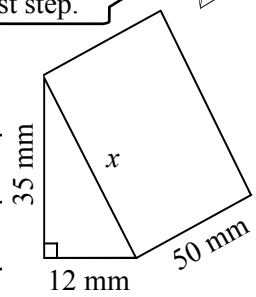


Surface Area - Triangular Prisms using Pythagoras Theorem

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the surface area of these triangular prisms. Pythagoras Theorem is required as a first step.

Example



$x^2 = 12^2 + 35^2$

$x^2 = 1\ 369$

$x = \sqrt{1\ 369}$

$x = 37$ mm

SA = 2 × ½ × 12 × 35

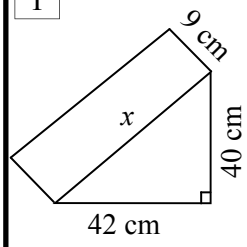
+ 12 × 50

+ 35 × 50

+ 37 × 50

SA = 4 620 mm^2

1



$x^2 = 42^2 + 40^2$

$x^2 = 3\ 364$

$x = \sqrt{3\ 364}$

$x = 58$ cm

SA = 2 × ½ × 42 × 40

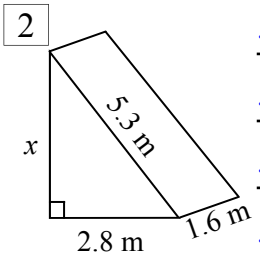
+ 42 × 9

+ 58 × 9

+ 40 × 9

SA = 2 940 cm^2

2



$x^2 = 5.3^2 - 2.8^2$

$x^2 = 20.25$

$x = \sqrt{20.25}$

$x = 4.5$ m

SA = 2 × ½ × 2.8 × 4.5

+ 2.8 × 1.6

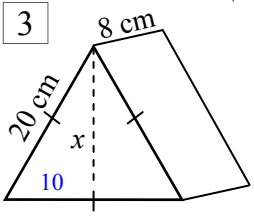
+ 4.5 × 1.6

+ 5.3 × 1.6

SA = 32.76 m^2

Round to 2 d.p when required.

3



$x^2 = 20^2 - 10^2$

$x^2 = 300$

$x = \sqrt{300}$

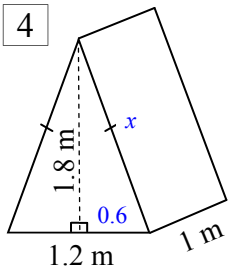
$x = 17.32$ cm

SA = 2 × ½ × 20 × 17.32

+ 3 × 20 × 8

SA = 826.4 cm^2

4



$x^2 = 1.8^2 - 0.6^2$

$x^2 = 2.88$

$x = \sqrt{2.88}$

$x = 1.70$ m

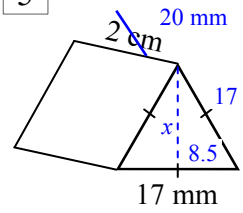
SA = 2 × ½ × 1.2 × 1.8

+ 1.2 × 1

+ 2 × 1.7 × 1

SA = 6.76 m^2

5 *Answer in mm^2



$x^2 = 17^2 - 8.5^2$

$x^2 = 216.75$

$x = \sqrt{216.75}$

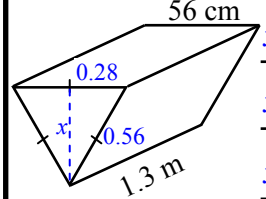
$x = 14.72$ mm

SA = 2 × ½ × 17 × 14.72

+ 3 × 17 × 20

SA = 1 270.24 mm^2

6 *Answer in m^2



$x^2 = 0.56^2 - 0.28^2$

$x^2 = 0.2352$

$x = \sqrt{0.2352}$

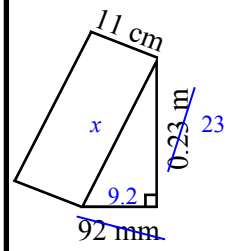
$x = 0.48$ m (or 48.50 cm)

SA = 2 × ½ × 0.56 × 0.48

+ 3 × 0.56 × 1.3

SA = 2.45 m^2 or 2.46 m^2 (if 0.485 m used)

7 *Answer in cm^2



$x^2 = 9.2^2 + 23^2$

$x^2 = 613.64$

$x = \sqrt{613.64}$

$x = 24.77$ cm

SA = 2 × ½ × 9.2 × 23

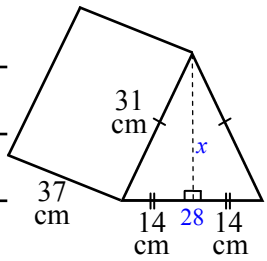
+ 9.2 × 11

+ 23 × 11

+ 24.77 × 11

SA = 838.27 cm^2

8



$x^2 = 31^2 - 14^2$

$x^2 = 765$

$x = \sqrt{765}$

$x = 27.66$ cm

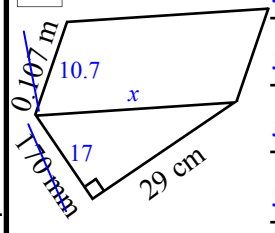
SA = 2 × ½ × 28 × 27.66

+ 28 × 37

+ 2 × 31 × 37

SA = 4 104.48 cm^2

9 *Answer in cm^2



$x^2 = 17^2 + 29^2$

$x^2 = 1\ 130$

$x = \sqrt{1\ 130}$

$x = 33.62$ cm

SA = 2 × ½ × 29 × 17

+ 17 × 10.7

+ 33.62 × 10.7

+ 29 × 10.7

SA = 1 344.93 cm^2

Surface Area - Square & Rectangular Pyramids

A Square (based) Pyramid consists of its square base and four identical triangles. So to find the S.A. of a Square Pyramid:

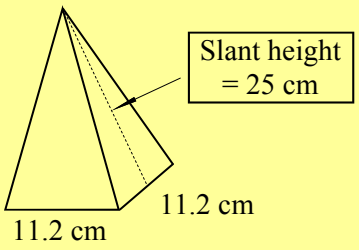
$$SA = l^2 + 4 \times \tfrac{1}{2}bh$$

where:

l = side length of the square base
b = the base length of the triangles (which is equal to l)
h = the perpendicular height of the triangles (which is called the slant height)

You don't have to remember the formula, just remember to add the area of the square and the four triangles together.

Example



4 × ½ = 2 Quicker

$SA = 11.2^2 + 4 \times \tfrac{1}{2} \times 11.2 \times 25$

$SA = 685.44 \text{ cm}^2$

Square units

Calculator Steps: 1 1 . 2 x^2 + 4 × 0 . 5 × 1 1 . 2 × 2 5 =

Note that some questions show the net of the solid, these are calculated the same as if the net were folded up to construct the solid.

Rectangular (based) Pyramids consist of a rectangular base and two pairs of identical triangles. So to find the S.A. of a Rectangular Pyramid:

$$SA = lb + 2 \times \tfrac{1}{2}b_1h_1 + 2 \times \tfrac{1}{2}b_2h_2$$

where:

l, b = side lengths of the rectangular base
b_1 = the base length of the first of the triangles (which is equal to b)
h_1 = the perpendicular height of the first triangle (which is called the slant height)
b_2 = the base length of the second of the triangles (which is equal to l)
h_2 = the perpendicular height of the second triangle (which is called the slant height)

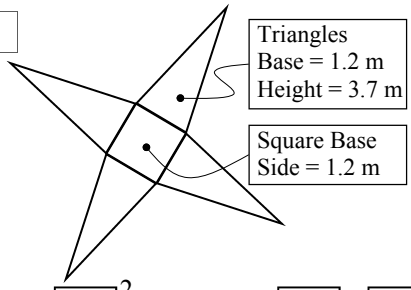
Would you remember the above formula? Don't bother, just realise that the SA is found by adding the rectangle with the two pairs of triangles. Question 5 has the setting out for you to follow.

Surface Area - Square & Rectangular Pyramids

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the surface area of the Square Pyramids first shown as nets.

1



SA = $\square^2 + 4 \times \frac{1}{2} \times \square \times \square$

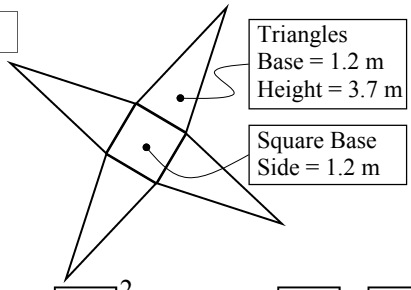
Find the surface area of the Square Pyramids first shown as nets.

1

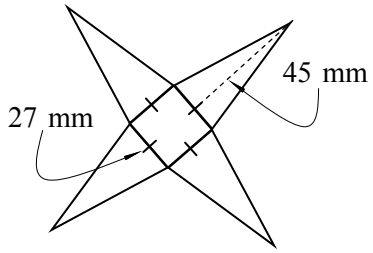


SA = $1.2^2 + 4 \times ½ \times 1.2 \times 3.7$

Area of Square + Area of 4 triangles

SA = 10.32 m^2

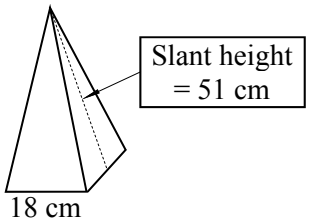
2



SA = $27^2 + 4 \times ½ \times 27 \times 45$

SA = 3 159 mm^2

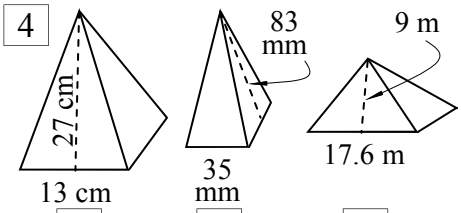
3



SA = $18^2 + 4 \times ½ \times 18 \times 51$

SA = 2 160 cm^2

4



A SA = $13^2 + 4 \times ½ \times 13 \times 27$

SA = 871 cm^2

B SA = $35^2 + 4 \times ½ \times 35 \times 83$

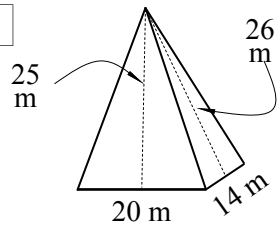
SA = 7 035 mm^2

C SA = $17.6^2 + 4 \times ½ \times 17.6 \times 9$

SA = 626.56 m^2

Rectangular pyramids have two matching pairs of triangles and a rectangular base.

5



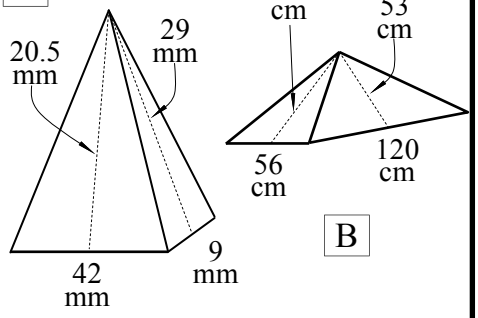
SA = 20×14 Area of Rectangular Base

$+ 2 \times ½ \times 20 \times 25$ Area of 1st pair of Δ's

$+ 2 \times ½ \times 14 \times 26$ Area of 2nd pair of Δ's

SA = 1 144 m^2

6



A SA = 42×9

$+ 2 \times ½ \times 42 \times 20.5$

$+ 2 \times ½ \times 9 \times 29$

SA = 1 500 mm^2

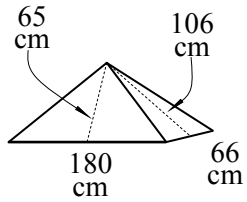
B SA = 56×120

$+ 2 \times ½ \times 56 \times 75$

$+ 2 \times ½ \times 120 \times 53$

SA = 17 280 cm^2

7



SA = 180×66

$+ 2 \times ½ \times 180 \times 65$

$+ 2 \times ½ \times 66 \times 106$

SA = 30 576 cm^2

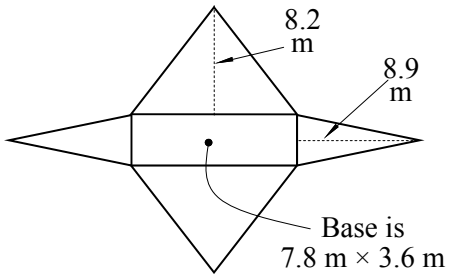
These are a mix of Square and Rectangular based pyramids. Find the SA.

8 Square Pyramid with a slant height of 19 cm and a base side length of 8 cm.

SA = $8^2 + 4 \times ½ \times 8 \times 19$

SA = 368 cm^2

9 Net - Find assembled SA.



SA = 7.8×3.6

$+ 2 \times ½ \times 3.6 \times 8.9$

$+ 2 \times ½ \times 7.8 \times 8.2$

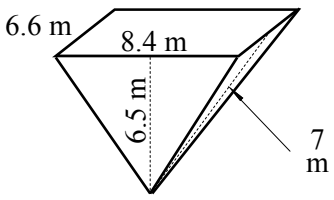
SA = 124.08 m^2

10 Square Pyramid with a slant height of 46 m and a base side length of 27 m.

SA = $27^2 + 4 \times ½ \times 27 \times 46$

SA = 3 213 m^2

11 Find the cost to anodise the Aluminium seed hopper shown if the process costs \$11.35/m^2 of the external SA. (To nearest m^2)



SA = 6.6×8.4

$+ 2 \times ½ \times 6.6 \times 7$

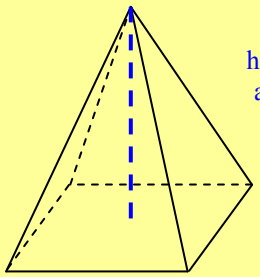
$+ 2 \times ½ \times 8.4 \times 6.5$

SA = 156.24 m^2 (156 nearest m^2)

Cost = 156×11.35 = \$1 770.60

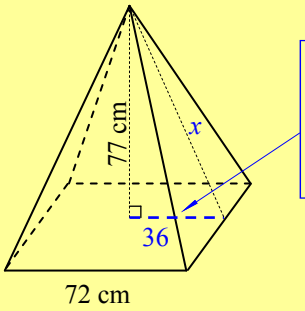
Surface Area - Square Pyramids - Using Pythagoras

This sheet should be attempted after the previous sheet has been completed. It deals with finding the surface area of a Square Pyramid but rather than being given the slant height you are given the altitude of the pyramid. The altitude is the vertical height of the pyramid, from the centre of the base to the apex.



The method is the same as the previous sheet, except Pythagoras Theorem has to be applied first to obtain the slant height.

Example - Find the Surface Area of the Square Pyramid.



Note that this length is half the width of the square base.

$72 \div 2 = 36$ cm

Find the slant height first

$x^2 = 36^2 + 77^2$

$x^2 = 7\,225$

$x = \sqrt{7\,225}$

$x = 85$ cm

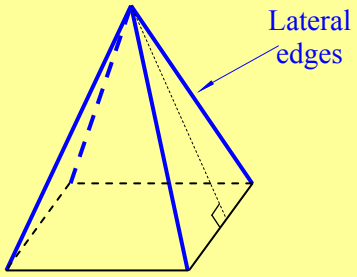
Then calculate the surface area

$SA = 72^2 + 4 \times \frac{1}{2} \times 72 \times 85$

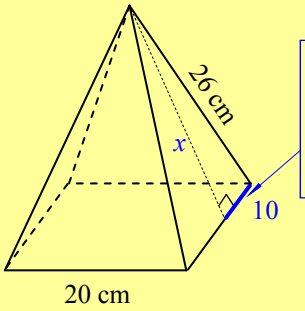
square + 4 triangles

$SA = 17\,424$ cm^2

Another length you could be given is the length along the 'lateral edge'. These are shown in blue on the diagram (right). If you are given this length then you need to use Pythagoras Theorem to find the slant height, but you will subtract when using Pythagoras Theorem.



Example - Find the Surface Area of the Square Pyramid.



Note that this length is half the width of the square base.

$20 \div 2 = 10$ cm

Find the slant height first

$x^2 = 26^2 - 10^2$

$x^2 = 576$

$x = \sqrt{576}$

$x = 24$ cm

Then calculate the surface area

$SA = 20^2 + 4 \times \frac{1}{2} \times 20 \times 24$

square + 4 triangles

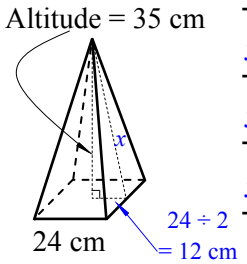
$SA = 17\,424$ cm^2

Surface Area - Square Pyramids - Using Pythagoras

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Given the height (altitude) of these square pyramids use P. T. to calculate the slant height then the SA.

Example



$x^2 = 12^2 + 35^2$

$x^2 = 1\ 369$

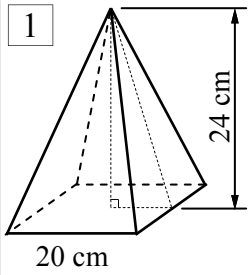
$x = \sqrt{1\ 369}$

$x = 37$ cm

$SA = 24^2 + 4 \times ½ \times 24 \times 37$

$SA = 2\ 352\ cm^2$

1



$x^2 =$

$x^2 =$

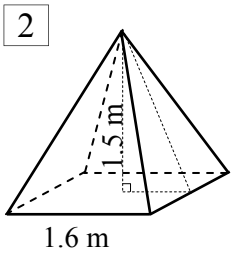
$x =$

$x =$ cm

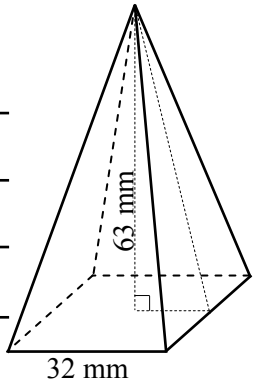
SA =

SA =

2

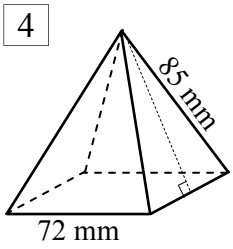


3

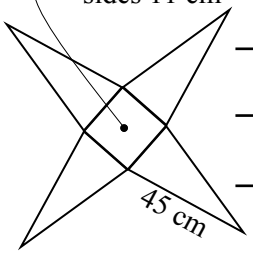


Now you are given the length along the lateral edge. Use P.T ***subtraction***, find the SA and round to 1 d.p. if needed.

4

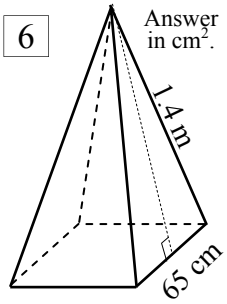


5

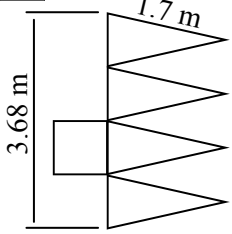


Find SA when the solid is assembled.

6



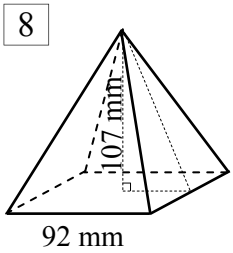
7



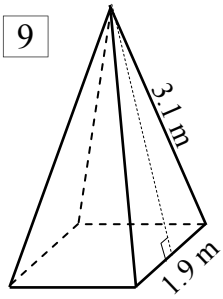
Find SA when the solid is assembled.

These are mixed, find the slant height and then the SA to 1 decimal place.

8



9



10 The Pyramid of Khufu has a square base with side lengths of 230 m. It has a height (attitude) of 138 m. Estimate the SA of its 4 exposed triangular faces. (m^2)

Sketch the pyramid, showing measurements

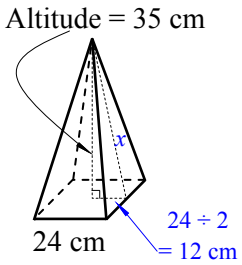
Note that the SA is an estimation because the surface of the faces are stepped rather than flat

Surface Area - Square Pyramids - Using Pythagoras

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Given the height (altitude) of these square pyramids use P. T. to calculate the slant height then the SA.

Example



$x^2 = 12^2 + 35^2$

$x^2 = 1\ 369$

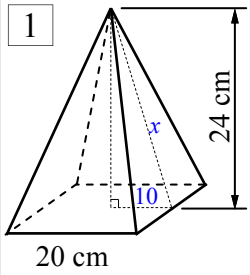
$x = \sqrt{1\ 369}$

$x = 37$ cm

$SA = 24^2 + 4 \times ½ \times 24 \times 37$

$SA = 2\ 352$ cm^2

1



$x^2 = 24^2 + 10^2$

$x^2 = 676$

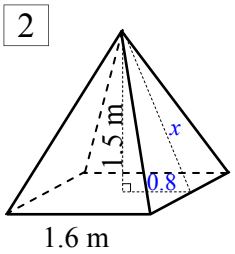
$x = \sqrt{676}$

$x = 26$ cm

$SA = 20^2 + 4 \times ½ \times 20 \times 26$

$SA = 1\ 440$ cm^2

2



$x^2 = 0.8^2 + 1.5^2$

$x^2 = 2.89$

$x = \sqrt{2.89}$

$x = 1.7$ m

$SA = 1.6^2 + 4 \times ½ \times 1.6 \times 1.7$

$SA = 8$ m^2

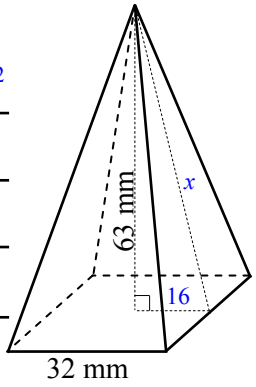
3

$x^2 = 16^2 + 63^2$

$x^2 = 4\ 225$

$x = \sqrt{4\ 225}$

$x = 65$ mm

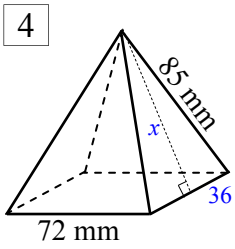


$SA = 32^2 + 4 \times ½ \times 32 \times 65$

$SA = 5\ 184$ mm^2

Now you are given the length along the lateral edge. Use P.T ***subtraction***, find the SA and round to 1 d.p. if needed.

4



$x^2 = 85^2 - 36^2$

$x^2 = 5\ 929$

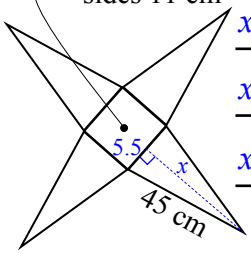
$x = \sqrt{5\ 929}$

$x = 77$ mm

$SA = 72^2 + 4 \times ½ \times 72 \times 77$

$SA = 16\ 272$ mm^2

5



$x^2 = 45^2 - 5.5^2$

$x^2 = 1\ 994.75$

$x = \sqrt{1\ 994.75}$

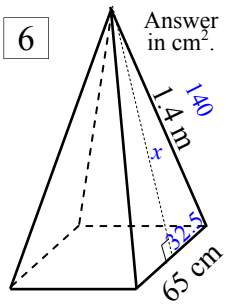
$x = 44.7$ cm

Find SA when the solid is assembled.

$SA = 11^2 + 4 \times ½ \times 11 \times 44.7$

$SA = 1\ 104.4$ cm^2

6



$x^2 = 140^2 - 32.5^2$

$x^2 = 18\ 543.75$

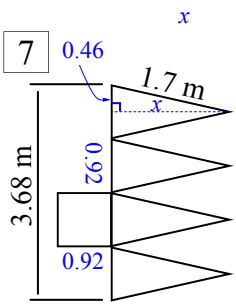
$x = \sqrt{18\ 543.75}$

$x = 136.2$ cm

$SA = 65^2 + 4 \times ½ \times 65 \times 136.2$

$SA = 21\ 931$ cm^2

7



$x^2 = 1.7^2 - 0.46^2$

$x^2 = 2.6784$

$x = \sqrt{2.6784}$

$x = 1.6$ m

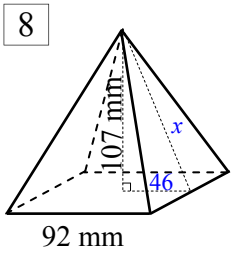
Find SA when the solid is assembled.

$SA = 0.92^2 + 4 \times ½ \times 0.92 \times 1.6$

$SA = 3.8$ m^2

These are mixed, find the slant height and then the SA to 1 decimal place.

8



$x^2 = 107^2 + 46^2$

$x^2 = 13\ 565$

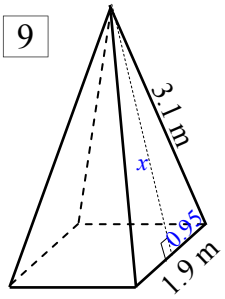
$x = \sqrt{13\ 565}$

$x = 116.5$ mm

$SA = 92^2 + 4 \times ½ \times 92 \times 116.5$

$SA = 29\ 900$ mm^2

9



$x^2 = 3.1^2 - 0.95^2$

$x^2 = 9.1875$

$x = \sqrt{9.1875}$

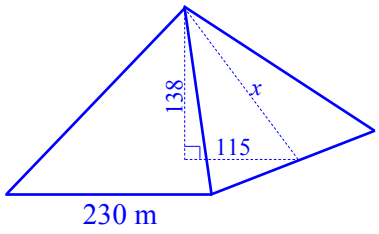
$x = 3$ m

$SA = 1.9^2 + 4 \times ½ \times 1.9 \times 3$

$SA = 15$ m^2

10 The Pyramid of Khufu has a square base with side lengths of 230 m. It has a height (attitude) of 138 m. Estimate the SA of its 4 exposed triangular faces. (m^2)

Sketch the pyramid, showing measurements



$x^2 = 138^2 + 115^2$

$x^2 = 32\ 269$

$x = \sqrt{32\ 269}$

$x = 179.6$ m

Note that the SA is an estimation because the surface of the faces are stepped rather than flat

$SA = 4 \times ½ \times 230 \times 179.6$

$SA = 82\ 616$ m^2

Surface Area - Mixed Exercises

This is a review sheet covering previous work completed, but it is mixed together.

The first worksheet has no rounding, no Pythagoras Theorem and like units in each question. There are also hints to help you get started.

The second sheet requires rounding, unit conversion and Pythagoras Theorem to be applied and contains no hints. So the second sheet is more difficult.

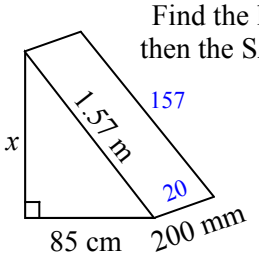
6 Find the length x, then the SA in cm^2.



$x^2 = 157^2 - 85^2$

$x^2 = 17\ 424$

$x = \sqrt{17\ 424}$

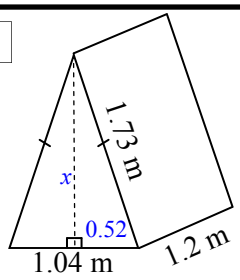
$x = 132$ cm

$SA = 2 \times ½ \times 85 \times 132$

$+ 132 \times 20 + 157 \times 20 + 85 \times 20$

$SA = 18\ 700\ cm^2$

7



$x^2 = 1.73^2 - 0.52^2$

$x^2 = 2.7225$

$x = \sqrt{2.7225}$

$x = 1.65$ m

$SA = 2 \times ½ \times 1.04 \times 1.65$

$+ 1.04 \times 1.2 + 2 \times 1.73 \times 1.2$

$SA = 7.1\ m^2$ (1 d.p.)

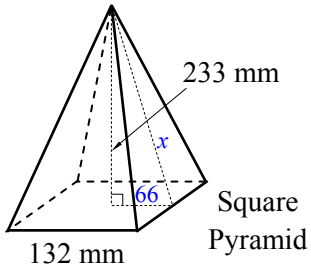
8

$x^2 = 233^2 + 66^2$

$x^2 = 58\ 645$

$x = \sqrt{58\ 645}$

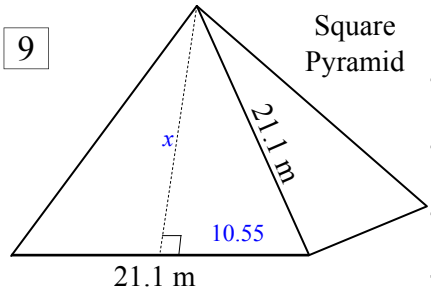
$x = 242.2$ mm (1 d.p.)



$SA = 132^2 + 4 \times ½ \times 132 \times 242.2$

$SA = 81\ 364.8\ mm^2$

9



$x^2 = 21.1^2 - 10.55^2$

$x^2 = 333.9075$

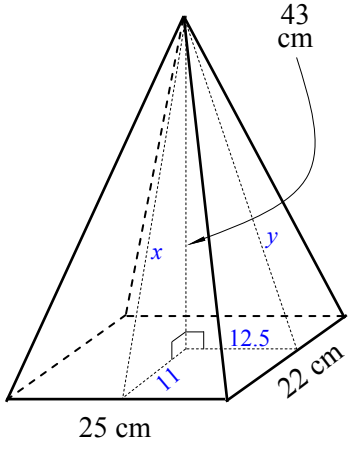
$x = \sqrt{333.9075}$

$x = 18.3$ m

$SA = 21.1^2 + 4 \times ½ \times 21.1 \times 18.3$

$SA = 1\ 217.5\ m^2$

10



$x^2 = 43^2 + 11^2$

$x^2 = 1\ 970$

$x = \sqrt{1\ 970}$

$x = 44.4$ cm

$y^2 = 43^2 + 12.5^2$

$y^2 = 2\ 005.25$

$y = \sqrt{2\ 005.25}$

$y = 44.8$ cm

$SA = 25 \times 22 + 2 \times ½ \times 25 \times 44.4$

$+ 2 \times ½ \times 22 \times 44.8$

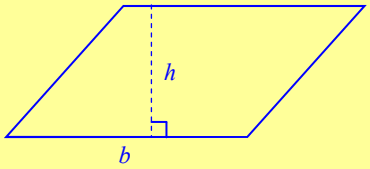
$SA = 2\ 645.6\ cm^2$

Surface Area - Other Prisms

Prisms are solids that have a uniform cross-section. This uniform face can be of any shape, but common plane shapes include squares, rectangles, triangles and circles. There are also other plane shapes such as kites, rhombi (plural of rhombus), parallelograms and trapezia (plural of trapezium).

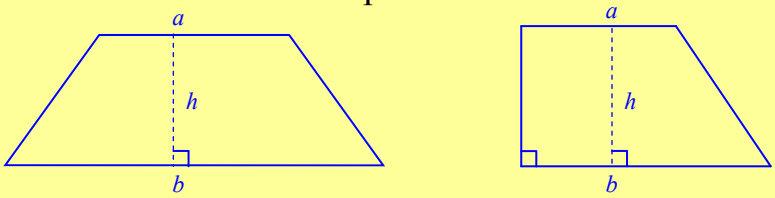
Area Formulae

Parallelogram



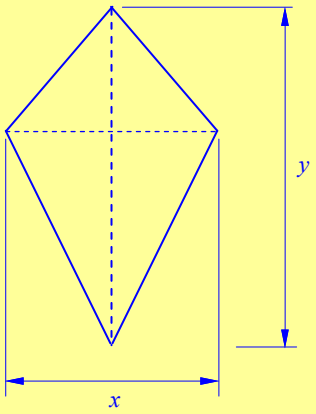
$A = bh$

Trapezium



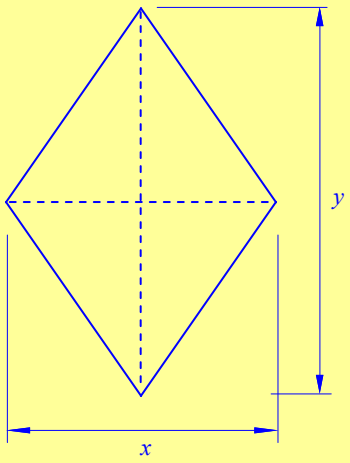
$A = \frac{1}{2}(a + b)\, h$

Kite



$A = \frac{1}{2}xy$

Rhombus



$A = \frac{1}{2}xy$

The process is similar to finding the SA of rectangular prisms. Find double the area of the front face then add all the side faces. Sometimes there will be two pairs of matching faces, with parallelograms/kites, four matching faces with rhombi and a different possibilities with Trapezia, depending on the sides of the shape. The first 3 questions have the working out set up for you, the last two questions (third column) require Pythagoras Theorem to be applied before the SA can be found.

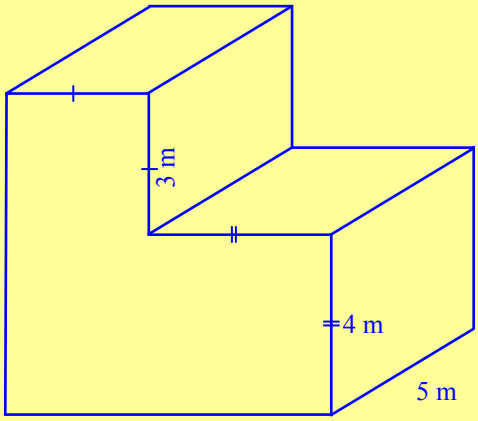
$+ 2 \times 53 \times 115$

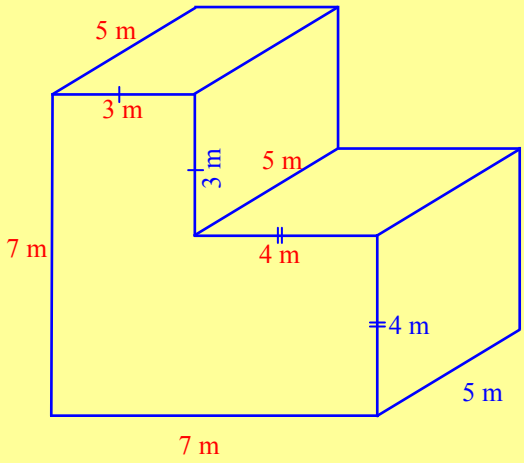
SA = 62 240 mm^2

Surface Area - Composite Solids

Finding the SA of a composite solids can be difficult as it requires visualizing the solid, identifying all the face areas and then a complicated process of adding them all. But there are two ways to approach the questions, the longer but more easy to follow approach or the quicker method. It is easier to lose track of where you are up to and make mistakes using the quicker method. Sheet 1 is structured with full setting out ready to go. Sheet 2 has no setting out and harder questions, including Pythagoras Theorem.

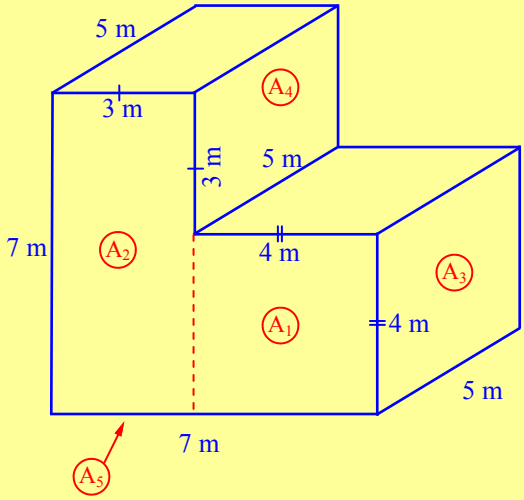
Example - Find the SA of the solid below - Method 1





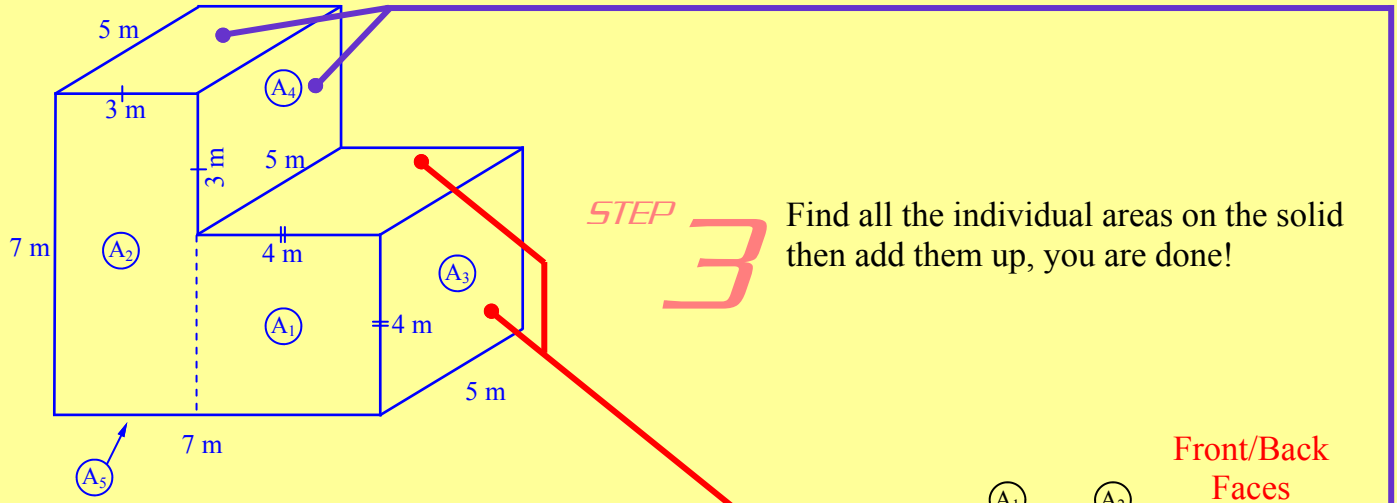
STEP 1

Write distances on all sides, including the two missing sides '7 m' which had to be calculated.



STEP 2

Break the front face up into 2 areas, label all faces note that some faces are repeated, there are four matching pairs of faces with this question, the front/rear face and three matching pairs around the solid.



STEP 3

Find all the individual areas on the solid then add them up, you are done!

Front Face

Side Faces

$A_1 = 4 \times 4 = 16\ m^2$

$A_2 = 7 \times 3 = 21\ m^2$

$A_3 = 4 \times 5 = 20\ m^2$

$A_4 = 3 \times 5 = 15\ m^2$

$A_5 = 7 \times 5 = 35\ m^2$

Front/Back Faces

$SA = 2 \times (16 + 21)$

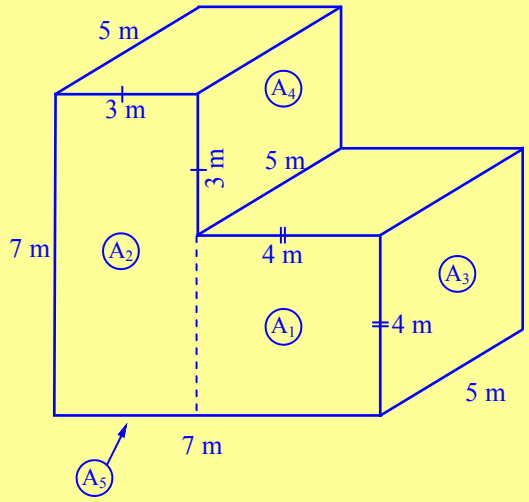
$+ 2 \times 20 + 2 \times 15$

LHS Face & Base

$+ 2 \times 35$

$SA = 214\ m^2$

Example - Find the SA of the solid below - Method 2



STEP 1

Write distances on all sides, including the missing side '7 m' which had to be calculated.

STEP 2

Break the front face up into 2 areas, label all faces note that some faces are repeated, there are four matching pairs of faces with this question, the front/rear face and three matching pairs around the solid.

STEP 3

Use either of the two methods below.

$SA = 2 \times 4 \times 4 + 2 \times 7 \times 3$ Front/Back Faces

$+ 2 \times 5 \times 4 + 2 \times 3 \times 5$ $2 \times A_3 + 2 \times A_4$

$+ 2 \times 7 \times 5$ LHS Face & Base

$SA = 214\ m^2$

OR

$SA = 2 \times 4 \times 4 + 2 \times 7 \times 3$ Front/Back Faces

$+ 5 \times (4 + 4 + 3 + 3 + 7 + 7)$ Perimeter Front Face × Depth

$SA = 214\ m^2$

Surface Area - Composite Solids (Sheet 2)

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the SA for the composite solids shown. All measurements are in cm.

1

$A_1 = 15 \times 6 = 90 \text{ cm}^2$

$A_2 = 3 \times 11 = 33 \text{ cm}^2$

$A_3 = 11 \times 2 = 22 \text{ cm}^2$

$A_4 = 12 \times 2 = 24 \text{ cm}^2$

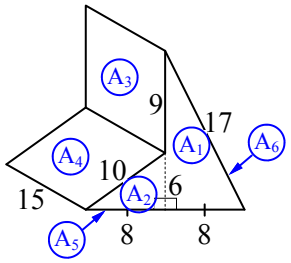
$A_5 = 6 \times 2 = 12 \text{ cm}^2$ $A_6 = 15 \times 2 = 30 \text{ cm}^2$

$A_7 = 17 \times 2 = 34 \text{ cm}^2$ $A_8 = 3 \times 2 = 6 \text{ cm}^2$

$SA = 2 \times (90 + 33) + 22 + 24 + 12 + 30 + 34 + 6$

$SA = 374 \text{ cm}^2$

2



$A_1 = \frac{1}{2} \times 15 \times 8 = 60 \text{ cm}^2$

$A_2 = \frac{1}{2} \times 8 \times 6 = 24 \text{ cm}^2$

$A_3 = 9 \times 15 = 135 \text{ cm}^2$

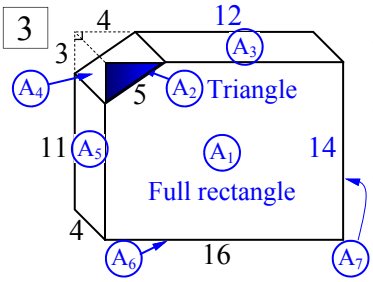
$A_4 = 10 \times 15 = 150 \text{ cm}^2$

$A_5 = 16 \times 15 = 240 \text{ cm}^2$ $A_6 = 17 \times 15 = 255 \text{ cm}^2$

$SA = 2 \times (60 + 24) + 135 + 150 + 240 + 255$

$SA = 948 \text{ cm}^2$

3



$A_1 = 16 \times 14 = 224 \text{ cm}^2$

$A_2 = \frac{1}{2} \times 3 \times 4 = 6 \text{ cm}^2$

$A_3 = 12 \times 4 = 48 \text{ cm}^2$

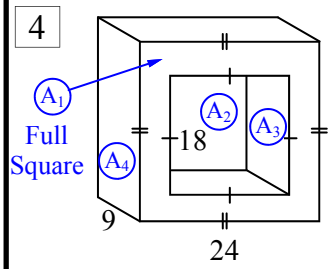
$A_4 = 5 \times 4 = 20 \text{ cm}^2$

$A_5 = 11 \times 4 = 44 \text{ cm}^2$ $A_6 = 16 \times 4 = 44 \text{ cm}^2$

$A_7 = 14 \times 4 = 56 \text{ cm}^2$

$SA = 2 \times (224 - 6) + 48 + 20 + 44 + 44 + 56 = 648 \text{ cm}^2$

4



$A_1 = 24^2 = 576 \text{ cm}^2$

$A_2 = 18^2 = 324 \text{ cm}^2$

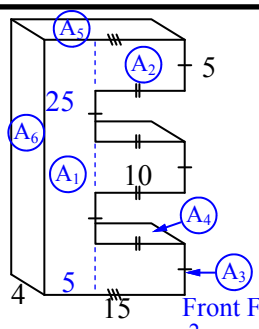
$A_3 = 18 \times 9 = 162 \text{ cm}^2$

$A_4 = 24 \times 9 = 216 \text{ cm}^2$

$SA = 2 \times (576 - 324) + 4 \times 162 + 4 \times 216$

$SA = 2\,016 \text{ cm}^2$

5



$A_1 = 25 \times 5 = 125 \text{ cm}^2$

$A_2 = 10 \times 5 = 50 \text{ cm}^2$

$A_3 = 5 \times 4 = 20 \text{ cm}^2$

$A_4 = 10 \times 4 = 40 \text{ cm}^2$

$A_5 = 15 \times 4 = 60 \text{ cm}^2$ $A_6 = 25 \times 4 = 100 \text{ cm}^2$

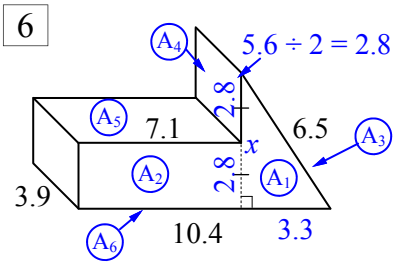
$SA = 2 \times (125 + 3 \times 50) + 5 \times 20 + 4 \times 40$

$+ 2 \times 60 + 100$

$SA = 1\,030 \text{ cm}^2$

These require Pythagoras Theorem to be applied. All units are in metres.

6



$x^2 = 6.5^2 - 3.3^2$

$x^2 = 31.36$

$x = \sqrt{31.36}$

$x = 5.6 \text{ m}$

$A_1 = \frac{1}{2} \times 3.3 \times 5.6 = 9.24 \text{ m}^2$

$A_2 = 7.1 \times 2.8 = 19.88 \text{ m}^2$ $A_3 = 6.5 \times 3.9 = 25.35 \text{ m}^2$

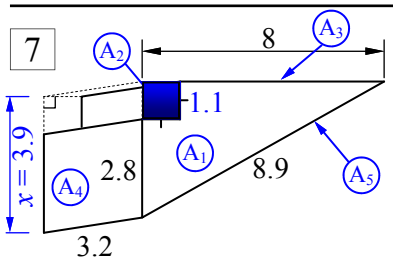
$A_4 = 2.8 \times 3.9 = 10.92 \text{ m}^2$ $A_5 = 7.1 \times 3.9 = 27.69 \text{ m}^2$

$A_6 = 10.4 \times 3.9 = 40.56 \text{ m}^2$

$SA = 2 \times (9.24 + 19.88) + 25.35 + 2 \times 10.92$

$+ 27.69 + 40.56 = 173.68 \text{ m}^2$

7



$x^2 = 8.9^2 - 8^2$

$x^2 = 15.21$

$x = \sqrt{15.21}$

$x = 3.9 \text{ m}$

$A_1 = \frac{1}{2} \times 3.9 \times 8 = 15.6 \text{ m}^2$

$A_2 = 1.1^2 = 1.21 \text{ m}^2$ $A_3 = 8 \times 3.2 = 25.6 \text{ m}^2$

$A_4 = 3.9 \times 3.2 = 12.48 \text{ m}^2$

$A_5 = 8.9 \times 3.2 = 28.48 \text{ m}^2$

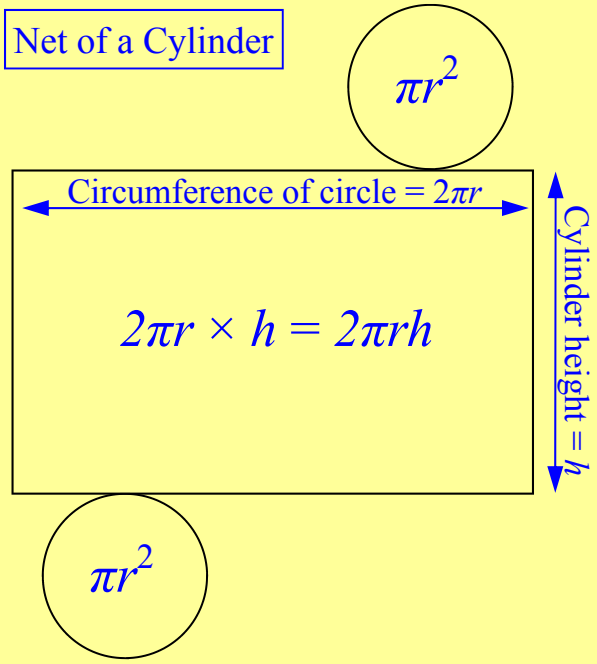
$SA = 2 \times (15.6 - 1.21) + 25.6 + 12.48 + 28.48$

$SA = 95.34 \text{ m}^2$

Estimation/Terms of π - Surface Area of Cylinders

When you calculate the SA of a cylinder, or the area of a cylinder wall (the curved part of a cylinder) you will generally use a calculator. A calculator uses an approximation for π because π is irrational, its decimal component goes on forever. So if an exact value is required, the answer must be expressed 'in terms of π'.

Net of a Cylinder



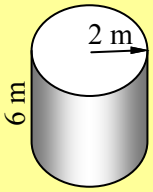
As the net shows, each circle has an area of πr^2. So the two circles added gives an area of $2\pi r^2$.

The cylinder wall, the rectangle in the net, wraps around the circle so one of its sides is the same length as the circumference of the circular ends, which is $2\pi r$. Its height is the height of the cylinder, which is h. As this area is a rectangle, its area is one side times the other, or $2\pi r \times h = 2\pi rh$.

SA of a Cylinder = $2\pi r^2 + 2\pi rh$

SA of a Cylinder Wall = $2\pi rh$

Example - Exact Area of a Cylinder Wall & Estimation of area (using π =3).



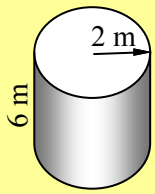
$A = 2\pi rh$	Write the formula
$= 2\times\pi\times2\times6$	Substitute r and h
$A = 24\pi$ m^2	Find area

Estimate:

$A = 24\pi$ m^2	
$\approx 24 \times 3$	Replace π with 3
$A \approx 72$ m^2	

Example - Exact Surface Area of a Cylinder & Estimation of area (using π =3).

$SA = 2\pi r^2 + 2\pi rh$	Write the formula
$= 2\times\pi\times2^2 + 2\times\pi\times2\times6$	Substitute r and h
$= 8\pi + 24\pi$	Simplify parts
$SA = 32\pi$ m^2	Find SA



Estimate: using $\pi = 3$

$SA = 32\pi$ m^2
$\approx 32 \times 3$
$SA \approx 96$ m^2

Note that as π = 3.14 to 2 d.p., using π = 3 will always give an answer that is below the actual surface area/area. But it is a simple estimate and a quick way to check your calculations.

$A = 1\,300\pi$ mm^2

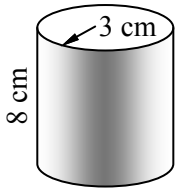
Estimate: $A = 1\,300\pi$ mm^2

$\approx 1\,300 \times 3$

$A \approx 3\,900$ mm^2

Now repeat the same process except this time for the SA of a cylinder.

5



$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times\boxed{3}^2 + 2\times\pi\times\boxed{3}\times\boxed{8}$

$= \boxed{18}\ \pi + \boxed{48}\ \pi$

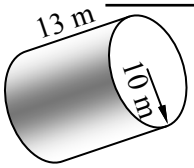
$SA = \boxed{66}\ \pi$ cm^2

Estimate: $SA = 66\pi$ cm^2

$\approx 66 \times 3$

$SA \approx 198$ cm^2

6



$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times10^2 + 2\times\pi\times10\times13$

$= 200\pi + 260\pi$

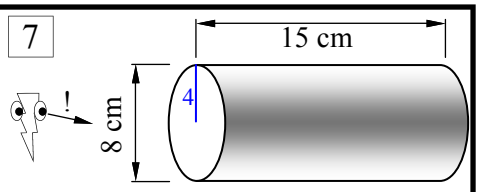
$SA = 460\pi$ m^2

Estimate: $SA = 460\pi$ m^2

$\approx 460 \times 3$

$SA \approx 1\,380$ m^2

7



$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times4^2 + 2\times\pi\times4\times15$

$= 32\pi + 120\pi$

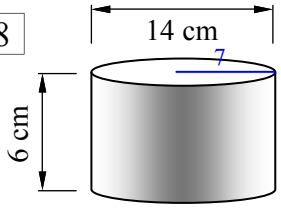
$SA = 152\pi$ cm^2

Estimate: $SA = 152\pi$ cm^2 using $\pi = 3$

$\approx 152 \times 3$

$SA \approx 456$ cm^2

8



$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times7^2 + 2\times\pi\times7\times6$

$= 98\pi + 84\pi$

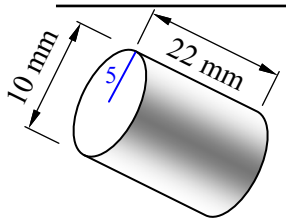
$SA = 182\pi$ cm^2

Estimate: $SA = 182\pi$ cm^2 using $\pi = 3$

$\approx 182 \times 3$

$SA \approx 546$ cm^2

9



$SA = 2\pi r^2 + 2\pi rh$

$= 2\times\pi\times5^2 + 2\times\pi\times5\times22$

$= 50\pi + 220\pi$

$SA = 270\pi$ mm^2

Estimate: $SA = 270\pi$ mm^2 using $\pi = 3$

$\approx 270 \times 3$

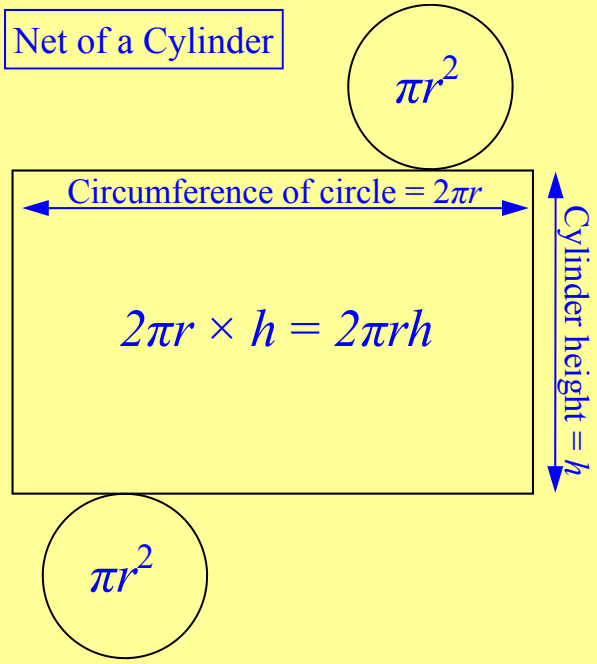
$SA \approx 810$ mm^2

Surface Area of Cylinders

The surface area of a cylinder is the sum of the areas of the solid. As the net of a cylinder below shows, each circle has an area of πr^2. So the two circles added together gives an area of $2\pi r^2$. The cylinder wall, (also called the curved surface) is the rectangle in the net, it wraps around the circles so one of its sides is the same length as the circumference of the circular ends, which is $2\pi r$. Its height is the height of the cylinder, which is h.

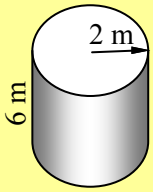
As this area is a rectangular area, its area is one side times the other, or $2\pi r \times h = 2\pi rh$.

Net of a Cylinder



SA of a Cylinder = $2\pi r^2 + 2\pi rh$

Example - SA of a cylinder - Using $\pi = {}^{22}/_{7}$



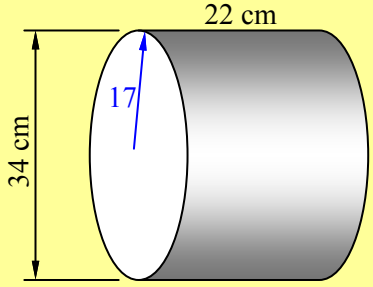
$SA = 2\pi r^2 + 2\pi rh$	Write the formula
$= 2\times{}^{22}/_{7}\times 2^2 + 2\times{}^{22}/_{7}\times 2\times 6$	Substitute r and h, Change π to ${}^{22}/_{7}$.
$SA = 100.57\ m^2$ (2 d.p.)	Find surface area

Calculator 2 × 2 2 $a^b/_c$ 7 × 2 x^2 + 2 × 2 2 $a^b/_c$ 7 × 2 × 6 =

Answer on Screen 100⌟4⌟7

Calculator $a^b/_c$ Answer on Screen 100.5714286 Round to 2 decimal places $100.57\ m^2$ (2 d.p.)

Example - SA of a cylinder - Given the diameter instead of radius - Using π key



Divide the diameter by two. Then on the diagram draw the radius.

Use that number in your calculation. It may be a decimal.

$SA = 2\pi r^2 + 2\pi rh$	Write the formula
$= 2\times\pi\times 17^2 + 2\times\pi\times 17\times 22$	Substitute r and h
$SA = 4\ 165.75\ cm^2$ (2 d.p.)	Find surface area

Calculator 2 × π × 1 7 x^2 + 2 × π × 1 7 × 2 2 =

Answer on Screen 4165.751859 Round to 2 decimal places $4\ 165.75\ cm^2$ (2 d.p.)

Surface Area of Cylinders

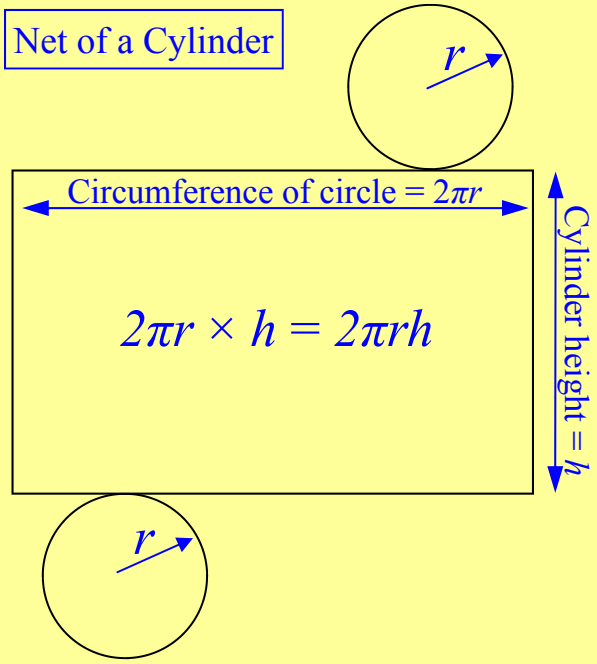
$SA = 24.17 \text{ m}^2$ (2 d.p.)

$Cost = 24.17 \div 11 = 2.19 \ldots = 3$ tins required

Area of Curved Surface - Cylinders

The cylinder wall of a cylinder, (also called the curved surface) is the rectangle shown in the net below, it wraps around the circular ends so one of its sides is the same length as the circumference of the circular ends, which is $2\pi r$. Its height is the height of the cylinder, which is h.

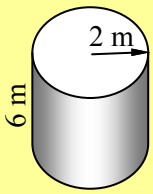
Net of a Cylinder



As this area is a rectangular area, its area is one side times the other,
or $2\pi r \times h = 2\pi rh$.

Area = $2\pi rh$

Example - Area of a cylinder wall - Using $\pi = {}^{22}/_{7}$



SA = $2\pi rh$	Write the formula
= $2\times{}^{22}/_{7}\times2\times6$	Substitute r and h, Change π to ${}^{22}/_{7}$.
SA = 75.4 m^2 (1 d.p.)	Find area of the curved surface

Calculator 2 × 2 2 $a^b/_c$ 7 × 2 × 6 =

Answer on Screen 75⌟ 3⌟ 7

Calculator $a^b/_c$ Answer on Screen 75.42857143 Round to 1 decimal place 75.4 m^2

Column 1 uses $\pi = 3.14$ first. So use the formula $A = 2\pi rh$ and calculate the area. The lower part of the sheet uses $\pi = {}^{22}/_{7}$, solve as above in the example.

Column 2 uses the π key on your calculator, also you may be given the radius or the diameter. If you are given the diameter then halve it (÷ 2) to change the length to the radius, then solve as before. There is a table at the bottom of the column, this doesn't require working out, just answers. The last two questions are different and require division and brackets, see how you go.

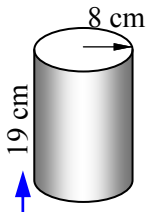
Column 3 features problem style questions, they require an extra step or two to complete.

Area of Curved Surface - Cylinders

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the area of the curved surface of these cylinders. Use $\pi = 3.14$. Round to 2 d.p.

Example



$A = 2\pi rh$

$= 2 \times 3.14 \times 8 \times 19$

$A = 954.56$ cm^2

units^2 must match

1

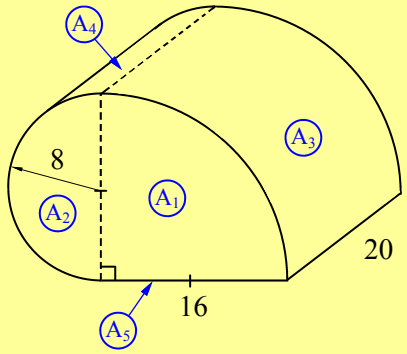
Percentage $= 7.30$ %

Surface Area of Composite Solids - Circles

Finding the SA of a composite solids can be difficult as it requires visualizing the solid, identifying all the face/curved surface areas and then a complicated process of adding them all. The questions on this worksheet all prisms except for question 2. The method is to:

- Find the area of the front face and double it (as the rear face is the same - prisms only)
- Find the face/curved surface areas around the sides of the solid
- Add the areas together

Example - Find the SA of the solid below, measurements are in cm.



STEP 1

Break the front face up into 2 areas, label all faces/curved surfaces around the outside of the solid.

$A_1 = \frac{1}{4} \times \pi \times 16^2$

$A_1 = 201.06 \text{ cm}^2$

$A_2 = \frac{1}{2} \times \pi \times 8^2$

$A_2 = 100.53 \text{ cm}^2$

$A_3 = \frac{1}{4} \times 2 \times \pi \times 16 \times 20$

$A_3 = 502.65 \text{ cm}^2$

$A_4 = \frac{1}{2} \times 2 \times \pi \times 8 \times 20$

$A_4 = 502.65 \text{ cm}^2$

$A_5 = 16 \times 20 = 320 \text{ cm}^2$

STEP 2

Calculate the individual areas.

$SA = 2 \times (201.06 + 100.53) + 502.65 + 502.65 + 320$

$SA = 1\,568.48 \text{ cm}^2$

STEP 3

Find the SA by adding each of the areas.

Surface Area of Composite Solids - Circles

© FREEFALL MATHEMATICS - FREEFALL MATHEMATICS ALTITUDE BOOK 2 - LICENSED FOR NON-COMMERCIAL USE

Find the SA for the composite solids. All measurements are in cm. Round to 2 d.p.

1

$A_1 = 14^2 = 196$ cm^2

$A_2 = \frac{1}{2}\pi r^2$

$= \frac{1}{2} \times \pi \times 7^2 = 76.97$ cm^2

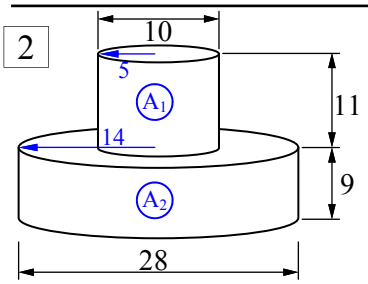
$A_3 = 12^2 = 144$ cm^2

$A_4 = \frac{1}{2} \times 2\pi rh = \frac{1}{2} \times 2 \times \pi \times 7 \times 12 = 263.89$ cm^2

SA = 2 × (196 + 76.97) + 3 × 144 + 263.89

SA = 1 241.83 cm^2

2



$A_1 = 2\pi rh$

$= 2 \times \pi \times 5 \times 11$

$= 345.58$ cm^2

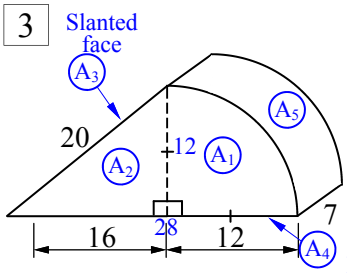
$A_2 = 2\pi r^2 + 2\pi rh$

$= 2 \times \pi \times 14^2 + 2 \times \pi \times 14 \times 9 = 2\,023.19$ cm^2

SA = 345.58 + 2 023.19

SA = 2 368.77 cm^2 (or 2 368.76 cm^2 in 1 step)

3



$A_1 = \frac{1}{4} \times \pi \times 12^2$

$= 113.10$ cm^2

$A_2 = \frac{1}{2} \times 16 \times 12 = 96$ cm^2

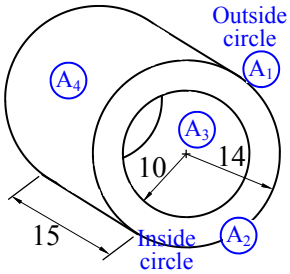
$A_3 = 20 \times 7 = 140$ cm^2

$A_4 = 28 \times 7 = 196$ cm^2 A_5: $\frac{1}{4} \times 2 \times \pi \times 12 \times 7 = 131.94$ cm^2

SA = 2 × (113.10 + 96) + 140 + 196 + 131.94

SA = 886.14 cm^2

4



$A_1 = \pi \times 14^2 = 615.75$ cm^2

$A_2 = \pi \times 10^2 = 314.16$ cm^2

$A_3 = 2 \times \pi \times 10 \times 15$

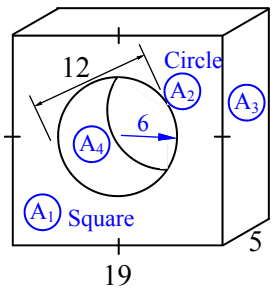
$= 942.48$ cm^2

$A_4 = 2 \times \pi \times 14 \times 15 = 1\,319.47$ cm^2

SA = 2 × (615.75 - 314.16) + 942.48 + 1 319.47

SA = 2 865.13 cm^2 (or 2 865.14 cm^2 in 1 step)

5



$A_1 = 19^2 = 361$ cm^2

$A_2 = \pi r^2 = \pi \times 6^2$

$= 113.10$ cm^2

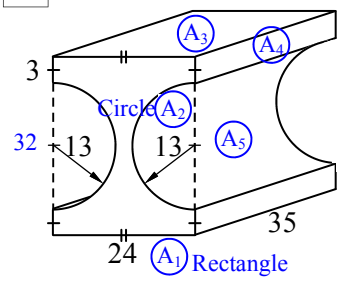
$A_3 = 19 \times 5 = 95$ cm^2

$A_4 = 2\pi rh = 2 \times \pi \times 6 \times 5 = 188.50$ cm^2

SA = 2 × (361 - 113.10) + 4 × 95 + 188.50

SA = 1 064.30 cm^2

6



$A_1 = 24 \times 32 = 768$ cm^2

$A_2 = \pi r^2 = \pi \times 13^2$

$= 530.93$ cm^2

$A_3 = 24 \times 35 = 840$ cm^2

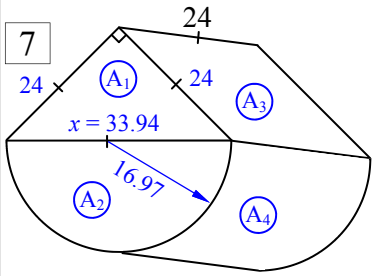
$A_4 = 3 \times 35 = 105$ cm^2

$A_5 = 2\pi rh = 2 \times \pi \times 13 \times 35 = 2\,858.85$ cm^2

SA = 2×(768 - 530.93)+2×840+4×105+2 858.85

SA = 5 432.99 cm^2

7



Pythagoras needed!

$x^2 = 24^2 + 24^2$

$x^2 = 1\,152$

$x = \sqrt{1\,152}$

$x = 33.94$ cm (2 d.p.)

$A_1 = \frac{1}{2} \times 24 \times 24 = 288$ cm^2

$A_2 = \frac{1}{2}\pi r^2 = \frac{1}{2} \times \pi \times 16.97^2 = 452.36$ cm^2

$A_3 = 24^2 = 576$ cm^2

$A_4 = \frac{1}{2} \times 2 \times \pi \times 16.97 \times 24 = 1\,279.51$ cm^2

SA = 2 × (288 + 452.36) + 2 × 576 + 1 279.51

SA = 3 912.23cm^2

$A_{F+B} = 20l^2$

$= 20 \times 1.2^2$

$A_{F+B} = 28.8 \text{ m}^2$

$A_{BASE} = 5lb$

$= 5 \times 1.2 \times 0.85$

$A_{BASE} = 5.1 \text{ m}^2$

$A_{2.4} = 2lb$

$= 2 \times 2.4 \times 0.85$

$A_{2.4} = 4.08 \text{ m}^2$

$A_{1.2} = 7lb$

$= 7 \times 1.2 \times 0.85$

$A_{1.2} = 7.14 \text{ m}^2$

$TSA = 45.12 \text{ m}^2$

Surface Area - Find a Word

Look for words in the list at the bottom of the grid. Once you find a word cross it off the list.

A letter could be used more than once so don’t colour it in too dark (using a texta for example) so that you can still read it.
